5' Plants mostly 20–80 cm tall, if less than 10 cm (*S. menziesii*), then cauline leaves in 5–10+ pairs and closely overlapping; seed not winged; plants mostly of lower elevations ..... (7)

6. Flower nodding, calyx broadly elliptic to campanulate (pressed), 12–14 mm long, 6–10 mm wide (to 16 mm, 15 mm, respectively, in fruit), thin and membranous between nerves; petals purple-red; seed 1.5–2 mm long, marginal wing nearly the width of body of seed ..... ***S. uralensis***
6' Flower erect, calyx elliptic (pressed), 6–12 mm long, 5–8 mm wide, enlarging little in fruit, thicker in texture; petals white to pink; seed 0.7–1.2 mm long, marginal wing about 1/4 the width of body of seed ..... ***S. hitchguirei***

7. Plants annual or perennial; calyx usually 15–25 cm long; corolla white or pinkish, petal blades 7–15 mm long; introduced, of disturbed places ..... (8)
7' Plants perennial; calyx usually 5–16 mm long; corolla white to pink or purple, petal blades 1–6 mm long; native, of undisturbed areas ..... (9)

8. Flowers perfect; calyx teeth 6–13 mm long, linear-lanceolate to subulate, nerves 10, prominently anastomosing in mature flowers; styles 3; capsule teeth 6 ..... ***S. noctiflora***
8' Flowers unisexual, plants usually dioecious; calyx teeth 3–5 (6) mm long, narrowly to broadly triangular, nerves 10 in staminate flowers, 20 in pistillate flowers, without prominent anastomoses; styles 5; capsule teeth mostly 5 or 10 ..... ***S. latifolia***

9. Calyx in flower 5–7 mm long, nerves obscure; cauline leaves 5–20, of relatively uniform size and distribution ..... ***S. menziesii***

9' Calyx in flower usually 8–16 mm long, nerves prominent; cauline leaves mostly 3–5, usually progressively and markedly reduced above.....(10)

10. Inflorescence with 2–8+ flowers per node, flowering nodes 4–6+, flowering progressing up the inflorescence; styles mostly 3; capsule teeth 3 or 6.....***S. scouleri***

10' Inflorescence with 1 or 2 flowers (occasionally flowering branches) per node, flowering nodes mostly 2 or 3, flowering beginning from apex as determinate cymes or only central flower developing; styles mostly 5; capsule teeth mostly 5 .....***S. drummondii***

Silene acaulis L. (stalkless) Moss campion. Perennial herbs, densely matted and forming cushions. **STEMS** 1–3 cm tall, internodes glabrous. **LEAVES** 3–6 pairs per stem, 0.4–1.5 cm long, 0.5–1.2 mm wide, linear, bases closely enveloping internodes. **INFL** a solitary flower, pedicel erect or ascending. **FLOWERS** perfect and unisexual; calyx tubular to campanulate (pressed), 6–9 mm long, 2–3 mm wide (in fruit to 13 mm and 5 mm, respectively), 10-nerved, not anastomosing, glabrous, lobes lanceolate to ovate, 1–1.5 mm long, base becoming depressed at pedicel; petals bright pink, rarely white in some individuals, 1.2–1.5× calyx length, rounded to bilobed, lobes rounded, appendages poorly developed; stamens exserted 0–1 mm in staminate flowers; styles 3, exserted 2–3 mm. **FRUIT** opening by 6 teeth; carpophore 1 mm long. **SEEDS** light brown, 0.8–1 mm long, margins neither prominently papillate nor winged. $2n = 24$. [*S. acaulis* subsp. *subacaulescens* (F. N. Williams) Hultén]. Subalpine and alpine meadows and talus slopes. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3650–4250 m (12000–14000'). Flowering: Jun–Sep. Canada; Washington to Montana, south to Arizona and New Mexico.

Silene antirrhina L. (with leaves like *Antirrhinum*) Sleepy catchfly. Annual herbs (ours), caudex 1–few-branched. **STEMS** 15–70 cm tall, upper internode(s) with a glutinous band accumulating debris. **LEAVES** 7 (11) pairs per stem, 1–7 cm long, 2–12 mm wide, narrowly oblanceolate to linear, much shorter to occasionally 1.3× internode length. **INFL** an open, 1–25+-flowered cyme, pedicel erect to ascending. **FLOWERS** perfect; calyx ovoid to ellipsoid (pressed), 5–6 mm long, 2–3 mm wide (in fruit to 8 mm and 5 mm, respectively), 10-nerved, not anastomosing, glabrous, lobes (teeth) narrowly triangular, 1–2 mm long, base tapered at pedicel; petals mostly dark red throughout or in part, 1.1–1.2× calyx length, bilobed, lobes rounded, appendages 2, 0.1–0.4 mm long; stamens included; styles 3, included. **FRUIT** opening by 6 teeth; carpophore 0.8–1 mm long. **SEEDS** gray-brown, 0.5–0.8 mm long, margins neither prominently papillate nor winged. $2n = 24$. Desert shrub and piñon-juniper woodland communities; grasslands, riparian areas, and disturbed sites. ARIZ: Apa; COLO: Dol, LPl, Mon; NMEX: McK, SJn; UTAH. 1100–2400 m (3600–6800'). Flowering: Mar–Jun. Introduced throughout most of North America.

Silene drummondii Hook. (for Thomas Drummond, 1780–1835, Scottish botanical explorer and naturalist) Drummond's catchfly, forked catchfly. Perennial herbs, caudex 1–few-branched. **STEMS** 20–70 cm tall, internodes uniformly stipitate-glandular, without glutinous bands. **LEAVES** 2–5 pairs per stem, 3–10 cm long, 4–12 mm wide, narrowly lanceolate to oblanceolate or linear, most shorter than internodes. **INFL** with 1 or 2 flowers (occasionally flowering branches) per node, flowering nodes mostly 2 or 3, flowering beginning from apex as determinate cymes or only central flower developing. **FLOWERS** perfect; calyx broadly tubular to ellipsoid (pressed), 12–18 mm long, 4–8 mm wide (in fruit to 14–18 mm and 5–8 mm, respectively), 10-nerved, not anastomosing, glandular-pubescent, lobes (teeth) triangular, 1–1.5 mm long, base tapered at pedicel, petals white, often dark red at least in part, slightly exceeding calyx, bilobed, lobes rounded, appendages 2, 0.1–0.4 mm; stamens included; styles mostly 5, included. **FRUIT** opening by mostly 5 teeth. **SEEDS** dark brown, 0.7–1 mm long, margins minutely papillate, not winged. Root used as a "life medicine" by the Ramah Navajo.

1. Petals not exceeding calyx, white; fruiting calyces mostly broadly ovoid (pressed), 2.25–3× as long as broad; seeds 0.7–0.8 mm long; inflorescence mostly 3–10-flowered.....**var. *drummondii***

1' Petals exserted 4–6 mm, dark red to purple apically; fruiting calyces narrowly ovoid to ellipsoid (pressed), 2× as long as broad; seeds 1–1.2 mm long; inflorescence mostly 1–4-flowered .....**var. *striata***

var. *drummondii* **INFL** mostly 3–10-flowered. **CALYX** in fruit mostly broadly ovoid (pressed), 2.25–3× as long as broad. **PETALS** not exceeding calyx, white. Oak thickets, ponderosa pine, aspen forests, riparian areas, and subalpine and alpine meadows and talus slopes. ARIZ: Apa; COLO: Arc, LPl, Min, Mon, SJn; NMEX: McK, SJn; UTAH. 2135–3810 m (7000–12500'). Flowering: May–Aug. British Columbia to Manitoba, south to Arizona, New Mexico, and Nebraska.

var. *striata* (Rydb.) Bocquet (striped) **INFL** typically 1–4 (–8)-flowered. **CALYX** in fruit narrowly ovoid to ellipsoid (pressed), 2× as long as broad. **PETALS** exserted 4–6 mm, dark red to purple apically. [*S. drummondii* subsp. *striata*

(Rydb.) J. K. Morton]. Ponderosa pine and spruce-fir forests, subalpine and alpine meadows and rocky areas. ARIZ: Apa; COLO: Hin, LPl, Min, RGr, SJn; NMEX: McK, SJn; UTAH. 2500–4000 m (8200–13000'). Flowering: Jun–Aug. Saskatchewan south to Nevada, Arizona, and New Mexico.

Silene hitchguirei Bocquet (contraction of C. L. Hitchcock and B. Maguire) Mountain campion. Perennial herbs, caudex 1–few-branched, with tuft of basal leaves. **STEMS** 2–10 cm tall, internodes uniformly stipitate-glandular, septa purple. **LEAVES** 1–3 pairs per stem, 5–8 cm long, 5–10 mm wide, narrowly oblanceolate and long-spatulate, most shorter than internodes. **INFL** mostly 1–4-flowered. **FLOWERS** perfect; calyx elliptic (pressed), 6–12 mm long, 5–8 mm wide, enlarged little in fruit, 10-nerved, anastomosing apically, densely pubescent, hairs purple-septate, lobes triangular, 1.5–4 mm long, base tapered at pedicel, petals white or pink, 1–1.5× calyx, emarginate, appendages 2, 0.2–0.3 mm long; stamens equaling calyx; styles 5, equaling calyx. **FRUIT** opening by 5 or 10 teeth; carpophore 0.5–1 mm long. **SEEDS** brown, 0.7–1.2 mm long, margin not papillate, wing less than 1/4 width of body of seed. $2n = 24$. [*Lychnis apetala* L. var. *montana* (S. Watson) C. L. Hitchc.; *Silene uralensis* (Rupr.) Bocquet subsp. *montana* (S. Watson) McNeill]. Subalpine and alpine meadows; rocky areas. COLO: Hin, Min, SJn. 3400–4200 m (11200–13850'). Flowering: Jun–Aug. Alberta south to Utah and Colorado.

Silene laciniata Cav. (deeply cut) Gregg's Mexican pink or campion. Perennial herbs, caudex 1–few-branched. **STEMS** 20–60 cm tall, internodes uniformly stipitate-glandular, without glutinous bands. **LEAVES** 4–7 pairs per stem, 3–6 cm long, 8–30 mm wide, lanceolate or elliptic to oblanceolate, shorter than to occasionally 1.5× internode length. **INFL** a (1) 3–9-flowered cyme, pedicel mostly ascending to erect. **FLOWERS** perfect; calyx cylindrical (pressed), 19–23 mm long, 5–6 mm wide, (in fruit to 25 mm and 8 mm, respectively), 10-nerved, anastomosing near lobes, stipitate-glandular with clear cross walls, lobes 3–3.5 mm long, triangular, bases becoming depressed at pedicel; petals scarlet, 1.4–1.6× calyx length, 4–6-lobed, lobes linear to oblong, appendages 2, 1–2 mm long; stamens exserted 8–10 mm; styles 3, exserted 9–12 mm. **FRUIT** opening by 6 teeth; carpophore 2–4 mm long. **SEEDS** reddish brown, 1.2–2.5 mm long, margin long-papillate, not winged. $2n = 48$. Oak woodlands, ponderosa pine and spruce forests. ARIZ: Apa; NMEX: McK, SJn. 2100–2700 m (6900–8900'). Flowering: Jul–Sep. Arizona, New Mexico, and Texas; Mexico. Our material belongs to **var. *greggii*** (A. Gray) S. Watson (for Josiah Gregg, 1806–1850, merchant and explorer who collected plants in the region around Santa Fe, New Mexico).

Silene latifolia Poir. (broad-leaved) White campion or cockle. Annual or short-lived perennial herb, caudex 1–few-branched, plants of disturbed areas. **STEMS** 30–80+ cm tall, internodes uniformly pubescent, often stipitate-glandular. **LEAVES** 3–8 pairs per stem, 2–12 cm long, 6–25 mm wide, lanceolate to elliptic, much shorter than to 2× internode length. **INFL** open, 3–30-flowered cymes, pedicels erect to widely spreading. **FLOWERS** unisexual; calyx in staminate flowers tubular (pressed), 15–20 mm long, 5–8 mm wide (in fruit to 22 mm and 9 mm, respectively), 10-nerved, not anastomosing, in pistillate flowers elliptic, 15–25 mm long, 5–9 mm wide (in fruit to 23 mm and 15 mm, respectively), 20-nerved, not anastomosing, lobes narrowly to broadly triangular, 3–6 mm long, tapering at base, often abruptly; petals white, 0.4–0.6× calyx length, mostly deeply bilobed, lobes rounded, appendages 2, 1–1.5 mm long; stamens exserted 5–7 mm; styles mostly 5, exserted 7–10 mm. **FRUIT** opening by mostly 5 or 10 teeth; carpophore 1–2 mm long. **SEEDS** dark gray-brown, 1.2–1.5 mm long, margins neither prominently papillate nor winged. [*Lychnis alba* Mill.; *Silene pratensis* (Raf.) Gren. & Godr.]. Roadsides, alluvial flats, other disturbed sites. COLO: Arc, Hin, Min. 1800–2900 m (6000–9500'). Flowering: May–Aug. Introduced throughout North America.

Silene menziesii Hook. (for Archibald Menzies, 1754–1842, British physician, gardener, botanist, and plant collector in northwest North America) Menzies' catchfly. Perennial herbs, shoots decumbent to matted at base. **STEMS** mostly 5–30 cm tall, internodes uniformly stipitate-glandular, without glutinous bands. **LEAVES** 5–20 pairs per stem, 2–4 (6) cm long, 3–20 mm wide, broadly elliptic to oblanceolate, mostly 1–3× internode length. **INFL** of solitary, terminal flowers or 3–7+ in a leafy cyme. **FLOWERS** functionally perfect or unisexual; calyx campanulate (pressed), 5–7 mm long, 3–6 mm wide, enlarged little in fruit, obscurely 10-nerved, not anastomosing, puberulent to stipitate-glandular, lobes 1.5–3 mm long, bases tapered at pedicel; petals white, 1–1.7× calyx length, 2-lobed, lobes oblong, appendages 2, 0.1–0.3 mm long; stamens equaling calyx in staminate flowers; styles mostly 3, exserted 1–3 mm. **FRUIT** opening by 3 or 6 teeth; carpophore 0.5–1 mm long. **SEEDS** brown, 0.6–1 mm long, margins neither prominently papillate nor winged. $2n = 24, 48$. [*S. menziesii* var. *viscosa* (Greene) C. L. Hitchc. & Maguire]. Oak and aspen woodlands, ponderosa, Douglas-fir, and spruce forests. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn. 2225–3350 m (7350–11000'). Flowering: May–Aug. Northwestern North America; Washington to Montana, Nebraska, south to Arizona and New Mexico.

Silene noctiflora L. (night-flowering) Night-flowering catchfly. Annual herbs, caudex 1–few-branched, plants of disturbed areas. **STEMS** 30–70+ cm tall, internodes uniformly stipitate-glandular, without glutinous bands. **LEAVES** 5–9 pairs per stem, 1–12 cm long, 3–35 mm wide, broadly elliptic to lanceolate, much shorter to 2× internode length. **INFL** a 3–9-flowered cyme, pedicels erect to widely spreading. **FLOWERS** perfect; calyx ovate-elliptic (pressed), 17–20 mm long, 5–8 mm wide (in fruit to 22 cm and 12 mm, respectively), 10-nerved with prominent anastomoses, densely pilose, often stipitate-glandular, lobes 6–13 mm long, linear-lanceolate to subulate, base tapered, often abruptly, at pedicel; petals white or pinkish, 1.2–1.3× calyx length, deeply bilobed, lobes usually oblong, appendages 2, 0.5–1.5 mm long; stamens exserted 1–3 mm; styles 3, exserted 3–4 mm. **FRUIT** opening by 6 teeth; carpophore 1–3 mm long. **SEEDS** grayish brown, 1–1.6 mm long, neither winged nor papillate. $2n = 24$. Disturbed areas. COLO: Arc. 2300 m (7500'). Flowering: Jun–Sep. Introduced throughout North America. A poultice of leaves applied to a prairie dog bite by the Ramah Navajo.

Silene scouleri Hook. (for John Scouler, a Scottish geologist and botanist, naturalist on the voyage to the Columbia River with David Douglas in 1824–1825) Hall's catchfly. Perennial herbs, caudex 1–several-branched. **STEMS** mostly 25–70 cm tall, internodes uniformly stipitate-glandular, without glutinous bands. **LEAVES** 1–12 pairs per stem, 6–25 cm long, 4–30 mm wide, ovate-lanceolate to lanceolate, oblanceolate, or rarely linear, much shorter than to 2× internodes. **INFL** 2–8+ flowers per node, flowering nodes 4–6+, flowering progressing up the inflorescence. **FLOWERS** perfect; calyx campanulate (pressed), 8–13 mm long, 3–7 mm wide (in fruit to 18 mm and 8 mm, respectively), 10-nerved, anastomosing apically, densely stipitate-glandular, lobes lanceolate, 2–5 mm long, base becoming depressed at pedicel; petals white, greenish white, or pink, 1.2–1.3× calyx length, deeply 2-lobed, lobes broadly oblong, appendages 2, 1–3 mm long; stamens equaling calyx; styles mostly 3, exserted 4–6 mm. **FRUIT** opening by mostly 6 teeth; carpophore 1.5–4 mm long. **SEEDS** grayish brown, 0.9–1.5 mm long, margins neither prominently papillate nor winged. $2n = 48$, 96. Oak and juniper thickets, meadows, subalpine forests, and alpine meadows and rocky areas. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: SJn; UTAH. 1800–3600 m (6000–11800'). Flowering: May–Sep. British Columbia and Alberta south to Oregon, Idaho, and New Mexico. Our material belongs to subsp. ***hallii*** (S. Watson) C. L. Hitchc. & Maguire (for Elihu Hall, 1820–1882, botanist, farmer; with J. P. Harbour he collected plants in the mountains of central Colorado in 1862).

Silene uralensis (Rupr.) Bocquet (of the Ural Mountains) Nodding campion. Perennial herbs, caudex 1–few-branched, with tuft of basal leaves. **STEMS** 8–20 cm tall, internodes uniformly stipitate- and nonstipitate-glandular, septa purple. **LEAVES** 1–3 pairs per stem, 0.5–4 cm long, 2–4 mm wide, linear to linear-lanceolate, most shorter than internodes. **INFL** mostly 1 (3)-flowered per stem, pedicels recurved, becoming erect in fruit. **FLOWERS** perfect; calyx broadly elliptic to campanulate (pressed), 12–14 mm long, 6–10 mm wide (in fruit to 16 mm and 15 mm, respectively), 10-nerved, anastomosing apically, densely pubescent, hairs purple-septate, lobes triangular to oblong, 2.5–4 mm long, base tapered or abruptly narrowed at pedicel; petals dingy pink to purple, 1–1.3× calyx, emarginate to 2-lobed, lobes rounded, appendages 2, 0.2–0.3 mm long; stamens equaling or slightly exceeding calyx; styles 5, equaling or slightly exceeding calyx. **FRUIT** opening by 5 or 10 teeth; carpophore 1–2 mm long. **SEEDS** brown, 1.5–2 mm long, margin not prominently papillate, wing about equaling width of body of seed. $2n = 24$. [*Lychnis apetala* L. var. *attenuata* (Farr) C. L. Hitchc.]. Alpine meadows and rocky areas. COLO: Hin, SJn. 3800–3900 m (12500–12800'). Flowering: Jun–Aug. Northern North America; Montana to Utah and Colorado. Our material belongs to var. ***uralensis***.

Silene vulgaris (Moench) Garcke (common) Bladder campion. Perennial short-lived herbs, caudex 1–few-branched. **STEMS** 20–45 cm tall, upper internodes glabrous. **LEAVES** 7–12 pairs per stem, 2–8 cm long, 5–30 mm wide, broadly oblong to oblanceolate or lanceolate, much shorter to 1.5× internodes. **INFL** an open 5–50-flowered cyme, pedicel erect to spreading. **FLOWERS** perfect; calyx campanulate (pressed), 10–16 mm long, 7–11 mm wide (in fruit to 20 mm and 15 mm, respectively), in fruit 20-nerved with distinctive reticulations of secondary veins, glabrous, base depressed at pedicel, lobes (teeth) broadly triangular, 2–3 mm long; petals white, 1.3–1.5× calyx length, mostly bilobed, lobes broadly rounded, appendages absent or essentially so; stamens exserted 1–3 mm; styles 3, exserted 5–12 mm. **FRUIT** opening by 6 teeth; carpophore 2–3 mm long. **SEEDS** brown, 1–1.3 mm long, margins neither prominently papillate nor winged. [*Silene cucubalus* Wibel]. Disturbed areas. COLO: Arc. 1800–2400 m (6000–8000'). Flowering: Jun–Aug. Introduced throughout much of North America.

Spergularia (Pers.) J. Presl & C. Presl Sand-spurry

(derivative of the genus *Spergula*) Annual or perennial herbs with taproot. **STEMS** erect to sprawling, simple to freely branched distally or throughout, terete. **LEAVES** not congested at or near base of flowering stem, with stipules

lanceolate to triangular, scarious, blades threadlike to linear. **INFL** symmetrical or 1-sided cymes or flowers solitary. **FLOWERS** briefly perigynous; sepals 5, briefly connate, apex acute to obtuse, not hooded, awn absent; petals 5, white to pink, not clawed, auricles absent, coronal appendages absent, blade apex entire; stamens 1–10, arising from rim of hypanthial disc, staminodes absent; ovary 1-locular; styles 3. **FRUIT** an ovoid capsule, opening by 3 spreading valves with recurved tips. **SEEDS** 30–90, dark or reddish brown, smooth to papillate, submarginally grooved, marginal wing present or absent, appendage absent. About 60 species, mostly temperate and arid America and Mediterranean region of Europe and Africa (Rossbach 1940).

1. Stipules conspicuous, shiny white, lanceolate; axillary leaves 2–4+ per cluster; seed sculpturing of parallel, wavy lines; stamens 6–10 ..... ***S. rubra***
1' Stipules inconspicuous, dull white, broadly triangular; axillary leaf clusters mostly absent; seeds ± smooth; stamens 1–3 (5) ..... ***S. salina***

Spergularia rubra (L.) J. Presl & C. Presl (red) Red sand-spurry. Annual or short-lived perennial herbs, delicate, 4–25 cm tall, with stalked glands distally. **STEMS** with primary ones 0.3–0.5 mm diameter proximally. **LEAVES** with conspicuous stipules, shiny white, lanceolate, 3.5–5 mm long, apex long-acuminate; blade filiform to linear, 0.4–1.5 cm long, scarcely fleshy, apex apiculate to spine-tipped; axillary leaves 2–4+ per cluster. **INFL** a cyme, simple or 3 or more times compound or flowers solitary and axillary. **FLOWER** sepal lobes lanceolate, 2–3.2 mm long, to 4 mm in fruit, apex obtuse to acute; petals pink, obovate to ovate; stamens 6–10. **FRUIT** 3.5–5 mm long, equaling to 1.2× sepal length. **SEEDS** red-brown to dark brown, broadly ovate or ± truncate, angular at broad end, plump, 0.4–0.6 mm long, sculpturing of parallel, wavy lines, margins with peglike papillae (30×); wing absent. $2n$ = 18, 27, 36, 54. Along trails and other disturbed sites. COLO: LPl, Min, Mon, SJn. 2700–3300 m (8900–10800'). Flowering: May–Sep. Alaska south through Washington and Montana to California and New Mexico (excluding Arizona); eastern North America.

Spergularia salina J. Presl & C. Presl (salt) Salt-marsh sand-spurry, lesser sea-spurry. Annual herbs, delicate, 8–30 cm tall, with stalked glands at least distally. **STEMS** with primary ones 0.6–2 (–3) mm diameter proximally. **LEAVES** with inconspicuous stipules, dull white, broadly triangular, 1.2–3.5 mm long, apex acute to short-acuminate; blade linear, (0.8–) 1.5–4 cm long, fleshy, apex blunt to apiculate; axillary leaf clusters usually absent. **INFL** a cyme, simple or 3 or more times compound or flowers solitary and axillary. **FLOWER** sepal lobes ovate to elliptic, 2.5–4.5 mm long, to 4.8 mm in fruit, apex rounded to acute; petals white or pink to rosy, ovate to elliptic-oblong; stamens 2–3, rarely 5. **FRUIT** 2.8–6.4 mm long, equaling to 1.5× sepal length. **SEEDS** light brown to reddish brown, broadly ovate, mostly plump, 0.5–0.7 (–0.8) mm long, dull, ± smooth, often with gland-tipped papillae (30×); wing usually absent or incomplete. $2n$ = 18, 36. [*S. marina* (L.) Griseb.]. Alkali seeps. UTAH. 1100–1380 m (3700–4525'). Flowering: Apr–Jun. Throughout much of North America except the highest latitudes.

Stellaria L. Chickweed, Starwort

(Latin *stella*, star, + *aria*, pertaining to, referring to the shape of the flower) Annual or perennial herbs with taproot or slender rhizomes. **STEMS** prostrate to ascending or erect, simple or branched, terete or 4-angled. **LEAVES** not congested at or near base of flowering stem, without stipules, blades linear or lanceolate to broadly ovate or elliptic. **INFL** an open cyme or umbellate or flower solitary. **FLOWERS** hypogynous or weakly perigynous; sepals 4 or 5, distinct, apex acute, acuminate, or obtuse, not hooded, awn absent; petals 4 or 5, white (sometimes translucent in *S. borealis*), not clawed, auricles absent, coronal appendages absent, blade apex bifid for 2/3–4/5 its length; stamens 4, 5, or 10, arising from nectariferous disc (prominent in *S irrigua*), staminodes absent; ovary 1-locular; styles usually 3. **FRUIT** an ovoid to globose capsule, opening by 6 (8 or 10) ascending to recurved valves. **SEEDS** 5–35, yellow-brown to dark brown, papillate or rugose, marginal wing absent, appendage absent. About 120 species worldwide, mainly north-temperate regions (Morton 2005c).

1. Plant annual, taprooted; stem terete, villous in a line between nodes; at least basal leaves with petiole 5–20+ mm long ..... ***S. media***
1' Plant perennial, rhizomatous; stem 4-angled (except *S. obtusa*), glabrous or uniformly pubescent; leaves sessile or petiole less than 2 mm long ..... (2)

2. Bracts scarious or largely so, 0.1–0.4 cm long; flowers in a terminal cyme ..... (3)
2' Bracts herbaceous or foliaceous, mostly 0.5–3 cm long; flower in a leafy terminal cyme or solitary in upper leaf axil ..... (5)

3. Cyme umbelloid with 3–5+ pedicels appearing to radiate from one point; pedicels deflexed below, often curved apically in fruit; petals absent ..... ***S. umbellata***
3′ Cyme not umbelloid; pedicels straight to arcuate; petals present ..... (4)

4. Leaf margins minutely tuberculate-scaberulous as viewed under a strong (20×) lens, dull; cymes axillary or terminating axillary shoots with divaricately branched pedicels; petals bifid to near base ..... ***S. longifolia***
4′ Leaf margins smooth, lustrous, often coriaceous; cymes terminal with erect or ascending pedicels; petals deeply notched ..... ***S. longipes***

5. Sepals 3.5–5 mm long in flower; leaf margins smooth, lustrous, often coriaceous; petals deeply notched, 1.1–1.6× sepal length ..... ***S. longipes***
5′ Sepals 1.3–3 mm long in flower; leaf margins herbaceous or scarious and transparent to white or purple; petals bifid to near base or absent, less than 1× sepal length (to 1.5× longer in *S. crassifolia*) ..... (6)

6. Mature plant purplish throughout; leaves fleshy, midrib prominent abaxially, margin transparent to white or purple; flower solitary, axillary, often concealed by upper leaves ..... ***S. irrigua***
6′ Mature plant green; leaves herbaceous (somewhat fleshy in *S. crassifolia*), midrib not prominent, margins herbaceous; flower solitary, axillary, but not concealed by leaves, or 3–many in a leafy cyme ..... (7)

7. Flower solitary, axillary; bracts absent; plant prostrate or creeping ..... (8)
7′ Flowers 3–many in leafy cymes; bracts leaflike; plant mostly erect, sometimes prostrate ..... (9)

8. Petals 5; sepals 5, 2–3 mm long in flower, narrowly triangular-lanceolate, acute, veins 3; stems 4-angled (most obvious in proximal 1/2) ..... ***S. crassifolia***
8′ Petals 0; sepals 4 (5), 1.3–1.7 mm long in flower, ± ovate, ± obtuse, veins obscure; stems ± terete ..... ***S. obtusa***

9. Mature capsule dark purple, ± globose; styles usually 0.5–0.9 mm long, thick, curved outward; leaves (primary ones) ovate to broadly elliptic, 0.5–2.5 cm long; sepals obscurely veined, 1.2–1.5 mm long in flower, to 2.5 mm long in fruit ..... ***S. calycantha***
9′ Mature capsule light green to tan, ovate-elongate; styles usually 0.9–1.6 mm long, slender, straight (often contorted when pressed); leaves (primary ones) elliptic-lanceolate to narrowly elliptic or linear-lanceolate, 2–4 cm long; sepals 1–3-veined, 2–2.5 mm long in flower, to 3 mm long in fruit; peripheral to the Four Corners region .... *S. borealis*

Stellaria calycantha (Ledeb.) Bong. (cupped flower) Northern starwort. Perennial herbs, forming clumps, green, rhizomes slender. **STEMS** mostly erect, sometimes trailing, branched, 4-angled, 15–35 cm tall, glabrous or pilose. **LEAVES** with petiole absent or essentially so, blades ovate to elliptic, 0.5–2.5 cm long (widest over lower 1/2), thin, margins glabrous or rarely ciliate, herbaceous to thinly scarious, midrib moderately prominent on lower surface, apex acute. **INFL** mostly a 3–many-flowered terminal cyme; bracts foliaceous, 0.5–3 cm long; pedicels ascending in fruit, 5–35 mm long. **FLOWER** sepals 5, veins obscure, ovate, 1.2–1.5 mm long in flower, to 2.5 mm long in fruit, margins broadly scarious, apex broadly acute, glabrous; petals 5 or 0, bilobed to near base, 0.4–0.6× sepal length; stamens 5; styles 3–5, usually 0.5–0.9 mm long, thick, curved outward. **FRUIT** dark purple, ± globose, 3–5 mm long, valves 6, 8, or 10. **SEEDS** brown, ovate, 0.5–0.9 mm long, smooth or shallowly tuberculate. $2n = 26$. [*S. simcoei* (Howell) C. L. Hitchc.]. Meadows, willow bogs, and spruce-fir communities; scree slopes in alpine communities. COLO: LPl, SJn. 3290–3900 m (10800–12800′). Flowering: Jul–Aug. Alaska to the Atlantic, south to California, Wyoming, Michigan, and New York; Eurasia.

Stellaria crassifolia Ehrh. (thick-leaved) Thick-leaved starwort. Perennial herbs, delicate, mat-forming, green, rhizomes slender. **STEMS** prostrate or creeping, diffusely branched, 4-angled (most obvious in lower 1/2), 3–30 cm long, glabrous. **LEAVES** with petiole absent, blades broadly elliptic-lanceolate to linear-lanceolate, 0.2–1.5 cm long, somewhat fleshy, margins glabrous, transparent to thinly scarious, midrib thinly evident on lower surface, apex acute to acuminate. **INFL** with a solitary flower, axillary but not concealed; bracts foliaceous, 0.5–1 cm long; pedicels sharply curved at apex in fruit, 3–40 mm long. **FLOWER** sepals 5, veins 1–3, narrowly triangular-lanceolate, 2–2.5 mm long in flower, to 3 mm long in fruit, margins narrowly scarious, apex acute, mostly glabrous; petals 5, bilobed to near base, 0.9–1.3× sepal length; stamens 5–10; styles 3. **FRUIT** tan, conic to ellipsoid, 4–5 mm long, valves 6. **SEEDS** tan to reddish brown, reniform to round, 0.7–1 mm long, rugose. $2n = 26$. Riparian areas. COLO: Mon. 3500 m (11700′). Flowering: Jun–Aug. Canada and adjacent areas; North Dakota, South Dakota, Wyoming, Colorado, and Utah. This species is documented in the flora based solely on one collection; it may prove to be far more common.

Stellaria irrigua Bunge (well-watered or wet) Altai chickweed, Altai starwort. Perennial herbs, forming mats or low cushions, mature plant purplish throughout, rhizomes elongate. **STEMS** ascending to spreading, somewhat branched, 4-angled, 2–10 cm tall, glabrous. **LEAVES** with petiole absent, blades elliptic or lanceolate to oblanceolate, 0.1–1 cm long, fleshy, margins glabrous, transparent, white to purple, midrib prominent on lower surface, apex acute. **INFL** a solitary flower, often concealed by upper leaves; pedicels curved to deflexed in fruit, 3–15 mm long. **FLOWER** sepals 5, veins 3, lanceolate, 2.5–3 mm long in flower, to 4 mm long in fruit, margins membranous, apex acute, glabrous; petals 5, bilobed to near base, 0.4–0.5× sepal length; stamens 5; styles 3. **FRUIT** green to tan, ovoid-obtuse, 2.5–3 mm long, teeth 6. **SEEDS** pale brown, reniform, 1–1.2 mm long, not glossy, sides smooth to shallowly rugose, margins thickened with shallow longitudinal ridges. Rocky areas in alpine communities. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn. 3600–4250 m (11700–14000'). Flowering: Jun–Aug. Siberia; Colorado and New Mexico. The type specimen for this species is from the Altai, Siberia. If *S. irrigua* is conspecific with material from southern Colorado and adjacent New Mexico, it represents a geographical disjunction of more than 12000 km (7500 miles).

Stellaria longifolia Muhl. ex Willd. (long-leaved) Long-leaved starwort. Perennial herbs, forming loose clumps, green, rhizomes elongate. **STEMS** straggling to erect, diffusely branched, 4-angled, 10–35 cm tall, glabrous except angles minutely roughened. **LEAVES** with petiole absent, blades linear to very narrowly elliptic, 0.8–4 cm long, thickish, margins ciliate near base, minutely tuberculate-scaberulous (20×), dull, midrib prominent on lower surface, apex acuminate to acute. **INFL** a 2–many-flowered, divaricately branched cyme, axillary or terminating axillary shoots, visible; bracts mostly scarious, 1–4 mm long; pedicels straight to arcuate in fruit, 3–30 mm long. **FLOWER** sepals 5, obscure veins 3, ovate-elliptic, 2.5–3 mm long in flower, to 4 mm long in fruit, margins broadly scarious, apex acute, glabrous; petals 5, bilobed to near base, 0.9–1.3× sepal length; stamens 5–10; styles 3. **FRUIT** blackish purple or tan, ovoid-conic, 3–6 mm long, valves 6. **SEEDS** brown, broadly reniform, 0.7–0.8 mm long, slightly rugose. $2n = 26$. Most common in moist meadows. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: SJn. 1950–3050 m (6400–10000'). Flowering: Jun–Aug. Alaska to Newfoundland, south to California and east to South Carolina; northern Mexico.

Stellaria longipes Goldie **CP** (long-stalked) Goldie's starwort. Perennial herbs, forming small to large clumps or mats, or diffuse, green, rhizomes slender. **STEMS** ascending to erect, often branched, 4-angled, 3–32 cm tall, glabrous or softly pubescent. **LEAVES** with petioles absent, blades linear-lanceolate to ovate-triangular, 0.8–4 cm long, margins glabrous or ciliate, smooth, lustrous, often coriaceous, midrib prominent on lower surface, apex acute to acuminate. **INFL** a 1–20-flowered terminal cyme, visible; bracts foliaceous or scarious and 1–3 mm long; pedicels ascending to erect in fruit, 5–30 mm long. **FLOWER** sepals 5, veins 3, midrib prominent, lanceolate to ovate-lanceolate, 3.5–4 mm long in flower, to 5 mm long in fruit, margins narrowly scarious, apex acute, glabrous or pubescent; petals 5, deeply notched, 1.1–1.6× sepal length; stamens 5–10; styles 3. **FRUIT** purplish black, ovoid to lanceoloid, 4–6 mm long, valves 6. **SEEDS** brown, reniform to globose, 0.6–0.9 mm long., shallowly tuberculate to smooth. $2n$ = mostly 52, 78, or 104. [*S. longipes* var. *altocaulis* (Hultén) C. L. Hitchc.; *S. longipes* var. *monantha* (Hultén) S. L. Welsh; *S. longipes* var. *laeta* (Richardson) S. Watson]. Riparian areas, coniferous forests, alpine and subalpine meadows and talus slopes. ARIZ: Apa; COLO: Arc, Con, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2400–4000 m (7900–13200'). Flowering: May–Sep. Canada and northern United States south to California, Arizona, and New Mexico. Our material belongs to **var. *longipes***.

Stellaria media (L.) Vill. (intermediate) Common chickweed. Annual herb, green, taprooted. **STEMS** creeping to ascending, diffusely branched, terete, 5–40 cm long, villous in a line between nodes. **LEAVES** with petiole 5–20+ mm long at least below, blades ovate to broadly elliptic, 0.5–4 cm long, thickish, margins often ciliate, herbaceous, midrib often prominent on lower surface, apex acute or shortly acuminate. **INFL** a 5–many-flowered terminal cyme, visible; bracts foliaceous, 0.5–4 cm long; pedicels ascending, deflexed at base in fruit, 3–40 mm long. **FLOWER** sepals 5, veins obscure, ovate-lanceolate, 4–5 mm long in flower, to 6 mm long in fruit, margins narrowly scarious, apex obtuse, usually glandular; petals 5 or 0, 0.5–0.9× sepal length, bilobed to near base, stamens usually 3–5; styles 3. **FRUIT** green to tan, ovoid-oblong, 3–5 mm long, valves 6. **SEEDS** reddish brown, broadly reniform to round, 0.9–1.3 mm long, with rounded or flat-topped tubercles. $2n = 40, 42, 44$. Disturbed areas. COLO: LPl; NMEX: SJn. 1800–2400 m (6000–8000'). Flowering: Apr–Aug. Introduced throughout North America.

Stellaria obtusa Engelm. (blunt) Blunt-sepaled starwort, Rocky Mountain starwort. Perennial herbs, creeping, mat-forming, green, rhizomatous. **STEMS** prostrate, branched, ± terete, 3–23 cm long, mostly glabrous. **LEAVES** with petioles to 2 mm long at least below, blades broadly ovate to elliptic, 0.2–1.2 cm long, thin, margins often ciliate near base, herbaceous, midrib faint on lower surface, apex acute. **INFL** a solitary flower, axillary but not concealed; bracts

absent; pedicels spreading, 3–12 mm long. **FLOWER** sepals 4–5, veins obscure, ± ovate, 1.3–1.7 mm long in flower, to 3 mm long in fruit, margins narrowly scarious, apex ± obtuse, glabrous; petals 0; stamens 10 or fewer; styles 3 (4). **FRUIT** green to tan, globose to broadly ovoid, 2.3–3.5 mm long, valves 6. **SEEDS** reddish to grayish black, broadly elliptic, 0.5–0.7 mm long, finely reticulate. 2n = 26, 52, about 65, about 78. Riparian areas. COLO: Hin, LPl, Min. 2400–2500 m (8000–8200'). Flowering: May–Aug. Southwestern Canada; Washington to Montana, south to California, Arizona, and New Mexico. This species is likely more common than represented by specimens.

Stellaria umbellata Turcz. (in umbels) Umbellate starwort. Perennial herbs, clumped or matted, green, rhizomes slender. **STEMS** erect, branched at base, 4-angled, 5–30 cm tall, glabrous. **LEAVES** with petiole ± absent, blades elliptic to lanceolate, 3–9 cm long, somewhat fleshy, margins glabrous, herbaceous, midrib prominent on lower surface, apex acute. **INFL** a (2)- 5–many-flowered terminal or subterminal umbelloid (3–5+ pedicels appearing to radiate from one point) cyme; bracts mostly scarious, 1–4 mm long; pedicels deflexed below, often curved apically in fruit, 7–20 mm long. **FLOWER** sepals 5, veins 3, lanceolate, 1.5–2 mm long in flower, to 3 mm long in fruit, margins narrowly scarious, apex obtuse, glabrous; petals 0; stamens 5; styles 3. **FRUIT** tan, conic, 3–4.5 mm long, valves 6. **SEEDS** brownish, round, 0.5–0.7 mm long, shallowly rugose. 2n = 26. [*S. weberi* B. Boivin]. Spruce-fir forests, stream banks, and alpine meadows and talus slopes. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn; UTAH. 2400–4000 m (7875–13125'). Flowering: Jun–Sep. Canada and Alaska; Washington to Montana, south to California, Arizona, and New Mexico.

Vaccaria Wolf Cow Herb, Cow Soupwort

(Latin *vacca*, cow, + *aria*, pertaining to, referring to its value as fodder) Annual herbs with taproots. **STEMS** ascending to erect, simple proximally, branched distally, terete. **LEAVES** not congested at or near base of flowering stem, without stipules, blades lanceolate to broadly so. **INFL** a dense to open cyme. **FLOWERS** hypogynous; sepals 5, connate proximally into 5-angled, 5-winged tube, apex acute to acuminate, not hooded, awn absent; petals 5, pink to purplish, clawed, auricles absent, coronal appendages absent, blade apex entire or briefly bilobed; stamens 10, adnate with petals, staminodes absent; ovary 1-locular or 2-locular proximally; styles usually 2. **FRUIT** an oblong capsule, opening by usually 4 slightly spreading teeth. **SEEDS** 5–10, black, papillose, marginal wing absent, appendage absent. One or four species; Eurasia, introduced into South America, Africa, Australia.

Vaccaria hispanica (Mill.) Rauschert (Spanish) Cow herb, cowcockle. Plants glabrous, glaucous. **STEMS** 20–100 cm tall. **LEAVES** with blades 2–10 cm long, base cuneate to cordate. **INFL** an open cyme, 16–50 (–100)-flowered. **FLOWER** calyx 9–17 mm long; petals with claw 8–14 mm long, blade 3–8 mm long. **FRUIT** included in calyx tube. **SEEDS** 2–2.5 mm wide. 2n = 30. [*V. pyramidata* Medik.]. Roadsides, floodplains, and weedy areas. COLO: Arc. 1800–2100 m (6000–6900'). Flowering: Jun–Sep. Introduced throughout much of North America.

CELASTRACEAE R. Br. STAFF-TREE or BITTERSWEET FAMILY

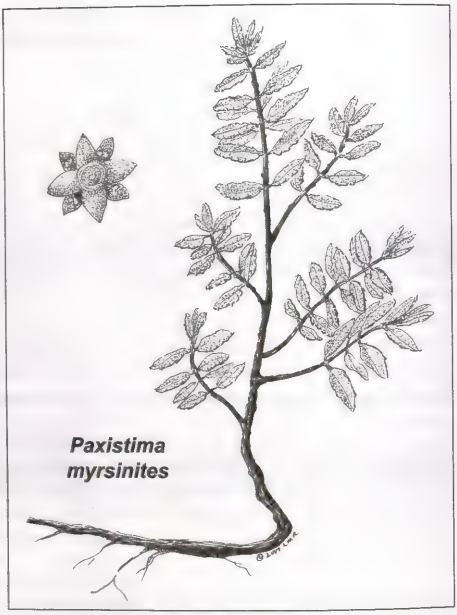
John R. Spence

Shrubs or trees, sometimes climbing or twining. **LEAVES** persistent, stipitate or stipules sometimes lacking, alternate to opposite, sessile or pedicellate. **INFL** axillary to terminal, cymose, racemose, or flowers solitary. **FLOWERS** perfect, actinomorphic, hypogynous or somewhat perigynous, 4–5-merous; sepals small, connate at base or distinct; petals small, distinct, often spreading, sometimes lacking; stamens alternate, on or just oustide nectary disc; ovary of 2–5 united carpels, superior; style single, terminal, with a variously lobed or capitate stigma. **FRUIT** a capsule, samara, berry, achene, or drupe. **SEEDS** typically encased in an aril. *x* = 8, 12, 14. A family of 95 genera and 1300 species. Worldwide, but concentrated in the tropics and Southern Hemisphere, rare in the Northern Hemisphere. The genus *Euonymus* (burning bush) has many cultivated species. The genus *Catha* is the source of the stimulant drink khat.

Paxistima Raf. Mountain-lover, Box-leaf Myrtle, Dinasts' óóz

(unexplained, perhaps Greek *pachy*, thick, + *stima*, stigma) Low-growing to decumbent evergreen shrub from a creeping fibrous root base, stems often arranged in flat sprays, twigs glabrous when young, roughened-scurfy when older. **LEAVES** small, opposite, persistent, rather coriaceous, glossy, margins smooth to serrate or crenate; stipules small, caducous. **INFL** of short axillary cymes or flowers solitary. **FLOWERS** 4-merous; petals green or maroon, free, spreading; stamens alternate, attached to base of nectary disc; style single, stigma capitate; carpels 2, united into compound 2-locular ovary. **FRUIT** a 2-valved capsule. **SEEDS** partly enclosed in a white aril. A genus of two species, one in western North America, and the second in the southern Appalachian Mountains. This genus is considered relictual from the Tertiary (Navaro and Blackwell 1990).

Paxistima myrsinites (Pursh) Raf. (for superficial similarity to *Myrsine*) Low-growing shrub from creeping fibrous root base, branches splayed to erect. **LEAVES** closely crowded, glossy, elliptic to oblong or elliptic-oblanceolate, 1–4.5 cm long, to 1.5 cm wide, serrate above middle or sometimes lower, petiole very short, 1–2 mm long. **INFL** of solitary axillary flowers, or short axillary cymes of few flowers. **FLOWER** sepals very small, greenish, petals maroon to brown-red, 1–2 mm long, spreading, stamen filaments short, usually less than 1 mm. **FRUIT** capsule valves 4–5 mm long. **SEEDS** 2/3 covered by the white aril. [*Pachystima m.*, incorrect spelling; *Paxistima myrtifolia* L. C. Wheeler]. Moist forests and slopes, talus, rocky outcrops, from the lower montane zone to the lower subalpine zone. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn. UTAH. 2400–3400 m (6500–8000'). Flowering: May–Jul. Fruit: Jul–Sep. Widespread in the mountains of western North America from Alberta and British Columbia south to California, Arizona, and New Mexico. This plant is important in Navajo ceremonies as an emetic in the Holy Way, Hand-trembling Way, and others. Elsewhere a tea has been used for colds, tuberculosis, and as a pain killer. The fruits (seeds) have sometimes been eaten in times of scarcity. It is an attractive, low-growing ornamental shrub.



CERATOPHYLLACEAE Gray HORNWORT FAMILY

C. Barre Hellquist

Perennial, rootless, aquatic. **STEMS** slender, with lateral branches. **LEAVES** whorled, sessile, finely dissected. **FLOWERS** small, unisexual, lacking a perianth, solitary, sessile in leaf axil, subtended by an 8–14-cleft involucre replacing the calyx; stamens 12–20; filaments short, the large anthers terminating in 2–3 sharp points; pistillate flowers consisting of a simple 1-celled ovary. **FRUIT** a 1-seeded, ovoid-oblong achene (Les 1986, 1988; Lowden 1978). One genus, six species, worldwide. Seeds and foliage may provide food for ducks.

Ceratophyllum L. Hornwort

(Greek *ceras*, a horn, and *phyllum*, leaf) **STEMS** submersed, floating, olive-green, lacking rhizomes; fragments generate into new plants. **LEAVES** 3–11 per whorl, usually 1–4-dichotomously dissected into filiform to narrowly linear divisions, completely submersed. **INFL** extra-axillary, alternating with leaves. **FLOWERS** with basal connate bracts; pedicel less than 1 mm, almost absent. **FRUIT** an ellipsoidal, moderately compressed achene with marginal or basal spines. $x = 12, 19, 20$.

Ceratophyllum demersum L. (submerged) Hornwort, coontail. **STEMS** elongate, branching, brittle, cordlike. **LEAVES** finely dissected into capillary to linear and flattened serrate divisions, as many as 12 in a verticil; leaf divisions toothed, about 15 mm long. **FLOWERS** monoecious, occasionally dioecious; staminate in pairs on opposite sides of the stem, short-stalked, with a calyxlike involucre of 8–12 short, stout, oblong segments, each 2–3-toothed at apex; pistillate usually solitary, with a unilocular ovary and long style. **FRUIT** ellipsoid, flattened, 4–6 mm long, with a terminal persistent style 4–6 mm long, with 2 recurved basal, lateral spines. Still water of lakes, ponds, and streams. ARIZ: Apa; COLO: SJn; NMEX: SJn. 1850–2750 m (6100–9400'). Flowering and fruiting: Jun–Sep. Alaska east to Prince Edward Island and Nova Scotia, south to California, Arizona, Texas, and Florida; Mexico; West Indies; Central America. $2n = 24$, 38, 40, 48. The main means of reproduction is asexual due to fragmentation.

CHENOPODIACEAE Vent. GOOSEFOOT FAMILY

S. L. Welsh & N. D. Atwood

(*chen*, goose, + *pous*, foot, referring to the leaf shape) Herbs, subshrubs, or shrubs, often succulent or scurfy. **LEAVES** simple, alternate or opposite, estipulate. **FLOWERS** inconspicuous, monoecious, dioecious, polygamous, or perfect; calyx persistent, 1- to 5-lobed, enclosing the fruit, or lacking in some pistillate flowers; corolla none; stamens opposite the calyx lobes and as many or fewer; pistil 1, the ovary superior, with 1–3 stigmas, 1-loculed and 1-ovuled. **FRUIT** a utricle. $x = 6–9$ (Flores and Davis 2001; Jacobs 2001; Welsh 1984). One hundred genera, 1300 species worldwide, especially in deserts and saline or alkaline soils. *Beta* (beet, sugar beet, chard) and *Chenopodium* (quinoa) cultivated for food.

1. Leaves scalelike; stems fleshy; plants of saline pans and other salty sites ..... ***Salicornia***
1' Leaves well developed, not scalelike; stems not fleshy; plants of various habitats ..... (2)

2. Leaves or bracts of inflorescence tipped with a spine or a spinelike bristle ..... (3)
2' Leaves and floral bracts not bristle- or spine-tipped ..... (4)

3. Leaves linear to subulate; bracts of inflorescence ovate-lanceolate, spine-tipped; fruiting sepals winged on the back; flowers not embedded in hairs ..... ***Salsola***
3' Leaves sausagelike, abruptly spine-tipped; bracts of inflorescence not different from the leaves; sepals ending in wings; flowers embedded in hairs ..... ***Halogeton***

4. Leaves sub- or semicylindric to linear, usually fleshy ..... (5)
4' Leaves with flattened blades, not especially fleshy ..... (7)

5. Shrubs, armed with thorny branchlets; staminate flowers in spikes, pistillate flowers solitary and axillary ..... ***Sarcobatus***
5' Shrubs or herbs, not armed; flowers perfect or both perfect and pistillate ..... (6)

6. Herbage villous-tomentose; plants low subshrubs ..... ***Bassia***
6' Herbage glabrous and glaucous, or puberulent; plants annual or perennial, or if subshrubs, then tall ..... ***Suaeda***

7. Plants densely white-hairy with at least some dendritic hairs, these becoming golden brown in age; shrubs of broad distribution ..... ***Krascheninnikovia***
7' Plants variously hairy or glabrous, but not as above; shrubs or herbs of various distribution ..... (8)

8. Flowers imperfect, the pistillate enclosed in 2 accrescent or connate bracteoles ..... (9)
8' Flowers perfect or some also pistillate, all with sepals and not enclosed by paired bracteoles ..... (12)

9. Leaf blades orbicular or suborbicular, flabellate to broadly obtuse at the base; fruit flask-shaped in outline ..... ***Suckleya***
9' Leaves mainly ovate to lanceolate, acute to obtuse basally ..... (10)

10. Bracteoles dorsally compressed, variously tuberculate, smooth, or winged; pubescence of inflated hairs or none; plant a shrub or perennial or annual herb; axillary rounded buds lacking ..... ***Atriplex***
10' Bracteoles laterally compressed or 6- to 8-ribbed, lacking appendages; pubescence of simple or branched hairs; plants shrubby; axillary rounded buds present ..... (11)

11. Shrubs with divaricate, often thorny branches; bracteoles with margins thickened, spongy within; pubescence of branched hairs ..... ***Grayia***
11' Shrubs with erect, nonthorny branches; bracteoles with margins not spongy-thickened, either obcompressed or dorsiventrally compressed and 6-ribbed; pubescence of scurfy or moniliform hairs ..... ***Zuckia***

12. Plants more or less tomentulose; calyx transversely winged in fruit ..... ***Cycloloma***
12' Plants glabrous, scurfy, pilose, or otherwise pubescent, but not or seldom as above; calyx not transversely winged in fruit, except in *Bassia*, and then not tomentulose ..... (13)

13. Perianth developing conspicuous horizontal, scarious wings or armed with curved or uncinate spines ..... ***Bassia***
13' Perianth lobes rounded or keeled on the back, lacking wings or spines ..... (14)

14. Calyx lobes 5, largely concealing to exposing the fruit; stamens usually 5; herbage glabrous or scurfy ..***Chenopodium***
14' Calyx lobes 1–3, the fruit largely exposed; stamens 1–3; plants not scurfy ..(15)

15. Leaves hastately lobed, or if entire, 4–12 mm long, the blades mainly 2–8 mm broad or more; calyx 1-lobed; stamens 1; plants widespread, of many habitats ..***Monolepis***
15' Leaves linear, 0.8–6 cm long, entire, 1–2 mm wide; calyx 1- to 3-lobed; stamens 1–3; plants of sandy, low-elevation sites..***Corispermum***

Atriplex L. Saltbush

(ancient Latin name) Monoecious or dioecious herbs or shrubs, often with scurfy (mealy) collapsed hairs. **LEAVES** alternate or opposite. **INFL** an axillary cluster, glomerule, or spicate panicle. **FLOWERS** small, inconspicuous; staminate flowers with calyx 3- to 5-parted, bractless; stamens 3–5; pistillate flowers without a perianth, pistil naked or rarely with a perianth, commonly enclosed within a pair of foliaceous bracteoles, enlarged in fruit, variously thickened and appendaged; styles 2. **FRUIT** with the pericarp free. **SEEDS** flattened, mainly erect. The genus is complex both taxonomically and nomenclaturally. It consists of both native and introduced herbs and shrubs. Indigenous shrubby species form hybrids with all or most of their constituent taxa, wherever they come in contact. The resulting plasticity allows these remarkable plants to occupy numerous habitats but poses problems that preclude a "neat" taxonomic treatment. The following keys are tentative at best. Several species of *Atriplex* have been demonstrated to be poisonous to livestock due to secondary or facultative selenium accumulation. Kranz anatomy, related to the C_4 photosynthetic pathway, has become a useful tool in recognition of species and species groups not only within *Atriplex*, but within the family as a whole (see Jacobs 2001). Chloroplasts are aligned along veinlets, a feature easily seen by scraping off the epidermis and extraneous coverings (Hanson 1962; Stutz and Sanderson 1983; Thorne 1977). About 250 species in temperate to subtropical saline or alkaline soils, sometimes accummulating selenium. Many weedy.

1. Plants herbaceous annuals..KEY 1
1' Plants woody, at least below; perennial..KEY 2

KEY 1

PLANTS HERBACEOUS ANNUALS

1. Seeds of 2 types, black and brown; plants mainly introduced ..(2)
1' Seeds all alike, either black or brown; plants indigenous..(7)

2. Fruiting bracteoles orbicular or nearly so, the dorsal surfaces smooth, entire ..(3)
2' Fruiting bracteoles triangular to ovate or rhombic, the dorsal surfaces usually tubercled, denticulate to entire ..(4)

3. Black seeds horizontal, enclosed in a membranous calyx; brown seeds vertical between very large bracteoles ..***A. hortensis***
3' Black seeds vertical between small bracteoles; brown seeds vertical between large bracteoles .....***A. heterosperma***

4. Lowermost leaves ovate, dentate, sessile or short-petiolate; leaves with Kranz anatomy..... ***A. rosea***
4' Lowermost leaves lanceolate, rhombic, triangular, or hastate, dentate or entire, petiolate; leaves lacking Kranz anatomy ..(5)

5. Lowermost leaves lanceolate to linear-lanceolate; plants ruderal, not typically of saline sites .....***A. patula***
5' Lowermost leaves (sometimes all) triangular or hastate-triangular in outline, or if lanceolate to linear-lanceolate, the plants of moist saline sites ..(6)

6. Leaves thick-textured, more or less scurfy, mostly longer than broad; fruiting bracteoles often spongy-thickened at the base; plants indigenous in moist saline sites..***A. dioica***
6' Leaves thin-textured, typically glabrous, at least some often as broad as long or broader; fruiting bracteoles thin-textured throughout; plants introduced in moist saline sites ..***A. prostrata***

7. Plants mainly dioecious; widely distributed ..***A. powellii***
7' Plants mainly monoecious, of various distribution ..(8)

8. Fruiting bracteoles all stipitate, or some of them sessile to subsessile, cuneate, and entire on the sides, when stipitate usually prominently tubercled; leaves mainly oval-ovate; plants forming low rounded clumps on saline substrates ..***A. saccaria***

8' Fruiting bracteoles all sessile, subsessile, or short- to long-stipitate, variously tubercled, or if definitely stipitate, as in *A. graciliflora*, *A. pleiantha*, and some *A. argentea*, the surfaces smooth or the leaves definitely triangular-ovate; plants slender or clump-forming, variously distributed ..... (9)

9. Fruiting bracteoles 1.5–2.5 mm long, 1–2.5 mm wide, ovate-oblong or oval to obovate, sometimes constricted below, giving an overall violin shape ..... ***A. powellii***
9' Fruiting bracteoles of various length and width, but if as above then differing otherwise ..... (10)

10. Fruiting bracteoles with margins dentate, foliaceous well below the apex, the surfaces sometimes with appendages ..... ***A. argentea***
10' Fruiting bracteoles samara-like and orbicular or triangular-ovate, the surfaces smooth ..... (11)

11. Fruiting bracteoles samara-like and orbicular, enclosing a single flower ..... ***A. graciliflora***
11' Fruiting bracteoles triangular-ovate, enclosing 2 to 6 flowers ..... ***A. pleiantha***

KEY 2

PLANTS WOODY, AT LEAST BELOW; PERENNIAL

1. Bracteoles with 4 lateral wings or 4 rows of teeth; plants unarmed ..... (2)
1' Bracteoles without lateral wings, merely tuberculate or smooth dorsally; plants sometimes thorny ..... (4)

2. Leaves more than 8 mm wide; bract tip with or without lateral teeth; lower canyons of the San Juan River ..... ***A. garrettii***
2' Leaves less than 8 mm wide; bract tip without lateral teeth; distribution various ..... (3)

3. Bracteoles more than 9 mm wide, with tips not exceeding the wings; staminate flowers yellow; shrubs to 2 m tall; widely distributed ..... ***A. canescens***
3' Bracteoles less than 9 mm wide, with tips exceeding the wings; staminate flowers mostly brown; plants mainly 5–10 dm tall; clay soils ..... ***A. gardneri***

4. Plants with thorny branches; bracteoles foliose, united only basally, the surfaces smooth; staminate flowers yellow; widely distributed ..... ***A. confertifolia***
4' Plants lacking thorny branches; bracteoles not foliose, at least 1/3 united and the surfaces typically with appendages; staminate flowers yellow or brown ..... (5)

5. Leaves 2–4 mm wide; bracteoles with appendages on lower 1/3; staminate flowers in spikes; plants prostrate ..... ***A. corrugata***
5' Leaves often more than 4 mm wide; bracteoles with appendages various; staminate flowers mainly in panicles; plants not or seldom prostrate ..... (6)

6. Leaves oblong-ovate to orbicular, more than 10 mm wide, the lowermost alternate; stems stiffly erect; staminate glomerules very numerous ..... ***A. obovata***
6' Leaves linear to oblong, mainly less than 10 mm wide, or if wider, the lowermost opposite; stems mainly prostrate to ascending from the root-crown, less commonly erect; staminate glomerules numerous ..... ***A. gardneri***

Atriplex argentea Nutt. (silvery) Silver orach. Plants annual, monoecious. **STEMS** simple or freely branched. **LEAVES** petiolate or the upper ones subsessile, with Kranz anatomy, the blades 0.5–6 cm long, 0.4–5 cm wide, elliptic, lance-ovate, lanceolate, deltoid, or cordate, runcinate to subhastate or acute basally, obtuse to acute apically, entire or repand-denticulate, scurfy (glabrous). **INFL** with staminate glomerules borne in terminal spikes or panicles, or terminal on lateral branches. **FLOWERS**: staminate with 5-parted calyx. **FRUIT** bracteoles sessile, subsessile, or short- (rarely long-) stipitate, 4–11.2 mm long, 4–10 (–14) mm wide, the margin foliaceous below the apex, dentate to laciniate, the face smooth, tubercled, or crested. **SEEDS** about 2 mm wide, brown. $2n = 18$. Valuable for salt concentration, used as a forage and fodder plant by Navajos. Ramah Navajos used the leaves as a fumigant for pain, as an infusion for colds, and as a poultice for spider bites. Acomas used fruits for food. Leaves were also boiled with fat or meat and eaten as greens by Hopis. Seeds were parched, ground into a flour, and made into a mush by Paiutes.

1. Leaf blades triangular-ovate to oval, the base broadly obtuse to acute or less commonly acute ..... **var. *argentea***
1' Leaf blades elliptic to oval, attenuate to a cuneate base ..... **var. *rydbergii***

var. *argentea* **STEMS** 3–8 dm tall, erect, the branches ascending. **LEAVES** with blades 0.6–5 cm long, 0.4–4 cm wide, ovate or ovate-elliptic to deltoid, the upper short-petioled, entire or repand-dentate, grayish scurfy when young; fruiting bracteoles sessile or some stipitate (the stipe 0.5–15 mm long), cuneate to obovate to suborbicular in profile, 3.8–11.2 mm long, 4–8.5 (–14) mm wide, usually compressed, united nearly to the apex, the green free margins extending nearly to the base, dentate, the sides smooth or sparsely to densely tuberculate or cristate. $2n = 18$. Mat-atriplex, shadscale, and greasewood communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: RAr, SJn; UTAH. 1515–1820 m (5000–6000′) Flowering/Fruit: Jun–Sep. Widespread in western United States and Mexico.

var. *rydbergii* (Standl.) S. L. Welsh (for P. A. Rydberg, Colorado botanist) Rydberg's orach. **STEMS** (0.2) 1–4 dm tall, erect, the branches ascending. **LEAVES** with blades (0.4) 0.6–3.5 cm long, (2) 4–25 mm wide, elliptic to ovate or rhombic, acute to cuneate at the base, rounded to obtuse or acute at the apex, entire or rarely toothed, grayish scurfy. **INFL** of staminate flowers in axillary glomerules or terminal spikes. **FRUIT** bracteoles short-stipitate (the stipe to 4 mm long) or subsessile, compressed, flabelliform to obovate or suborbicular, 2.5–7 (8.4) mm long (including the stipe length), (2) 2.7–6 (7.5) mm wide, widest near or above the middle, united nearly to the middle, the free portion scurfy, shallowly or deeply and coarsely dentate, the sides smooth or with 1 to few thickened processes, and these sometimes again appendaged. [*Atriplex rydbergii* Standl.; *A. pachypoda* Stutz & G. L. Chu]. Saline, fine-textured substrates derived mainly from Cretaceous Mancos Shale and Morrison formations and clay or silty alluvium, growing in salt desert shrub and floodplain communities. ARIZ: Apa; COLO: LPl, Mon; NMEX: SJn; UTAH. 1100–2070 m (3600–6830′). Flowering/Fruit: May–Sep. A Four Corners region endemic.

Atriplex canescens (Pursh) Nutt. (grayish) Four-wing saltbush. Dioecious or rarely monoecious shrubs, mainly 8–20 dm tall, not especially armed. **LEAVES** persistent, alternate, sessile or nearly so, 10–40 mm long, 2–8 mm wide, linear to oblanceolate, oblong, or obovate, entire, retuse to obtuse apically. **INFL** of staminate flowers in clusters 2–3 mm wide, borne in panicles or axillary spikes; pistillate flowers in terminal panicles, 5–40 cm long. **FLOWERS**: staminate yellow (rarely brown). **FRUIT** bracteoles 9–25 mm long and as wide, on a pedicel 1–8 mm long, with 4 prominent wings extending the bract length, united throughout, the surface of wings and body smooth or reticulate; wings dentate to entire, the apex toothed. **SEEDS** 1.5–2.5 mm wide. $2n = 18$, 36, or higher. [*Calligonum canescens* Pursh; *Atriplex nuttallii* S. Watson; *A. tetraptera* (Benth.) Rydb.; *Pterochiton occidentale* Torr. & Frém; *A. occidentalis* (Torr. & Frém.) D. Dietr.; *A. canescens* var. *occidentalis* (Torr. & Frém.) S. L. Welsh & Stutz]. Sandy, commonly nonsaline, sites in blackbrush, greasewood, salt desert shrub, sagebrush, mountain brush, and piñon-juniper communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1060–2170 m (3500–7160′). Flowering: Apr–Jul. Fruit: Jun–Oct. Washington to Alberta and South Dakota, south to Mexico and Texas. This species forms hybrids with *A. confertifolia* and *A. gardneri* varieties. It is an important browse plant for both wildlife and domestic livestock. It is used in reclamation projects and might be found established at sites beyond its usual range and habitat latitude. Navajos used a decoction of tops or roots as an emetic, used the leaves for cough, and a poultice of leaves for ant bites. Leaves and twigs were used to make a yellow dye and to intensify red dyes. Hopis used the plant for kiva fires, twigs as prayer sticks, and ashes as a baking soda and to maintain the blue in blue cornmeal. Zunis used the twigs in prayer plumes.

Atriplex confertifolia (Torr. & Frém.) S. Watson (crowded leaves) Shadscale. Dioecious spinescent shrubs, 3–8 dm tall. **LEAVES** persistent, alternate, with petioles 1–4 mm long; blades 9–25 mm long, 4–20 mm wide, orbicular to ovate, elliptic, or oval, entire, obtuse apically. **INFL** of staminate flowers in axillary clusters 2–4 mm wide or in spikes to 1 cm long; pistillate flowers paniculate, 3–15 cm long. **FLOWERS**: staminate yellow. **FRUIT** bracteoles sessile or subsessile, suborbicular to rhombic or elliptic, 4–12 mm long and wide, the surface smooth, lacking appendages; terminal teeth distinct, foliaceous, shorter than the bracteoles, entire or toothed below, spreading at maturity. **SEEDS** 1.5–2 mm broad. $2n = 18$, 36, 54, or higher. [*Obione confertifolia* Torr. & Frém.; *A. collina* Wooton & Standl.]. Gravelly to fine-textured soils in greasewood, mat-atriplex, shadscale, sagebrush, and piñon-juniper communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1160–2150 m (3830–7100′). Flowering: Apr–Jul. Fruit: Aug–Oct. Oregon east to North Dakota, south to California, Arizona, New Mexico, and Texas. Shadscale forms hybrids with *A. canescens*, *A. garrettii*, *A. corrugata*, and *A. gardneri* varieties. It is a valuable browse plant for wildlife and livestock, especially sheep. Hopis used the burned plant as an anticonvulsive; the leaves were also used in puddings and boiled as a green. Navajos rubbed the plant on horses to repel gnats and Paiutes used the plant as a cold and sore muscle remedy.

Atriplex corrugata S. Watson (wrinkled leaves) Mat-saltbush, mat-atriplex. Dioecious, low, spreading shrubs (often appearing as if prostrate), mainly 3–15 cm tall and 3–15 dm broad. **LEAVES** persistent, sessile, opposite below, alter-

nate above, 3–18 mm long, 1–6 mm wide, linear to linear-oblanceolate or oblong, entire, obtuse apically. **INFL**: staminate in clusters 3–6 mm wide, borne in spikes 1–8 cm long; pistillate in leafy bracteate spikes 5–15 cm long. **FLOWERS**: staminate yellow to brownish. **FRUIT** bracteoles sessile or subsessile, 3–5 mm long, 4–6 mm wide, densely tuberculate (or smooth), entire or undulate, rounded to acute apically. **SEEDS** about 1.5 mm wide. $2n = 36$. Saline, usually fine-textured substrates derived from Mancos Shale, Morrison, and other similar formations in mat-atriplex and Castle Valley saltbush communities. COLO: Mon; NMEX: SJn; UTAH. 1455–2150 m (4800–7100′). Flowering: Apr–Jul. Fruit: May–Oct. Mat-saltbush is known to form intermediates with both *A. confertifolia* and *A. gardneri* var. *cuneata*. This saltbush is a valuable browse plant on the sparsely vegetated clays and silts of the Four Corners region, especially on Mancos Shale exposures, where it is often the only woody vegetation present and the only thing available for grazing animals to eat.

Atriplex dioica Raf. (dioecious) Thickleaf orach. Monoecious annual herb, 3–15 dm tall, typically erect and often branching, the stems angular, green or striped. **LEAVES** without Kranz anatomy, opposite or subopposite at least below, the petiole 1–3 cm long, the blades 3–12.5 cm long, 2.5–6 (8) cm wide, thickened, lanceolate to linear-lanceolate or often triangular-ovate or lance-ovate, the basal or subbasal lobes spreading to mainly antrorse, obtuse, the blade otherwise entire to sparingly dentate, typically scurfy and strongly 3-veined from near the base. **INFL** in terminal clusters or terminal on lateral branches, in spiciform spikes 2–9 cm long, naked except at the base. **FRUIT** bracteoles sessile, thick, green, blackening in age, 3–10 mm long, broadly triangular to triangular-ovate, usually longer than wide, the apex acute, the base truncate to obtuse, the margins united at the base, the lateral angles entire or with short, sharp teeth, the faces smooth or with 1 or more tubercles, with an inner spongy layer, rarely smooth, veined or the veins obscure. **SEEDS** dimorphic, brown ones 1.5–3 mm wide, wider than long, and flattened at base, and black ones shiny, 1–2 mm wide, wider than long, the radicle inferior; $2n = 36, 54$. [*Chenopodium subspicatum* Nutt.; *Atriplex subspicata* (Nutt.) Rydb.; *A. lapathifolia* Rydb.; *A. carnosa* A. Nelson]. Roadsides, irrigation canals, stream banks, salt flats, and other typically moist saline sites, with saltgrass, pickleweed, and rush. ARIZ: Apa; COLO: Arc, Mon; NMEX: SJn; UTAH. 1525–2120 m (4620–7000′). Flowering: Jul–Sep. Fruit: Aug–Oct. Coastal eastern North America, and west of the 95th meridian from Yukon and the Northwest Territories, south to southern California, northern Arizona, northern New Mexico, and Oklahoma. The habitats are mainly saline, and the species is apparently indigenous. It has long been mistaken for the closely similar *A. prostrata*.

Atriplex gardneri (Moq.) D. Dietr. (for Alexander Gordon, botanical collector; his name misspelled by Moquin) Gardner's saltbush. Dioecious or sparingly monoecious subshrubs, mostly 1–4.5 dm tall and 4–20 dm wide, with decumbent branches. **LEAVES** opposite to subalternate below, alternate above, with petioles 2–12 mm long, the blades 10–50 mm long, 5–25 mm wide, about 1.5 to 4.5× longer than wide, obovate to spatulate, orbicular or oblong, entire or rarely remotely dentate. **INFL**: staminate in glomerules 3–4 mm thick, borne in terminal panicles 2–11 cm long; pistillate in rather leafy, unbranched spikes or spicate panicles 5–23 cm long. **FLOWERS**: staminate dark brown or rarely yellow. **FRUIT** bracteoles sessile or on stipes to 9 mm long, (4) 6–9 mm long and wide, globose to flattened, ovate, obovate, or elliptic to cuneate in profile, the surface densely tuberculate to smooth and free of tubercles, the terminal tooth to 2 mm long, subtended by 2–4 lateral teeth. **SEEDS** 2–2.5 mm broad, brown, the radicle superior. $2n = 18, 27, 36$, and higher. [*Obione gardneri* Moq.; *Atriplex nuttallii* S. Watson, misapplied]. Plants of this complex occur commonly in fine-textured saline substrates in much of the western Great Plains and in the Intermountain region.

Diploids, triploids, tetraploids, and hexaploids (and higher polyploids, all multiples of the base number 9) are known within the complex, and hybrids are known between the constituents and the other woody species which they contact, i.e., *A. canescens*, *A. confertifolia*, and *A. corrugata*. The treatment essentially follows the alignment of taxa suggested by Hanson (1962), with the exception that they are reduced to varietal status and var. *bonnevillensis* (C. A. Hanson) S. L. Welsh is placed within the *gardneri* phase and not with *A. canescens*. The name *A. nuttallii* S. Watson has been used for this complex, but it is based squarely on *A. canescens* (Pursh) Nutt. and is illegitimate. Within Utah there are six morphologically intergrading entities that seem worthy of taxonomic recognition. Our material belongs to **var. *cuneata*** (A. Nelson) S. L. Welsh (referring to the wedge-shaped bracteoles), Castle Valley saltbush. [*Atriplex cuneata* A. Nelson]. Saline fine-textured substrates on Mancos Shale, Morrison, and other formations of similar texture and salinity, but also in alluvium, in greasewood, shadscale, matchweed, horsebrush, juniper, and mat-atriplex communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, RAr, SJn; UTAH. 1120–1740 m (3700–5750'). Flowering: Mar–Aug. Fruit: May–Oct. The hybrids between var. *cuneata* and *A. confertifolia* have been described as *A. neomexicana* Standl. They occur where the ranges of the species overlap. Possibly both of the described intermediates warrant taxonomic recognition, but no nomenclatural combination is intended or implied herein.

Atriplex garrettii Rydb. (for Albert O. Garrett, teacher and botanist in Salt Lake City, Utah) Garrett's saltbush. Dioecious (rarely monoecious) shrubs or subshrubs, mainly 2–6 dm tall, unarmed. **LEAVES** opposite or subopposite below, petiolate, the blades 8–55 mm long, 6–32 mm wide, ovate to obovate, lanceolate, elliptic, or orbicular, yellow-green, sparingly scurfy, entire or repand-dentate, obtuse to cuneate basally, rounded or emarginate to acute apically. **INFL**: staminate brown to tan (rarely yellow), in clusters 2–4 mm wide on panicles 2–8 cm long; pistillate in spikes or spicate panicles 4–30 cm long. **FLOWERS**: staminate brown to tan (rarely yellow). **FRUIT** bracteoles 6–10 mm long and wide, 4-winged, the surface smooth, reticulate, or with flattened processes, toothed apically. **SEEDS** about 2 mm wide, brown. $2n = 18$. [*Atriplex canescens* (Pursh) Nutt. subsp. *garrettii* (Rydb.) H. M. Hall & Clem.; *A. canescens* var. *garrettii* (Rydb.) L. D. Benson]. Shadscale, ephedra, eriogonum, blackbrush, and mixed shrub-grass communities on talus slopes of canyons of the lower San Juan River. UTAH. 1125–1210 m (3410–4000'). Flowering: Mar–Oct. Fruit: May–Oct. Endemic to southeast Utah. This distinctive plant has been regarded as a portion of the variation within an expanded *A. canescens*, with which it shares the feature of four-winged pistillate fruiting bracteoles, but it is possibly more closely allied with *A. confertifolia*, with which it hybridizes. The hybrid intermediates are distinguished by their armed branches and four-winged fruiting bracteoles. Utah plants belong to **var. *garrettii***; those from the vicinity of Navajo Bridge in Coconino County, Arizona, belong to var. *navajoensis* (C. A. Hanson) S. L. Welsh & Crompton. The whole plant has been used with alum to produce a yellow dye by Great Basin tribes.

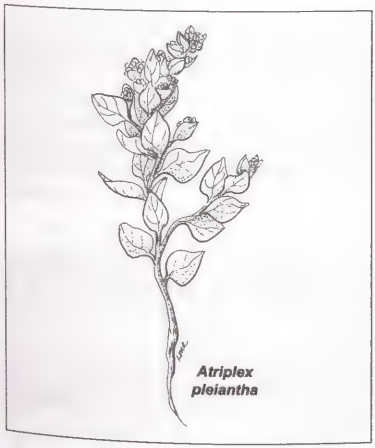
Atriplex graciliflora M. E. Jones (slender flower) Blue Valley orach. Monoecious annual herbs, mainly 1–4 (5) dm tall, branching from the base, forming clumps 0.5–6 dm wide. **STEMS** ascending to erect, sometimes suffused with red. **LEAVES** alternate, petiolate, the blades 8–15 (23) mm long and 5–19 mm wide, ovate to orbicular, reniform, cordate, or deltoid, truncate to cordate basally, rounded to obtuse or acute apically, entire. **INFL**: staminate in panicles overtopping the foliage; pistillate axillary. **FLOWERS**: staminate with the perianth 5-lobed. **FRUIT** bracteoles samara-like, 6–16 mm wide, stipitate, compressed, orbicular, oblong or cordate in outline, winged, the wings undulate or entire, the surfaces smooth. **SEEDS** about 3 mm wide, dull white. Saltbush, seepweed, greasewood, rabbitbrush, and tamarix communities on saline, often salt-encrusted, soils. COLO: LPl; UTAH. 1210–1820 m (4000–6000'). Flowering: May–Jul. The plants grow on Mancos Shale at the type locality, on Tropic Shale in eastern Kane County, Utah, and on the same or other similar formations (e.g., Entrada) throughout its range. Less commonly it occurs on saline alluvium. Blue Valley orach is easily distinguished by its flattened, samara-like fruiting bracteoles.

Atriplex heterosperma Bunge (different seed) Russian atriplex; two-seed orach. Monoecious annual herbs, mainly 1.5–14 dm tall, erect, branched from below the middle or above. **LEAVES** opposite or subopposite below and sometimes almost throughout, commonly alternate above and petiolate, the blades mainly 15–80 mm long and as wide or wider, hastately lobed, triangular, the main lobe entire or sharply dentate, palmately veined from near the base, the base truncate to cordate or obtuse, acute apically. **FLOWERS**: staminate with 5 sepals. **FRUIT** bracteoles 2–7 mm long, orbicular to suborbicular or ovate, entire, the surfaces smooth, dimorphic, the larger with a pale brown vertical seed 2–3 mm wide, the smaller with a shiny black vertical seed about 1 mm wide. $2n = 36$. Riparian and palustrine (less commonly ruderal) habitats in greasewood, saltgrass, cocklebur, tamarix, cottonwood, and rush-cattail communities. COLO: Arc, Dol, LPl, Mon; NMEX: RAr, SJn; UTAH. 1615–2260 m (5330–7460'). Flowering: Jul–Sep. Fruit: Aug–Oct. Widespread in North America south of the Arctic; adventive from Eurasia. This is a handsome vigorous annual that appears to be invading saline lowland but also occurs in other disturbed, nonsaline areas throughout the regions occupied.

Atriplex hortensis L. (refers to garden) Garden orach. Monoecious annual herbs, mainly 5–15 (25) dm tall, erect, branching from the middle or above. **LEAVES** without Kranz anatomy, opposite or subopposite below, alternate above, petiolate, the blades commonly 1.5–13.5 cm long and 1–13 cm wide, ovate to lanceolate, not especially hastate, the base acute to cordate, acute to rounded apically. **FLOWERS** shortly pedicellate; staminate with 3–5 sepals; pistillate dimorphic, the pistil vertical and enclosed in bracteoles or the pistil horizontal and enclosed in a 4- or 5-lobed calyx. **FRUIT** bracteoles 8–18 mm long, orbicular to ovate, entire, the surfaces smooth, greenish or reddish. **SEEDS** dimorphic, either 2–4 mm wide and brown or about 1 mm wide and black. Disturbed sites in riparian and ruderal habitats. COLO: LPl, Mon; NMEX: SJn. 1425–1820 m (4700–6000'). Flowering: Jul–Sep. Practically cosmopolitan, introduced from Eurasia. This plant is grown as a potherb and is to be expected practically anywhere. It persists and escapes following cultivation.

Atriplex obovata Moq. (inversely ovate-shaped leaves) New Mexico saltbush. Dioecious shrubs, mainly 2–8 dm tall. **LEAVES** tardily deciduous, alternate, shortly petiolate, the blades 8–30 mm long, 6–20 mm wide, obovate to elliptic or orbicular, gray-green, entire or rarely crenate-dentate, rounded to retuse or obtuse apically. **INFL**: staminate in clusters 2–3 mm wide, borne in panicles 6–30 cm long, to 1/2 or more of plant height. **FLOWERS**: staminate yellow. **FRUIT** bracteoles 4–5 mm long, 5–9 mm wide, sessile, broadly cuneate, the surfaces smooth or rarely tubercled, the margins entire, the apical tooth subtended by 2–6 equal or smaller teeth. **SEEDS** 1–1.5 mm wide, brownish. Salt desert shrub and lower piñon-juniper communities, mainly on Mancos Shale. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1435–2105 m (4735–6945'). Flowering: May–Aug. Fruit: Aug–Oct. Arizona, New Mexico, and Mexico. Plant burned by Hopis as an anticonvulsive and also used as greens or a spice.

Atriplex patula L. (open or spreading) Fat-hen saltplant. Monoecious annual herbs, mainly 1.5–10 dm tall, prostrate-ascending or erect, simple or branched. **LEAVES** lacking Kranz anatomy, alternate or some or all opposite, petiolate, the blades mainly 1–12 cm long, 1–5 cm wide or more, ovate, deltoid, lance-ovate, or lance-linear, cordate to hastate, truncate, or acute to cuneate basally, rounded to obtuse or acute apically, entire to dentate or hastate, thin or thick, green, glabrous or scurfy. **INFL** in paniculate clusters. **FLOWERS**: staminate with 4 or 5 sepals. **FRUIT** bracteoles sessile, subsessile, or rarely stipitate, 2–12 mm long, 3–9 mm wide, deltoid to ovate or rhombic, sometimes spongy-thickened, the margin entire or denticulate, the face smooth, roughened, or tuberculate. **SEEDS** vertical, dimorphic, either black and 1–2 mm wide or brown and 1–3 mm wide. $n = 9, 18, 36$. Roadsides, ditch banks, gardens, and sedge-reed, willow, and cottonwood communities, and other nonsaline ruderal habitats. COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; UTAH. 1940 m (6400'). Flowering: Jul–Aug. Fruit: Sep. Widespread in North America; native to Eurasia. Materials tentatively assigned here are thin-leaved, but bracteoles vary in outline from rhombic to ovate or narrowly oblong and the surfaces from smooth to tubercled.



Atriplex pleiantha W. A. Weber (more flower) Four Corners orach. Monoecious, glabrous or sparingly scurfy annual herbs, mainly 0.5–1.5 dm tall, branching from the base. **LEAVES** alternate to subopposite, petiolate, the blades 5–18 (20) mm long and about as wide, ovate to suborbicular, obtuse to acute apically, entire. **INFL**: staminate in short terminal spikes. **FRUIT** bracteoles 3–7 mm wide and about as long, triangular-ovate, short-stipitate, compressed, entire, enclosing 2–5 flowers, these with perianth well-developed, consisting of 5 hyaline, sparsely ciliate scales 1–1.2 mm long. **SEEDS** black, smooth and shining, about 1.5 mm long, falling at maturity. [*Proatriplex pleiantha* (W. A. Weber) Stutz & G. L. Chu]. Salt desert shrub community, Morrison and Mancos Shale formations. COLO: Mon; NMEX: SJn; UTAH. 1495–1665 m (4530–5500'). Flowering: May–Jun. Fruit: Jul. A Four Corners endemic. Those who wish to recognize this entity at the generic level overlook the similarity of this species with other species of *Atriplex* in the Colorado Plateau, especially *A. saccaria*. The presence of apparently primitive inflorescences within the flowering bracteoles is probably a derived, not primitive, feature.

Atriplex powellii S. Watson (for John Wesley Powell, geologist and naturalist) Powell's orach. Dioecious (or sparingly to often monoecious) annual herbs. **STEMS** slender to stout, mainly 1–5 (7) dm tall, branching almost throughout;

herbage pubescent with scurfy and arachnoid hairs. **LEAVES** with Kranz anatomy, alternate, the lowermost with petioles (0.3) 0.5–3 cm long, becoming short-petiolate or sessile upward, the blades 0.4–5 cm long, 0.2–3 cm wide, ovate to rhombic, orbicular, or elliptic, entire, rounded to cuneate basally, acute to obtuse apically, prominently 3-veined. **FLOWERS**: staminate with calyx 4- or 5-lobed. **FRUIT** bracteoles sessile, 1.5–5.5 mm long, 1.5–5 mm wide, thick, united to the apex, ovate to oblong or broadly cuneate, truncate to cuspidate apically, the surfaces with thickened processes or rarely smooth. **SEEDS** about 2 mm long, greenish or yellowish brown, the radicle superior. $2n = 18$. Saline, usually fine-textured substrates, in greasewood, rabbitbrush, shadscale, seepweed, mat-atriplex, piñon-juniper, and riparian communities. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1495–1980 m (4530–6535'). Flowering: May–Sep. Fruit: Aug–Oct. Montana and South Dakota to Arizona and New Mexico. This is the only annual atriplex in the study area that approaches being truly dioecious, but flowers of the opposite gender occur also, resulting in monoecious individuals. Hopis and Navajos boiled the leaves and ate them with fat and as a salt substitute. Zunis mixed the seeds with ground corn to make a porridge.

Atriplex prostrata Boucher ex DC. (procumbent branching) Thinleaf orach; hastate saltplant. Monoecious annual herb, 1–10 dm tall, erect, decumbent or procumbent, branching. **STEMS** subangular to angular, green or striped. **LEAVES** without Kranz anatomy, opposite or subopposite at least below and often far upward, the petiole (0) 1–3 (4) cm long, the blades 2–10 cm long and almost as wide or wider, triangular-hastate, the lobes spreading, entire, serrate, dentate, or merely irregularly toothed, thin and green (turning reddish or purplish in autumn), subpalmately veined from near the base, the base truncate or cordate, the apex acute to obtuse. **INFL** spiciform, the naked spikes 2–9 cm long, sometimes forming terminal panicles. **FRUIT** bracteoles 3–5 mm long, tringular-hastate to tringular-ovate, green, becoming brown to black at maturity, the apex acute, the base truncate to obtuse, the margins united at the base, the lateral angles mostly entire, the faces smooth or with 2 tubercles, veined or the veins obscure. **SEEDS** dimorphic, brown ones 1–2.5 mm wide, and black ones 1–1.5 mm wide, the radicle subbasal, obliquely antrorse to spreading. $2n = 18$. [*Atriplex triangularis* Willd.; *A. patula* L. var. *triangularis* (Willd.) K. H. Thorne & S. L. Welsh; *A. hastata* L.]. Saltgrass, sedge-rush, rush-cattail, and other palustrine and riparian habitats, usually in saline mucky soils. ARIZ: Apa; NMEX: SJn. 1535–1800 m (5065–5940'). Flowering: Jun–Aug. Fruit: Aug–Sep. Widely distributed in North America; Europe. Though mainly thin-leaved, there are specimens with at least somewhat thickened leaves included here also. Thus, not all specimens will fit neatly here or with the closely similar *A. dioica*, for which the thinleaf orach has long been mistaken. The problem of typification of *A. hastata* L. was reviewed by Taschereau (1972). That name evidently replaces the long-established European *A. calotheca* (Rafn) Fr., a plant not known from New Mexico.

Atriplex rosea L. (for the rosy-colored stems and leaves) Tumbling orach. Monoecious, coarse, annual herbs. **STEMS** simple or more commonly branching throughout, (1) 2–10 (20) dm tall; herbage scurfy to glabrate. **LEAVES** alternate, petiolate, with Kranz anatomy, the blades mainly 1.2–8 cm long, 0.6–5 cm wide, ovate to lanceolate, acute to obtuse apically, irregularly dentate and often subhastately lobed or rarely entire, prominently 3-veined. **INFL** pistillate in axillary glomerules of 5–10. **FLOWERS**: staminate with 4 or 5 sepals. **FRUIT** bracteoles sessile or short-stipitate, (3) 4–6 (10) mm long and as wide, ovate to rhombic, united to the middle, conspicuously dentate, sharply tuberculate to almost smooth on the surfaces, prominently 3–5-nerved. **SEEDS** dimorphic, brown and 2–2.5 mm wide; or black and 1–2 mm wide, the radicle inferior. $n = 9$. [*Atriplex spatiosa* A. Nelson; *A. virgata* Osterh.]. Widely established weedy species of disturbed sites, often in riparian habitats, pond margins, or in barnyards or on animal bedgrounds, in numerous plant community types. ARIZ: Apa, Nav; COLO: Arc, Mon, SMg; NMEX: RAr, SJn; UTAH. 1515–2140 m (4970–7020'). Flowering: Jun–Aug. Fruit: Aug–Oct. Widespread in North America; native to Eurasia. Used for sheep and horse feed, as porridge, and as a black dye by Ramah Navajos.

Atriplex saccaria S. Watson (bag-shaped or pouched, referring to the bracteoles) Stalked orach, medusa-head orach. Low monoecious herbs, forming rounded clumps, mainly 0.5–4 (5) dm tall. **STEMS** usually branched from the base, often suffused red-purple when young; herbage scurfy. **LEAVES** alternate or the lowermost subopposite, with petioles 2–5 mm long or the upper ones sessile, with Kranz anatomy, the blades mainly 0.6–4 cm long, 0.4–3 cm wide, cordate-ovate or subreniform to ovate or deltoid-ovate to oval, entire or in some the base subhastately lobed, truncate to subcordate or broadly cuneate basally, acute to rounded apically. **INFL**: staminate borne in the upper axils or in short, subnaked, terminal (early-deciduous) spikes or panicles; pistillate usually in fascicles of 1–3 in the lower axils. **FLOWERS**: staminate with 5-parted perianth. **FRUIT** bracteoles monomorphic or typically dimorphic, the larger ones on stipes (2) 4–10 (15) mm long, the others sessile, united to the base, round-triangular or suborbicular, 4–6 mm long, irregularly and coarsely dentate and more or less densely beset with flat, cristate, or hornlike appendages, the smaller bracteoles in the same axils, oblong to cuneate, 3–4 mm long, truncate at the apex, dentate only at the summit and the faces

smooth. **SEEDS** 1.5–2.3 mm wide, brownish to whitish, the radicle superior. $n = 9$. Young tender leaves cooked and eaten as greens by Hopis.

1. Leaves oval to rhombic, the bases truncate to cuneate-attenuate; fruiting bracteoles with stipes of various length ..... **var. *cornuta***
1' Leaves mainly ovate to cordate in profile, the uppermost bracteate ones (and sometimes all) often broadly so in age; fruiting bracteoles with stipes seldom exceeding 10 mm..... **var. *saccaria***

var. *cornuta* (M. E. Jones) S. L. Welsh (horned) Blade orach. **LEAVES** with petioles mainly 1–3 cm long, gradually shortened upward, the blades 1–2.5 cm long and as broad or broader (to 3.7 cm), rhombic to deltoid or ovate, acute to rounded apically, broadly to narrowly cuneate basally. **INFL**: staminate in small sessile glomerules axillary in the uppermost bracteate leaves, less commonly terminal and spicate or paniculate. **FRUIT** bracteoles dimorphic, those on stipes (2) 4–15 mm long or longer, with surfaces covered with flattened processes, the sessile ones cuneate as in the type variety. [*Atriplex cornuta* M. E. Jones; *A. argentea* Nutt. var. *cornuta* (M. E. Jones) M. E. Jones]. Salt desert shrub communities, on fine-textured, saline substrates associated with the Mancos Shale and other fine-textured formations. ARIZ: Apa; NMEX: RAr, SJn; UTAH. 1425–2045 m (4700–6750'). Flowering: May–Aug. Fruit: Aug–Oct. Perhaps this phase represents nothing more than the extreme ends of variation of the next variety and possibly does not deserve taxonomic status. Certainly the tendency to flattened, sometimes acute and sometimes flabellate to rounded processes is compelling.

var. *saccaria* **LEAVES** all petiolate or the upper ones subsessile, the blades 1–3 cm long and 1–2.5 cm wide, cordate-ovate or subreniform to oval or ovate, the base cordate or some only broadly truncate or less commonly rather abruptly cuneate, entire or slightly hastate. **INFL**: staminate in glomerules in upper axils and in terminal deciduous panicles. **FRUIT** bracteoles dimorphic, those with subglobose bodies bearing flattened or cristate processes and borne on stipes to 10 mm long or more, and those mainly lacking processes, cuneate in outline, and sessile. [*Atriplex caput-medusae* Eastw.; *A. argentea* Nutt. var. *caput-medusae* (Eastw.) Fosberg; *A. saccaria* S. Watson var. *caput-medusae* (Eastw.) S. L. Welsh]. Mat-atriplex, shadscale, greasewood, and piñon-juniper communities, on Mancos Shale, Morrison, and other fine-textured, saline substrates. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, San, SJn; UTAH. 1450–2215 m (4800-7310'). Flowering: Mar–Jul. Fruit: Jun–Oct. Wyoming, Utah, Colorado south to northern Arizona and New Mexico.

Bassia All. Summer Cypress

(for Ferdinando Bassi, 18th-century Italian botanist) Annual herbs or subshrubs. **LEAVES** alternate or some opposite, linear to narrowly lanceolate, in some fleshy and terete, entire, sessile; herbage pilose or tomentose, at least in inflorescence. **INFL** glomerate or solitary in leaf axils and in short axillary spikes. **FLOWERS** perfect and pistillate, bracteate; calyx 5-lobed, depressed-globose, enclosing the fruit and usually prominently armed with a curved or hooked spine on the dorsal surface of each lobe, or the lobes keeled and horizontally winged; stamens mostly 5, hypogynous; styles 1, with 2 (3) stigmas. **FRUIT** compressed. **SEEDS** horizontal [*Kochia* Roth] (Scott 1978). About 20 species in western North America and Eurasia. Used as a drug for venereal disease by Navajos.

1. Calyx in fruit armed with hooked spines ..... ***B. hyssopifolia***
1' Calyx in fruit with horizontal wings or wartlike tubercles..... (2)

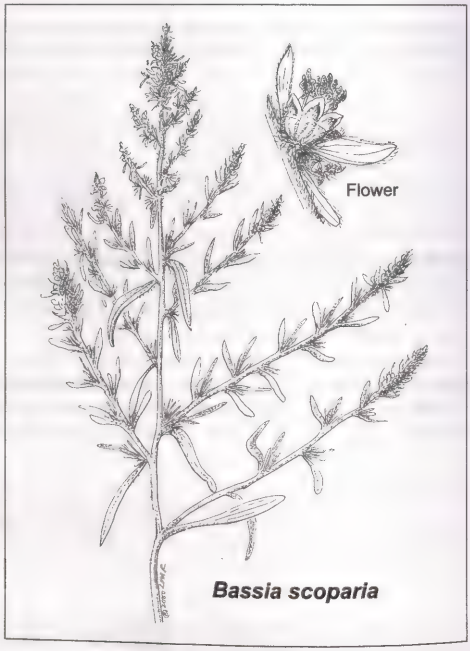
2. Plants annual, introduced weeds of disturbed habitats..... ***B. scoparia***
2' Plants perennial, woody at the base, indigenous in saline habitats ..... ***B.americana***

Bassia americana (S. Watson) A. J. Scott (America) Gray Molly. Plants mainly 5–30 (45) cm tall, with erect branches from a woody base; herbage villous-pilose to glabrous. **LEAVES** 5–25 mm long, 1–2 mm wide, linear, semiterete and fleshy. **INFL** often more than 1/2 the branch length; solitary flowers, or 2–5, sessile in axils of scarcely reduced leaves. **FLOWER** perianth segments pubescent, at least apically, 1–1.5 mm long, hooded above, somewhat enlarged in fruit, ultimately keeled and with a membranous, striate wing to 2 mm long and 3 mm wide. [*Kochia americana* S. Watson; *K. americana* var. *vestita* S. Watson; *K. vestita* (S. Watson) Rydb.]. Greasewood, seepweed, saltbush, saltgrass, matchweed, horsebrush, and piñon-juniper communities. ARIZ: Apa; COLO: Mon; NMEX: SJn; UTAH. 1450–1985 m (4790–6550'). Flowering/Fruit: May–Sep. Oregon to Montana, south to California, Arizona, and New Mexico.

Bassia hyssopifolia (Pall.) Kuntze (aromatic herb) Bassia. Annual herbs, the main stem erect, the lower lateral ones often decumbent, 2–10 dm tall or more; herbage more or less lanate, especially in the inflorescence. **LEAVES** 4–40 mm long,

1–5 mm wide, linear to oblong or narrowly oblanceolate. **INFL** clustered in terminal or lateral spikes, or solitary in leaf axils. **FLOWER** bracteoles reduced; pistillate and sterile flowers mixed with perfect ones. **FRUIT** calyx about 2 mm wide, each lobe with a stout, curved to uncinate spine; pericarp membranous, planoconvex. $2n = 18$. [*Salsola hyssopifolia* Pall.; *Echinopsilon hyssopifolium* (Pall.) Moq.; *Kochia hyssopifolia* (Pall.) Schrad.]. Commonly on saline substrates, often in riparian, lacustrine, or palustrine habitats, in saltgrass, greasewood, horsebrush, shadscale, and cottonwood-tamarix communities. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: RAr, SJn; UTAH. 1585–2380 m (5230–7855'). Flowering/Fruit: Jul–Oct. Adventive from Eurasia. This species forms apparent hybrids with *B. scoparia*, from which it differs in having spines on the sepals instead of horizontal flattened processes.

Bassia scoparia (L.) A. J. Scott (form of a broom) Summer cypress. Annual herbs, mainly 3–12 (15) dm tall, green, or suffused with red in autumn; simple or branched from the base, villous and often finely lanate to glabrous. **LEAVES** 0.8–4.5 (6) cm long, 1–4 mm wide, lanceolate to oblanceolate, elliptic or linear, usually 3- to 5-veined, glabrous or softly pilose below (and above) or glabrous above, generally ciliate, acute. **INFL** spicate, interrupted. **FLOWERS**: perfect ones with fruiting perianth glabrous dorsally, ciliate, mostly transversely keeled, tubercled or sometimes horizontally winged from middle of the keel, often lacking a keel. **SEEDS** ovate in outline, 1.5–2 mm long. $2n = 18$. [*Chenopodium scoparium* L.; *Kochia scoparia* (L.) Schrad.]. Disturbed roadsides, canal banks, field margins, and other waste places in salt marsh, sedge-rush, sagebrush, mountain brush, and piñon-juniper communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1425–2695 m (4700–8890'). Flowering/Fruit: Jul–Oct. Widespread in North America; adventive from Eurasia. This species is known to form apparent hybrids with *B. hyssopifolia*. The plants are intermediate in every regard, and vegetative specimens are difficult if not impossible to distinguish to species. Because of this, and other considerations, the writer somewhat hesitantly agrees with the A. J. Scott treatment wherein the two genera were combined.



Chenopodium L. Goosefoot, Pigweed, Quelitos

(*chen*, goose, and *pous*, foot, referring to the leaf shape) Annual herbs, glabrous, pubescent, glandular, or farinose (mealy). **LEAVES** alternate, flat, entire, toothed, or lobed. **INFL** usually in cymes, variously arranged in spicate or paniculate inflorescences. **FLOWERS** perfect or some pistillate only, ebracteate; calyx segments usually 4 or 5, persistent, flat or keeled, more or less covering the fruit; stamens commonly 5; styles 2 (3). **FRUIT** rarely becoming fleshy. **SEEDS** lenticular, horizontal or vertical. The genus is notoriously complex for several reasons. The floral features are greatly reduced and diagnostic characteristics are often based on either vegetative structures or on minutiae of the calyx, pericarp, and seed coat, which are often subject to interpretation and might be demonstrated ultimately as trivial. Nomenclature is tangled within both the native and introduced entities, leading to taxonomic treatments that do not satisfactorily circumscribe the taxa as represented by actual specimens. Further, there is variability within the diagnostic features, leading to contradictory statements in taxonomic treatments; e.g., with regard to such characters as adherent versus nonadherent pericarps. Thus, the treatment presented below attempts to provide names for the taxa recognizable in the Four Corners region based on examination of actual specimens. The entities seem to be real, but the names might be misapplied in some cases (Bassett and Crompton 1982; Wahl 1954). About 150 temperate species; some cultivated for greens (*Beta*) or grain (*Chenopodium*).

1. Herbage with yellow resinous glands or glandular hairs, not farinose, aromatic ..... (2)
1' Herbage glabrous or farinose, eglandular, not aromatic ..... (4)

2. Flowers in small sessile clusters, borne in bracteate panicles; plants rare ..... ***C. ambrosioides***
2' Flowers solitary or loosely clustered, borne in small dichotomous cymes, these spreading-recurved along the axis of an elongate panicle; plants common or rare ..... (3)

3. Plants densely glandular-pubescent; keel calyx lobes smooth, not tuberculate; plants common and widespread ..... ***C. botrys***
3' Plants sparsely puberulent, the lower leaves and calyx with yellow resinous dots; keel of calyx lobes tuberculate ..... ***C. graveolens***

4. Seeds all, or at least some, vertical in the flowers (except sometimes in C. *glaucum*, keyed both ways) ..... (5)
4' Seeds usually all horizontal ..... (9)

5. Leaves mainly 0.5–2 cm long, 2–7 mm wide, irregularly dentate, glaucous-farinose beneath ..... ***C. glaucum***
5' Leaves mainly larger and often hastately lobed, or, if as small as above, green or reddish beneath ..... (6)

6. Plants with prostrate to spreading-ascending stems, growing on beaches and in draw-down areas of reservoirs, ponds, and lakes ..... ***C. humile***
6' Plants with erect to ascending stems, or if these prostrate (as in phases of *C. capitatum*), the plants not or seldom of palustrine sites ..... (7)

7. Flowers in elongate axillary clusters, these forming erect or steeply ascending compact panicles, or in compact axillary glomerules mainly less than 4 (5) mm wide; plants commonly palustrine ..... ***C. rubrum***
7' Flowers in subglobose axillary clusters, these forming bracteate spikes; plants usually montane ..... (8)

8. Glomerules subtended by foliose bracts throughout the inflorescence; flowers maturing from base to plant apex ..... ***C. foliosum***
8' Glomerules not subtended by leaflike bracts in distal 1/2 of spike; flowers maturing uniformly from apex to plant base ..... ***C. capitatum***

9. Leaf blades 0.5–2 cm long, 2–7 mm wide, sinuate-dentate, glaucous-farinose beneath ..... ***C. glaucum***
9' Leaf blades various, but not simultaneously as above ..... (10)

10. Larger cauline leaves with blades more or less cordate to truncate basally, often over 4 cm wide, thin and glabrous; sepals not keeled dorsally; panicles large and open ..... ***C. simplex***
10' Larger cauline leaves with bases various, but seldom as above, and less than 4 cm wide, often farinose beneath; sepals usually keeled ..... (11)

11. Larger cauline leaf blades mainly 3–5 or more times longer than wide, entire or with a pair of basal lobes ..... (12)
11' Larger cauline leaf blades mainly 1–3 times longer than broad, hastately lobed, toothed, or entire ..... (13)

12. Leaves 1-veined, linear, entire; pericarp adherent to the seed, this typically less than 1 mm wide ..... ***C. leptophyllum***
12' Leaves 3-veined (at least near the base in larger ones), distinctly broader than linear, often lanceolate to oblong or elliptic, entire or with 2 basal lobes; pericarp not adherent to the seed ..... ***C. desiccatum***

13. Leaf blades hastately lobed (the lobe sometimes again lobed or toothed), or oval to elliptic and entire, or rarely with 1 or more teeth on the apical larger lobe; calyx lobes obscurely or narrowly membranous-margined; plants indigenous ..... (14)
13' Leaf blades sinuate-dentate, ovate to lanceolate, or entire; calyx lobes with broad scarious margins; plants adventive ..... (15)

14. Leaf blades not hastately lobed; pericarp usually not adherent; seeds black, shining, 0.8–1.3 mm wide; plants usually of upper middle to higher elevations ..... ***C. atrovirens***
14' Leaf blades often hastately lobed; pericarp not adherent; seeds dark reddish brown to black, shining, 1–1.3 mm wide; plants of wide altitudinal range ..... ***C. fremontii***

15. Fruits sharply angled on the margin; seed coat with minute rounded pits ..... ***C. murale***
15' Fruits rounded to obtuse on the margin; seed coat smooth to sculptured; plants common or uncommon, of various distribution ..... (16)

16. Seeds sculptured, alveolate-reticulate, or reticulate ..... ***C. berlandieri***
16' Seeds smooth or faintly striate ..... ***C. album***

Chenopodium album L. (white) Lamb's quarters, pigweed, quelitos. Erect annual herbs. **STEMS** red-striate, 1–10 dm tall or more, simple or more commonly branched; herbage more or less farinose, at least when young. **LEAVES** petiolate, the blades 1–6.5 cm long, 0.5–5.6 cm wide, ovate to rhombic-ovate or lanceolate, sinuate-dentate and often subhastately lobed or the upper (rarely all) entire. **INFL** in dense glomerules, these spicate in upper axils. **FLOWER** calyx with keeled lobes, enclosing the fruit. **FRUIT** pericarp adherent. **SEEDS** horizontal, rounded marginally, smooth to sculptured, black, 1–1.5 mm wide. $2n$ = 18, 36, 54, 108. Weedy species of disturbed habitats. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon; NMEX: McK, RAr, San. 1515–2265 m (5000–7475'). Flowering/Fruit: Jul–Sep. Widespread in North America; adventive from Eurasia. This taxon has been confused with *C. fremontii*, q.v., but in those plants having mature fruits the adherent pericarps are diagnostic. Our material belongs to **var. *album***. This was and is a very useful plant to many Native Americans and Hispanics. Navajos used the plant as a burn dressing and for deflecting snakes and snakebite. Seeds were dried and used like corn by Navajos, especially in the Nightway chant, and also by Hopis. The young greens were used, both raw and cooked, by almost every tribe as well as Hispanics.

Chenopodium ambrosioides L. (food of the gods) Mexican-tea. Aromatic annual herbs. **STEMS** erect or ascending, mainly 4–10 dm tall; herbage pubescent and with sessile glands. **LEAVES** short-petioled, the blades 2–10 cm long, 3–30 mm wide (or more), usually lanceolate, dentate to laciniate. **INFL** paniculate, the cymes sessile on ultimate branches, usually bracteate. **FLOWER** calyx united to the middle or above. **SEEDS** 0.5–0.8 mm wide. $2n$ = 32, 36, 48–64. [*Teloxys ambrosioides* (L.) W. A. Weber; *Dysphania ambrosioides* (L.) Mosyakin & Clemants]. Ruderal and garden weeds. ARIZ: Apa. Flowering/Fruit: Jul–Sep. Widespread in tropical and temperate New World; adventive from Mexico.

Chenopodium atrovirens Rydb. (terrible, green) Mountain goosefoot. Plants mainly 2–75 cm tall. **STEMS** erect or steeply ascending, usually branched; herbage sparingly scurfy to glabrous. **LEAVES** petiolate, the blades 0.6–4 cm long, 2–23 mm wide, lanceolate to ovate, entire or obscurely hastately lobed, otherwise entire, obtuse basally. **INFL** clustered in leaf axils or in interrupted terminal spikes, the lower ones subtended by foliose bracts, becoming ebracteate upward. **FLOWER** perianth lobes free to below the middle, keeled dorsally. **FRUIT** pericarp adherent or not adherent to the horizontal, rugulose to smooth, obtusely margined seed. **SEEDS** about 0.8–1.3 (1.5) mm wide. $2n$ = 18. [*Chenopodium fremontii* S. Watson var. *atrovirens* (Rydb.) Fosberg; *C. incognitum* Wahl]. Sagebrush, piñon-juniper, mountain brush, ponderosa pine, Douglas-fir, aspen–tall forb, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1890–3050 m (6240–10065'). May–Oct. British Columbia to Saskatchewan south to California, Nevada, Colorado, and Iowa. Relationship of this species probably lies closer to the *leptophyllum* end of the spectrum. The occasional specimens with free pericarps might indicate intermediacy with *C. fremontii*, however. There has been little agreement between previous authors as to whether the pericarp was adherent or not, but in the specimens examined from Utah, the pericarps are usually adherent.

Chenopodium berlandieri Moq. (for Jean L. Berlandier, Swiss botanist who collected in Texas) Berlandier's pigweed. Ill-scented, mostly glabrous annual. **STEMS** up to 1 m or more tall with slender, ascending-arched branches. **LEAVES** thin, oblong, ovate, or rhombic, 2–4 cm long, sinuate to dentate, pale green and glabrate on the upper surface, glabrous to farinose beneath. **INFL** in glomerules borne on slender-branched panicles. **FLOWER** perianth segments pitted. [*Chenopodium album* L. var. *berlandieri* (Moq.) Mack. & Bush]. Weedy or pioneer plants of disturbed substrates in various plant communities in saline to nonsaline substrates. ARIZ: Apa; COLO: Arc, Dol, LPl, Min, Mon; NMEX: McK, RAr, San, SJn. 1640–2410 m (5410–7955') Flowering/Fruit: Jun–Sep. Widespread in North America. Plants from New Mexico belong to the widespread and common **var. *zschackei*** (Murr) Murr ex Graebn. n = 18. [*C. zschackei* Murr; *C. berlandieri* subsp. *zschackei* (Murr.) A. Zobel]. I have been unable to distinguish from among the relatively small sample of specimens available to me the var. *sinuatum* (Murr) Wahl, which is mapped in *Flora of North America* (Clemants 2003a) to include most of New Mexico. It differs in an intangible feature of the style base possessing a yellow area.

Chenopodium botrys L. (like a bunch of grapes) Jerusalem-oak. Aromatic annual herbs. **STEMS** commonly 1–5 dm tall, erect or ascending, usually branched; herbage glandular-villous. **LEAVES** petiolate, the blades sinuate-pinnatifid, the lobes again toothed or lobed, oblong to oval in outline. **INFL** an erect panicle of loosely spreading-recurved cymes, mainly shortly bracteate. **FLOWER** sepals about 1 mm long. **SEEDS** horizontal or vertical, 0.5–0.8 mm wide, dull, dark. $2n$ = 18, 36. [*Teloxys botrys* (L.) W. A. Weber; *Dysphania botrys* (L.) Mosyakin & Clemants]. Widespread ruderal weedy species, established locally in indigenous communities, especially in gravelly washes. ARIZ: Apa; COLO: LPl; NMEX: McK, RAr, San, SJn. 1665–2105 m (5500–6945'). Flowering/Fruit: Aug–Sep. Widely distributed in the United States; adventive from Eurasia.

Chenopodium capitatum (L.) Ambrosi (knoblike head) Strawberry-spinach. Plants mainly 1–4 dm tall. **STEMS** erect or decumbent-ascending, simple or more commonly branched from the base; herbage glabrous. **LEAVES** petiolate, the blades (1) 1.5–10 cm long, 1–10 cm wide, triangular-hastate to lanceolate, shallowly to deeply toothed or subentire, hastately lobed or the upper entire, acute to obtuse apically, often turning reddish. **INFL** axillary capitate clusters, these borne in spikes, the lower clusters subtended by foliose bracts, the upper ones ebracteate or with reduced bracts. **FLOWER** perianth lobes free to below the middle, not mealy, dry and greenish or becoming fleshy and reddish, shorter than the fruit. **FRUIT** pericarp adherent to the erect (or less commonly horizontal) seed. **SEEDS** about 1 mm long. $2n = 18$. [*Blitum capitatum* L.; *C. overi* Aellen; *C. chenopodioides* (L.) Aellen]. Plant used as a lotion for head bruises and for black eyes by Kayenta Navajo.

1. Flower clusters often over 6 (to 12) mm wide, the calyx becoming red and fleshy at maturity; plants uncommon ..... **var. *capitatum***
1′ Flower clusters commonly less than 6 (to 8) mm wide, the calyx not fleshy, though sometimes reddish at maturity; plants common ..... **var. *parvicapitatum***

var. *capitatum* $2n = 18$. Gravelly soil or sandy soils in meadows and clearings in ponderosa pine, Douglas-fir–aspen, and spruce-fir forests. COLO: Arc, Min; NMEX: McK, RAr. 2440–2685 m (8050–8860′). Flowering/Fruit: Aug–Oct. Alaska to Quebec, south to California and New England. The entire plant becomes anthocyanic late in its life cycle. Northward the species is abundant in Alaska and Yukon.

var. *parvicapitatum* S. L. Welsh (smallhead) Smallhead chenopod [*Blitum hastatum* Rydb.; *Chenopodium overi* Aellen]. Mountain brush, ponderosa pine, aspen, and spruce-fir communities. ARIZ: Apa; COLO: Arc, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn. 1860–3050 m (6140–10065′). Flowering/Fruit: Jun–Sep. British Columbia to Saskatchewan, south to California, Nevada, Wyoming, and Colorado. At specific level the correct name would be *C. overi* Aellen. This common plant of montane habitats has been identified variously as *C. capitatum* or *C. rubrum*, and more recently, as *C. chenopodioides* (L.) Aellen. The latter plant is a portion of the flora of Russia and might represent nothing more than phases of *C. rubrum* sensu lato. Certainly the description provided for that entity (Shishkin 1970) is not of our specimens, and neither is the habitat cited (i.e., "wet solonchaks"). The name given here is for the purpose of providing an unequivocal epithet for this montane western American phase of *C. capitatum*. According to *Flora of North America* (2003: 276), *C. chenopodioides* is allied to *C. rubrum*, differing in the perianth segments being connate almost to the tip in the former, and "mostly" near the very base in the latter, and both of them segregated on elusive and overlapping characteristics from *C. capitatum* (and *C. foliosum*), i.e., glomerules of *chenopodioides–rubrum* being 2–5 mm (not 3–10), and presence of both horizontal and vertical seeds (not all vertical). The other characteristics noted are inconclusive and subject to interpretation. *Chenopodium foliosum* (Moench) Asch. [*Morocarpus foliosus* Moench, 1794 Methodus 342] is closely allied morphologically to *C. capitatum* var. *parvicapitatum*, differing in the foliose bracts throughout the inflorescence and in the sepals that turn fleshy-red at maturity as in var. *capitatium* (see *Flora of North America* 2003: 276, wherein it is mapped for San Juan County, Utah). None of the specimens seen bearing the name *C. foliosum* from the study area are indeed that species; they are all var. *parvicapitatum*.

Chenopodium desiccatum A. Nelson (dried up, for its desert habitat) Desert goosefoot. Plants mainly 3–8 dm tall. **STEMS** erect, simple or branched; herbage commonly more or less scurfy. **LEAVES** petiolate, the blades mostly 1.3–6 cm long and 2–10 (15) mm wide, linear to narrowly lanceolate or elliptic, entire or less commonly hastately lobed, cuneate basally. **INFL** clustered in terminal or axillary spicate panicles. **FLOWER** perianth lobes free to below the middle, keeled dorsally. **FRUIT** pericarp not adherent to the horizontal, smooth to rugulose, obtusely margined seed. **SEEDS** 0.9–1.2 mm wide. $2n = 18$. [*Chenopodium pratericola* Rydb.; *C. petiolare* Kunth var. *leptophylloides* Murr.; *C. leptophyllum* (Moq.) Nutt. ex S. Watson var. *desiccatum* (A. Nelson) Aellen; *C. leptophyllum* var. *oblongifolium* S. Watson; *C. pratericola* var. *oblongifolium* (S. Watson) Wahl]. Shadscale, hopsage, rabbitbrush, tamarix-poplar, sagebrush, and piñon-juniper communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, Mon, Smg; NMEX: RAr, San. 1635–2565 m (5400–8420′). Flowering/Fruit: Aug–Sep. Yukon to Manitoba, south to California, New Mexico, and Nebraska. Material assigned to *C. desiccatum* in a strict sense, as distinct from *C. pratericola* in a strict sense, has perianth lobes covering the mature fruit, as opposed to having the fruit not covered. The distinction is not great. Reduction of this taxon to *C. leptophyllum* (as var. *oblongifolium*) begs the question of a probably nearer relationship to *C. fremontii*, with which it shares nonadherent pericarp and broader, more veined leaves. Furthermore, apparent intermediates between *C. fremontii* and *C. desiccatum* exist. The entire complex is in need of monographic study.

Chenopodium foliosum (Moench) Asch. (leafy) Leafy goosefoot. Annual, mostly 0.5–6 dm tall. **STEMS** mostly branching, glabrous to minutely scaly. **LEAVES** with blades 7–40 mm long, entire to irregularly toothed, glabrous to minutely scaly; lower lanceolate to deltate, base 2-lobed to hastate; upper oblong to lanceolate, base tapered. **INFL** 3–5 mm diameter, axillary, mostly spheric, leafy-bracted. **FLOWER** sepals mostly 3, smooth, mostly glabrous, often becoming reddish; stamens 3–4. **FRUIT** 1 mm diameter; wall mostly adherent to seed. **SEEDS** usually vertical. $2n = 16, 18$. Rocky soils; riparian areas in ponderosa pine and subalpine communities. COLO: Arc, LPl, Mon, SJn; NMEX: SJn. 2440–3050 m (8000–10000'). Flowering: (May) Jun–Sep. Western Canada south to New Mexico. Native to Europe.

Chenopodium fremontii S. Watson (for John C. Frémont, explorer and naturalist) Frémont's goosefoot. Plants mainly 1–8 (12) dm tall. **STEMS** erect or ascending, usually branched; herbage more or less scurfy to glabrous. **LEAVES** petiolate, the blades 0.6–5 (6) cm long, and about as broad, less commonly 2–3 times longer than broad, triangular-ovate to ovate or lanceolate, commonly hastately lobed, the lobes often again lobed or toothed, otherwise entire or rarely with 1 or few teeth on the main apical lobe, broadly cuneate to subcordate basally. **INFL** clustered in large, interrupted terminal and smaller lateral spikes, often in naked or near naked panicles. **FLOWERS** scurfy; perianth lobes free to below the middle, keeled dorsally. **FRUIT** pericarp not adherent to the horizontal, smooth to rugulose, obtusely margined seed. **SEEDS** 0.9–1.2 mm wide. $n = 9$. This closely interrelated complex of forms involves the linear-leaved *C. leptophyllum* (q.v.) at one end of the spectrum and the broad-leaved phases of *C. fremontii* at the other end (and with both *C. atrovirens* and *C. desiccatum*, inter alia, between the extremes). The intervening plants have been regarded as species or some of them have been placed within expanded species concepts at both ends of the series. The course followed herein is a compromise between having one all-inclusive species, with numerous varieties, and recognizing all of the named entities at specific level. The proposed treatment attempts to represent the major taxa as they occur in the Four Corners region; the synonymy might not be properly applied in all cases. Hopis used the seeds and leaves as food, flavoring, and packing around yucca fruits when baked. Navajos used the seeds to make bread.

1. Plants 0.5–8 dm tall, variously branched but, if as below, the lateral branches much shorter than the main stem; leaves white-farinose to glabrous and green (at least above), becoming anthocyanic in age, at least some typically over 15 mm long ..... **var. *fremontii***
1'. Plants mainly less than 2.5 dm tall, branching from the base, the curved ascending branches subequal to the main stem; leaves more or less white-farinose, at least beneath and sometimes on both sides, mainly 4–15 (20) mm long and typically as broad ..... **var. *incanum***

var. *fremontii* $2n = 18$. Warm desert shrub, salt desert shrub, sagebrush, mountain brush, piñon-juniper, aspen, Douglas-fir, ponderosa pine, and spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1650–2770 m (5445–9140'). Flowering/Fruit: Jul–Oct. British Columbia to Manitoba, south to California and Mexico.

var. *incanum* S. Watson (hoary, for the white hairs) Silvery goosefoot. $2n = 18$. [*Chenopodium incanum* (S. Watson) A. Heller; *C. incanum* var. *occidentale* D. J. Crawford; *C. watsonii* A. Nelson]. Blackbrush, salt desert shrub, sagebrush, piñon-juniper, mountain brush, and ponderosa pine communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon, SMg; NMEX: RAr, San, SJn; UTAH. 1850–2780 m (6105–9175'). Flowering/Fruit: May–Sep. Nevada to Nebraska, south to Texas and Mexico. There are numerous intermediates that form a transition to var. *fremontii*. Specimens assigned here are not uniform with regard to leaf shape, plant height, and openness of the inflorescence. The plant is treated at species level in *Flora of North America* (2003: 291).

Chenopodium glaucum L. (whitish covering of the leaves) Oakleaf goosefoot. Plants mainly 3–30 (exceptionally to 70) cm long. **STEMS** prostrate to ascending or erect, usually branched; herbage farinose, especially on lower leaf surfaces. **LEAVES** with short to rather elongate petioles; the blades 4–25 (30) mm long, 2–10 (18) mm wide, lanceolate to oblong or ovate, coarsely sinuate-dentate. **INFL** in clusters in numerous short, bracteate or ebracteate, axillary spikes and a terminal spicate panicle. **FLOWER** perianth cleft almost to base, not enclosing the fruit. **FRUIT** pericarp not adherent to the seed. **SEEDS** horizontal or vertical, 0.8–1.3 mm wide, smooth. $2n = 18, 36$. Often in saline substrates on pond and lake shores and stream banks, in sedge-rush, tamarix-sedge, rabbitbrush, piñon-juniper, and aspen to spruce-fir communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1090–2470 m (3600–8150'). Flowering/Fruit: May–Oct. Widespread in the United States and Canada; Eurasia. Our material is assignable to **var. *salinum*** (Standl.) B. Boivin (salty) on the basis of its larger fruits (0.8–1.3 mm, not 0.6–0.9 mm). [*Chenopodium salinum* Standl.]

Chenopodium graveolens Willd. (strong-smelling) New Mexico goosefoot, foetid goosefoot. Plants annual, strongly scented. **STEMS** erect, 1.5–4 (6) dm tall, simple or paniculately branched from the base, sparsely puberulent to glabrate, often suffused red. **LEAVES** 2–6.5 cm long, 1.5–3 cm wide, lanceolate to narrowly oblong or deltoid-ovate, sinuate- or laciniate-pinnatifid, the lobes triangular, bright green, glabrous or viscid-villous above, covered with yellow glands beneath, obtuse to acuminate apically, truncate to cuneate at the base. **INFL** of numerous loosely few-flowered axillary cymes, these aggregated into narrow, elongate naked panicles. **FLOWERS** sessile in branch axils and at ends of slender, lateral branches, pedicellate flowers usually abortive; calyx deeply cleft, the lobes cornately appendaged, bearing yellow or orange-yellow sessile glands, incompletely enclosing the fruit. **SEEDS** horizontal, 0.5–0.8 mm wide, dark brown, the pericarp adherent. [*Teloxys graveolens* (Willd.) W. A. Weber; *Dysphania graveolens* (Willd.) Mosyakin & Clemants]. Disturbed sites, pond margins, and roadsides in various indigenous plant communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, SJn. 2200–2745 m (7260–9060′) Flowering/Fruit: Aug–Sep. Arizona and New Mexico to Texas (and elsewhere in the U.S.); Central and South America; Africa. Our material has been assigned to **var. *neomexicanum*** (Aellen) Aellen. [*Chenopodium incisum* Poir. var. *neomexicanum* Aellen]. Zunis steeped the plant in water and inhaled the vapor for headaches. Hopis ground the seeds, mixed them with cornmeal, and cooked the dumplings in corn husks. Ramah Navajos made a cold infusion to be taken as protection in warfare.

Chenopodium humile Hook. (low) Low goosefoot. **STEMS** mainly 5–15 cm long, at least the lowermost branches prostrate-ascending; herbage glabrous or nearly so. **LEAVES** petiolate, the blades 0.5–3 cm long, 0.2–2.5 cm wide, triangular to ovate, lanceolate, or elliptic, entire or somewhat lobed, some often subhastate, fleshy and often suffused with red. **INFL** sessile, the clusters borne in simple or branched axillary glomerules and terminal spicate panicles. **FLOWER** perianth lobes cleft nearly to the base. **FRUIT** pericarp not adherent. **SEEDS** nearly always vertical, oval in outline, 0.8–1 (1.2) mm broad. Often, but not exclusively, on moist, saline substrates in palustrine and riparian habitats and in pond or reservoir draw-down areas. COLO: LPl, Min, Mon, SMg; NMEX: RAr, SJn; UTAH. 2380–2525 m (7855–8330′). Flowering/Fruit: Jun–Sep. Widespread in the United States and Canada; Eurasia. [*Chenopodium rubrum* L. var. *humile* (Hook.) S. Watson]. This plant has been mistaken previously for *C. capitatum* var. *parvicapitatum* and for *C. rubrum*, with which it is sometimes placed at varietal level. In some floras similar plants are keyed to *C. chenopodioides* (L.) Aellen (Correll and Johnston 1979a), which is distinguished by the "perianth segments connate to near the tip." Careful examination is necessary to distinguish the proper course through the key presented above. The apparent restriction to lacustrine and/or palustrine habitats, the tendency to entire or merely hastate leaves, and the prostrate to prostrate-ascending habit of these dwarf plants in combination are definitive for this entity. In both habit and habitat the low goosefoot approaches *C. glaucum* but differs in mainly (but not always) lacking scurf on the undersurface of the leaves and the leaves are not as distinctly dentate. If draw-down areas of reservoirs, ponds, and other similar habitats were searched in late summer, the species would probably be found to be much more common than indicated by the few collections examined.

Chenopodium leptophyllum (Moq.) Nutt. ex S. Watson (narrow leaf) Narrowleaf goosefoot. Plants mainly 12–70 cm tall, erect or the branches ascending, simple or branched. **LEAVES** short-petiolate, the blades mainly 0.7–4 cm long, 1–5 (7) mm wide, linear to narrowly oblong or narrowly lanceolate, 1-veined, cuneate to acute basally, entire. **INFL** in loose to compact cymes aggregated into terminal or axillary spicate panicles. **FLOWER** perianth lobes cleft to well below the middle, keeled dorsally. **FRUIT** pericarp adherent. **SEEDS** horizontal, 0.9–1.1 mm wide, black, finely rugulose to smooth. $2n = 18$. [*Chenopodium album* L. var. *leptophyllum* Moq.]. Shadscale, greasewood, rabbitbrush, tamarix, sagebrush, fringed sagebrush, mountain brush, and aspen communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1525–2260 m (4620–7460′). Flowering/Fruit: May–Oct. British Columbia to Saskatchewan, south to California and Mexico. The one-veined, narrow leaf blades and adherent pericarps are apparently definitive for this plant. The young leaves were cooked by Apaches and Hispanics as greens. The sprouts were also boiled with meat. Seeds were considered important food by Zunis, Apaches, Navajos, and Hopis, often ground and put into cakes or steamed balls. Indeed, Zunis considered this one of the most important food plants.

Chenopodium murale L. (growing on walls) Nettleleaf goosefoot. Plants mainly 2–8 dm tall. **STEMS** erect or with branches ascending; herbage glabrous or sparingly farinose, especially in inflorescences. **LEAVES** petiolate, the blades 1–5 (7) cm long and as broad or nearly so, ovate to oval or lanceolate, irregularly sinuate-dentate and some often subhastate, cuneate to subcordate basally. **INFL** sessile and solitary to clustered in axillary or terminal panicles not much, if at all, surpassing the leaves. **FLOWER** perianth lobes free to below the middle, keeled dorsally. **FRUIT** pericarp adherent to the horizontal, rugulose to smooth, sharply margined seed. **SEEDS** horizontal, rugulose to smooth, sharply margined; 1–1.5 mm long. $2n = 18$. Ruderal weeds. ARIZ: Apa. 2170 m (7160′). Flowering/Fruit: Aug–Sep.

Widespread in the United States and Canada; adventive from Eurasia. This is a robust, weedy species with large, irregularly sinuate-dentate leaves, and both lateral and terminal paniculate inflorescences.

Chenopodium rubrum L. (red) Red goosefoot. Plants mainly 0.5–10 dm tall, erect, simple or with steeply ascending branches; herbage glabrous or somewhat villous in inflorescence. **LEAVES** petiolate, the blades 0.7–9 (13) cm long, 0.4–7 (10) cm wide, triangular to ovate, lanceolate, or elliptic, sinuate-dentate or -lobed, some often subhastate, fleshy and often suffused with red. **INFL** sessile, the clusters borne in simple or branched axillary and terminal spicate panicles. **FLOWER** perianth lobes cleft to the middle or below, rounded or sometimes keeled dorsally. **FRUIT** pericarp not adherent. **SEEDS** nearly always vertical, oval in outline, 0.6–1 mm long. $2n = 18, 36$. Saline, moist substrates in lacustrine, palustrine, and riparian habitats. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Mon; NMEX: RAr, SJn; UTAH. 1520–2680 m (5025–8850'). Flowering/Fruit: Aug–Sep. Widespread in the U.S. and Canada; Eurasia. The plants turn anthocyanic in autumn.

Chenopodium simplex (Torr.) Raf. (simple) Mapleleaf goosefoot. Plants mainly 2–10 dm tall. **STEMS** erect, simple or branched; herbage glabrous, except in inflorescence. **LEAVES** alternate or the lower often opposite, long-petiolate, the blades commonly 1.7–10 cm long, 1.2–10 cm wide, ovate to deltoid-ovate, sinuate-dentate to lobate, with 2–4 teeth or lobes, cordate to truncate or obtuse basally. **INFL** in small cymes, these arranged in large terminal (to 30 cm long or more) and smaller axillary panicles, more or less farinose and often sparingly glandular. **FLOWER** perianth cleft nearly to the base, not strongly keeled dorsally. **FRUIT** pericarp not or moderately adherent. **SEEDS** 1.2–1.9 mm wide, with obtuse margin, smooth or somewhat sculptured. $2n = 18, 36$. [*Chenopodium hybridum* L. var. *simplex* Torr.; *C. gigantospermum* Aellen; *C. hybridum* var. *gigantospermum* (Aellen) Rouleau]. Sagebrush, piñon-juniper, mountain brush, ponderosa pine, and aspen communities, less commonly in riparian or palustrine habitats. COLO: LPl, Mon; NMEX: RAr. 2680 m (8850'). Flowering/Fruit: Jul–Sep. Widely distributed in the United States and Canada; Europe. A case can be made for inclusion of our material as a variety of *C. hybridum* L. Certainly they are more than mere look-alikes. However, on the basis of the seed being less sculptured than in typical European material, it is herein regarded as specifically distinct. The name taken up here is one long overlooked by students of the genus, but noted by Robert Dorn in his treatment of the vascular plants of Wyoming.

Corispermum L. Bugseed

(*coris*, bedbug, + *sperma*, seed) Annual herbs, often pubescent with stellate hairs. **LEAVES** alternate, sessile, entire, 1-veined. **INFL** solitary or clustered in bract axils, arranged in dense or lax spikes. **FLOWERS** perfect; perianth segments 1–3, minute, unequal, the posterior 1 largest, erect, 1-nerved, scarious; stamens 1–3 (5); stigmas 2, connate basally. **FRUIT** an achene, strongly flattened, plano-convex, indurate, the margin winged or acute (Mosyakin 1995). Sixty north-temperate species.

Corispermum americanum (Nutt.) Nutt. (America) American bugseed, tickseed. **STEMS** mainly 8–50 cm tall, commonly branched throughout, the lower branches often curved-ascending to ascending, usually reddish or purplish; herbage glabrous or sparsely to densely pubescent with soft, branched hairs. **LEAVES** alternate, sessile, semicylindric and more or less involute or subulate, mostly 0.8–6 cm long, 0.5–3 mm wide, apiculate. **INFL** typically slender and elongate, the bracts broadly scarious-margined, with the lower ones narrower or broader than the fruit, the upper ones usually broader than the fruit. **FLOWER** perianth mostly consisting of a single posterior erose segment (rarely with 2 additional small anterior-lateral segments); stamens 3–5. **SEEDS** 2.9–3.5 mm long, 1.6–2.6 mm wide, oval to suborbicular, smooth, glabrous, brownish; wing 0.2–0.3 mm wide, opaque, stramineous, 1/8–1/5 as wide as the body. $2n = 18$. [*Coriospermum hyssopifolium* L. *var. americanum* Nutt.; C. *hyssopifolium* L.; *C. nitidum* Kit.]. Usually growing on sandy substrates, in ephedra, four-wing saltbush, rabbitbrush, scurfpea, and piñon-juniper communities. ARIZ: Apa, Nav; NMEX: McK, RAr, San, SJn; UTAH. 1605–2395 m (5290–7900'). Flower/Fruit: Jul–Sep. Montana and North Dakota south to Arizona, New Mexico, and Texas. The American bugseed species have long been mistaken as introductions from the Old World and have been regarded mainly as either *C. hyssopifolium* and/or *C. nitidum* Kit. ex Schult. The problem was discussed in *A Utah Flora* (Welsh et al. 1993). Mosyakin recognizes a rather large set of intergrading native American taxa, which require careful examination prior to their acceptance. The plants become anthocyanic in autumn and at least in some years form beautiful assemblages of pink, orange, and purple clumps on sands, especially on bars in the various river drainages.

Cycloloma Moq. Winged Pigweed

(*cyclos*, a circle, + *loma*, a border, from the encircling calyx wing) Annual herbs. **STEMS** commonly branched and forming rounded clumps. **LEAVES** alternate, sinuate-dentate; herbage more or less pubescent, eglandular. **INFL** a panicle

of interrupted spikes. **FLOWERS** sessile; perianth 5-lobed, stamens 5. **FRUIT** perianth segments with a transverse wing on the back, the wings connate and completely encircling the fruit. **SEEDS** depressed; horizontal. One species native to central North America.

Cycloloma atriplicifolium (Spreng.) J. M. Coult. (leaves resemble *Atriplex*) Winged pigweed. Plants mainly 0.8–5 dm tall (rarely more), divaricately branched, and forming clumps about as broad as tall or broader. **STEMS** striate, loosely and sparingly tomentulose, becoming glabrate. **LEAVES** short-petioled to sessile, the blades 1–8 cm long, 2–15 mm wide, coarsely serrate-dentate, acute apically, cuneate basally. **FLOWERS** perfect and pistillate; sepals 5, keeled, the perianth developing into a horizontal wing; wings white-hyaline, lobed or toothed, 4–5 mm in diameter, often red or purple at maturity; ovary tomentulose; styles 2 or 3. **FRUIT** enclosed in calyx. **SEEDS** about 1.5 mm wide, black, smooth; pericarp not adherent. $2n = 36$. [*Salsola atriplicifolia* Spreng.]. Sandy habitats in blackbrush, mixed desert shrub, and juniper communities. ARIZ: Apa, Nav; NMEX: RAr, SJn; UTAH. 1370–1890 m (4500–6220'). Flowering/Fruit: May–Oct. Manitoba and Indiana, south to Arizona and Texas; adventive in Europe. Hopis used the plant to treat headaches, for fever and rheumatism; the red seeds were used to produce a pink dye. Apaches, Hopis, and Zunis used the seeds in porridge or steamed cakes. The blossoms were chewed and rubbed on the hands for protection against arrows.

Grayia Hook. & Arn. Hopsage

(for Asa Gray) Dioecious or less commonly monoecious shrubs or subshrubs; branches more or less thorny; axillary buds subglobose, prominent. **LEAVES** alternate, entire; herbage pubescent with simple and stellate hairs. **INFL** in terminal and axillary spicate panicles; staminate flowers 2–5 in clusters in bract axils, not separately bracteolate; pistillate flowers 1–several per bract. **FLOWERS** imperfect; staminate flowers with the perianth 4- or 5-lobed, subequal to the 4 or 5 stamens; pistillate flowers often vestigial, each enclosed by 2 connate bracteoles, the more or less accrescent bracteoles obcompressed, the margins thickened and spongy within; stigmas 2. **FRUIT** vertical. One species.

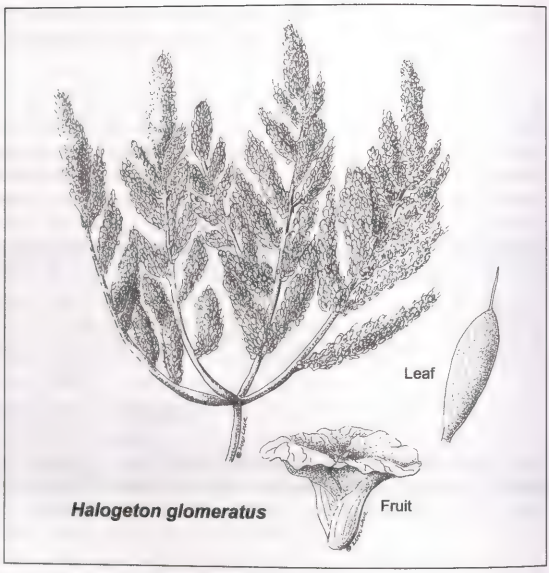
Grayia spinosa (Hook.) Moq. (spiny) Hopsage. Shrubs, mainly 5–12 (15) dm tall; branches gray-brown; branchlets often spinose-persistent, the bark exfoliating in long strips, pubescent with scurfy and stellate hairs when young. **LEAVES** 5–30 mm long (or more), mainly 2–12 mm wide, spatulate to oblanceolate, entire, tapering to a short petiole. **INFL** with pistillate flowers in short spicate inflorescences, the subtending bracts reduced, enclosed by paired, accrescent, obcompressed bracts, orbicular or cordate, the wings thickened and spongy within, 6–15 mm wide, greenish, straw-colored, or suffused with red. **FLOWERS**: staminate with usually 4-lobed perianth, enclosing the 4 stamens, 1.5–2 mm long. $2n = 36$. [*Chenopodium spinosum* Hook.; *Grayia polygaloides* Hook. & Arn.]. Blackbrush, other warm desert shrub, shadscale, horsebrush, rabbitbrush, sagebrush, and piñon-juniper communities. ARIZ: Apa, Coc; COLO: Mon; NMEX: SJn; UTAH. 1130–1790 m (3425–5905'). Flowering/Fruit: Apr–May. Washington to Montana, south to California, Arizona, and New Mexico. This is a valuable browse plant for livestock, especially for sheep. Locally it is called "applebush" because of its palatability. For consideration of relationship to *G. brandegeei* A. Gray, see discussion under *Zuckia*.

Halogeton C. A. Mey. Halogeton

(salt neighbor) Annual herbs. **LEAVES** alternate, fleshy and sausagelike, bearing an apical slender spine. **FLOWERS** perfect or partially pistillate, usually bracteolate; perianth of 5 segments, free nearly to the base, embedded in white hair, the segments gibbous, winged in fruit; stamens 2–5, connate basally into a glandular, hypogynous disc; stigmas 2. **SEEDS** vertical, laterally flattened, adherent to the pericarp. A mostly Mediterranean genus of nine species.

Halogeton glomeratus (M. Bieb.) C. A. Mey. (close together into a head) Halogeton. Plants mainly 3–45 cm tall and as broad, glaucous, usually branched from the base, with curved-ascending branches. **LEAVES** mainly 3–15 mm long and 1–2 mm thick, terete, dilated and semiamplexicaul basally, obtuse and terminating in a deciduous slender spine about 1–1.5 mm long, bearing a tuft of hairs and fascicled leaves in the axils; bracteoles ovate. **FLOWER** perianth segments membranous, ovate to oblong, 1-veined, with lustrous, membranous, fanlike, veiny wings 2–3 mm long and 3–4 mm wide; stamens united into 2 clusters of 2 or 3, with 1 anther per cluster. **FRUIT** oval to obovate, 1.2–1.8 mm long, with an erect cusp on 1 or both sides. $2n = 18$. [*Anabasis glomerata* M. Bieb.]. Mainly in disturbed sites in cheatgrass, Russian thistle, saltgrass, mixed desert shrub, salt desert shrub, and piñon-juniper communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1220–1985 m (4025–6550'). Flowering/Fruit: Jul–Sep. Widely distributed in the western United States; adventive from Eurasia. This plant was introduced into northern Nevada in the early 1930s (first collected in 1934), possibly for use in grazing experiments. It spread quickly into the lower-elevation desert grazing lands of Nevada and western Utah, and subsequently into eastern Utah and other states. The plant is rich in oxalates

and poses a serious threat to grazing animals, especially to sheep, which have suffered thousands of death losses for several decades. As many as 1250 sheep of a herd of 1500 succumbed following ingestion of this plant in Antelope Valley, Millard County, Utah, in the 1970s.



Krascheninnikovia Gueldenst.
Winterfat

(for S. P. Krascheninnikov, Russian botanist of the 18th century) Monoecious tomentose shrubs. **LEAVES** alternate, entire. **FLOWERS**: staminate ebracteate, with calyx 4-lobed; stamens 4; pistillate lacking a perianth, enclosed in 2 villous-pilose, partially connate bracteoles, the tips divergent and hornlike; styles 2, slender. **FRUIT** with pericarp thin, free from the seed. [*Eurotia* Adans. in 1768 and *Ceratoides* Gagnebin in 1772, both misapplied] (Howell 1971). About eight species of the northern Mediterranean, temperate Asia, and western North America.

Krascheninnikovia lanata (Pursh) A. Meeuse & A. Smit (with woolly hairs) Winterfat, white-sage, eurotia. Shrubs, woody for 0.2–8 dm aboveground (or more), and with numerous annual branchlets mainly 0.5–3 (5) dm long; herbage stellate-hairy, commonly with longer straight hairs intermixed, the hairs white or becoming yellowish in age. **LEAVES** 1–4.5 cm long, 1–6.5 mm wide, linear to narrowly lanceolate, entire, revolute to almost flat, sessile above, short-petiolate below. **INFL** borne in dense axillary clusters or more or less spicate along branch tips; pistillate flowers 2–4 per axil; staminate flowers in spicate axillary clusters. **FLOWERS**: staminate with perianth segments 1.5–2 mm long; fruiting bracts 3–6 mm long, obscured by the long covering hair. $2n = 18$. [*Diotis lanata* Pursh; *Eurotia lanata* (Pursh) Moq.; *Ceratoides lanata* (Pursh) J. T. Howell]. Shadscale, black sagebrush, sagebrush, and piñon-juniper communities. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1550–2840 m (5115–9370'). Flowering/Fruit: Jun–Oct. Yukon to Saskatchewan, south to California, New Mexico, and Texas. Name changes for this common and widespread American species can be traced to interpretations of the International Code of Botanical Nomenclature, whose rules are finally, and reluctantly, bowed to by this botanist. Apologies are owed to all those who have to learn the impossibly long and difficult name dictated by stipulations of the Code. This is an instance where common names have greater staying power than the scientific ones, but the search for stability in nomenclature continues. Cold infusion of plant taken by Ramah Navajos as an antidote for *Datura* poisoning. Chewed leaves used for poison ivy rash. Plant is a "Life Medicine" and a major forage plant for sheep. Also used in the sweathouse for Mountain Chant. Used by Hopis in ceremonials to produce steam. Zunis made a poultice of ground roots for burns.

Monolepis Schrad. Poverty-weed

(single scale) Annual, polygamo-monoecious herbs. **LEAVES** simple, hastately lobed or entire, alternate, mealy to subglabrous, fleshy. **INFL** borne in axillary clusters. **FLOWERS** unisexual, inconspicuous; perianth consisting of 1 bract-like scale (rarely 2 or 3, or lacking), not enclosing the fruit; stigmas 2. **FRUIT** with pericarp reticulately patterned or warty, adherent to the erect seed. Three species of western North America.

Monolepis nuttalliana (Schult.) Greene (for Thomas Nuttall, Harvard botanist) Poverty-weed. Plants mainly 4–30 cm tall. **STEMS** prostrate or ascending to erect, simple or much-branched from the base, mealy to subglabrous; leaves 5–50 mm long, the blades 1–15 mm wide, lanceolate to elliptic or oblong, with 1 pair of lateral lobes near the middle, reduced upward and sometimes entire, the petiole 1–20 mm long. **INFL** borne in dense, sessile, axillary clusters. **FLOWER** perianth segments 1–2 mm long, more or less acute apically; pericarp pitted, usually pale. **FRUIT** 0.9–1.5 mm broad. $2n = 18$. [*Blitum nuttallianum* Schult., based on *B. chenopodioides* L.; *Monolepis chenopodioides* Moq.]. Pioneer plant of open sites in blackbrush, shadscale, mat saltbush, sagebrush, piñon-juniper, mountain brush, ponderosa pine,

Douglas-fir, and aspen communities. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1515–2550 m (5000–8415′). Flowering/Fruit: Apr–Jul. Alaska and Yukon to California and New Mexico, east to Manitoba and Missouri. The plants are often anthocyanic in whole or in part, even when very young. Plant used by Ramah Navajos as a ceremonial emetic, poultice for skin abrasions, and as a hunting medicine. Hopis used the seeds to make mush. Navajos used the plants as sheep fodder.

Salicornia L. Pickleweed

(*sal*, salt, + *cornu*, horn) Annual herbs from taproots. **LEAVES** simple, scalelike, opposite, connate, glabrous. **INFL** with flowers in opposite groups of 3, sunken in depressions of thickened, terminal spikes. **FLOWERS** perfect, borne sessile; subtended by scalelike bracts; perianth consisting of 4 connate segments free at the tip around a slitlike opening; stigmas commonly 2. **FRUIT** with perianth enclosing; pericarp thin, free from the erect, retrorsely pubescent seed. About 13 species worldwide.

Salicornia europaea L. (Europe) Annual samphire. Plants annual, mainly 9–30 cm tall, from slender taproots. **STEMS** fleshy, erect or ascending, commonly branched, often reddish at maturity. **LEAVES** scalelike, often with a scarious margin; spikes 0.5–5 cm long, 2–3 mm thick, the joints 2–4 mm long. **INFL** with central flowers much above the lateral ones. **FRUIT** dehiscent, the seeds falling separately. $2n = 18, 36$. [*Salicornia rubra* A. Nelson; *S. europaea* L. subsp. *rubra* (A. Nelson) Breitung; *S. rubra* var. *prona* Lunell; *S. europaea* var. *prona* (Lunell) B. Boivin]. Saline, typically fine-textured substrates in salt marsh, seepweed, poverty weed, alkali sacaton, and saltgrass communities. COLO: Mon. 2000 m (6600′). Flowering/Fruit: Jul–Sep. Widespread in North America and Eurasia. Our specimens are supposed to differ from the more coastal ones in having slender spikes with joints about as thick as long, but no such correlation is apparent. Recognition of our material at infraspecific level seems moot.

Salsola L. Tumbleweed

(an Arabic name) Annual herbs. **LEAVES** alternate, entire, commonly spinulose. **INFL** spicate; solitary or clustered in axils of spiny bracts, each with 2 smaller bracteoles. **FLOWERS** perfect, 5-merous; stamens 5, usually inserted at the margin of a lobed disc; styles 2 or 3. **FRUIT** closely enveloped in the persistent calyx; fruiting perianth with winglike, mostly horizontally spreading ridges. **SEEDS** horizontal to oblique (Beatley 1973). About 100 species worldwide of maritime and other saline habitats.

1. Bracts appressed and imbricate along slender inflorescence branches, gradually attenuate to the subulate, spinulose apex; spikes rather dense, continuous; perianth segments wingless or the wing narrow and erose; stems usually erect ..... ***S. collina***

1′ Bracts reflexed, not imbricate when mature, usually rather abruptly narrowed to the spinose or mucronulate apex; spikes interrupted at maturity, at least in the lower portion; perianth segments winged; stems erect or ascending ..... ***S. tragus***

Salsola collina Pall. (found on a hill) Pallas' tumbleweed. **STEMS** simple or much-branched, forming rounded clumps that tumble freely when mature; green or streaked with red, glabrous or somewhat hirsute. **LEAVES** mainly 2–6 cm long and about 1 mm wide, narrowly linear to filiform, modified upward as spinescent bracts with expanded bases and scarious margins. **INFL** elongate-spicate, mainly 15–40 cm long, the tip frequently nodding. **FLOWER** bracts ovate, 4–8 mm long, appressed, the apex straight or slightly recurved, weakly spinose, the margins entire to crenulate, the bracteoles somewhat shorter and narrower; perianth segments 2.5–3.5 mm long, ovate to oval below the somewhat inconspicuous protuberance, above the protuberance ovate to narrowly deltoid, the apex acute, the margins entire to crenulate; stamens included to exserted, the anthers about 0.6 mm long. **FRUIT** ovoid and horizontally ridged at the apex, 1.5–2.5 mm in diameter. **SEEDS** blackish, shiny, cochleate, about 1.5 mm wide, smooth. $n = 9$. Weedy areas with cockleburs, chenopods, and sunflowers. COLO: Arc, LPl; NMEX: SJn. 1875–1985 m (6190–6550′). Flowering/Fruit: Jun–Sep. Rather widespread in North America; adventive from Asia.

Salsola tragus L. (goat) Russian-thistle, tumbleweed. **STEMS** simple or freely branched, clump-forming, taller than wide to wider than tall, 1–15 dm tall and wide or even larger; with red-purple, longitudinal striations, glabrous or pubescent. **LEAVES** mainly 1.5–4 (6) cm long, 0.3–0.8 mm wide, narrowly linear or filiform, spinulose apically, modified upward as spinescent bracts with expanded bases and scarious margins. **INFL** short-spicate, mainly 1–10 cm long. **FLOWER** bracts spreading and often recurved, ovate to narrowly deltoid, 3–8 mm long, glabrous or pubescent basally, strongly spinose apically; perianth segments distinct, 2.5–3.5 mm long, ovate to oval or oblong below the median protuberance, above the protuberance narrowly deltoid, acute apically, entire to crenulate, membranous in anthesis,

in fruit becoming transversely winged, the wings mainly 1–2 mm long. **SEEDS** horizontal, blackish, shiny, about 1.5 mm wide, smooth. $n = 18, 36$. |*Salsola pestifer* A. Nelson; *S. iberica* Sennen & Pau; *S. kali* L.|. Weedy species of disturbed habitats. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1060–2380 m (3500–7855'). Flowering/Fruit: Jun–Oct. Widespread in North America; adventive from Asia. Russian thistle was first introduced with flaxseed from Russia into South Dakota circa 1873. In the following few decades it spread over the American West. This Russian thistle species forms intermediates with *S. paulsenii* Litv., which differs in largely intangible ways, i.e., in three of the perianth segments being attenuate into spinose tips and forming a column at maturity. In specimens examined the spinose development is one of degree and is not absolute. Nevertheless, I have been unable to discern specimens of *S. paulsenii* from the Four Corners region. Russian thistle is indeed a pestiferous weed that grows vigorously in dryland grain fields and elsewhere. The rounded dead plants with their interlaced branches blow in the wind and stack against fences, fill ravines, clog irrigation ditches, and are generally a nuisance. However, it produces considerable biomass on arid rangelands and is eaten by livestock in winter, especially when wet following a storm. Some livestock operators consider it as security for their livestock when other more palatable plants are not available. Chewed plants used as a poultice for bee and ant stings by Navajos; ashes also used internally and externally for smallpox. Roasted seeds and young sprouts used as food or for horse feed.

Sarcobatus Nees Greasewood

(fleshy bush) Thorny shrubs. **LEAVES** mostly alternate, linear, fleshy, sessile. **INFL** borne in axillary spikes. **FLOWERS** imperfect, the staminate ones spirally arranged, ebracteate, and lacking a perianth; stamens 2 or 3, borne beneath stalked peltate scales; pistillate flowers sessile, 1 or 2, in the axils of scarcely reduced leaflike bracts, the pistil surrounded by a cuplike, shallowly lobed to subentire perianth. **FRUIT** with perianth accrescent and adherent to the fruit base, its upper portion flaring to form a broad, winglike border. **SEEDS** erect, flattened, orbicular. One species in western North America.

Sarcobatus vermiculatus (Hook.) Torr. (worm-eaten) Greasewood. Shrubs, mainly 10–20 dm tall or more; branches rigid, spreading, often modified as thorns. **LEAVES** 0.3–4.5 cm long, 1–3 mm wide, semicylindric, linear. **INFL** with staminate spikes catkinlike, 1–4 cm long; pistillate flowers fewer than the staminate ones. **FLOWERS**: pistillate with the perianth about 1 mm long; calyx wing 2–6 mm long. **FRUIT** 4–5 mm long, cup-shaped below the wing. **SEEDS** brown, about 2 mm long. $n = 18$. |*Batis vermiculata* Hook.; *Fremontia vermiculata* (Hook.) Torr.|. Greasewood, seepweed, saltbush, and other plant communities of saline substrates. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1325–1960 m (4350–6470'). Flowering/Fruit: May–Sep. Washington and Alberta to North Dakota, south to California, Arizona, New Mexico, and Texas. Four Corners plants are referable to **var. *vermiculatus***. The plant is characteristic of fine-textured saline valley bottoms and slopes through much of the American West. This is an important browse species for cattle and sheep, even though potentially poisonous due to oxalate salts of sodium and potassium, and oxalic acid. The wood is tough and durable and was used both as tools and as firewood by prehistoric Indians. Hopis use the plant as kiva fuel because it gives a sparkling fire; also used to make furniture and clothes hooks. Used by Navajos for insect bites and by Paiutes as an antidiarrheal. Wood used for cooking tools by many tribes.

Suaeda Forssk. ex Scop Sea Blite, Seepweed

(an Arabic name) Annual or perennial herbs or shrubs. **LEAVES** alternate, entire, terete or flattened, often succulent. **INFL** solitary or clustered in leaf axils. **FLOWERS** inconspicuous, mostly perfect, bracteate; calyx 5-lobed, fleshy, the lobes equal and unappendaged or unequal and some more or less corniculately appendaged; stamens 5, the filaments short; ovary subglobose or depressed. **SEEDS** horizontal or vertical. One hundred fifteen species worldwide in saline and alkaline soils.

1. Plants suffrutescent or definitely shrubby; leaves abruptly short-petiolate; calyx lobes equal, not appendaged, smooth dorsally; herbage glabrous or puberulent; seeds vertical or horizontal ..... (2)
1' Plants annual; leaves sessile; calyx lobes unequal in fruit, horned; herbage glabrous; seeds horizontal ..... (3)

2. Leaves 10–30 mm long; glaucous ..... ***S. moquinii***
2' Leaves 3–5 mm long; rarely glaucous ..... ***S. nigra***

3. Plants often over 3 dm tall, erect, not clump-forming, the branches stiffly erect-ascending; flowers mostly 3–7 per axil ..... ***S. calceoliformis***
3' Plants mainly 0.5–3 dm tall, forming depressed rounded clumps, the branches spreading, more or less flexuous; flowers 1–3 per axil ..... ***S. occidentalis***

Suaeda calceoliformis (Hook.) Moq. (like a little shoe) Broom seepweed. Plants glabrous, often glaucous, erect, simple or with erect-ascending branches and broomlike, 1–5 (8) dm tall. **LEAVES** mainly 1–4 cm long, 1–2 mm wide, linear or tapering from base to apex, semiterete, intergrading with floral bracts upward. **INFL** spikes slender; flowers sessile, mostly in clusters of 3–7. **FLOWERS** with calyx lobes unequal, about 1.5 mm long, at least some conspicuously horned. **FRUIT** horizontal. **SEEDS** smooth, 1–1.5 mm wide, dark brown. $2n = 54$. [*Chenopodium calceoliforme* Hook.; *Suaeda depressa* (Pursh) S. Watson; *S. depressa* (Pursh) S. Watson var. *erecta* S. Watson]. Saline palustrine or riparian sites in saltgrass, greasewood, seepweed, alkali sacaton, and cattail-sedge communities. ARIZ: Apa, Nav; COLO: LPl; NMEX: McK, RAr, SJn. 1420–2260 m (4680–7460'). Flowering/Fruit: Aug–Oct. British Columbia to Saskatchewan, south to California, Arizona, New Mexico, and Texas. Seeds were eaten as food by Paiutes.

Suaeda moquinii (Torr.) Greene (for C. Moquin-Tandon, a French chenopod expert) Bush seepweed. Subshrub or shrub up to 15 dm tall, glabrous or hairy, glaucous. **STEMS** spreading or erect, the base usually woody, yellow-brown; branches spreading. **LEAVES** ascending or widely spreading, petiole 1 mm; blade 10–30 mm, subcylindric to flat, linear to narrowly lanceolate. **INFL** open; clusters confined to the upper stems, 1–12 per cluster, bracts usually shorter than the leaves. **FLOWERS** bisexual or lateral pistillate; calyx lobes rounded; stigmas 3. **SEEDS** horizontal or vertical, 0.5–1 mm, shiny, black. [*Suaeda torreyana* S. Watson incl. var. *ramosissima* (Standl.) Munz; *S. fruticosa* Forssk. ex J. F. Gmel.]. Alkaline and saline places. COLO: LPl, Mon; NMEX: RAr. 1780–1980 m (5800–6535'). Flowering/Fruit: Aug–Oct. Western Canada south to Texas and Mexico. Hopis used a poultice of dry leaves on sores and as a medicinal bath. Kayenta Navajos used the plant for bleeding bowels and Paiutes used it for chicken pox. Navajos boiled the seeds into a gruel.

Suaeda nigra (Raf.) J. F. Macbr. (black, dark) Torrey's seepweed. Plants glabrous or pubescent, sometimes glaucous, suffrutescent or definitely shrubby, 1–12 (15) dm tall or more and as broad or broader, with slender ascending to spreading branches. **LEAVES** 0.5–3.5 cm long, 1–3 mm thick, subterete to flattened, abruptly short-petiolate, intergrading with floral bracts upward. **INFL** with flowers 1–8 or more per axil. **FLOWER** calyx lobes equal, about 1.5–2 mm long, the lobes merely rounded dorsally, not horned or tuberculate. **FRUIT** horizontal or vertical. **SEEDS** 0.8–1.2 mm wide, black, shiny. $n = 9, 18$. [*Chenopodium nigrum* Raf.; *Suaeda intermedia* S. Watson; *S. nigrescens* I. M. Johnst.; *S. suffrutescens* S. Watson; *S. torreyana* S. Watson]. Greasewood, seepweed, saltgrass, and other salt desert shrub communities, often in riparian or palustrine habitats. ARIZ: Apa, Nav; COLO: Mon; NMEX: RAr, SJn; UTAH. 1320–2075 m (4350–6850'). Flowering/Fruit: Jun–Oct. California, Nevada, Wyoming, Arizona, and Mexico.

Suaeda occidentalis (S. Watson) S. Watson (western) Western seepweed. Plants glabrous, often glaucous, forming depressed rounded clumps, not broomlike, but sometimes slender and more or less unbranched, mainly 0.5–3 dm tall. **LEAVES** mostly 0.5–2 (3) cm long, linear-oblong, semicylindric, intergrading with floral bracts upward. **INFL** a slender spike, mostly 1–3 flowers per cluster. **FLOWER** calyx lobes unequal, about 1.5 mm long, at least some conspicuously horned. **FRUIT** horizontal. **SEEDS** smooth, 1–1.5 mm wide, dark brown. [*Schoberia occidentalis* S. Watson]. Saline palustrine or riparian habitats in greasewood, saltgrass, seepweed, and other such communities. ARIZ: Apa, Nav; NMEX: McK. 1985–2220 m (6550–7320'). Flowering/Fruit: Jun–Sep. Washington to Wyoming, south to Nevada, Utah, and Colorado.

Suckleya A. Gray Suckleya

(for Dr. George Suckley, surgeon and naturalist) Monoecious annual. **STEMS** prostrate or ascending, branched, terete, not jointed, unarmed, not fleshy. **LEAVES** alternate, long-petiolate, the blade rhombic-obovate to suborbicular or flabellate, abruptly short-cuneate, repand-dentate, the apex rounded or acute, sparingly scurfy. **INFL** borne in axillary clusters of nearly all leaves. **FLOWERS** small, inconspicuous; staminate flowers with 4-parted calyx, stamens usually 4; pistillate flowers with perianth segments becoming connate and 4-lobed; pistil enclosed by enlarged, obcompressed perianth; stigmas 2. **FRUIT** with pericarp free. **SEEDS** vertical, brown at maturity. A genus of a single species in the Rocky Mountain reigon.

Suckleya suckleyana (Torr.) Rydb. Poison suckleya. **STEMS** stout, terete, much-branched, 2–5 dm long, prostrate or ascending, sparsely scurfy or glabrate. **LEAVES** numerous, the petioles equaling or exceeding the blades, the blades suborbicular to rhombic or rhombic-ovate, 1–2.5 cm long, rounded at the apex, abruptly short-cuneate at the base, repand-dentate with short, triangular, acute or obtuse teeth, green, sparsely scurfy when young, soon glabrate. **INFL** with flowers in dense clusters in the axils of nearly all the leaves, the staminate in the upper axils. **FRUIT** bracteoles ovate-rhombic, often subhastate, 5–6 mm long, dorsiventrally 4-ribbed, laterally 2-winged, bidentate at the apex, glabrous or nearly so, green. **SEEDS** filling the cavity, ovate, about 3–3.3 mm long, reddish brown, the radicle superior.

[*Atriplex suckleyana* (Torr.) S. Watson; *Obione suckleyana* Torr.; *Suckleya petiolaris* A. Gray]. Around drying pond margins and on dry lake beds with ruderal plants. NMEX: McK, RAr, San, SJn. 1650–2230 m (5445–7360'). Flowering/Fruit: Jun–Sep. Montana south to Colorado and Texas. The genus *Suckleya* was early treated within *Atriplex*, but the obcompressed completely connate fruiting bracteoles (or connate subligneous perianth parts) are quite unlike anything in *Atriplex*, and the plants have long been recognized within a stand-alone genus.

Zuckia Standl. Siltbush

(for Ethyl Zuck, a collector of *Zuckia*) Dioecious or less commonly monoecious shrubs or subshrubs; branches not thorny; axillary buds subglobose, prominent. **LEAVES** alternate, entire or more or less lobed; herbage more or less scurfy. **INFL** with staminate flowers 2–5 in clusters in bract axils, not separately bracteolate; pistillate flowers 1 to several per bract, often some vestigial. **FLOWERS**: staminate with perianth 4- or 5-lobed, subequal to the 4 or 5 stamens; pistillate each enclosed by 2 bracteoles, these dorsiventrally flattened and unequally 6-keeled or obcompressed and thin-margined, often subtended by a single filiform bractlet; stigmas 2. **FRUIT** vertical or horizontal.

Zuckia brandegeei (A. Gray) S. L. Welsh & Stutz (for Townshend S. Brandegee, botanist and civil engineer) Siltbush. Plants mainly 1–5 dm tall; branching from a persistent woody base about 0.5–2 dm tall. **STEMS** erect or ascending; herbage more or less scurfy and less commonly with some moniliform hairs in the inflorescence. **LEAVES** subsessile or tapering to a short petiole, 13–80 mm long, 15–42 mm wide, linear or narrowly oblanceolate-spatulate to elliptic, ovate, obovate, or orbicular, entire or rarely hastately lobed. **FLOWERS**: staminate with a 4- or 5-lobed stramineous perianth, cleft to the middle or below, about 1.5–1.8 mm long; pistillate flower bracts obcompressed or dorsiventrally compressed. **FRUIT** bracts vertical or horizontal, respectively, but not exclusively, when mature either flattened and 4–8 mm wide or 6-keeled (with 4 small and 2 large keels) and 2–4 (5) mm wide; fruit included within the bracts. $2n$ = 36. [*Grayia brandegeei* A. Gray]. Bract and bud differences in *Zuckia* are correlated, apparently, with the C_3 type of photosynthesis and its attendant foliar morphology, while the shrubby atriplexes have the C_4 type of photosynthesis with its Kranz-type morphology.

1. Leaves mainly less than 6 mm broad.....**var. *brandegeei***
1' Leaves mainly over 6 mm broad (to 25 mm or more).....**var. *plummeri***

var. *brandegeei* $2n$ = 18. Fine-textured, often saline and seleniferous substrates on the Jurassic Morrison, Triassic Chinle, and Permian Cutler formations (and probably others). ARIZ: Apa, Nav; COLO: Mon; UTAH. 1250–2210 m (4125–7295'). Flowering/Fruit: May–Oct. Utah, Colorado, and Arizona.

var. *plummeri* (Stutz & S. C. Sand.) Dorn (for Perry Plummer, longtime Utah botanist with the intermountain Forest Service) Plummer's siltbush. $2n$ = 36. [*Grayia brandegeei* var. *plummeri* Stutz & S. C. Sand. Fine-textured, often saline and seleniferous substrates on Mancos Shale Formation. ARIZ: Coc; NMEX: SJn. 1635–1705 m (5400–5630'). Flowering/Fruit: May–Sep. New Mexico, Wyoming, and Colorado.

CLEOMACEAE Bercht. & J. Presl CLEOME FAMILY

Steve L. O'Kane, Jr.

Annual to rarely perennial in our flora, ill-smelling herbs. **LEAVES** stipulate, alternate, palmately compound; leaflets 3 to 7, rarely simple above. **INFL** a bracteate raceme. **FLOWERS** actinomorphic or zygomorphic by displacement of petals to one side, perfect; sepals 4, free; petals 4, free, ± clawed; stamens typically 6 but up to 20 in *Polanisia*; pistil 1, 2-carpellate; ovary superior, with a replum (but no false septum as in Brassicaceae), stipitate on an elongated gynophore or subsessile, locule 1, placentae 2, parietal, style 1, stigma 2-lobed. **FRUIT** a 2-valved septicidal capsule or didymous and forming a pair of 1–3-seeded nutlets. x = 8–17 (Ernst 1963; Iltis 1957, 1958). Thirty-seven to 50 genera, 800–900 species. Worldwide in tropical and subtropical regions, with few species in warm-temperate, primarily arid regions. Many members of the family have an unpleasant odor, hence common names like stinkflower, stinkweed, and skunkweed. Clammyweed is another common name, referring to the sticky stems and foliage of some species. Cleomaceae is here recognized as distinct from Capparaceae, which lacks a replum and has a woody habit (Hall, Sytsma, and Iltis 2002).

1. Stamens 8–20; plants sticky, glandular-puberulent; petals white to cream; ovary subsessile.....***Polanisia***
1' Stamens 6; plants glabrous or at least not glandular; petals colored, not or very rarely white or cream; ovary stipitate.....(2)

2. Fruit didymous, indehiscent, forming 2 nutlets ..... ***Wislizenia***
2' Fruit a dehiscent capsule ..... (3)

3. Fruit short and broad, as wide as long or wider, 2–12-seeded, not constricted between the seeds ..... ***Cleomella***
3' Fruit clearly longer than broad, many-seeded, somewhat constricted between the seeds ..... ***Cleome***

Cleome L. Beeplant, Spiderplant, Waa' (Navajo), Tu'mi (Hopi)

(derivation obscure, an early European name for a mustardlike plant) **LEAVES** palmately compound, leaflets 3–7. **FLOWERS** zygomorphic but occasionally appearing actinomorphic, petals yellow or pink to pinkish purple (rarely white in a few); stamens 6; ovary stipitate with a basal gland. **FRUIT** a capsule, longer than wide, linear to oblong, spreading or pendulous, somewhat constricted between the seeds. **SEEDS** many. Mostly tropical and subtropical America and Africa. One hundred fifty to 200 species primarily in warm tropical areas.

1. Petals yellow; leaflets 3–7 ..... ***C. lutea***
1' Petals pink to purplish (rarely white); leaflets 3 ..... ***C. serrulata***

Cleome lutea Hook. (yellow) Yellow beeplant, waa' (Navajo). Plants erect, herbage glabrous or slightly hairy. **STEMS** mainly 3–15 dm tall, branched or simple. **LEAFLETS** 3–5 (7), oblong to lanceolate or elliptic, 0.8–5 cm long, 2–10 mm wide. **INFL** 2–10 cm long. **FLOWERS** with pedicels 3–10 mm long; sepals and petals yellow; stamens yellow. **FRUIT** 1–3 (4) cm long, surface striate, spreading, on stipes 6–12 mm long. $2n = 32, 34$. [*Peritoma lutea* (Hook.) Raf.] Clay flats, desert scrub, piñon-juniper to ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: SJn; UTAH. 900–2400 m (2950–7900'). Flowering: May–Jul. Washington to Nebraska, south to California and New Mexico. The seeds were used as a food source prior to the introduction of the Spanish horse (Ute Mountain Ute).

Cleome serrulata Pursh (saw, referring to the minutely serrulate sepals) Rocky Mountain beeplant, Rocky Mountain beeweed, blue Colorado beeplant, spiderplant, clammyweed, stinkflower, stinkweed, guaco, waa' (Navajo). Plants erect, herbage glabrous or slightly hairy. **STEMS** mainly 3–20 dm tall or more, simple or branched above. **LEAFLETS** 3, lanceolate, elliptic, or oblanceolate, 1.5–7 cm long, 4–14 mm wide, entire. **INFL** 5–25 cm long or more. **FLOWERS** with pedicels 12–23 mm long; petals lavender; sepals purple to green; stamens with purple filaments. **FRUIT** 2.5–7 cm long, surface smooth, descending to pendulous, on stipes 1–25 mm long. $2n = 32, 34, 60$. [*C. inornata* Greene; *C. integrifolia* Torr. & A. Gray; *C. serrulata* var. *angusta* Tidestr.; *C. serrulata* forma *inornata* (Greene) W. A. Weber; *Peritoma inornata* Greene; *P. serrulata* (Pursh) DC.]. Disturbed sites and often along roads and stream banks. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 900–2800 m (2950–9200'). Flowering: May–Aug. Washington to Saskatchewan, south to California and Arizona. Young plants used among the Navajo as a potherb (its foul odor dissipates upon cooking); seeds ground for meal when mixed with corn; plants used in making prayer-sticks (paho) for the Powamu ceremony (Hopi). Boiled stems produce an important yellow dye used in Anasazi pottery. This dye, when mixed with other ingredients, produces a permanent black color when the pots are fired. The plant is also reported as a treatment for stomach disorders, fever, and worms, and as a general tonic.

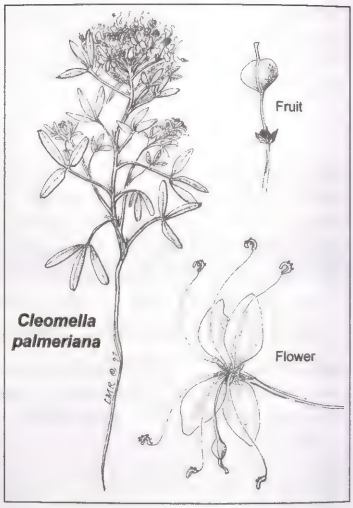
Cleomella DC. Stinkweed, Cleomella

(diminutive of *Cleome*) Plants generally ascending to erect, usually branched from the base, glabrous, often red-tinged. **STEMS** 6–30 cm tall. **LEAVES** palmately compound, leaflets 3. **FLOWERS** actinomorphic, petals yellow to yellow-orange, upper 2 often recurved, stamens 6, anthers coiled when dry, ovary stipitate. **FRUIT** obdeltoid, rhomboidal, deltoid, or ovoid, usually wider than long, seeds 2–12 (Payson 1922). Ten species limited to arid Mexico and the southwestern United States.

1. Leaflets about 3.5 times longer than wide (2–7 mm wide); foliage bracts reduced to setae ..... ***C. palmeriana***
1' Leaflets about 5.5 times longer than wide (1–3 mm wide); foliage bracts linear to 3-foliate ..... ***C. plocasperma***

Cleomella palmeriana M. E. Jones (for Civil War general William J. Palmer) Palmer cleomella. Plants erect-ascending. **STEMS** branching from the base, 6–30 cm tall. **LEAFLETS** 9–20 mm long, 2–9 mm wide, elliptic to oblong or lance-oblong; upper bracts reduced to setae. **FLOWERS** on pedicels 5–6 mm long; sepals acute; petals 3–4 mm long and tipped with red in bud; filaments to about twice as long as petals. **FRUIT** obtuse apically, base triangular-acute, 2–5 mm long and 5–9 mm wide on an often recurved stipe 3–7 mm long. **SEEDS** few to several. [*C. nana* Eastw.; *C. cornuta* Rydb.; *C. montrosae* Payson; *C. oöcarpa* A. Gray]. Mancos Shale in desert shrub communities. ARIZ: Apa; COLO: Mon; NMEX: SJn. 1200–1850 m (3900–6100'). Flowering: May–Jul. A Colorado Plateau endemic limited to the Four Corners

region except for var. *goodrichii* Welsh with conspicuously horned fruits which is endemic to the Uinta Basin. Our plants are **var. *palmeriana***.



Cleomella plocasperma S. Watson (twisted seed, referring to the odd-shaped fruits) Watson's cleomella. Plants erect-ascending. **STEMS** several, diffuse, generally branching from upper nodes, 15–40 cm tall. **LEAFLETS** 7–18 mm long, 1– 3 mm wide, linear to narrowly oblong; bracts linear or lowermost 3-foliate. **FLOWERS** on pedicels 9–15 mm long; sepals lanceolate, 0.9–2.2 mm long; petals 3–5 mm long. **FRUIT** ovoid, rhomboidal, or obovoid, 1.5–3 mm long and 3–6 mm wide on a stipe 2–7 mm long. **SEEDS** several. Moist or seasonally moist saline-alkaline areas with saltgrass and other salt-tolerant species. ARIZ: Apa; COLO: Mon; UTAH. 1400–1525 m (4670–5000'). Flowering: Jun–Aug. Mostly limited to the Great Basin in Utah, Oregon, Idaho, and California; apparently disjunct in our area.

Polanisia Raf. Clammyweed

(Greek *polys*, many, + *anisos*, unequal, referring to the many unequal stamens) Plants viscid-puberulent and strongly rank-smelling. **LEAVES** palmately compound, leaflets 3. **INFL** a dense terminal raceme. **FLOWERS** zygomorphic, petals white, stamens 8–20, long-exserted, purple, and unequal. **FRUIT** capsular, elongate, erect, subsessile, glandular, somewhat flattened, valves persistent and dehiscing apically, seeds many (Iltis 1954, 1958, 1966). Four to six species limited to North America.

Polanisia dodecandra (L.) DC. (12 men, referring to 12 stamens) Clammyweed. Plants glabrous. **STEMS** 1.5–8 dm tall. **LEAFLETS** 0.8–4.5 cm long, 3–18 mm wide, obovate to oblanceolate or elliptic. **FLOWERS** on pedicels 10–21 mm long; sepals purplish; petals white to cream, emarginate; stamens with filaments purple, long-exserted. [*P. graveolens* Raf.; *P. trachysperma* Torr. & A. Gray; *P. uniglandulosa* DC.]. Desert shrub and juniper communities, often in wash bottoms and often growing on soil derived from Mancos Shale. COLO: Arc; NMEX: SJn. 1060–2000 m (3480–6560'). Flowering: May–Oct. British Columbia east to South Dakota, south to Texas and Mexico and west to California. Our plants belong to **var. *trachysperma*** (Torr. & A. Gray) H. H. Iltis.

Wislizenia Engelm. Jackass-clover

(named for Friedrich Adolph Wislizenus, 19th-century naturalist-physician and plant collector) (Keller 1979). A genus of one species.

Wislizenia refracta Engelm. (bent abruptly backward, referring to the reflexed stalk of the fruits) Jackass-clover. Plants annual or perennial, glabrous to puberulent. **STEMS** branched from the base, 0.5–24 dm tall. **LEAVES** palmately compound with usually 3 leaflets, petiole 3–25 mm long. **INFL** a dense, terminal raceme up to 20 cm in fruit. **FLOWERS** actinomorphic; pedicels 5–10 mm long; sepals about 2 mm long, green; petals elliptic, yellow, tapered to the base; stamens 8–14 mm long, yellow; ovary of 2 nearly separate lobes, each usually with 1 ovule. **FRUIT** of 2 nutlets with deciduous valves on a reflexed, stalklike receptacle. **SEEDS** usually 1 per nutlet. $2n = 40$. Alkaline soils in valleys and washes. ARIZ: Nav; UTAH. Up to 2000 m (6560'). Flowering: May–Jun. California to Texas and northwest Mexico. Plants are reported to be toxic to humans but in California are considered an important honey plant. Our plants belong to **var. *refracta***.

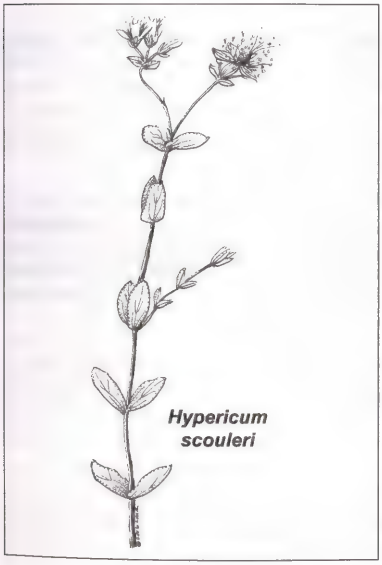
CLUSIACEAE Lindl. ROSE APPLE, ST. JOHNSWORT FAMILY

(GUTTIFERAE, HYPERICACEAE)

Linda Mary Reeves

Primarily trees and shrubs, some epiphytic; most green plant parts produce glandular secretions in canals. **LEAVES** usually opposite, without stipules, entire, sometimes fleshy, as in *Clusia*. **INFL** a cyme or thyrse. **FLOWERS** perfect or imperfect and dioecious; perianth in 4–5 parts, sepals and petals usually distinct, sometimes fleshy; petals often contorted when in bud; androecium, when present, of 2 whorls, each with 5 stamen bundles, filaments free nearly to base, the outer whorl often sterile or absent, inner whorl always fertile, except in imperfect female flowers; stamens may be

variously modified by fusion or reduction, such as reduction of a stamen bundle to a single stamen; ovary superior and of 2–13, usually 3–5, united carpels and many locules; ovules 1 to many per locule; placentation axile or parietal; styles free, united, or lacking. **FRUIT** usually a capsule, but sometimes a fleshy berry or drupe. **SEEDS** often with an aril or wing. $x = 7, 8, 9, 10$. About 50 genera with about 1000 species worldwide, primarily tropical and subtropical. The Clusiaceae contains many economically useful plants, such as timber sources (*Cratoxylum*, *Mesua*, etc.), gums and resins (*Clusia*, *Garcinia*), drugs (*Hypericum*), and fruits such as mangosteen (*Garcinia mangostana*) and mammey apple (*Mammea americana*). *Hypericum anagalloides*, a small, peach-flowered herb, is known from Arizona and should be searched for in our area.



Hypericum L. St. Johnswort

(Greek name for St. Johnswort) Perennial glabrous herbs or shrubs. **LEAVES** opposite; simple; sessile; entire; glandular-punctate. **INFL** a cyme or solitary flower. **FLOWERS** perfect; actinomorphic; perianth 5-merous; corolla yellow, pinkish, reddish, or purplish; stamens numerous, clustered in 3–5 fascicles, filaments elongate; ovary 3-loculed, stigmas minute. **FRUIT** a capsule or berry, many-seeded. **SEEDS** short-cylindric, reticulate. About 300 species in cosmopolitan distribution.

Hypericum scouleri Hook. (after John Scouler) Scouler's St. Johnswort. Herbaceous perennial. **STEMS** erect from creeping rootstocks, 20–70 cm tall, occasionally branched. **LEAVES** 1–3.5 cm long, ovate to elliptic or oblong; apex obtuse or acuminate, black punctate-glandular. **INFL** a branching cyme with few to many flowers. **FLOWERS** actinomorphic; sepals ovate, 2–5 mm long, punctate-glandular; petals 6–15 mm long, yellow; stamens numerous. **FRUIT** a capsule, 8 mm long. $2n = 16$. [*Hypericum formosum* Kunth var. *scouleri* (Hook.) J. M. Coult.]. Banks of montane watercourses and meadows in ponderosa pine and aspen communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, SJn, RAr; UTAH. 1830–2760 m (6000–9000'). Flowering: late Jun–Aug. Fruit: Jul–Sep. Washington, Oregon, and California to Montana, Wyoming, Colorado, and New Mexico. Our material belongs to **subsp. *scouleri*.**

COMMELINACEAE Mirb. SPIDERWORT FAMILY

William Jennings

Perennial (ours) or annual herbs, usually somewhat succulent. **LEAVES** basal or cauline, with sheathing bases, alternate, simple, margins entire, venation parallel. **INFL** terminal or terminal and axillary, cymose, thyrsiform, or umbellike. **FLOWERS** actinomorphic or zygomorphic, perfect or both perfect and staminate on the same plant; sepals 3, petals 3, stamens 6, all fertile or some staminoidal or some absent; ovary superior, 2–3-locular, stigma 1, simple. **FRUIT** a loculicidal capsule, seeds 1 to several per locule. Forty genera, about 630 species. Pantropical and nearly pantemperate. The petals are ephemeral and do not press well.

1. Flowers zygomorphic; stamens of 2 types, the filaments naked; inflorescence subtended by 1 spathelike bract .... ***Commelina***

1' Flowers actinomorphic; stamens all alike, filaments bearded below; inflorescence subtended by several leaflike bracts .... ***Tradescantia***

Commelina L. Dayflower, Widow's-tears

(for the brothers J. and K. Commelijn, Dutch botanists) **LEAVES** 2-ranked or spirally arranged, not glaucous; blade sessile or petiolate. **INFL** terminal, leaf-opposed; cymes 1 or 2, enclosed in spathes. **FLOWERS** both perfect and staminate, zygomorphic; sepals distinct or proximal 2 connate; petals distinct, petals all the same color or the proximal petal a different color and smaller than the distal 2; stamens 5 or 6, 3 fertile, 2 or 3 sterile (staminoidal), filaments glabrous. **FRUIT** 2- or 3-valved, 2- or 3-locular. **SEEDS** 1 or 2 per locule. Mainly tropical, but almost worldwide, about 170 species.

Commelina dianthifolia Delile **CP** (leaves like a *Dianthus*) Perennial plants with tuberous-thickened roots. **STEMS** simple or branched, erect or decumbent. **LEAVES** linear-lanceolate, acuminate, 4–15 × 0.4–1 cm. **INFL** a distal cyme, usually 1-flowered, exserted, spathe 3 to 6 cm, not connate at base, very long-acuminate or caudate, with the tip as long as or longer than the body, glabrous or short-pubescent. **FLOWER** petals blue, 10–12 mm long, proximal petal smaller. **FRUIT** capsule 3-locular, 2 valves, 5 seeds, brown, 2 to 3 mm, rugose, pitted. Rocky soils in shaded or open ground, ponderosa and oak habitat; uncommon in our area at the northern limit of its range. ARIZ: Apa; COLO: LPl, SJn; NMEX: McK, SJn. 1675–2670 m (5500–8765'). Flowering: Aug. Southern Colorado, Arizona, and New Mexico to Texas; Mexico. Infusion given to livestock as an aphrodisiac by Ramah Navajos.

Tradescantia L. Spiderwort

(for John Tradescant, gardener to King Charles I of England) **LEAVES** arranged spirally or 2-ranked, sessile, linear to oblong, produced in a perfoliated sheath. **INFL** terminal or terminal and axillary pairs of cymes, cymes sessile, umbel-like, subtended by a spathelike bract, either similar to leaves or different. **FLOWERS** perfect, actinomorphic, sepals distinct, petals distinct, white to pink, blue, or violet, stamens 6, all fertile, filaments bearded (ours) or glabrous; ovary with 3 locules. **FRUIT** a dry loculicidal capsule, 3-valved, 3-locular. **SEEDS** usually 2 per locule. About 70 species of the temperate and tropical regions of the New World (including *Tradescantia*, *Rhoeo*, *Setcreasea*, and *Zebrina*).

1. Roots thick, but not tuberlike, rootstock none; stems stout, often branched; sheaths glabrous; corolla usually more than 2 cm in diameter ..... ***T. occidentalis***

1' Roots partly tuberous-thickened, fascicled at base of stem or borne on a creeping rootstock; stems slender; usually unbranched; sheaths pubescent or puberulent, especially on the margins; corolla not more than 2 cm in diameter (all flower parts smaller than above) ..... ***T. pinetorum***

Tradescantia occidentalis (Britton) Smyth (of the West) Western spiderwort. **STEMS** typically 30–60 cm tall, erect, branching, glabrous. **LEAVES** linear-lanceolate, long-acuminate, glabrous, 0.2–2 cm wide × 5–30 cm long. **INFL** an umbel-like cyme, terminal or axillary; pedicels erect to spreading or reflexed, glandular-puberulent. **FLOWERS** broadly campanulate, sepals elliptic, acute to acuminate, 4–10 mm long, greenish, or suffused with rose or purple, glandular-puberulent; petals broadly ovate, 7–16 mm long, magenta, purple, rose-purple, or bluish; stamens erect, filaments densely pilose. Rather dry, often sandy or rocky habitats, frequently found at roadsides. ARIZ: Apa, Nav; NMEX: McK, San, SJn; UTAH. 1735–2060 m (5700–6755'). Flowering: late May–early Jul. North Dakota to Texas, west to eastern Montana, central Wyoming, eastern Colorado, across New Mexico and Arizona into southern Utah. Our material belongs to **var. *occidentalis***. *Tradescantia occidentalis* var. *scopulorum* (Rose) E. S. Anderson & Woodson, with glabrous pedicels and sepals, occurs to the south of the San Juan drainage. Tender shoots eaten by Puebloans. Decoction of root taken for internal injuries by Navajos.

Tradescantia pinetorum Greene (of the pine woods) **STEMS** slender, sparsely branched, 8–39 cm, usually scabridulous. **LEAVES** linear-lanceolate, glabrous, glaucous, 0.15–0.8 cm wide × 1–10 cm long. **INFL** terminal, solitary or with axillary inflorescences from distal nodes, pedicels glandular-puberulent. **FLOWER** sepals 4–6 mm, frequently suffused with red or purple, glandular-puberulent; petals 9–12 mm long, magenta, purple, rose-purple, or bluish; filaments pilose. Moist canyons and stream banks, usually in pine woods. ARIZ: Apa; NMEX: McK, SJn. 1735–2490 m (5700–8170'). The specimen from San Juan County (*Heil & Hyder 7082*, SJNM!) is a significant range extension northeastward from the next-nearest populations in the Chuska Mountains, which are on the southern edge of the San Juan drainage. Flowering: Jul–Sep. Arizona, New Mexico; Mexico. Used by Ramah Navajos as a livestock aphrodisiac.

CONVOLVULACEAE Juss. MORNING GLORY FAMILY

Daniel F. Austin

Herbs, shrubs, or vines, the sap milky in some species; rootstocks sometimes large, otherwise fibrous. **LEAVES** simple, pinnately lobed to pedate or pectinate, or palmately compound; exstipulate. **INFL** axillary, dichasial, solitary, racemose, or paniculate. **FLOWERS** perfect in ours, actinomorphic or slightly zygomorphic, hypogynous, small and inconspicuous to large and showy, but mostly wilting quickly; sepals 5, free, imbricate, equal or unequal, persistent, occasionally accrescent in fruit; petals 5, united; stamens 5, distinct, epipetalous; ovary of 2–3 (4) carpels, usually 1–3-locular; style 1–2; stigmas variable. **FRUIT** 1–4-locular, dehiscent capsule or utricle, or indehiscent and baccate or nutlike. **SEEDS** 1–4, glabrous or hairy. $x = 6–15$ (Austin 1990, 1991, 1998). Fifty-five genera and 1200 species. These plants are most frequent in the tropics and subtropics. Includes the sweet potato (*Ipomoea batatas*) and many ornamentals.

1. Yellow-orange parasitic plants; leaves reduced, minute, scalelike ..... ***Cuscuta***
1' Green plants with normally developed leaves ..... (2)

2. Leaf bases obtuse to acute ..... (3)
2' Leaf bases truncate, cordate to hastate ..... (4)

3. Flowers white and salverform, or white to blue and rotate to broadly campanulate; styles 2 ..... ***Evolvulus***
3' Flowers purple and funnelform, or white and salverform; styles 1 ..... ***Ipomoea***

4. Flower limb lavender, blue, red, or white, throat purple to purple-red ..... ***Ipomoea***
4' Flower limb white, with or without tinges of lavender to pink, throat white ..... (5)

5. Calyx enclosed by 2 foliaceous bracts; stigmas oblong, flattened when fresh ..... ***Calystegia***
5' Calyx not enclosed by bracts ..... ***Convolvulus***

Calystegia R. Br. Hedge Bindweed

(Greek *caly*, beautiful, + *stegia*, roof, in reference to the bracts) Herbs. **STEMS** twining to erect, glabrous or pubescent. **LEAVES** glabrous or pubescent, ovate, the base sagittate or hastate. **INFL** axillary, often solitary, or in few-flowered cyme. **FLOWER** sepals subequal, ovate, ovate-lanceolate to oblong, usually glabrous; corolla funnelform, white or pink, 3–6 cm long, glabrous or puberulent on the margin of the limb, especially the apex of the petal lobes, stamens included, subequal, the filaments sometimes with glandular trichomes basally; ovary ovoid, glabrous, 2-locular basally and 1-locular apically, 4-ovulate, the style 1, unlobed, glabrous, the 2 stigma lobes oblong, flattened. **FRUIT** capsular, 4-valved, surrounded by enlarged sepals and (usually) bracts. **SEEDS** 1–4, glabrous, black to dark brown, smooth to verrucose (Brummitt 1965; Austin, Diggs, and Lipscomb 1997). About 12 species in the United States and Eurasia.

1. Blade of leaf basally rounded; plants normally pubescent on all vegetative parts ..... ***C. macounii***
1' Blade of leaf basally 2-angled; plants normally glabrous or with a few trichomes on petioles ..... ***C. sepium***

Calystegia macounii (Greene) Brummitt (named for John Macoun) Herbs. **STEMS** erect or sparsely twining, these simple or branched, usually from near base, finely pubescent. **LEAVES** with petioles 0.5–40 mm long, blade ovate to ovate-lanceolate, finely pubescent, 2–6 cm long, 1–5 cm wide, basally cordate to subsagittate, the lobes rounded, less often angled, apically obtuse to rarely acute, the margins entire. **INFL** often fewer than 4 per plant, frequently arising from lower few axils. **FLOWERS** on a peduncle 3–5 cm long, rarely longer; pedicel absent; bracts surrounding the calyx, ovate to ovate-mucronate, mostly obtuse, sometimes acute; the sepals elliptic to ovate, subequal, 10–12 mm long, 5–7 mm wide, thin, transparent at least on margins, acute to acuminate, mucronate, glabrous or ciliate; corolla funnelform, white, 4–5 cm long; stamens subequal, 25–28 mm long, filaments basally glandular-pubescent, the anthers 4–5 mm long, basally sagittate; the style 20–23 mm long. **FRUIT** globose to ovoid, brown. **SEEDS** not seen. [*Calystegia interior* House; *C. sepium* (L.) R. Br.]. Moist habitats, near lakes and streams. ARIZ: Apa, Nav. 1950–2050 m (6400–6600'). Flowering: July. Western Minnesota and Iowa to northwestern Missouri and Oklahoma, west to Montana, Wyoming, and Colorado. This is a Great Plains species, ranging from Canada south to Texas. The Arizona plants were introduced to the region during an early logging period; the currently known plants, and former locations, are mostly along the old logging railway and roads.

Calystegia sepium (L.) R. Br. (of hedges) Hedge bindweed. Herbs with rhizomatous, twining stems, these cylindrical or angulate, glabrous. **LEAVES** with petioles 2–7 cm long, blade ovate to ovate-lanceolate, glabrous, 2–15 cm long, 1–9 cm wide, basally cordate-sagittate to hastate, 5-nerved, the auricles obtuse to acute or 2- or 3-dentate, rarely 2-lobed,

apically acute to acuminate, the margins entire or undulate. **INFL** of solitary flowers. **FLOWERS** on a peduncle 3–13 cm long; pedicels absent; bracts surrounding calyx angular, ovate, convex, glabrous or ciliate, foliaceous, borders sometimes pinkish, 14–26 mm long, 10–18 mm wide, mucronate, mostly acute; sepals elliptic to ovate-lanceolate, more or less equal, 11–15 mm long, 4–6 mm wide, thin, transparent, acute to more or less obtuse, mucronate, apically ciliate; corollas funnelform, white or tinged at least on limb with rose or pink, 4.5–5.8 cm long; stamens subequal, 23–29 mm long, filaments basally glandular-pubescent, anthers 4.5–6 mm long, basally sagittate; style 20–23 mm long. **FRUIT** ovoid to globose, brown. **SEEDS** 4.5–5 mm long, black, glabrous, smooth or granulose. $2n = 22$. [*Convolvulus sepium* L.; *C. americanus* (Sims) Greene]. Thickets and fence rows. COLO: Mon; NMEX: RAr, SJn. 1525–2195 m (5000–7200'). Flowering: Jun–Aug. Canada from British Columbia to New Brunswick; Washington south to Utah and New Mexico, and from Vermont and New Hampshire south to North Carolina. This is the most common western variant of a highly polymorphic species that has been variously interpreted in the past. Four Corners material is **subsp. *angulata*** Brummitt (angles, referring to the teeth or shallow lobes near the base of the leaf blades).

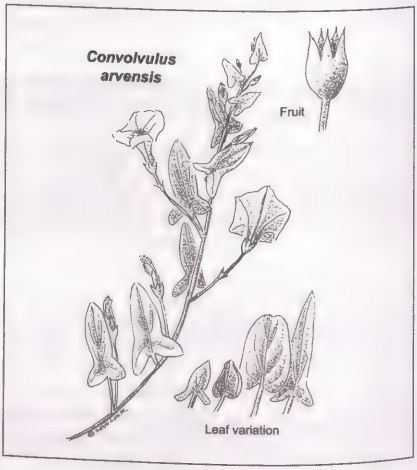
Convolvulus L. Bindweed

(to entwine) Woody or herbaceous vines or shrubs. **LEAVES** petiolate, rarely sessile, blade herbaceous to coriaceous, linear to ovate or elliptic with subtruncate, cordate, sagittate, or hastate bases, glabrous or hairy, the margins usually undulate to crenate or irregularly lobed or laciniate. **INFL** of solitary flowers or in cymose groups. **FLOWER** pedicels mostly 1–3 cm long, bracts and bracteoles linear, elliptic or ovate; sepals subequal, the inner 3 often somewhat longer, suborbicular, elliptic to ovate, hairy or glabrous, obtuse to acute, usually mucronate; corollas white to rose or purple or blue on the limb and white or purplish within the tube, funnelform, the limb 5-angulate to 5-lobed, midpetaline bands glabrous or hairy; stamens included, unequal, with glandular trichomes on the filament base, anthers oblong, basally auriculate, introrse; disc usually lobed; ovary 2-locular, 4-ovulate, ovoid to subglobose, glabrous or hairy; style 1; with 2 filiform, papillose stigmas. **FRUIT** a capsule, 4-valved, mostly brown, chartaceous, ovoid to conical-ovoid, glabrous or hairy. **SEEDS** 1–4, trigonous or rounded, smooth or verrucose, black to dark brown, glabrous (Sa'ad 1967; Austin 2000). This basically Mediterranean genus probably has about 100 species, many of which are found only in Europe and Asia. A few species are native in the Americas, particularly in temperate latitudes or elevations.

1. Leaf blades almost as broad as long; calyx 3–5 mm long; perennials from deep creeping root, forming large patches ..... ***C. arvensis***

1' Leaf blades usually much longer than broad; calyx 6–12 mm long; perennials from taproot, sometimes divided at apex but not forming large, creeping patches ..... ***C. equitans***

Convolvulus arvensis L. (of the field) Field bindweed, ch'il na'atlo'ii, naa-xóoyaaih (Navajo). Widely spreading rhizomatous herbs with branched, decumbent or twining stems. **LEAVES** with petioles 3–40 mm long, blade variable, often ovate, ovate-lanceolate to elliptic, 1–10 cm long, 0.3–6 cm wide, entire or with the margin somewhat undulate, basally cordate to subtruncate, hastate, or sagittate, the lobes obtuse or acute, entire or with 2–3 teeth, glabrous or inconspicuously puberulent. **INFL** cymose or 2 or 3 flowers solitary on a peduncle 3–3.5 mm long; bracts elliptic, linear or obovate, 2–3 (9) mm long, the bracteoles linear, 2–4 mm long. **FLOWER** pedicels 5–18 (35) mm long, reflexed in fruit, usually glabrous; sepals obtuse, or less often truncate or emarginate, mucronate, ciliate, the outer elliptic, 3–4.5 mm long, 2–3 mm wide, glabrous or tomentose, the inner suborbicular to obovate, 3.5–5 mm long, 3–5 mm wide; corollas campanulate, white or tinged with pink, 1.2–2.5 cm long; stamens 8–13 mm long, anthers 2–3.5 mm long; ovary ovoid, glabrous, the style 7–10 mm long. **FRUIT** subglobose to ovoid, 5–7 mm wide. **SEEDS** 1–4, 3–4 mm long, black to dark brown, glabrous, tuberculate. $2n = 48, 50$. Cultivated fields, gardens, roadsides. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1125–2350 m (3700–7700'). Flowering: Apr–Oct. Throughout the temperate United States and nearby Canada; naturalized from Europe. Used as a medicine against spider bites (Ramah Navajo).



Convolvulus equitans Benth. (overlapping in two ranks) Silver bindweed, desert bindweed. Herbs with branched, prostrate or decumbent stems arising from a taproot, densely hairy. **LEAVES** with petioles 0.25–5 cm long, blade variable, ovate-elliptic to triangular-lanceolate or narrowly oblong with projecting basal lobes; blades most often deeply indented basally, 1–7 cm long, 0.2–4 cm wide, densely hairy on both surfaces with loosely appressed indumentum, margins toothed or lobed or both, rarely entire. **INFL** usually 1-flowered, less often 2–3 and cymose, peduncle 0.5–10.5 cm long; bracts and bracteoles scalelike, hairy like leaves. **FLOWER** pedicels 5–24 mm long; sepals oblong to ovate, obtuse to weakly retuse apically, 6–12 mm long, 3–6 mm wide, appressed-sericeous, the margins membranaceous, subcordate with age; corolla white to pink, at times with a reddish center, (1.5) 2.5–3 cm long, sericeous on the petal lobes; ovary ovoid, glabrous. **FRUIT** subglobose, 7–8 mm wide, glabrous. **SEEDS** 1–4, 4–4.5 mm long, black, granulate, glabrous. [*Convolvulus hermannioides* A. Gray; *C. incanus* Vahl]. Dry plains and hills. ARIZ: Apa, Nav; NMEX: McK, San, SJn. 1525–2000 m (5000–6500'). Flowering: Mar–Nov. Arizona, New Mexico, Colorado, Texas, Oklahoma, Kansas, Nebraska, disjunct into Arkansas and Alabama; Chihuahua, Coahuila to Nuevo León, Mexico, and South America.

Cuscuta L. Dodder

Mihai Costea

(from the Aramaic and Hebrew triradical root of the verb K-S-Y [Kaph, Shin, Yodh], which means "to cover") Holoparasitic, rootless herbs. **STEMS** filiform, yellow or orange, glabrous, trailing or twining and attached to the host by numerous small haustoria. **LEAVES** reduced to alternate, minute scales. **INFL** loose to dense, monochasial clusters grouped in glomerulate, paniculiform, or umbelliform cymes, often confluent in larger inflorescences. **FLOWERS** commonly 5-merous, but often some 4-merous on the same plant; fleshy or thin-membranous, white or white-creamy; laticifers often visible in the calyx, corolla, ovary/capsules, pellucid, yellow or orange, isolated or arranged in rows especially in the midveins of calyx and corolla lobes, ovoid to elongate; calyx fused at least at the base, but distally lobes distinct for various lengths, calyx tube cylindric, cupulate, or campanulate; corolla tube cupulate to cylindric with lobes erect, spreading, or reflexed; stamens inserted near the base of the sinuses; infrastaminal scales present (in the flora), fringed or fimbriate scalelike appendages fused with the corolla tube base and forming a corona alternating with the corolla lobes; ovary superior, 2-locular, each locule with 2 anatropous ovules; styles 2, terminal, stigma spherical (ours). **FRUIT** a capsule, indehiscent to irregularly dehiscent or circumscissile along a transverse line near the base. **SEEDS** 1–4 per capsule; endosperm nuclear; embryo uniformly slender, 1–3-coiled (except globose-enlarged at the base in *C. denticulata*), without a radicle and cotyledons. About 180 species, nearly cosmopolitan in distribution. Molecular studies have shown that *Cuscuta* is nested within Convolvulaceae. All the species in the flora belong to the subgenus *Grammica*. Identification of most *Cuscuta* species is a lengthy process because rehydration of flowers, dissection, and examination under a microscope are necessary. Color and texture of calyx were noted only on dried material. Observation of papillae and laticifers requires magnifications of at least 100× (Costea, Nesom, and Tardif 2005; Costea, Nesom, and Stefanović 2006). Common hosts include *Ambrosia*, *Artemisia*, *Chrysothamnus*, *Grindelia*, *Gutierrezia*, and *Polygonum*.

1. Capsules circumscissile; inflorescence umbelliform ..... ***C. umbellata***
1' Capsules indehiscent or irregularly dehiscent; inflorescences glomerulate, paniculiform, or corymbiform .....(2)

2. Calyx lobes obovate-orbicular, margins denticulate; corolla lobes with straight apices and denticulate margins; seeds 1 per capsule ..... ***C. denticulata***
2' Calyx lobes triangular-ovate to lanceolate, margins entire; corolla lobes with inflexed apices and entire margins; seeds usually 2–4 per capsule .....(3)

3. Flowers fleshy, papillate; calyx 1/2–3/4 of the corolla tube, calyx lobes acute ..... ***C. indecora***
3' Flowers membranous, not papillate; calyx equaling corolla tube, calyx lobes obtuse to rounded .... ***C. campestris***

Cuscuta campestris Yunck. (of the field) Field dodder. **INFL** dense, corymbiform or glomerulate; pedicels 0.3–2.5 (–3.5) mm. **FLOWERS** (1.9–) 2.1–3.6 mm long, membranous, white-creamy when fresh, creamy or golden yellow when dried; papillae absent; laticifers evident in the calyx and less obvious in the corolla and ovary/capsule, isolated or arranged in rows, rotund, ovoid, or elongated; calyx yellow, reticulate, shiny, cupulate, about as long as corolla tube, divided 2/5–3/5 the length; lobes overlapping, ovate-triangular, margins entire, apex obtuse to rounded; corolla tube campanulate, (1.1–) 1.5–1.9 mm long; lobes spreading, triangular-lanceolate, about as long as the tube, margins entire, apex acute to acuminate, inflexed; stamens exserted, anthers broadly elliptic, (0.3–) 0.4–0.5 mm; infrastaminal scales equaling or slightly exceeding corolla tube, oblong-ovate to spatulate, rounded, uniformly dense-fimbriate. **CAPSULES**

indehiscent to irregularly dehiscent, globose-depressed to depressed; not thickened or risen around the large interstylar aperture, sometimes translucent, persistent corolla enveloping 1/3 or less of the capsule base. **SEEDS** 4 per capsule, angled, subrotund to broadly elliptic, 1.12–1.54 × 0.9–1.1 mm. $2n = 56$. [*C. arvensis* Beyr. ex Engelm. var. *calycina* Engelm.; *C. pentagona* Engelm. var. *calycina* Engelm.]. On numerous hosts growing in waste and disturbed places, margins of roads, and agricultural fields. The most common species in the Four Corners region. Worldwide dispersal has been through contaminated seeds of previously infested forage legumes. ARIZ: Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1125–1900 m (3700–6235′) Flowering/Fruit: Jul–Sep. Native to North America, very common, and perhaps the most successful and widespread *Cuscuta* weed species worldwide.

Cuscuta denticulata Engelm. (from the small-toothed calyx and corolla lobes) Small-tooth dodder. **INFL** dense, glomerulate; pedicels (0–) 0.5–2.2 mm. **FLOWERS** 1.8–3.1 mm long, membranous, white when fresh, straw-yellow when dried; papillae absent; laticifers visible in the midveins of calyx lobes, arranged in rows, elongated; calyx straw-yellow, reticulate and shiny, campanulate to urceolate, as long as the corolla tube or nearly so, lobes basally overlapping, obovate-orbicular, margins denticulate, apex rounded; corolla tube campanulate, 0.6–1.5 mm; lobes reflexed, about equaling the tube, ovate to broadly elliptic, margins irregularly denticulate, apex rounded, straight; stamens included to slightly exserted, anthers 0.25–0.4 mm, subrotund to elliptic; infrastaminal scales reaching the filament bases, oblong-ovate, rounded, uniformly denticulate or fringed. **CAPSULES** indehiscent to irregularly dehiscent, globose-ovoid, 1.3–2.1 × 1–2 mm, not thickened or risen around the inconspicuous interstylar aperture, translucent, capped by the withered corolla. **SEEDS** 1 per capsule, globose to globose-ovoid, 0.85–1.1 × 0.82–1.1 mm; embryo globose-enlarged at the base. $2n = 30$. Hosts from desert scrubs or dry, sandy places. COLO: Mon. 1370–2000 m (4500–6560′). Flowering/Fruit: Jul–Sep. Native to western North America, from Washington to Mexico (Baja California).

Cuscuta indecora Choisy (unfit or improper) Large-seed dodder. **INFL** loose to dense, paniculiform or corymbiform; pedicels 0.5–6 mm long. **FLOWERS** 2–5.3 mm long, fleshy, translucent white when fresh, creamy yellow to dark brown when dried; perianth cells convex, domelike, papillae usually present on the pedicels, perianth, and ovary; laticifers visible in the perianth along the midveins and in ovary/capsules, isolated or in longitudinal rows, ovoid to elongated; calyx creamy yellow to brownish, not reticulate or shiny, cupulate, 1/2–3/4 of the corolla tube, divided 1/3–2/3 of the length, lobes overlapping or not at the base, triangular-ovate to lanceolate, margins entire, apex acute to attenuate; corolla tube campanulate, campanulate-cylindric, subglobose, or suburceolate, 1–3.2 mm long, lobes suberect to erect, 1/3 to equaling the tube, triangular-ovate, margins entire, apex acute, inflexed; stamens barely exserted or enclosed, anthers ovate-elliptic to oblong, 0.3–0.5 mm long; infrastaminal scales reaching the filament bases, more or less spatulate, rounded, rarely truncate, uniformly dense-fimbriate. **CAPSULES** indehiscent to irregularly dehiscent, globose to subglobose, 2–3.5 × 1.9–4 (–5) mm, thickened and risen around the interstylar aperture, translucent, surrounded or capped by the withered corolla. **SEEDS** 2–4 per capsule, broadly elliptic to transversely oblique, 1.4–1.85 × 1.25–1.6 mm. $2n = 30$. Wide range of herbaceous and woody host species. COLO: LPl, Mon; NMEX: SJn; UTAH. 1370–1800 m (4500–5905′). Flowering/Fruit: Jul–Aug. Common in North America and South America. Our material belongs to **var. *indecora***.

Cuscuta umbellata Kunth (from the umbrella-like appearance of the inflorescence) Flat-globe dodder. **INFL** dense to loose, umbelliform with up to 300 pedicellate flowers; pedicels 2–10 mm long. **FLOWERS** 2–4 mm, membranous, creamy white when fresh, straw-yellow when dried; papillae usually absent, laticifers evident in the calyx and corolla, isolated, ovoid; calyx straw-yellow, not or finely reticulate, slightly shiny, campanulate, equaling or somewhat longer than the corolla tube, divided 1/2–3/5 the length, lobes not basally overlapping, triangular-ovate margins entire, apex acute to acuminate; corolla tube campanulate, 1.5–2.2 mm, lobes erect to reflexed, as long as or somewhat longer than the tube, lanceolate, margins entire, apex acute to acuminate, straight; stamens exserted, anthers oblong, 0.6–0.9 mm; infrastaminal scales reaching the filament bases, oblong-spatulate, rounded, uniformly dense-fringed to fimbriate. **CAPSULES** circumscissile, depressed-globose, 1.6–2.3 × 1.6–3 mm, thickened and slightly risen around the inconspicuous interstylar aperture, translucent, surrounded by the withered corolla. **SEEDS** 4 per capsule, ovate to broadly elliptic or subrotund, 0.92–1.1 × 0.85–1 mm. Numerous herbaceous hosts. NMEX: RAr. 1900 m (6235′). Flowering/Fruit: Jul–Sep. Common from southern United States and Mexico to South America. Our material belongs to **var. *umbellata***.

Evolvulus L. Evolvulus, Dwarf Morning Glory

(to unroll) Herbs or small suffrutescent shrubs, annual or perennial, not twining but sometimes creeping. **LEAVES** usually small, ovate to almost linear, entire. **INFL** in axillary, pedunculate, 1- to several-flowered dichasia. **FLOWER** pedicels about as long as calyx or apparently absent; sepals equal or subequal; corolla conspicuous, blue, or inconspicuous, faded pale bluish white, rotate, funnelform or salverform, the limb plicate, mostly subentire, the lobes pilose

externally; stamens with filiform filaments, the anthers ovate to oblong or linear; ovary 2-locular, each locule 2-ovulate, sometimes 1-locular and 4-ovulate; styles 2, free or partially united at the base, each style deeply bifid for at least 1/2 its length into long, terete, filiform to subclavate stigmas. **FRUIT** globose to ovoid, 4-valved. **SEEDS** 1–4, small, smooth or minutely verrucose (Ooststroom 1934). About 100 American species; mostly tropical.

Evolvulus nuttallianus Roem. & Schult. **CP** (for Thomas Nuttall, 1786–1859) Evolvulus, dwarf morning glory. Suffrutescent herbs, erect to ascending. **STEMS** 10–15 cm tall, densely spreading-pilose with an indumentum of ferruginous, brown, fulvous, or gray color. **LEAVES** with short or absent petioles, blades linear-oblong, narrow-lanceolate to narrow-oblanceolate or rarely oblong, 8–20 mm long, 1.5–5 mm wide, entire, attenuate basally, acute to obtuse apically, densely pilose on both surfaces. **INFL** solitary, in axils over whole length of stem. **FLOWER** pedicels 3–4 mm long, reflexed in fruit; bracteoles subulate, 1–4 mm long; sepals lanceolate to narrowly lanceolate, long-acuminate, 4–5 mm long, spreading-villous; corollas rotate to broadly campanulate, 8–12 mm wide, subentire, purple or blue; anthers 1–2 mm long, oblong, basally auriculate, filaments twice as long as the oblong anthers; ovary subglobose, glabrous. **FRUIT** ovoid, about as long as sepals, glabrous. **SEEDS** (1) 2, brown, smooth. [*Evolvulus pilosus* Nutt.]. Sandy and rocky prairies and plains and piñon-juniper woodland communities. ARIZ: Apa, Nav; COLO: LPl; NMEX: RAr, San, SJn; UTAH. 1125–2450 m (3700–8000'). Flowering: May–Jul. Montana, North Dakota south to Missouri, Arkansas, Kansas, and Texas, west to Utah and Arizona, disjunct to Illinois and Tennessee; Chihuahua and Coahuila, Mexico. The Kayenta Navajo use the plants as a snuff for itching of the nose and sneezing.

Ipomoea L. Morning Glory

(a reference to the twining habit) Annual or perennial vines, shrubs, or trees. **STEMS** usually twining, sometimes prostrate or floating, glabrous or hairy. **LEAVES** petiolate, blade variable in shape and size, simple, lobed, divided, or less often compound. **INFL** mostly axillary, 1 to many flowers, in cymes, rarely paniculate. **FLOWERS** on long or short pedicels, the bracts scalelike to foliose; sepals herbaceous to subcoriaceous, ovate to oblong or lanceolate, glabrous to hairy, often somewhat enlarged in fruit but not markedly accrescent; corolla purple, red, pink, white, or less often yellow, regular or rarely slightly zygomorphic, mostly funnelform, less often campanulate, tubular, or salverform, the limb shallowly or rarely deeply lobed, the midpetaline bands well defined by 2 distinct nerves; stamens included or less often exserted, the filaments filiform, often triangular-dilated at the base, mostly unequal in length; ovary usually 2–4-locular, 4-ovulate, less often 3-locular, 6-ovulate; style simple, filiform, included or less often exserted; stigmas capitate, entire or 2–3-lobed, globose. **FRUIT** a globose to ovoid capsule, mostly 4–6-valved or splitting irregularly. **SEEDS** 1–4 (6). $x = 15, 30, 45$ (Austin 1986; Austin and Huáman 1996; Austin and Bianchini 1998). Perhaps over 600 species spread through the tropics and subtropics of the world.

1. Leaves simple, linear to lanceolate; stems erect to decumbent, somewhat fleshy ..... ***I. leptophylla***
1' Leaves simple to pedately dissected, cordate to orbicular in outline; stems often twining, less often decumbent, rarely fleshy although herbaceous ..... (2)

2. Leaves pedatisect ..... ***I. costellata***
2' Leaves simple or toothed to shallowly or deeply lobed, usually cordate, rarely acute ..... (3)

3. Corollas salverform, scarlet, orange, or yellow; bird flowers ..... ***I. cristulata***
3' Corollas funnelform, lavender to white or purple; bee or moth flowers ..... ***I. purpurea***

Ipomoea costellata Torr. (having ribs, on the leaves) Crestrib morning glory. Low annuals from a slender taproot. **STEMS** erect at first, in age trailing or twining at the tips. **LEAVES** with blades subsessile or on petioles 1–3 cm long, deeply pedatisect, the segments 5–9, linear or linear-lanceolate, 7–25 mm long. **INFL** mostly solitary; peduncles 1–3 (7) cm long. **FLOWER** pedicels 15–25 mm long, erect in fruit; bracts subulate, to 1 mm long; sepals slightly unequal, the outer 3–5 mm long, 1–2 mm wide, the inner 4–6 mm long, 2–3 mm wide, oblong-lanceolate, acute, mucronulate, scarious-margined, at least the inner slightly rugose along the veins; corolla pale lavender to pink, 1–1.2 cm long; stamens 3–5 mm long, anthers 1 mm long, with white trichomes along filaments from base to anther; ovary ovoid, 1 mm long, 2-locular, cream, glabrous; styles 4 mm long, green. **FRUIT** subglobose to ellipsoid-globose, 4–5 mm wide, with a 1–2 mm apiculum which is caducous, tan. **SEEDS** 3 mm long, ovoid, black, glabrous. [*Ipomoea pusilla* Brandegee; *I. futilis* A. Nelson]. Rocky sites in the ponderosa pine zone. ARIZ: Apa, Nav. 1980–2285 m (6500–7500'). Flowering: Jul–Oct. Arizona, New Mexico, Texas; Baja California, Chihuahua, Coahuila south to Chiapas, Mexico; introduced into South America.

Ipomoea cristulata Hallier f. (having a crest, on the sepals) Star glory, Trans Pecos morning glory. Annual. **STEMS** twining, glabrous or pilose on the nodes. **LEAVES** with petioles 2–9 cm long, blades ovate, 1.5–10 cm long, 1–7 cm

wide, typically the lower entire and the upper 3–5-parted or palmate, or all palmately parted or lobed, glabrous or pilose below, the margins irregularly dentate, the base cordate to subtruncate, the lobes rounded to acute, apically acute to acuminate, rarely obtuse, mucronate. **INFL** of 3–7 flowers, cymose or rarely solitary; peduncles 3–6 (25) cm long. **FLOWER** pedicels 5–14 mm long, reflexed in fruit; bracts linear-lanceolate to ovate, aristate, 1–3.5 mm long, bracteoles ovate to lanceolate, 1–2 mm long; sepals unequal, the outer oblong, 3–3.5 mm long, 2–2.5 mm wide, obtuse and rounded to subtruncate apically, muricate or smooth, with a subterminal arista 3–5 mm long, glabrous, the inner oblong, 4–5.5 mm long, 3–3.5 mm wide, apically truncate, with a subterminal arista 2.5–3.5 mm long; corolla salverform, 1.8–2.6 cm long, red or red-orange, glabrous, the limb 1–1.5 cm wide; stamens 21–23 mm long, exserted, anthers 1.5 mm long; ovary ovoid, 1 mm long, 4-locular, glabrous; styles 18–20 mm long. **FRUIT** subglobose, 7–8 mm wide, with an apiculum 2 mm long. **SEEDS** 1–4, 3.5–5 mm long, ovoid, black to dark brown, finely tomentose. [*Quamoclit gracilis* Hallier f.; *Ipomoea coccinea* L. var. *hederifolia* (L.) A. Gray; *I. coccinea* L.]. Ponderosa pine zone. ARIZ: Apa, Nav; NMEX: RAr, San, SJn. 1980–2800 m (6500–9100'). Flowering: May–Oct. Arizona, New Mexico, and Texas, disjunct and possibly introduced.

Ipomoea leptophylla Torr. (fine, slender leaf) Bush morning glory. Herbs, perennial, from an enlarged taproot. **STEMS** erect to decumbent, 0.3–1.2 m tall or sometimes slightly taller, glabrous. **LEAVES** with petioles 1–7 mm long, blade linear-lanceolate to linear, 3–15 cm long, 2–8 mm wide, entire, basally acute to attenuate, acute, glabrous. **INFL** of 1–3 flowers, rarely more in axillary cymes; peduncles 7–10. **FLOWER** pedicels 5–10 mm long; sepals unequal, the inner longer and wider than outer, 5–10 mm long, ovate to elliptic to orbicular-ovate, obtuse; corollas funnelform, 5–9 cm long, purple-red to lavender-pink with a darker throat. **FRUIT** ovoid, 1–1.5 cm long, brown, glabrous. **SEEDS** 1–4, oblong-ellipsoid, covered with dense, short, brown indumentum. $2n = 30$. Plains and prairies. NMEX: RAr, San, SJn. 1675–1980 m (5500–6500'). Flowering: May–Sep. New Mexico to Wyoming and South Dakota, south to Texas and Oklahoma. Endemic to the Great Plains (Keeler 1980). The enlarged roots of these plants were used, at least in time of famine, by several groups of people on the Great Plains in spite of being laxative. The Western Keres were among those using the plant, but it was used as far north as the Lakota and Pawnee. Plants were also used as medicine.

Ipomoea purpurea (L.) Roth (purple, in reference to the flowers) Tall morning glory. Annual, loosely hairy to tomentose with short, appressed trichomes, retrorse and often large trichomes, also with antrorse, oblique to erect trichomes up to 4 mm long. **STEMS** twining, branched to simple. **LEAVES** with petioles 1–14 cm long, blade ovate, subtrilobate, trilobate, or rarely 5-lobed, also unlobed, 1–11 cm long, 1–12 cm wide, basally cordate, apically acute to acuminate, rarely obtuse, mucronate. **INFL** cymose, with (1) 2–5 flowers. **FLOWER** pedicels 5–16 mm, erect in flower, reflexed and enlarged in fruit, reaching 25 mm long; bracts linear to lanceolate, 1.3–9 mm long, bracteoles similar to bracts, 4.5 mm long; sepals subequal, the outer narrowly ovate-lanceolate to elliptic, 8–15 mm long, (1.5) 2.5–4.5 mm wide, acute to abruptly acuminate apically, more hairy near base, the inner ovate-lanceolate, 8–15 mm long, 2.5–3 mm wide, acute to abruptly acuminate; corolla funnelform, 2.5–4.3 (5) cm long, blue (white to purple in cultivated plants), white within tube, glabrous, the limb 2.4–4.8 (7) cm wide; stamens 8–10 (14) mm, the anthers 1.5–2 (3) mm long; ovary ovoid to conic, 1.5–2 mm long, green, 3-locular, 6-ovulate, glabrous; style 14–22 (30) mm long; stigmas 3, globose. **FRUIT** subglobose to ovoid, 7–8 (10) mm wide, with an apiculum 2–4 mm long, 6-valvate. **SEEDS** 3–6, 4–5 mm long, ovoid, black to dark brown, finely tomentose. $2n = 30$. [*Ipomoea hirsutula* J. Jacq.]. Disturbed sites, cultivated fields, and in cultivation. ARIZ: Apa, Nav; NMEX: San, SJn. 1525–2300 m (5000–7500'). Flowering: Jul–Nov. Pantropical, widespread in North America, from Maine to North Dakota, south to Utah, Nevada, and Arizona, California to Washington along the coast; probably naturalized from Mexico. This is an unusually variable species, at least in part due to cultivation. Cultivated forms are always larger than wild forms, but the size of flowers and sepals may vary even in the wild plants. Throughout much of its pantropical range, the seeds are valued as a laxative.

CORNACEAE Bercht. & J. Presl DOGWOOD FAMILY

Kenneth D. Heil and J. M. Porter

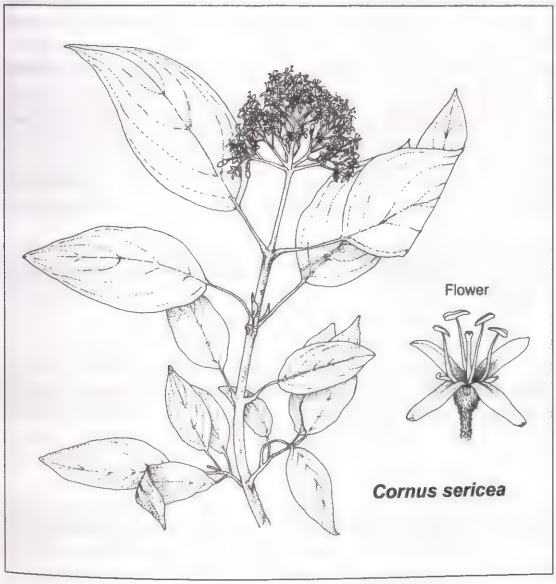
Shrubs or herbaceous perennial plants. **LEAVES** opposite or whorled, simple, entire. **INFL** cymose or capitate. **FLOWERS** perfect, regular, small; sepals 4–5; petals 4–5, distinct; stamens the same number as the petals and alternate to them; pistil 1, the ovary inferior, mostly 2-loculed, 1 ovule per locule; style 1. **FRUIT** a 1–2-seeded drupe. $x = 8–13, 19$. Twelve genera, 90 species of the north-temperate zone, rare in tropics and south-temperate zones.

Cornus L. Dogwood

(*cornus*, horn, carved from the hard wood) **LEAVES** deciduous, 3–9 cm long, lanceolate, elliptic, ovate to obovate, acute to short-acuminate. **INFL** in a terminal cyme with many flowers or capitate; sepals 0.4–0.5 mm long; petals 1.5–3 mm long, yellow to purple or white. **FRUIT** 7–9 mm in diameter. Forty-five species of the north-temperate zone. Many species are cultivated ornamentals with large, showy bracts. Fruit used in jam and syrup.

1. Plants herbaceous, not over 25 cm tall; leaves 4–6 in a single whorl; inflorescence capitate, subtended by 4 petaloid bracts; fruit red ..... ***C. canadensis***
1′ Woody shrubs over 25 cm tall; leaves many and opposite; inflorescence a flat-topped cyme, petaloid bracts not present; fruit white ..... ***C. sericea***

Cornus canadensis L. (of Canada) Bunchberry. Herbaceous plants from woody rootstocks. **STEMS** 5–20 cm tall. **LEAVES** 4–6, whorled in 1 series near apex, often a pair of smaller or scalelike leaves below; 3–6 cm long, ovate to obovate, acute to short-acuminate, cuneate at base, sparsely strigose above, glabrous and lighter in color below. **INFL** a capitate cyme with many flowers subtended by 4 large white or yellowish bracts, these about 10–15 mm long, nearly as wide. **FRUIT** red. $n = 22$, $2n = 44$. Spruce-fir and aspen communities. COLO: Arc. 3330 m (11000′). Flowering: Aug. Fruit: Sep. Greenland to Alaska, south to New Jersey, Pennsylvania, Minnesota, and West Virginia to California; eastern Asia and India. Uses include drugs, food, and ceremonial.



Cornus sericea L. (with silky hairs) Red-osier dogwood, kinnikinnik. Woody shrubs up to 4 m tall, and often as broad. Branches red to purplish or yellowish, subglabrous to strigulose, older stems grayish green, mostly glabrous. **LEAVES** mostly 5–9 cm long, lanceolate, elliptic to ovate, acute to acuminate, cuneate, glabrous or nearly so above, strigillose below with spreading hairs along the veins. **INFL** a flat-topped cyme with many flowers. **FLOWERS** with white petals. **FRUIT** white. $2n = 22$. Stream banks and other moist sites. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 1515–3030 m (5000–10500′). Flowering: May–Aug. Fruit: Jun–Sep. Newfoundland to Alaska, south to Mexico. Uses include numerous drugs, fiber, dye, and ceremonial items; fruit used as food. Dried parts are a component of a common smoking mixture.

CRASSULACEAE J. St.-Hil. STONECROP or ORPINE FAMILY

Steve L. O'Kane, Jr.

(Latin *crass*, thick, referring to the typically thick, succulent leaves) Annual to perennial, shrubs, a few trees, and herbs (ours), succulent, glabrous and often glaucous. **LEAVES** alternate, opposite, or whorled, entire to less frequently toothed, usually succulent, a basal rosette often present, often with Kranz anatomy. **INFL** a branched cyme, sometimes flowers solitary, terminal or axillary. **FLOWERS** usually bisexual, sometimes unisexual and the plants dioecious or polygamodioecious; (3–) 4–20-merous; calyx and corolla both distinct or somewhat fused at the base; stamens 1–2× the number of sepals or petals, free or sometimes the antisepalous ones epipetalous; carpels distinct, typically the same number as the sepals and petals, superior, placentation marginal; nectaries scalelike and at the base of and opposite the carpels. **FRUIT** a follicle, rarely capsular. **SEEDS** with oily or proteinaceous endosperm, (1–) few or more

commonly numerous in each carpel. $x = 4–22+$. The family is nearly cosmopolitan (except in Australia and Polynesia) and is especially speciose in arid- and warm-temperate regions; about 33 genera and 1500 species (Gontcharova, Artyukova, and Gontcharov 2006; Mayuzumi and Ohba 2004). Like the Cactaceae, the family consists almost entirely of succulent plants and the genera are often difficult to distinguish because of a stereotyped morphology. The genus *Sedum* is the largest in the family and has, over the years, been variously divided into segregate genera. Recent molecular work (e.g., refs. above) shows that our material is assignable to *Sedum* and the segregate genus *Rhodiola*. Members of the Crassulaceae are commonly cultivated in rock gardens.

1. Flowers pink (sometimes very pale and nearly white), red, or purple; shoots typically greater than 1.2 dm tall and ± erect; leaves flattened; cauline leaves persistent ..... ***Rhodiola***
1' Flowers white, cream, or yellow; shoots usually less than 1.2 dm tall, sprawling or erect; leaves subterete or flattened; cauline leaves deciduous after flowering ..... ***Sedum***

Rhodiola L. Stonecrop

Perennial herbs, glabrous and often glaucous, from scaly, short, thick, branched rootstocks (ours). **STEMS** clustered, erect to ascending. **LEAVES** alternate, succulent, entire to weakly toothed or crenate, flattened. **FLOWERS** 5-merous; bisexual or unisexual and the plants then dioecious or polygamodioecious, pink, purple, or sometimes nearly white; sepals nearly distinct or united at the base; petals distinct; stamens 10; carpels the same number as the petals. **FRUIT** follicles erect, the style slightly divergent. **SEEDS** numerous, minute, pointed at each end, finely longitudinally ribbed. $x = 7, 8$. Thirty-six species in north-temperate areas. Our species are often frequent and beautiful members of moist subalpine and alpine areas

1. Flowers red or purple, unisexual, in a flat-topped inflorescence; leaf midrib inconspicuous ..... ***R. integrifolia***
1' Flowers pink or nearly white, perfect, in capitate clusters; leaf midrib prominent ..... ***R. rhodantha***

Rhodiola integrifolia Raf. (entire leaf) King's crown, roseroot, ledge stonecrop. Perennial, succulent, usually glaucous. **STEMS** 3–20 (35) cm tall, stout, clustered, but each stem usually unbranched, erect or ascending. **LEAVES** all cauline, persistent, rhombic, oblanceolate, obovate, sometimes even wider, flattened, succulent, spreading to ascending, irregularly toothed, crenate, or entire. **INFL** a dense, terminal, corymbose cyme. **FLOWERS** often imperfect, the plants dioecious or polygamodioecious; sepals (4–) 5, narrowly lanceolate to lanceolate, 1.5–3 mm long, acute; petals (4–) 5, (ob)lanceolate or a little wider, red to purple; stamens (8–) 10, vestigial or lacking in pistillate flowers. **FRUIT** follicles distinct, erect with a slightly divergent style. **SEEDS** brown. $2n = 22, 33, 36$. [*Sedum integrifolium* (Raf.) A. Nelson; *S. rosea* (L.) Scop.; *S. roseum* (L.) Scop.; *Tolmachevia integrifolia* (Raf.) Á. Löve & D. Löve]. Aspen, spruce-fir, and alpine communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 2470–3890 m (8100–12760'). Flowering: Jun–Sep. Our material is **subsp. *integrifolia***. Western half of North America but apparently not yet found in Arizona. Used by native Alaskans as a tea (the plant tops), for sores in the mouth, as an analgesic, and a gastrointestinal aid.

Rhodiola rhodantha (A. Gray) H. Jacobsen (rose flower) Queen's crown, rose crown, redpod stonecrop. Perennial, succulent. **STEMS** 8–30 (–40) cm tall, stout, clustered, but each stem usually unbranched, erect or ascending. **LEAVES** all cauline, persistent, narrowly oblong, narrowly elliptic to (ob)lanceolate, flattened, succulent, spreading, entire or weakly toothed, becoming somewhat involute. **INFL** terminal, racemiform or paniculiform, bracteate, often headlike. **FLOWER** sepals 5, narrowly lanceolate, 4–7 mm long, obtuse, rounded, or acute; petals 5, lanceolate, pink to almost white; stamens 10, filaments pink, anthers dark purple; carpels 5. **FRUIT** follicles distinct, erect except for divergent tip. **SEEDS** pale brown. $2n = 14$. [*Clementsia rhodantha* (A. Gray) Rose; *Sedum rhodanthum* A. Gray]. Aspen, spruce-fir, alpine communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3230–3690 m (10600–12100'). Flowering: Jun–Sep. Arizona, Colorado, New Mexico, Utah, and Montana.

Sedum L. Stonecrop

(Latin name for stonecrop) Perennial (–annual) herbs, sometimes slightly suffrutescent, glabrous and often glaucous, often rhizomatous or stoloniferous. **STEMS** erect to spreading or decumbent. **LEAVES** alternate, rarely opposite, succulent, entire, denticulate, or toothed, sometimes imbricate, often a basal rosette present, terete to flattened. **FLOWERS** 4- or 5- (rarely 3, 6, or 7)-merous; bisexual (ours) or rarely unisexual, yellow or white (ours), pink or purple; sepals distinct or united at the base; petals distinct or united at the base; stamens twice the number of petals, the ones opposite the petals epipetalous at the base of the petal; carpels the same number as the petals. **FRUIT** follicles erect to widely divergent, with a slender or short and tapered style. **SEEDS** numerous, minute, pointed at each end, finely longitudinally ribbed. $x = 7, 8, 9$. More than 600 species mostly in warm or arid north-temperate areas. Many species are common rock garden or house plants.

1. Flowers white or cream; leaves flattened ..... ***S. cockerellii***
1' Flowers yellow; leaves subterete or the largest ones slightly flattened ..... ***S. lanceolatum***

Sedum cockerellii Britton (for University of Colorado entomologist T. D. A. "Theo" Cockerell, 1866–1948) Cockerell's stonecrop. Perennial, succulent. **STEMS** several, growing in clumps, individually weak, 4–20 cm tall, decumbent, ascending or erect. **LEAVES** sessile, flattened, not or little overlapping, spreading to ascending, at least the basal ones minutely papillose, linear, spatulate, narrowly elliptic to narrowly obovate, deciduous after flowering. **INFL** a cyme, terminal or in the axils of the apical leaves, bracteate. **FLOWER** sepals (4–) 5, obtuse, 4–5 mm long; petals (4–) 5, linear-lanceolate, white or white and pink-tinged; longer than the sepals; stamens (8 or) 10; carpels (4–) 5. **FRUIT** follicles erect and often spreading at the tip. **SEEDS** brownish. [*Cockerellia cockerellii* (Britton) Á. Löve & D. Löve; *Sedum griffithsii* Rose; *S. wootonii* Britton]. Shady, rocky sites; piñon-juniper woodlands, Gambel's oak, ponderosa pine, Douglas-fir, and spruce-fir communities. NMEX: McK, RAr. 2135–3505 m (7000–11500'). Flowering: Jun–Sep. Arizona, New Mexico, Texas; northern Mexico.

Sedum lanceolatum Torr. **CP** (lanceolate) Common stonecrop, spearleaf stonecrop. Perennial, succulent, much-branched below with fragile sterile shoots. **STEMS** 5–15 (–20) cm tall, erect, often with a decumbent base. **LEAVES** sessile, terete or the larger ones somewhat flattened, ascending to ± appressed to the stem, narrow-lanceolate to elliptic-ovate; deciduous after flowering. **INFL** a terminal cyme. **FLOWER** sepals (4–) 5, rounded to obtuse, 2–4 mm long; petals (4–) 5, lanceolate to ovate, yellow, longer than the sepals; stamens (8 or) 10; carpels (4–) 5. **FRUIT** follicles somewhat connate at the base, erect, styles erect or spreading. **SEEDS** brownish. $n = 8$. [*Amerosedum lanceolatum* (Torr.) Á. Löve & D. Löve; *Sedum stenopetalum* Pursh, misapplied]. Rocky outcrops; sagebrush, piñon-juniper woodlands, ponderosa pine, aspen, Douglas-fir, and spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: McK, SJn; UTAH. 2365–3900 m (7765–12800'). Flowering: Jun–Aug. Western half of North America. Our material is **subsp. *lanceolatum***. Leaves are edible and can be used as an addition to salads.

CROSSOSOMATACEAE Engl. CROSSOSOMA FAMILY

John R. Spence

Small to medium-sized shrubs, often spinescent and strongly branched, branches and stems often ridged or with hyaline to black trichomes. **LEAVES** microphyllous, deciduous or persistent, alternate to opposite, entire or tridentate, single or in fascicles, stipules present and small or absent. **INFL** axillary to terminal, flowers single or in axillary clusters. **FLOWERS** perfect or sometimes unisexual, actinomorphic, perigynous, sometimes with a nectary disc present on the hypanthium or at base; sepals 3–6, equal to unequal, imbricate and persistent; petals 3–6, typically 4–5, imbricate and distinct, longer than sepals; stamens 4–50, of equal or unequal lengths in 1–4 whorls, sometimes attached to nectary disc, alternate; ovary with 2–many ovules per carpel; style short, thick, with capitate stigma. **FRUIT** a coriaceous follicle that dehisces ventrally. **SEEDS** black to brown, with white or yellow entire to fimbriate aril. $x = 12$. A family of three genera and about seven to eight species mostly limited to arid habitats of the southwestern United States and northern Mexico.

Glossopetalon A. Gray Greasebush

(Greek *glosso*, tongue-shaped, + *petalon*, petal) Intricately branched spinescent shrubs, 1–2 m tall, branches ribbed by decurrent lines from the nodes. **STEMS** ribbed, young stems green, bark becoming orange-tan to gray. **LEAVES** small, alternate, entire, deciduous, sometimes absent most of the year; petioles short, decurrent; stipules minute, lanceolate. **INFL** of short axillary cymes or flowers solitary. **FLOWERS** perfect or sometimes unisexual; sepals 4–6, persistent, white; petals 3–5, free, spreading, white, inserted under a fleshy lobed nectary disc; stamens 4–10, attached to base of nectary disc; style lacking, stigma sessile; carpels 1–2, ovary 1-celled, ovules 1–2. **FRUIT** an asymmetrical, coriaceous, striate follicle, dehiscing ventrally. **SEEDS** small, partially enclosed by a white aril. A genus of five species, distributed primarily in arid regions of the southwestern United States and adjacent Mexico, but extending north to southern Washington, Idaho, and Wyoming. *Glossopetalon* (as *Forsellesia*) was placed in the Celastraceae until recently, but recent DNA studies have shown convincingly that it belongs in the Crossosomataceae (Sosa and Chase 2003; Holmgren 1988).

Glossopetalon spinescens A. Gray (for the spinescent branches) Low-growing, intricately branched, spinescent shrub, rarely to 2 m. **STEMS** ribbed, young stems green, bark becoming orange-tan to gray with age. **LEAVES** grayish green, somewhat glaucous, young leaves glabrous to somewhat puberulent, 3–15 mm long, 1–4 mm wide, with petioles 0.5–2.5 mm long, the blade oblanceolate with an apiculate tip, cuneate basally, typically appearing when the plant

begins flowering. **INFL** with flower solitary at nodes. **FLOWERS** subtended by a fascicle of bracts; pedicel 1–5 mm long; sepals (3) 5, white, rounded, 1–2 mm long, hyaline-margined; petals (3) 5, white, oblanceolate to linear, 2–7 mm long. **FRUIT** a single follicle, 3–6 mm long, longitudinally ribbed, green to brown, beaked, the stigma discoid, oblique. **SEEDS** 1, more or less globose, 2–3 mm wide, white to brown and shiny-smooth, with a fimbriate aril. [*Forsellesia meionandra* (Koehne) A. Heller]. Rocky outcrops and slopes, sandy washes in desert scrub, and piñon-juniper woodlands. COLO: Mon; UTAH. 1100–2000 m (3500–6800'). Flowering: Mar–May. Fruit: Jun–Aug. Widespread in the Intermountain region from southeastern Washington, central Idaho, and southwestern Wyoming, Nevada, and Arizona south to Mexico, east of the Oregon and California mountains; also on western Great Plains of Oklahoma, New Mexico, and Texas. Locally there are no known uses of this shrub, but the Shoshoni of the Great Basin apparently used a decoction of the plant for tuberculosis. *Glossopetalon spinescens* is a highly variable shrub with several described varieties. Most of our material can be referred to **var. *meionandrum*** (Koehne) Trel. Because of its variability, some plants in the Four Corners region seem to resemble varieties *aridum* M. E. Jones and *microphyllum* N. H. Holmgren from other parts of the species range to the west and north. This species is similar in appearance to other small, highly branched desert shrubs of the Four Corners region, such as *Fendlerella utahensis* (S. Watson) A. Heller, *Coleogyne ramosissima* Torr., *Cercocarpus intricatus* S. Watson, and *Menodora spinescens* A. Gray.

CUCURBITACEAE Juss. GOURD, SQUASH, CUCUMBER FAMILY

Linda Mary Reeves

Typically perennial, monoecious or dioecious, climbing herbaceous vines with some shrubs, succulent lianas, and a few annuals. Most have a swollen tuberous hypocotyl which develops into a large subterranean rootstock. **LEAVES** alternate; simple; palmately lobed and/or compound with 3 or more leaflets; palmately veined; with spiraling solitary or branched tendrils that arise from the base of the petiole or leaf base. The tendril's tip curls around any nearby plant or object and the remainder of the tendril coils up, springlike, which draws the stem close to the support. **INFL** with flower solitary, a small cyme or raceme. **FLOWERS** imperfect; perianth 5-merous, borne at the top of a hypanthium; petals more or less united at the base; stamens 3; filaments and anthers somewhat united; ovary inferior. **FRUIT** a berry, pepo, or fleshy, leathery, or dry indehiscent capsule. **SEEDS** without endosperm, usually large. $x = 7–14$. About 90 genera with about 700 species. Primarily in the tropics with some desert and temperate distributions. A major food family including cucumbers (*Cucumis sativus*), squashes, chayote, pumpkins (*Cucurbita*), melons (*Cucumis*), watermelon (*Citrullus lanatus*), calabash (*Lagenaria siceraria*), as well as succulent ornamentals (*Xerosicyos*, *Cyclantheropsis*).

1. Stems clambering, vining; seeds less than 10 per fruit or, if more than 10 seeds per fruit, fruit with spines or prickles ..... ***Echinocystis***
1' Stems not clambering, trailing; seeds numerous in each fruit or, if not numerous, fruit spineless ..... (2)

2. Corolla 5-lobed, united from middle to base ..... ***Cucurbita***
2' Corolla 5-parted to near or at the base ..... (3)

3. Tendrils simple, not branched ..... ***Cucumis***
3' Tendrils 2–3-branched ..... ***Citrullus***

Citrullus Schrad. Watermelon, Sandia, Citron

(Greek, little lemon) Mostly pubescent, vining annuals. **LEAVES** ovate to palmately lobed. **FLOWERS** small, solitary; corolla rotate; 5-lobed. **FRUIT** a pepo; globular or oblong, fleshy; generally green- or yellow-skinned, glabrous or finely pubescent-skinned with juicy or hard white, red, pink, yellow, or green flesh. **SEEDS** numerous, black, white, or red; flat. Several species from tropical and warm-temperate Africa and Asia.

Citrullus lanatus (Thunb.) Matsum. & Nakai (woolly) Watermelon, sandia. **LEAVES** ovate to ovate-oblong in outline, to 20 cm long, base cordate; pinnatifid lobes divided into 3–4 pairs, which are again lobed and/or toothed, apices broad; tendrils 2–3-forked. **INFL** with axillary solitary flower. **FLOWERS** monoecious; small; corolla 4 cm wide. **FRUIT** usually greenish, variously striped, rind nondurable; flesh generally reddish or yellowish. **SEEDS** generally black or whitish; smooth, to 15 mm long. Native to Africa. Escaped in our area around dwellings and agricultural fields. $2n = 22$. ARIZ: Apa. 1400–2000 m (4500–6500'). Flowering: May–Sep. Fruit: Aug–Oct. Our specimens are **var. *lanatus***. Flesh used as an important staple food by Hopis and Navajos (Diné), both fresh and sun-dried in strips for winter use. Ground seeds used by Hopi to grease piki bread stones and often parched and mixed with corn for piki bread.

Cucumis L. Melon, Cucumber, Gherkin

(Latin, cucumber) Annual or perennial trailing or climbing pubescent vines. **LEAVES** entire or partially dissected; tendrils simple. **INFL** usually with axillary, solitary flower; staminate often with more than 1 per axil. **FLOWERS** usually monoecious, corolla yellow; campanulate to rotate, deeply 5-lobed; anthers free; stigmas 3–5, styles short; ovules many. **FRUIT** fleshy and usually indehiscent, globular to elongated, glabrous, pubescent or echinate. About 25 species in tropical and warm-temperate regions, Africa and Middle East, western Asia.

Cucumis melo L. (fruit) Muskmelon, honeydew, cantaloupe. Trailing, pubescent vine with striate or angled stems. **LEAVES** orbicular-ovate to subreniform, to 13 cm wide, angled but usually not distinctly lobed, pubescent, scabrous; apex rounded; margins sinuate-dentate. **FLOWERS** about 25 mm across; corolla lobes obtuse. **FRUIT** various, mostly globular or ellipsoid; sometimes furrowed, pubescent at first, becoming glabrous or with raised ribs at maturity; fragrance musky, flesh orange, yellow, or green. **SEEDS** numerous, white, slender, about 12 mm long. $2n = 24, 48$. Escaped near agricultural fields and oil/gas rigs. NMEX: SJn. 2000 m (6500′). Flowering: May–Sep. Fruit: Jul–Sep. Native to Africa and western Asia. A food staple cultivated by many tribes.

Cucurbita L. Gourd, Squash, Pumpkin, Calabacita

(Latin, gourd) Annual or perennial with long, prostrate or climbing stems. **LEAVES** entire or lobed; usually scabrous or pubescent; tendrils branched. **FLOWERS** axillary, solitary; large; staminate flowers long-pedicelled; corolla yellow; lobed to about the middle or above; anthers united; stigmas 3–5, bilobed; ovary 1-celled. **FRUIT** mostly glabrous or slightly hairy, indehiscent, mostly fleshy or with a hard rind. **SEEDS** usually numerous, ovate to oblong-ovate, flat, white, tan, or black. About 15 species from the Western Hemisphere, primarily tropical and warm-temperate or desert habitats.

1. Leaves typically strongly triangular, longer than broad ..... ***C. foetidissima***
1′ Leaves not as above ..... (2)

2. Fruit globose; orange ..... ***C. pepo***
2′ Fruit various; yellow, green, or pale orange ..... (3)

3. Leaves broadly ovate to weakly triangular ..... ***C. moschata***
3′ Leaves circular to reniform ..... ***C. maxima***

Cucurbita foetidissima Kunth (evil-smelling) Buffalo gourd, Missouri gourd, calabacilla loca, wild pumpkin, chichicoyota. Rank-smelling, spreading perennial; stems often numerous, to 6 m or more long; root often large and fusiform. **LEAVES** coarse, thick; triangular-ovate; often shallowly angulate-lobed; base broadly rounded to cordate; apex acute to acuminate; to at least 30 cm long; ill-smelling when bruised; grayish green; scabrous. **FLOWER** corollas to 10 cm long, flaring above the middle. **FRUIT** globose; mostly green with lighter stripes; yellowish and dryish when ripe; diameter to 75 mm [*C. perennis* (E. James) A. Gray]. In sandy or gravelly roadsides or disturbed areas. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: SJn. 1650–2000 m (5400–6500′). Flowering: Jun–Sep. Fruit: Aug–Oct. From Missouri and Nebraska south and west to Texas, Arizona, California, and Mexico. Mashed stems, leaves, and roots used as a veterinary poultice and as a green paint by Apaches. Used as a skin poultice and for chest pains by Puebloans and Zunis. Used as a treatment to constrict blood vessels and to hasten childbirth by Apaches. Gourds used as dancing rattles and containers by many tribes. Flowers eaten as food by many tribes. Roots and fruits contain saponins and a bleaching agent used for washing clothing. Gourds often used in Mexico to wean babies from the breast because of the distasteful, foul-smelling cucurbitins, thus chichicoyotas, or "trickster breasts."

Cucurbita maxima Duchesne (greatest) Fall squash, winter squash. Stems short or long-trailing, with soft pubescence. **LEAVES** lax; orbicular; not lobed; base cordate; margins dentate. **FLOWERS** solitary; corolla with broad, reflexed lobes; pedicel short, sometimes enlarged at the middle. **FRUIT** glaucous or glabrous; variously colored and shaped. **SEEDS** inflated; margin obtuse. Escaped near fields or from agricultural runoff in canyons. ARIZ: Apa. 2450 m (8000′). Flowering: May–Sep. Fruit: Aug–Oct. Native of Central America. Blossoms baked in cakes by Hopis and Apaches.

Cucurbita moschata Duchesne (musk) Butternut, winter crookneck, cushaw. **STEMS** long-trailing, soft. **LEAVES** velvety, limp, broadly ovate to somewhat triangular-orbicular; not lobed; margin crenate to denticular-dentate. **FLOWERS** with calyx lobes often long; corolla tube broad at base, lobes crinkly, widely spreading. **SEEDS** thin, margin hyaline in fresh material. Escaped from cultivation in Canyon de Chelly. ARIZ: Apa. 1753 m (5750′) Flowering: Jun–Sep. Fruit: Sep -Oct. Native to Mexico and Central America, but commonly escaped near agricultural fields, old homesteads, and roadsides.

Cucurbita pepo L. (ripe) Field pumpkin. Trailing, spreading annual. Stems with stiff, translucent hairs. **LEAVES** large, stiff, rigid, scabrous; triangular or ovate-triangular, 10–35 cm long, lobed; apex acute and apiculate; margins irregularly serrate. **FLOWERS** solitary; corolla with erect or spreading pointed lobes; pedicel angled. **FRUIT** large, highly variable, usually globose or ovoid, orange, furrowed. $n = 10$. Escaped from agricultural fields. ARIZ: Nav; NMEX: SJn. 1600–1800 m (5300–6100'). Flowering: May–Sep. Fruit: Aug–Oct. Native of Central America. A food staple of Apaches, who also baked blossoms in cakes. Ramah Navajos used the blossoms as seasoning for soups. Many tribes used the dried fruit as a winter food.

Echinocystis Torr. & A. Gray Wild Mock-cucumber

(Greek *echinos*, spiny, + *cystis*, bladder, for the prickly fruit) Annual; clambering, vinaceous, usually thin-stemmed plants with branched tendrils. **LEAVES** lobed or angled. **INFL** monoecious; staminate flowers borne on a raceme or panicle; pistillate flowers solitary. **FLOWERS** small; corolla white, whitish, or cream, rotate, 5- or 6-lobed; filaments connate, anthers connate or distinct; ovary 2-loculed; ovules 2 per locule. **FRUIT** fleshy or dry, often echinate. Monotypic genus in North America.

Echinocystis lobata Torr. & A. Gray (lobed) Smooth wild cucumber. High-climbing annual, mostly glabrous. **LEAVES** suborbicular-ovate; to 12 cm long, to 12 cm wide; with 5 triangular serrate lobes; tendrils forked. **INFL** a long raceme or panicle in staminate flowers; pistillate flowers solitary or in small clusters, axillary; short-pedicelled; both staminate and pistillate inflorescences often from the same axil. **FLOWERS** 5–6-merous; greenish to white; corolla rotate, about 1 cm wide, lobes narrowly lanceolate and acuminate; stamens 3, filaments united into a column; ovary 2-celled; stigma broad-lobed. **FRUIT** ovoid; 3–5 cm long, to 25 mm diameter; inflated; beaked and with leathery glabrous prickles to about 6 mm long. **SEEDS** flat, dark. $2n = 32$. [*Sicyos lobatus* Michx.]. In moist soil along acequias in shade. COLO: LPl, Mon; NMEX: SJn. 1000–2100 m (4600–6900'). Flowering: Jul–Sep. Fruit: Sep–Oct. Saskatchewan south to Florida and west to Texas, Colorado, and Arizona. Escaped from cultivation and sporadic in the West.

CYPERACEAE Juss. SEDGE FAMILY

Sherel Goodrich

Perennial or annual, graminoids. **CULMS** (stems) triangular, rounded, or flattened in cross section, not jointed. **LEAVES** simple, linear, entire, 3-ranked, sometimes reduced to bladeless sheaths, these mostly closed. **INFL** spicate, racemose, or umbellate, of 1 to several spikes or spikelets (small spikes). **FLOWERS** much reduced, imperfect or perfect, sessile or nearly so, subtended by a very small bract referred to as a scale; perianth lacking or reduced to bristles; stamens usually 3, rarely 1 or 2, exserted at anthesis, the anther basifixed; ovary superior; stigmas 2 or 3. **FRUIT** a lenticular or trigonous achene.

1. Achene enclosed or folded within a closed or open sac or bract as well as subtended by a scale; perianth bristles lacking; flowers imperfect only ..... (2)
1' Achenes exposed, neither enveloped by nor enfolded in a sac or bract, merely subtended by a scale and sometimes by perianth bristles; flowers mostly perfect (except in *Cladium*) ..... (3)

2. Achene completely enclosed in a sac (perigynium), this closed except at the apex, through which the stigmas are exserted, concealing the attachment of the style to the achene ..... ***Carex***
2' Upper part of the achene exposed, the subtending bract with open margins, exposing the attachment of the style to the achene ..... ***Kobresia***

3. Perianth bristles numerous, long, cottonlike, concealing other parts of the inflorescence ..... ***Eriophorum***
3' Perianth bristles lacking to several, but not cottonlike, not concealing other parts of the inflorescence ..... (4)

4. Achene subtended by perianth bristles ..... (5)
4' Perianth bristles lacking ..... (7)

5. Fertile flowers or achenes solitary (rarely 2) in each spikelet, the lower scales of the spikelet empty ..... ***Rhynchospora***
5' Fertile flowers or achenes few to several in each spikelet (rarely solitary), the lower scales usually fertile (except in *Cladium*, in which the lower scales are empty) ..... (6)

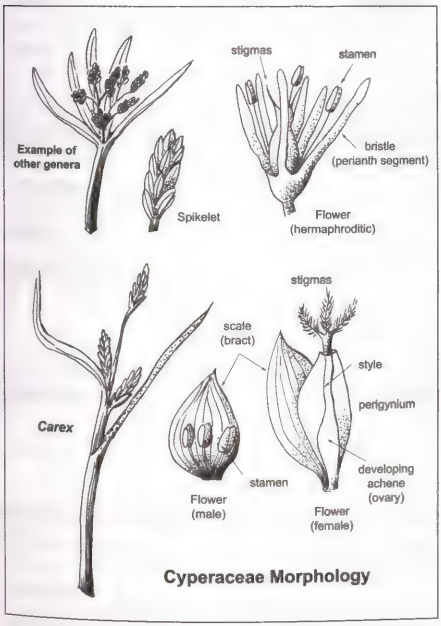
6. Spikelets solitary and terminal and without subtending leafy bracts; style thickened at the base, persistent on and forming a point or cap on the achene ..... ***Eleocharis***
6' Spikelets commonly 2 or more, often subtended by 1 or more leafy bracts ..... ***Scirpus***

7. Plants 1–2 m tall, with leafy stems and foliose bracts; lower scales empty; flowers in each spike all staminate except the terminal perfect one ..... ***Cladium***
7' Plants various but rarely as large as above; scales typically all subtending flowers, these mostly perfect ..... (8)

8. Scales of spikes strongly 2-ranked ..... ***Cyperus***
8' Scales of spikes not 2-ranked ..... ***Fimbristylis***

Carex L. Sedge

(Latin name for the genus) Plants perennial, monoecious or occasionally dioecious; stems tufted or arising singly or few together from creeping rhizomes. **INFL** of 1, few, or several spikes; spikes solitary, few, or several, sessile or pedunculate, staminate, pistillate, androgynous. **STAMINATE FLOWERS** borne above the pistillate ones, or gynaecandrous.



Cyperaceae Morphology

PISTILLATE FLOWERS with few to many imperfect, sessile or short-stipitate flowers; without perianth, the staminate ones reduced to 2 or 3 stamens, the pistillate ones consisting of a pistil, this enveloped in a closed scale or saclike perigynium or perigynia (plural) with the stigmas exserted through the apex (Hermann 1970; Hurd et al. 1998; Johnston 2001). About 1000 species. Cosmopolitan, especially temperate and cold wet places.

Munz and Keck, in *A California Flora* (1973), noted that hybridization in this genus has been recognized as common in parts of its range, but they also noted that instances of hybridization in California have been rarely observed or reported. Examination of numerous specimens for *A Utah Flora* (Welsh et al. 2003) and for this *Flora of the Four Corners* indicates hybridization is uncommon. The taxa treated are quite distinct. However, due to the large number of species and small differences between some of the species, identification can be difficult and hybridization assumed. Within some parts of the genus, including section *Ovales*, distinction of species can be particularly troublesome. There appears to be no way to construct a definitive key for separation in all cases. The interpretation of relative size of scales and perigynia and the shape of the beak of perigynia commonly used extensively in section *Ovales* appears to be more an art than a science. However, the taxa appear distinct when considering a composite of features that are sometimes difficult to encompass or combine in a key. Throughout the genus, slight morphological differences are often well supported by ecological and geographical differences (Hermann 1970). Distribution maps of *Carex* provided by Johnston (2001) were used extensively in preparation of this treatment. His maps (based on specimens) were considered valid documentation for inclusion in this flora.

1. Spike solitary; perigynia attached directly to the rachis ..... **Key 1**
1' Spikes more than 1; perigynia attached to a rachilla ..... (2)

2. Spikes all sessile, aggregated into a headlike or spikelike inflorescence ..... (3)
2' Lowest spike borne on a peduncle, other spikes sometimes also on peduncles ..... (6)

3. Stigmas 3; achenes trigonous; inflorescence with 3–5 spikes; terminal spike gynaecandrous, the lateral ones all pistillate ..... **Key 5**
3' Stigmas 2; achenes lenticular; inflorescence commonly with more than 5 spikes; spikes typically all androgynous or all gynaecandrous or all staminate or all pistillate ..... (4)

4. Spikes typically androgynous or the plants with well-developed, creeping rhizomes ..... **Key 2**
4' Spikes gynaecandrous; plants caespitose; rhizomes lacking or short ..... (5)

5. Perigynia round-margined, not winged, not conspicuously flattened, mostly less than 3.5 mm long; scales pale green to brown; inflorescence commonly less than 2 cm long and/or less than 1 cm wide; plants mostly of wet places ..... **Key 3**
5' Perigynia wing-margined, often conspicuously flattened, (2.5) 3.5–8 mm long; scales commonly brownish to dark brown, often with a green midrib; inflorescence often longer or wider than above; plants of dry or wet places (section *Ovales*) ..... **Key 4**

6. Terminal spike gynaecandrous, the lateral ones all pistillate or gynaecandrous with few staminate flowers; scales generally blackish ..... **Key 5**
6' Terminal spike and sometimes 1 or more lateral spikes staminate or androgynous; scales variously colored ..... (7)

7. Stigmas 2; achenes lenticular; scales often black or black-purple or with blackish lines flanking a greenish or pale midstripe, often contrasting with greenish or straw-colored perigynia ..... **Key 6**
7' Stigmas 3; achenes trigonous; scales greenish or brownish, or if blackish, then usually about the same color as the perigynia ..... **Key 7**

KEY 1

1. Spikes all staminate or all pistillate; perigynia pubescent ..... (2)
1' Spike androgynous; perigynia glabrous or puberulent (in *C. filifolia*) ..... (3)

2. Plants caespitose, 20–45 cm tall, often in hanging gardens in canyons below 1400 m (4600') ..... ***C. curatorum***
2' Culms arising singly or few together from rhizomes; plants 5–25 (30) cm tall, alpine above 3000 m (9840') ..... ***C. scirpoidea***

3. Stigmas 2; achenes lenticular ..... ***C. capitata***
3' Stigmas 3; achenes trigonous ..... (4)

4. Plants densely caespitose, often fasciculate; rhizomes lacking or nearly so; leaf blades rarely over 1 mm wide ..... (5)
4' Stems arising singly or few together from creeping rhizomes ..... (8)

5. Rachilla lacking; perigynia slightly spreading or widely so in age ..... ***C. pyrenaica***
5' Rachilla about equaling or longer than the achene; perigynia appressed or nearly so ..... (6)

6. Plants known from below 2300 m (7550') elevation; perigynia hirtellous above; spikes 1–4 cm long ..... ***C. filifolia***
6' Plants alpine or subalpine, known from above 3600 m (11800'); spikes 0.5–1.8 cm long ..... (7)

7. Perigynia with flattened margins; spike equaling or included in the leaves, the staminate part inconspicuous, 2–3 mm long ..... ***C. nardina***
7' Perigynia with rounded, somewhat involute margins; spike often exceeding the leaves, the staminate part 3–7 mm long ..... ***C. elynoides***

8. Perigynia 1 or 2 per spike, 5–6 mm long; staminate part of spike 1–2 (3) cm long ..... ***C. geyeri***
8' Perigynia either more numerous or smaller than above; staminate part of spike usually less than 1 cm long ..... (9)

9. Perigynia ascending, 1–6 per spike, these and scales persistent in age ..... ***C. obtusata***
9' Perigynia strongly spreading to reflexed at maturity, these and scales deciduous in age ..... (10)

10. Rachilla exserted beyond the orifice of the perigynium; scales and perigynia greenish or pale brown ***C. microglochin***
10' Rachilla obsolete; scales and perigynia blackish, at least in part ..... ***C. nigricans***

KEY 2

1. Inflorescence globose, with tightly compacted spikelets; plants known from above 3500 m (11500') elevation ..... (2)
1' Inflorescence spicate, not globose; plants known mostly from below 3500 m (11500') elevation ..... (3)

2. Perigynia ovate-elliptic, inflated; leaf blades to 1.5 mm wide ..... ***C. perglobosa***
2' Perigynia lanceolate, not inflated; leaf blades 2–4 mm wide ..... ***C. vernacula***

3. Culms arising singly or few together from creeping rhizomes ..... (4)
3' Plants caespitose; rhizomes lacking or short ..... (9)

4. Spikes mostly well separated from each other, about 5 mm long, each with 1–3 staminate and pistillate flowers; scales and perigynia green ..... ***C. disperma***
4' Spikes congested into a headlike or continuous spikelike inflorescence, mostly with more flowers and longer than above; scales and perigynia brownish to blackish ..... (5)

5. Perigynia winged; plants of coniferous forests and openings in forests ..... ***C. siccata***
5' Perigynia not winged or but slightly so; plants mostly not of forests ..... (6)

6. Perigynia 1.7–2.6 mm long, the beaks 0.2–0.5 mm long; plants usually of boggy meadows ..... ***C. simulata***
6' Perigynia or beaks longer than above; plants various ..... (7)

7. Rhizomes averaging 2–4 mm wide, blackish or dark brown; lower leaves reduced to bladeless sheaths, these blackish or dark brown; plants 10–70 cm tall ..... ***C. praegracilis***
7' Rhizomes averaging less than 2 mm wide, brownish; lower leaves with or without blades, the sheaths light brown or greenish; plants 8–28 cm tall ..... (8)

8. Plants unisexual, the spikes all staminate or pistillate; inflorescence 1.5–5 cm long ..... ***C. douglasii***
8' Plants bisexual, the spikes androgynous; inflorescence 0.8–2 cm long ..... ***C. duriuscula***

9. Inflorescence simple, the perigynia attached to a simple rachilla which is attached to the rachis ..... (10)
9' Inflorescence compound ..... (11)

10. Perigynia smooth and wingless; spikes with 3–7 perigynia ..... ***C. vallicola***
10' Perigynia usually minutely serrulate or slightly wing-margined in the upper 1/2; spikes with 4–12 perigynia ..... ***C. occidentalis***

11. Scales with awns 1–5 mm long ..... ***C. vulpinoidea***
11' Scales without awns ..... (12)

12. Perigynia 3.6–5.2 mm long ..... ***C. stipata***
12' Perigynia 2–3 mm long ..... ***C. diandra***

KEY 3

1. Inflorescence an ovoid head with internodes not greater than 1 mm long and concealed in the dense spikes; perigynia and scales dark brown to blackish in age ..... ***C. illota***
1' Inflorescence spikelike with at least the lower internodes generally over 1 mm long and conspicuous; perigynia greenish to dark brown ..... (2)

2. Perigynia widely spreading at maturity, the lower ones sometimes reflexed ..... (3)
2' Perigynia appressed ..... (4)

3. Beak of perigynium 1/4–1/3 (1/2) the length of the body, inconspicuously bidentate, with broad, short teeth; perigynia mostly 2.2–3.2 mm long ..... ***C. interior***
3' Beak of perigynium 1/2 or more the length of the body, conspicuously bidentate, the teeth narrow; perigynia mostly 2.8–3.5 (4) mm long ..... ***C. echinata***

4. Perigynia averaging over 3.5 mm long; inflorescence 4–6.5 cm long ..... ***C. deweyana***
4' Perigynia averaging less than 3.5 mm long; inflorescence various, but often shorter than above ..... (5)

5. Dorsal suture of perigynium 0.7–1.5 mm long, extending onto the distal part of the body of the perigynium; perigynia 2–3.5 mm long; pistillate scales as large as and covering the perigynia, brownish; spikes 2–4; plants mostly alpine or nearly so ..... ***C. bipartita***
5' Dorsal suture of perigynium mostly less than 0.7 mm long, mostly confined to the beak of the perigynium; perigynia 1.7–2.5 mm long; pistillate scales shorter and narrower than the perigynia, variously colored; spikes 4–10; plants mostly subalpine ..... (6)

6. Spikes 2–4, brownish or greenish brown; dorsal suture of perigynium extending the full length of the beak ..... ***C. praeceptorum***

6' Spikes generally 4–8, greenish, silvery green, pale gray, or sometimes turning brownish in age; dorsal suture of perigynium less than the length of the beak ..... ***C. canescens***

KEY 4

1. Inflorescence spicate, with 2–7 spikes; at least the lower spikes evident without teasing the inflorescence apart ....(2)
1' Inflorescence capitate, with 3–20 spikes, the spikes mostly closely aggregated such that individual spikes at least toward the center of the head are not distinguishable without teasing the head apart ..... (5)

2. At least the lower 2–3 spikes only 1–2 times longer than the associated internode; inflorescence rather flexuous, sometimes over 3 cm long; plants 40–80 cm tall ..... ***C. praticola***
2' Spikes mostly at least 2 times as long as the associated internodes; inflorescence mostly strict-erect, mostly less than 2.5 cm long; plants various ..... (3)

3. Plants with short, stout rhizomes ..... ***C. tahoensis***
3' Plants densely caespitose, without rhizomes ..... (4)

4. Plants montane in big sagebrush and aspen belts ..... ***C. petasata***
4' Plants subalpine and alpine in the San Juan Mountains ..... ***C. phaeocephala***

5. Perigynia 5.5–7.5 mm long and 2.5–3.8 mm wide; inflorescence with 3–8 spikes, these ovate or nearly globose and 9–15 mm long ..... ***C. egglestonii***
5' Perigynia shorter or narrower than above or both; inflorescence with about 3–20 spikes, these of various shape and size, but often shorter than above or not ovate or globose ..... (6)

6. Lowest bract exceeding the inflorescence ..... ***C. athrostachya***
6' Lowest bract inconspicuous or at least much shorter than the inflorescence ..... (7)

7. Beak of perigynia flattened ..... (8)
7' Beak of perigynia terete ..... (9)

8. Perigynia 2.3–3.7 mm long ..... ***C. bebbii***
8' Perigynia 4.5–5.5 mm long ..... ***C. arapahoensis***

9. Perigynia sharp-edged but not wing-margined, entire, 2.5–3 mm long; inflorescence 0.8–1.4 cm long, dark brown to blackish ..... ***C. illota***
9' Perigynia wing-margined, mostly 3–7.1 mm long; inflorescence sometimes longer than above ..... (10)

10. Spikes averaging over 10 mm long, the lower 1 or 2 commonly 11–13 and up to 15 mm long, elliptic or lanceolate, smooth with the perigynia appressed; inflorescence often cuneate at the base; perigynia 5.2–7.1 mm long, about 1–2 mm wide ..... ***C. ebenea***
10' Spikes averaging less than 10 mm long, the larger ones rarely over 11 mm long, ovate to nearly globose; inflorescence various; perigynia often shorter or wider than above or both ..... (11)

11. Perigynia usually averaging over 2.2 mm wide, up to 3 mm wide, the body brown to dark brown, the winged margins sometimes greenish; scales about as dark as the perigynia; inflorescence usually not conspicuously bicolored; plants mostly alpine ..... ***C. haydeniana***
11' Perigynia averaging less than 2.2 mm wide, up to 2.4 mm wide, the body often greenish; scales often darker than the perigynia until after maturity; inflorescence commonly strongly bicolored; plants commonly midmontane in the aspen and coniferous forest belts ..... (12)

12. Perigynia readily deciduous upon maturity, plano-convex, the perigynial cavity nearly filled by the plump achene ..... ***C. pachystachya***
12' Perigynia persistent well after maturity, strongly flattened except where extended by the relatively small achene ..... ***C. microptera***

KEY 5

1. Spikes congested into a dense head, the internodes of the rachis obsolete or short and hidden in the closely aggregated spikes; plants generally high montane to alpine ..... (2)
1' At least the lowest spike separated from the others by a conspicuous rachis internode; plants various ..... (3)

2. Perigynia 1.1–1.8 mm wide, often somewhat inflated, often without flattened margins or these inconspicuous, the width nearly filled by the mature achene ..... ***C. nelsonii***
2' Perigynia 2–3 mm wide, strongly flattened, with conspicuous flattened margins, conspicuously wider than the mature achene ..... ***C. nova***

3. Pistillate scales aristate, the awn-point 1–2 mm long ..... ***C. buxbaumii***
3' Scales not aristate ..... (4)

4. Culms arising singly or few together from long-creeping rhizomes, these covered with a yellowish feltlike tomentum; scales greenish brown; spikes spreading or drooping on slender peduncles ..... ***C. magellanica***
4' Culms tufted; rhizomes lacking or short; scales usually blackish; spikes various ..... (5)

5. Spikes not over 1.3 cm long; perigynia 2–2.8 mm long, green at maturity and strongly contrasting with the dark scales ..... ***C. norvegica***
5' At least one spike generally over 1.3 cm long and/or the perigynia over 2.8 mm long, the perigynia variously colored ..... (6)

6. Lateral spikes erect or nearly so; plants of hanging gardens of canyons ..... (7)
6' Lateral spikes spreading to pendulous; plants mostly montane ..... (8)

7. Achenes mostly lenticular; stigmas mostly 2; lateral spikes more or less of equal length; leaves comparatively lax; culms various but often less than 1 mm thick, also often lax compared to those of the following taxon ..... ***C. specuicola***
7' Achenes mostly trigonous; stigmas mostly 2; lateral spikes commonly unequal; leaves and culms comparatively rigid, the culms commonly over 1 mm thick ..... ***C. parryana***

8. Perigynia whitish green, rarely with red markings, strongly contrasting with the shorter, dark scales; lateral spikes ascending, spreading, or drooping at maturity, each usually on a slender peduncle, at least some in each inflorescence commonly gynaecandrous ..... ***C. bella***
8' Perigynia olive-green or commonly marked with dark red, purple, or black, often about as dark as the scales distally; lateral spikes ascending to erect, the upper ones commonly sessile or short-pedunculate, all pistillate or infrequently gynaecandrous in *C. heteroneura* ..... (9)

9. Perigynia 2.7–3.5 mm long, 1.6–2.1 mm wide, consistently papillate, sometimes completely black or black-purple at maturity; lowest rachis internode 0.2–1 cm long; lowest spike sessile or on a peduncle to about 0.3 cm long, the upper ones sessile or subsessile; plants 10–28 cm tall ..... ***C. albonigra***
9' Perigynia mostly more than 3.5 mm long or over 2.1 mm wide, rarely papillate, sometimes greenish at maturity; lowest internode of the rachis about 0.3–7 cm long; lowest spike sessile or on a peduncle to 4.5 cm long; plants (2) 2.5–10 dm tall ..... (10)

10. Perigynia flattened, broadly elliptic, ovate, or obovate, mostly suffused with dark purple or black, mostly wider than the mature achene; plants widespread ..... ***C. heteroneura***
10' Perigynia not flattened, lanceolate or narrowly elliptic, olive-green, becoming yellow-brown at maturity, seldom suffused with dark purple or black except the beak, not much wider than the mature achene ..... ***C. atrosquama***

KEY 6

1. Scales pale green; lowest peduncle enveloped at the base by a closed sheath 2–6 mm long, often originating on the lower 1/2 of the culm ..... ***C. aurea***
1' Scales darker or with at least a dark midrib; lowest peduncle not in a closed sheath, or if so, the sheath less than 2 mm long, mostly originating from the upper 1/2 of the culm ..... (2)

2. Pistillate spikes 1 or 2, 6–15 mm long; plants with mostly gynaecandrous terminal spikes, these occasionally all staminate; plants mostly of hanging gardens ..... ***C. specuicola***
2' Pistillate spikes generally more numerous or some usually over 15 mm long; habitat various ..... (3)

3. Style strongly bent at maturity and persistent on the achene, mature perigynia about as dark as the scales, slightly inflated; stigmas 2 and 3 ..... ***C. saxatilis***
3' Style not strongly bent, deciduous; perigynia various but often greenish or at least paler than and strongly contrasting with the dark scales (except in *C. scopulorum*); stigmas 2 ..... (4)

4. Plants tufted, with numerous fibrous roots, without rhizomes, the larger roots covered with yellowish or yellow-brown feltlike hairs; pistillate spikes 3–4 mm wide; perigynia rather quickly deciduous after maturity ..... ***C. lenticularis***

4' Culms arising singly or few together from long-creeping rhizomes; fibrous roots comparatively few, lacking feltlike hairs or these whitish; pistillate spikes various but often wider than above; perigynia persistent or deciduous ....(5)

5. Midrib of pistillate scales conspicuous throughout the length of the scale, commonly projected beyond the scale as a mucronate tip 0.5–1 mm long; perigynia nerved on both sides as well as on the margins; plants of valleys to midmontane ..... ***C. nebrascensis***

5' Midrib of pistillate scales commonly faint toward the apex of the scale, not or rarely projected into a mucronate tip; perigynia nerveless except on the margins; elevation various .....(6)

6. Lowest bract generally shorter than the inflorescence; mature pistillate scales dark brown or blackish throughout or with a slender pale midvein; mature perigynia usually about as dark as the scales at least where exposed beyond the scales; pistillate spikes often 5 mm wide or wider ..... ***C. scopulorum***

6' Lowest bract usually equaling or exceeding the inflorescence; pistillate scales usually with conspicuous, greenish or lighter midveins; mature perigynia greenish or suffused with red or red-brown but usually not as dark as the outer portions of the scales; pistillate spikes 3–5 mm wide .....(7)

7. Ligule acute, elongate; light central area of pistillate scales usually much narrower than the outer dark portions on either side; perigynia persistent through the summer; beak of perigynium often with a reddish or dark ring at the apex; plants midmontane to high montane ..... ***C. aquatilis***

7' Ligule truncate or broadly rounded; light central area of pistillate scales as wide or wider than the outer dark portions; perigynia often deciduous in early summer; beak of perigynium often white throughout, occasionally darker at the apex; plants of lower elevations, often along ditches ..... ***C. emoryi***

KEY 7

1. Perigynia pubescent .....(2)

1' Perigynia glabrous .....(5)

2. Fertile culms alike, bearing both staminate and pistillate spikes; basal spikes absent; plants with creeping rhizomes .....(3)

2' Fertile culms of 2 types, some short and hidden in the leaf bases and bearing only pistillate spikes, others elongate and equaling or exceeding the leaves and bearing a terminal staminate spike as well as laterally pistillate spikes; plants densely caespitose .....(4)

3. Plants to 23 cm tall, of well-drained uplands; pistillate spikes 7–10 mm long, with 5–15 perigynia ..... ***C. inops***

3' Plants mostly over 23 cm tall, riparian or near riparian; pistillate spikes over 10 mm long, with more than 15 perigynia ..... ***C. pellita***

4. Bract of lowest nonbasal pistillate spike leaflike, commonly exceeding the inflorescence ..... ***C. rossii***

4' Bract of lowest nonbasal pistillate spike commonly not exceeding the inflorescence ..... ***C. geophila***

5. Style continuous with, persistent on, and of the same firm texture as the achene, not withering; staminate spikes more than 1 and/or usually 2.1–8.5 cm long .....(6)

5' Style jointed to, deciduous from, and of softer texture than the achene, withering; staminate spikes mostly 1, 0.3–2.1 cm long .....(11)

6. Leaf sheaths pubescent; style straight ..... ***C. atherodes***

6' Leaf sheaths glabrous; style curved to strongly bent in age .....(7)

7. Pistillate scales narrowed to a serrulate-ciliolate awn ..... ***C. hystericina***

7' Pistillate scales not awned .....(8)

8. Pistillate scales soon purple-black or black except for the hyaline acute tip; styles 2 or 3; achenes lenticular or trigonous ..... ***C. saxatilis***

8' Pistillate scales green, stramineous, reddish brown, or if (rarely) dark brown then usually acuminate or caudate-acuminate; styles 3; achenes trigonous .....(9)

9. Inflorescence 5–13 cm long; spikes crowded, the pistillate ones longer than the rachis internodes; lowest bract 2–3 times longer than the inflorescence; perigynia 7–10 mm long ..... ***C. retrorsa***
9' Inflorescence commonly over 13 cm long; spikes not crowded, pistillate spikes from shorter than to longer than the rachis internodes; lowest bract 1–2 times longer than the inflorescence; perigynia 4–7 mm long ..... (10)

10. Perigynia spreading at maturity, the ellipsoid to subglobose body more or less abruptly contracted to a conspicuous beak; culms arising singly or few together from long-creeping rhizomes ..... ***C. utriculata***
10' Perigynia appressed or slightly ascending, the lanceolate to ovate body gradually tapering to the often poorly defined beak; culms tufted, rhizomes lacking or short (north of the Four Corners) ..... *C. vesicaria*

11. Peduncle of the lowest and often of the upper pistillate spikes enveloped in a closed sheath 0.4–2 (4) cm long ..... (12)
11' Peduncle of the lowest and other spikes not in a closed sheath or this less than 0.4 cm long ..... (13)

12. Pistillate spikes sessile or on erect or ascending peduncles, all crowded or the lowest one sometimes separate; inflorescence 2–5 (10) cm long; staminate spike 0.7–2.1 cm long ..... ***C. viridula***
12' Pistillate spikes borne on capillary, spreading or drooping peduncles, remote; inflorescence 5–30 cm long; staminate spike 0.3–0.9 cm long ..... ***C. capillaris***

13. Pistillate spikes 4–6 mm long, sessile; perigynia widely spreading, greenish; scales greenish or pale; plants caespitose ..... ***C. interior***
13' Pistillate spikes longer than 6 mm and/or at least one on a conspicuous peduncle; perigynia or scales or both brownish or blackish ..... (14)

14. Pistillate spikes sessile or on erect or strongly ascending peduncles; culms various ..... ***C. parryana***
14' Pistillate spikes borne on slender, spreading to drooping peduncles; culms arising singly or few together from long-creeping, slender rhizomes; roots and rhizomes covered with a feltlike tomentum ..... (15)

15. Terminal spike 4–12 mm long, occasionally with a few perigynia at the base; pistillate scales narrower than and longer than the perigynia; leaves mostly with well-developed blades ..... ***C. magellanica***
15' Terminal spike (10) 15–21 (27) mm long, staminate only; pistillate scales as wide as the perigynia and barely exceeding them in length; lower leaves commonly bladeless ..... ***C. limosa***

Carex albonigra Mack. (white and black) White and black sedge. Plants (10) 15–28 cm tall, the culms tufted; rhizomes lacking or short. **LEAVES** basal and on the lower culms, the blades 1–5 mm wide, bract shorter than the inflorescence. **INFL** (1) 1.5–3 cm long, surpassing the leaves, the lowest internode 2–10 mm long; spikes 3 (2–4), 8–15 mm long, 3–6 mm wide, elliptic to narrowly ovate, the terminal gynaecandrous, often a little larger than the lateral pistillate ones, the lowest one sessile on a peduncle to 3 mm long, the others sessile or subsessile; pistillate scales subequal to or shorter than the perigynia, black or blackish purple, with white hyaline margins, the midrib sometimes greenish or pale. **PERIGYNIA** 2.7–3.5 mm long, 1.6–2.1 mm wide, elliptic to nearly orbicular, papillate (at least apically), black or blackish purple throughout; stigmas 3; achenes trigonous, sessile or nearly so. High mountains in fell-fields, dry and wet meadows, and alpine tundra. COLO: Lpl. 3740 m (12265'). Flowering: Jul–Aug. Alaska and Northwest Territories south to California and Arizona. Known from one collection west of Trimble Pass near the head of Missouri Gulch, *O'Kane and Jamieson 7964*. *Carex albonigra* appears to be allied to *C. heteroneura* L., but it is consistently smaller, always of high elevations, and does not show the variation found in *C. heteroneura*. The perigynia are always papillate, but only occasionally and randomly papillate in *C. heteroneura*. Although apparently a distinct taxon, *C. albonigra* seems to pass into both *C. heteroneura* and *C. nova*. *Carex heteroneura* is much more common than *C. albonigra* in the Four Corners region.

Carex aquatilis Wahlenb. (living in water) Water sedge. Plants (0.6) 1.5–9.5 dm tall, from thick, long rhizomes; culms tufted or arising singly or few together. **LEAVES** on the lower 1/2 of the culms, the blades 1.5–5.5 mm wide, shorter than to exceeding the culms; bracts leaflike, the lowest shorter than, subequal to, or surpassing the inflorescence. **INFL** 3–19 cm long with 1–2 (3) staminate spikes above 2–3 (5) pistillate spikes, the transitional ones often androgynous; terminal staminate spike 1–3.5 cm long, the first lateral one 0.8–1.8 cm long, the second lateral one, if present, mostly larger than the first; pistillate spikes (0.7) 1.5–4.5 (7) cm long, 3–5 mm wide; pistillate scales blackish or blackish purple, shorter to longer and narrower than the perigynia, lanceolate to ovate, acute to acuminate or rather rounded at the tip, entire, the midrib green or pale or colored like the scale, not raised, not excurrent. **PERIGYNIA** numerous, 2–3.3 mm long including the beak, elliptic to obovate, more or less flattened, marginally nerved only, light green or

stramineous in age, often speckled or suffused with reddish brown, minutely granular-muricate, the beak 0.1–0.3 mm, entire or oblique but not bidentate or ciliolate; stigmas 2. **ACHENES** lenticular, shorter and usually narrower than the perigynia. $2n = 76$. Wet and boggy meadows, along streams, and margins of ponds and lakes. ARIZ: Apa; COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 2500–3750 m (8200–12300′). Flowering: Jun–Aug. Circumboreal, south in North America to California and New Jersey. Highly selected forage species by livestock, elk, and likely moose.

Carex arapahoensis Clokey (of the Arapaho) Arapaho sedge. Plants 12–30 cm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower culms, the blades 1.5–4 mm wide, flat or nearly so; lowest bract lacking. **INFL** 1–2 cm long; capitate, equaling or surpassing the leaves, the lowest internode of the rachis about 2–6 mm long; spikes usually 3–6, gynaecandrous, 8–12 mm long, sessile, closely aggregated but more or less distinct; pistillate scales equaling or longer than and as wide or wider than the perigynia, brown, with a pale midrib and hyaline margins. **PERIGYNIA** 4.5–5.5 mm long, 2–2.5 mm wide, more or less elliptic to ovate or elliptic-obovate, flattened, with thin winged margins, the wings extending onto the beak, serrulate at least in the distal 1/4–1/2, finely nerved on both sides, dark reddish brown; stigmas 2. **ACHENES** lenticular. Alpine communities. COLO: LPl, Mon, SJn. 3350–3720 m (11000–12200′). Flowering: Jul–Aug. Wyoming, Colorado, and eastern Utah.

Carex atherodes Spreng. (a beard or awn) Awned sedge, wheat sedge. Plants 4–15 dm tall; culms arising singly or few together from robust, creeping rhizomes. **LEAVES** distributed along the culms, the sheaths villous-hirsute, or sometimes only toward the ventral summit, the blades 4–12 mm wide. **INFL** to 45 cm long with well-spaced spikes mostly shorter than the internodes or the upper ones longer; upper 2–4 spikes staminate, 2.5–5 cm long, sessile or nearly so, except the terminal on a peduncle to 3 cm long; lower spikes pistillate or the intermediate ones sometimes androgynous, cylindrical, 5.5–9 cm long, about 10 mm wide, on peduncles 1–11 cm long, the lower ones enveloped in a closed sheath up to about 9 cm long; pistillate scales aristate-awned, the awn 1–5 mm long and subequal to the perigynia, the body pale, rather scarious, narrower than the perigynia. **PERIGYNIA** 7–10 mm long, lanceolate or lance-ovate, inflated below, conspicuously ribbed, ascending, with a bidentate beak, the teeth 1.5–3 mm long and often more or less divergent; stigmas 3. **ACHENES** trigonous, style continuous with, persistent on, and of the same firm texture as the achene, more or less contorted in age. $2n = 74$. Wet, low ground. The one specimen seen (*Heil 13399B* SJNM) was from along the Piedra River Trail. COLO: Arc, Hin. 2590–3375 m (8500–11080′). Flowering: Jun–Jul. Circumboreal, south in America to New York, Colorado, and Oregon.

Carex athrostachya Olney (of a single spike) Slender-beak sedge. Plants 10–52 cm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower culms, the blades 1–3 mm wide, flat or channeled; lowest bract (at least) subequal to or surpassing the inflorescence, but not uncommonly shorter, or broken and appearing shorter. **INFL** 1–2.5 cm long, 8–15 mm wide, capitate, usually exserted beyond the leaves, the lowest internode 1–3.5 mm long; spikes about 3–15, gynaecandrous, 5–10 mm long, about 5 mm wide, sessile, tightly aggregated, much longer than and concealing the internodes of the rachis, not, or hardly, evident without dissecting the inflorescence or the lower ones conspicuous; pistillate scales subequal to and almost as wide as the perigynia, brown with a green or pale midstripe and with or without narrow hyaline margins. **PERIGYNIA** 3.5–4.5 mm long, 1–1.5 mm wide, lanceolate or narrowly ovate, flattened, with winged margins, slightly nerved dorsally and sometimes ventrally, greenish, serrulate at least in the distal 1/2, tapered into a more or less terete, often brownish beak; stigmas 2. **ACHENES** lenticular. Drying mud of ephemeral pools, margins of ponds and lakes, and aspen-spruce, forb-grass, and wet meadow communities. ARIZ: Apa; COLO: Arc, Hin, Min, SJn; NMEX: McK, SJn; UTAH. 2470–2805 m (8100–9200′). Flowering: Jun–Aug. Alaska to Saskatchewan, south to California and Colorado.

Carex atrosquama Mack. (dark scale) Dark-scale sedge. Similar to *C. heteroneura*, but with **PERIGYNIA** lanceolate or narrowly elliptic, not flattened, olive-green, becoming yellow-brown at maturity, seldom suffused with dark color except for the beak, not much wider than the mature achene. [*C. atrata* L. subsp. *atrosquama* (Mack.) Hultén]. Mountain meadows and alpine slopes. COLO: LPl, SJn. 2525–3635 m (8000–12000′). Flowering: Jul–Aug. British Columbia to Montana and south to Colorado.

Carex aurea Nutt. (golden) Golden sedge. Plants 4–40 (65) cm tall; culms tufted or arising singly or few together from slender pale rhizomes. **LEAVES** borne on the lower culms, the blades 1–4 mm wide, flat, surpassing or shorter than the inflorescence; bracts leaflike, with sheathing bases, some usually equaling or exceeding the inflorescence, the lowest with a closed sheath 2–6 mm long or longer. **INFL** with terminal spike staminate or often gynaecandrous, rarely androgynous, 0.4–1.5 (2) cm long, 2–3 mm wide, with peduncles 0.4–2 cm long; lateral spikelets 1–3 (4), pistillate, 0.5–2.5 cm long, 3–5 mm wide, usually well spaced and pedunculate; peduncles filiform or capillary, commonly 0.3–7 cm

long, or the lowest one arising at or near the culm base and to 11 cm long, this often enclosed in a long sheath; pistillate scales shorter than the perigynia, greenish or brown with a green or pale center. **PERIGYNIA** 4–18, 1.7–3 mm long, ellipsoid to obovoid-globose, pale green and whitish papillate when young, sometimes turning golden and somewhat fleshy in age; stigmas 2, rarely 3. **ACHENES** lenticular. $2n = 52$. [*C. garberi* Fernald var. *bifaria* Fernald; *C. hassei* L. H. Bailey]. Around seeps and springs, along streams, wet meadows, and hanging gardens. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1110–3445 m (3650–11300'). Flowering: Mar–Jul. Alaska to Newfoundland south to New Mexico and Pennsylvania. Tall specimens from the Canyonlands of the Colorado River are somewhat similar in appearance to *C. aquatilis*. Such specimens might be referred to as *C. hassei*. However, the numerous specimens seen show a continuum in size from small to quite large, and the color (golden versus green) of the perigynia seems poorly correlated with any other feature including habitat (Cronquist et al. 1977).

Carex bebbii (L. H. Bailey) Olney ex Fernald (for M. S. Bebb) Bebb sedge. Plants 3–7 dm tall, densely tufted; rhizomes lacking. **LEAVES** borne on the lower culms, the lower reduced to bladeless sheaths or with short blades, the upper ones with blades 2–4 mm wide. **INFL** 1–3 cm long, 5–12 mm wide, subequal to or surpassing the leaves, without a subtending bract, the lowest internode of the rachis 3–4 mm long; spikes usually 4–12, gynaecandrous, 5–9 mm long, sessile, closely aggregated but more or less evident without dissecting the inflorescence, equal to or to 3 times as long as the rachis internodes; pistillate scales shorter and narrower than the perigynia, stramineous to light brown, with a greenish or pale midrib, the margins hyaline or not. **PERIGYNIA** 2.3–3.7 mm long, 1–1.2 mm wide, pale green to stramineous, flattened, with thin winged margins, the wings extending to near the ill-defined, flattened beak apex, serrulate, densely crowded in the spike and spreading-ascending; stigmas 2. **ACHENES** lenticular. $2n = 68$. Local in moist, swampy meadows. COLO: Hin, LPl, Min, SJn. 2440–3050 m (8000–10000'). Flowering: Jun–Jul. British Columbia to Newfoundland and south to Oregon, Colorado, and New Jersey.

Carex bella L. H. Bailey (beautiful) Beautiful sedge. Plants 20–68 cm tall, tufted, rhizomes lacking or short. **LEAVES** basal and on the lower culms, the blades 1–5 mm wide, flat; lower bract usually leaflike, typically shorter than or subequal to the inflorescence, or infrequently to 2.5 cm longer than the inflorescence, with a sheathing base about 3–4 mm long, the scarious margins of the sheath free or nearly so. **INFL** somewhat flexuous and tending to nod, 4–7 cm long or longer; spikes (2) 3–4, commonly gynaecandrous, pedunculate, more or less cylindrical, 1–3.2 cm long, 3–6 mm wide, the uppermost usually with a conspicuous but short staminate portion, subsessile to peduncled; the lateral ones usually with only a few stamens and infrequently all pistillate; peduncles slender-flexuous, the lower ones shorter to longer than the spikes, the lowest one rarely arising near the base of the culm; pistillate scales shorter than the perigynia, blackish or black-purple, the pale midrib obscure or slightly keeled, especially apically and sometimes excurrent as a mucro. **PERIGYNIA** 2.8–4 mm long, broadly oval to oblong-oval, flat but swollen by the ripening achene, green and strongly contrasting with the dark scales; stigmas 3. **ACHENES** trigonous. Krummholz meadows, subalpine meadows, stream sides in spruce-fir forest, clearcuts and other openings in forests. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2620–3610 m (8600–11850'). Flowering: Jul–Aug. Colorado and South Dakota, south to Arizona, New Mexico, and Mexico.

Carex bipartita All. (two parts) Bipartite sedge. Plants 5–20 cm tall, tufted, rhizomes lacking or short. **LEAVES** basal and on the lower culm, the blades 0.5–2 mm wide; lowest bract lacking or shorter than the first spike. **INFL** 1–1.5 cm long, 0.5–1 cm wide, surpassing the leaves; spikes 2–4, gynaecandrous, 0.5–1 cm long, 3–5 mm wide, sessile, approximate, longer than the internodes of the rachis, but evident in the inflorescence; pistillate scales subequal to and as wide as the perigynia, largely concealing them, except for the beak, brown to blackish purple-brown, with hyaline margins and usually a pale midstripe. **PERIGYNIA** 2.4–3.4 mm long, elliptic to obovate, more or less concavely tapered to a short beak to 0.7 mm long, the dorsal suture extending from the beak to the distal portion of the body, more or less flattened but with rounded margins, finely several-nerved on each side, yellow-green to brown-green with the nerves often brown-red, finely granular-roughened, ascending, about 10–20 per spike; stigmas 2. **ACHENES** lenticular. [*C. lachenalii* Schkuhr]. One specimen seen (*C. Holmes 877a*, SJNM) is from Hermosa Creek, Cascade Divide. Meadows and swamps from spruce-fir to alpine communities. COLO: LPl, SJn. 3595–3810 m (11800–12500'). Flowering: Jul–Aug. Alaska to Greenland south to Utah and Colorado in the Rocky Mountains and to New Brunswick. With brownish scales, reddish-nerved perigynia, approximate spikes, and alpine habitat, plants of *C. bipartita* are more like those of *C. praeceptorum* than they are like those of *C. canescens*.

Carex buxbaumii Wahlenb. (for Johann Christian Buxbaum, 1693–1730, professor of botany) Buxbaum sedge. Plants 3–5.5 dm tall, the culms arising singly or 2–3 together and well spaced on long-creeping rhizomes. **LEAVES** all cauline,

borne on the lower culms, the lower ones reduced to bladeless sheaths, the blades 1–3 mm wide; lowest bract leaflike, shorter than to exceeding the inflorescence by 2 cm. **INFL** 3.5–6.5 cm long, mostly surpassing the leaves; spikes 3–4, 0.7–2.2 cm long, 4–8 mm wide, ovoid to nearly cylindrical, erect or strongly ascending, the terminal one gynaecandrous, longer than its peduncle, the lower ones pistillate, sessile or longer than their peduncles, each slightly shorter or exceeding the internode it subtends; pistillate scales conspicuously aristate, the awn-point about 1–2 mm long, the body usually shorter than the perigynia, but with the awn exceeding it, brownish purple or blackish purple, with a greenish midrib. **PERIGYNIA** 2.5–4 mm long, elliptic or elliptic-obovate, faintly nerved; stigmas 3. **ACHENES** trigonous. The two specimens seen (*K. Heil 14073, S. L. O'Kane 4952*, both SJNM) were from peaty wetlands at Andrews Lake. COLO: SJn. 3280 m (10760′). Flowering: Jul–Aug. Circumboreal, south in America to California and North Carolina.

Carex canescens L. (grayed) Silvery sedge. Plants 18–50 cm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower culms, the blades 1.5–3.1 mm wide; lowest bract lacking or mostly shorter than the first spike and never exceeding the second one. **INFL** 1.4–5.2 cm long, 0.5–1 cm wide, spikelike, equaling or surpassing the leaves; spikes 4–8, androgynous, 0.5–1.4 cm long, 2.5–5 mm wide, sessile, more or less cylindrical, greenish or silver, approximate or the lower ones spaced, equal to or longer than the internodes or the lowermost rarely shorter; pistillate scales usually conspicuously shorter than the perigynia, pale green or silvery, mostly hyaline except for the green midstripe, sometimes pale brown in age. **PERIGYNIA** 1.8–2.5 mm long, 1–1.2 mm wide, elliptic to elliptic-ovate, more or less compressed but with rounded (wingless) margins, greenish, yellow-green, or grayish green, sometimes brownish toward the beak, finely nerved on both sides, the nerves green or rarely pale brown, (10) 15–32 per spike, quite noticeably granular-roughened distally, very short-beaked, the beak granular-roughened and often serrulate (use high magnification), the dorsal suture evident only on the beak, if at all; stigmas 2. **ACHENES** lenticular. $n = 28, 36$. Wet meadows and other riparian or lacustrine communities. COLO: Arc, Con, Hin, LPl, SJn. 2925–3735 m (9600–12250′). Flowering: Jul–Aug. Circumboreal, south in America to California and Virginia.

Carex capillaris L. (hairlike) Hair sedge. Plants 5–70 cm tall, densely caespitose from short rhizomes; culms slender, rather weak. **LEAVES** basal and on the lower culm, or 1 above the middle, the blades 1–3 mm wide; lowest bract foliose, shorter than the inflorescence, strongly sheathing, the sheath closed for 9–20 mm. **INFL** 5–30 cm long, surpassing the leaves; terminal spike staminate, rarely gynaecandrous, 3–9 mm long, borne on a capillary peduncle 1–5 cm long; lateral spikes pistillate, 6–11 mm long, with 5–25 perigynia, borne on capillary spreading to drooping peduncles to 3.5 cm long, each peduncle enveloped basally by the closed sheath of the subtending bract, the lowest spike and peduncle together much shorter than the accompanying internode of the rachis; pistillate scales 1/2–3/4 as long as the perigynia, with broad hyaline margins and greenish centers or greenish midstripe flanked by light reddish brown stripes. **PERIGYNIA** 2.4–3.3 mm long, more or less elliptic or lance-ovate, more or less rounded, the marginal nerves rather prominent, green at first, turning a glossy brown; stigmas 3. **ACHENES** trigonous, not filling the distal part of the perigynia. $2n = 50, 52, 54$. Moist and wet places, often in shade. COLO: LPl, SJn. 2670–3655 m (8760–12000′). Flowering: Jul–Aug. Circumboreal and south in America to New Mexico and New York.

Carex capitata L. (flowers form in a headlike cluster) Capitate sedge. Plants 5–20 cm tall, with culms closely spaced on short rhizomes. **LEAVES** borne on the lower 1/4 of the culms, the lower ones often reduced to bladeless sheaths, the upper ones with blades to about 1 mm wide, involute, filiform; bract lacking. **INFL** a solitary spike, erect, androgynous, 4–10 mm long, 3–7 mm wide, with 6–25 perigynia, the staminate short or elongate; pistillate scales shorter and narrower than the perigynia, dark brown with broad hyaline margins. **PERIGYNIA** 2–3.5 mm long, ovate to suborbicular, conspicuously beaked; rachilla about reaching the beak of the perigynia; stigmas 3. **ACHENES** trigonous, not filling the perigynia. Subalpine and alpine peat fens. COLO: SJn. 3625 m (11900′). Flowering: Jul–Aug. The single specimen seen (*G. Rink 3668*, SJNM) is from the north side of Vestal Peak. British Columbia and Alberta south to Utah and Colorado.

Carex curatorum Stacey (reference uncertain) Canyonlands sedge. Plants caespitose, shortly if at all rhizomatous, dioecious, 2–4.5 dm tall. **LEAVES** with sheaths puberulent, hyaline, purplish black to chestnut at culm base, lower leaves reduced to bladeless sheaths, upper leaves with blades 1–4 mm wide, flat; lowermost bract of inflorescence mostly lacking or rarely to 1.5 cm long, the sheath short, open. **INFL** a solitary spike, erect or nearly so, the staminate 2.5–3 cm long, 3 mm wide, the pistillate 2.5–4.5 cm long, 3–5 mm wide; pistillate scales oblong or lance-ovate, shorter than the perigynia, reddish purple, with lighter center and narrow hyaline margins. **PERIGYNIA** 3.2–4.5 mm long, (1.8) 2–2.3 (2.7) mm wide, broadly elliptic or obovate to nearly orbicular, abruptly contracted into a bidentate hyaline beak, blackish purple distally, greenish below, conspicuously pubescent with translucent hairs; stigmas 3. **ACHENES** trigonous. Hanging gardens and canyons along the Colorado and San Juan rivers. UTAH. 1100–1340 m (3600–4400′). Flowering: Jun–Jul. Southern Utah and northern Arizona.

Carex deweyana Schwein. (for Chester Dewey) Dewey sedge. Culms 40–70 cm tall, tufted; rhizomes lacking or short. **LEAVES** borne on the lower 1/3 of culms, the blades 1–3 mm wide, flat; lowest bract lacking or present and shorter than or subequal to the inflorescence. **INFL** 4–6.5 cm long, about 0.5–1 cm wide, spikelike, equaling the leaves or surpassing them; spikes 4–6 (10), gynaecandrous, 0.7–1.6 cm long, 4–6 mm wide, pale green, sessile, the lowest one usually remote, subequal to or to 2.5 times shorter than the internode, the upper ones remote or approximate, but individually evident without dissecting the inflorescence; staminate flowers few, their scales rather closely appressed to a peduncle-like portion of the rachis; pistillate scales as long as the body of the perigynia, pale green or slightly stramineous, often largely hyaline, with a darker green midrib, this sometimes excurrent. **PERIGYNIA** 3.8–4.6 mm long, 1–1.2 mm wide, lanceolate to lance-elliptic, pale green, the margins not winged or scarcely so distally, the marginal nerves prominent, raised, sometimes slightly extended onto the ventral surface, the dorsal ribs conspicuous, the ventral lacking to obscure, the body tapering to a serrulate bidentate beak with teeth to 0.4 mm long; stigmas 2. **ACHENES** lenticular, 1.5–2 mm long. *Populus-Salix* and other riparian communities. COLO: Arc, Con, Hin, Min. 1830–3385 m (6000–11100'). Flowering: Jun–Aug. Alaska to Newfoundland, south to California, Colorado, and Pennsylvania.

Carex diandra Schrank (with 2 stamens) Lesser panicled sedge. Plants 3–10 cm tall, caespitose, with short rhizomes. **LEAVES** borne on the lower culm, the lowermost reduced to bladeless sheaths, the upper with elongate blades 1–2.5 (3) mm wide, these subequal to or surpassing the inflorescence, flat or nearly so. **INFL** 1–6 cm long, 7–10 mm wide, compound but spikelike; spikes crowded, scarcely evident without dissecting the head, about 3–5 mm long, few-flowered, androgynous, pistillate scales rather hyaline, brownish or stramineous, the midrib firmer and sometimes projected as an aristate awn. **PERIGYNIA** 2.4–3 mm long, lance-ovate or lance-truncate, short-stipitate, gradually to abruptly tapered to a serrulate beak, the dorsal suture sometimes extended into a membranous keel, this usually conspicuous toward the apex, the body thick-walled, dark brown, shiny; stigmas 2. **ACHENES** lenticular. The one specimen seen (*Heil 19507* SJNM) is from a riparian community at Pastorius Reservoir. COLO: LPl. 2105 m (6900'). Flowering: Jun–Aug. Circumboreal, south in America to California and Pennsylvania.

Carex disperma Dewey (two-seeded) Softleaved sedge. Culms 10–45 cm long, densely tufted, from short slender rhizomes, rather flaccid or flexuous. **LEAVES** basal and on the lower culms, the blades 0.5–2 mm wide. **INFL** 0.8–4 cm long, 3–5 mm wide, usually interrupted, spikelike, sometimes subtended by a narrow bract, this shorter than the inflorescence; spikes sessile, 3–5, to about 5 mm long, about as wide as long, androgynous, with 1–2 (3) staminate flowers and 1–3 perigynia, the staminate flowers inconspicuous and the spikes sometimes appearing pistillate; pistillate scales shorter than to equaling the perigynia, pale green, scarious. **PERIGYNIA** 2–3 mm long, elliptic, abruptly contracted to a very short beak; stigmas 2. **ACHENES** lenticular, filling the perigynium; style semipersistent on the achene. $2n = 70$. Seeps and springs and along streams, mostly in shade of woods. COLO: Arc, Hin, LPl, Min, Mon, SJn. 3080–3340 m (10100–10950'). Flowering: Jun–Jul. Circumboreal, south in America to New Mexico and New Jersey.

Carex douglasii Boott (for David Douglas, botanical explorer) Douglas sedge, dioecious sedge. Plants 8–28 cm tall, mostly dioecious; culms arising singly or few together from long, slender, brownish rhizomes less than 2 mm in diameter. **LEAVES** basal and on the lower culms, the blades 0.5–2 mm wide; lowest bract lacking, or sometimes present and foliose. **INFL** 1.5–5.5 cm long, (5) 10–20 mm wide, spicate or capitate, exceeded by the leaves or surpassing them; spikes about 10–25, generally all staminate or all pistillate, rarely androgynous, densely crowded, over twice as long as the internodes of the rachis, more or less evident without dissecting the head or the upper ones sometimes not, the lower 0.8–2 cm long, ovoid or more commonly the larger ones elongate and nearly linear or linear-elliptic; pistillate scales longer than the perigynia and concealing them, these and usually the staminate ones with a sometimes excurrent, light green midstripe, this flanked on both sides by a narrow stramineous or pale brown stripe and then the broad hyaline margins very conspicuous in the spikes. **PERIGYNIA** 2.2–4.7 mm long, 1.1–1.8 mm wide, ovate to elliptic, brownish, the marginal nerves prominent and distended toward the ventral surface, otherwise obscurely nerved; beak of the perigynium 1–1.5 mm long, obliquely cleft, often hyaline, the dorsal suture often conspicuous and with a hyaline flap, this sometimes encroaching onto the body of the perigynium; stigmas 2. **ACHENES** lenticular. $2n = 60$. Alkaline sites, foothills and lower mountains. COLO: Arc, LPl, Min, SJn. 1830–2440 m (6000–8000'). Flowering: May-Jun. British Columbia to Manitoba and south to California and Iowa.

Carex duriuscula C. A. Mey. (somewhat hard) Narrowleaf sedge. Plants 8–28 cm tall; culms arising singly or few together from slender, brownish or pale-colored rhizomes less than 2 mm in diameter, and with numerous fibrous roots. **LEAVES** basal and on the lower culm, the blades 0.5–1.5 mm wide; lowest bract lacking. **INFL** 0.8–2 cm long, 5–10 mm wide, spicate or capitate; spikes about 3–10, sessile, androgynous or rarely all unisexual, 4–9 mm long, longer than the internodes of the rachis and closely aggregated, discernible or not without dissecting the inflorescence;

pistillate scales subequal to or slightly longer than the perigynia, brownish, with a dark green or brownish often keeled midrib, and with narrow or broad scarious margins. **PERIGYNIA** 2.6–3.5 mm long, rather narrowly fusiform-elliptic to broadly elliptic-ovate, brownish, the marginal nerves prominent, otherwise obscurely nerved; beak of the perigynium obliquely cleft, 0.5–1.2 mm long, the dorsal suture inconspicuous; stigmas 2. **ACHENES** lenticular. $2n = 60$. [*C. eleocharis* L. H. Bailey; *C. stenophylla* Wahlenb.]. Piñon-juniper, ponderosa pine, and Gambel's oak communities. ARIZ: Apa; COLO: Arc, SJn; NMEX: McK, SJn; UTAH. 2255–2725 m (7400–8940'). Flowering: May–Jun. Mostly of the Great Plains, but from Iowa to California and south to Arizona.

Carex ebenea Rydb. (of ebony) Ebony sedge. Plants 19–59 cm tall, densely caespitose; rhizomes lacking or short. **LEAVES** basal and on the lower culms, the blades 1–4.5 mm wide, flat or nearly so; lowest bract usually lacking, or if present, mostly much shorter than the inflorescence. **INFL** a head 1.3–2.8 cm long and about as wide, or more commonly slightly narrower (in unpressed specimens), ovate or broadly elliptic, truncate or more commonly cuneate at the base, the internodes of the rachis 0.5–2 mm long; spikes (3) 6–12, gynaecandrous, commonly 9–15 mm long, averaging over 10 mm long, sessile, densely congested, usually slightly more discernible than in *C. microptera*, about 5–10 times longer than the internodes of the rachis; pistillate scales slightly shorter and usually narrower (at least distally) than the perigynia, dark brown to blackish brown, with or without hyaline margins. **PERIGYNIA** (4.8) 5.2–7.1 mm long, 0.9–2 mm wide, the better developed ones commonly 4–6.4 times longer than wide, brown to dark brown in the center and commonly with narrow greenish wings, faintly nerved on both sides, serrulate except near the apex of the prominent slender beak; stigmas 2. **ACHENES** lenticular, 1.5–1.8 mm long. Subalpine and alpine meadows, riparian communities and talus. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2530–3800 m (8300–12450'). Flowering: Jul–Aug. Wyoming to Arizona and New Mexico. Plants of *C. ebenea* are more similar to *C. haydeniana* than to *C. microptera* (q.v.) especially in the darker-colored heads, fewer spikes on the average, and somewhat larger perigynia. They are also more common at higher elevations than is *C. microptera*. However, the perigynia in *C. microptera* are sometimes quite narrow and, except for mostly being shorter, could be mistaken for those of *C. ebenea*. Although intergrading specimens are sometimes encountered, most specimens seem reasonably assigned to one of the taxa.

Carex echinata Murray (spiny) Boreal sedge, star sedge. Plants 1–3 dm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** borne on the lower 1/3 of the culms, the blades 1–2.2 mm wide, flat; lowest bract lacking or usually shorter than the first spike. **INFL** 1–2.3 cm long, about 7 mm wide, exceeded by the leaves or surpassing them; terminal spike gynaecandrous, usually with more staminate flowers than pistillate ones or sometimes staminate, 7–10 mm long, often clavate with a slender staminate portion and wider pistillate portion; lateral spikes (1) 2–3, gynaecandrous, with only a few staminate flowers and 5–10 perigynia, 5–7 mm long and nearly as wide, subequal to or a little longer than the internodes, rather closely spaced but readily evident in the spike; pistillate scales shorter than the perigynia, pale green or pale stramineous with a green midstripe and broad hyaline margins. **PERIGYNIA** widely spreading and conspicuously beaked and giving a bristly appearance to the spikes, 2.8–3.5 (4) mm long, including the prominent serrulate beak 1.1–1.6 mm long, this 1/2 or more as long as the body, neither winged nor thin-margined but the marginal nerves prominent and sometimes ridged, these displaced toward the flattened ventral surface, the dorsal surface convex; stigmas 2. **ACHENES** lenticular. [*Carex muricata* L.; *C. angustior* Mack.]. Three specimens were seen from the edge of the San Juan drainage. One (*Heil 10346*, SJNM) is from 1.25 miles northwest of Elwood Pass. Another (*Heil, Mietty, King 13446*, SJNM) is from Little Sand Creek. The third location is near a small lake on Granite Bench (*Heil, Mietty 22316*, SJNM). Infrequent in swampy meadows. COLO: Arc, Hin, RGr. 2680–3320 m (8800–10900'). Flowering: Jun–Jul. British Columbia to Newfoundland and south to California and North Carolina.

Carex egglestonii Mack. (for Willard W. Eggleston, agriculturalist and economic botanist) Eggleston sedge. Plants (1.5) 3–9 dm tall, caespitose; rhizomes lacking or very short. **LEAVES** borne on the lower culms, the blades 1.5–5 mm wide, flat. **INFL** 1.5–2.7 cm long, 1–3 cm wide, capitate, with the lowest internode to about 5 mm long; surpassing the leaves; without a subtending bract, or this shorter than or rarely equaling the inflorescence; spikes 3–6, gynaecandrous, 10–17 mm long, 7–12 mm wide, ovate to nearly globose, sessile, closely aggregated, but more or less evident without dissecting the head, to about 3 or more times longer than the rachis internodes, with up to 45 or more perigynia; pistillate scales conspicuously shorter and narrower than the perigynia, brownish, with a green or pale brown midstripe and hyaline margins, acute. **PERIGYNIA** (5) 6–8 mm long, 2.5–3.5 mm wide, ovate, elliptic, or lanceolate, greenish or brownish, strongly flattened, with thin, broadly winged margins, finely serrulate distally and frequently below, gradually or rather abruptly tapered to a bidentate, more or less flattened, winged beak; anthers 2.5–3.7 mm long; stigmas 2. **ACHENES** lenticular. Engelmann spruce parklands. COLO: Hin, LPl, Mon, SJn; UTAH. 2880–2895 m (9450–10960'). Flowering: Jun–Aug. Wyoming, Utah, and Colorado. Apparently rarely collected in the Four Corners region.

Carex elynoides Holm (reference uncertain) Kobresia sedge, blackroot sedge. Plants 5–16 cm tall, densely caespitose, lacking rhizomes, the culms and leaves fasciculate. **LEAVES** basal and on the lower 1/4 of the rounded culms, mostly equal to, or surpassed by, the inflorescence, the blades 0.3–0.5 mm wide, strongly folded or involute and nearly terete; bract lacking. **INFL** a solitary spike, erect, androgynous, 1–1.8 cm long, the staminate part 3–7 mm long, shorter to longer than the pistillate part; pistillate scales wider and mostly longer than the perigynia, brown to dark brown, the centers usually not noticeably green or pale, the margins hyaline. **PERIGYNIA** usually 4–12, 2.5–4.5 mm long, oblong or ellipsoid, filled by the mature achene, glabrous or occasionally very sparingly serrulate-ciliolate near the beak; rachilla subequal to the achene; stigmas 3. **ACHENES** trigonous. Alpine tundra and fell-fields. COLO: Arc, Con, Hin, Min, Mon, SJn. 3550–3900 m (11700–12800'). Flowering: Jul–Aug. Montana to Nevada and Colorado. *Carex elynoides* is closely allied to *C. filifolia*, and except for the glabrous or nearly glabrous perigynia and different habitat, it would be almost impossible to distinguish them. Plants of *C. elynoides* are easily mistaken for *Kobresia myosuroides*, which sometimes grows in the same habitat.

Carex emoryi Dewey (for William H. Emory, engineer and major in the U.S. Army) Early sedge, Emory sedge. Plants 30–80 cm tall, with culms arising singly or few together from long-creeping rhizomes. **LEAVES** with reddish brown sheaths, the blades 3–6 mm wide; ligule truncate or broadly rounded; bracts, at least the lower, more or less equal to the inflorescence. **INFL** of 1–7 linear spikes, the terminal spike staminate, about 2–4 cm long, the lateral spikes pistillate or the upper ones androgynous or sometimes staminate, 2–10 cm long; pistillate scales with a light central area as wide or wider than the outer dark portions. **PERIGYNIA** about 2–3 mm long, ellipsoid, papillose, often deciduous in early summer; beak of perigynium often white throughout, occasionally darker at the apex; stigmas 2. **ACHENES** lenticular. Irrigation canal banks, roadsides, margins of ponds and lakes. COLO: Arc; NMEX: RAr, SJn. 1615–2105 m (5300–6900'). Flowering: Apr–Jun. Wyoming to Ontario and south to New Mexico, Texas, and Virginia.

Carex filifolia Nutt. (threadlike leaves) Threadleaf sedge. Plants 8–38 cm tall, densely caespitose, without rhizomes, the culms and leaves fasciculate. **LEAVES** basal or on the lower 1/4 of the rounded culms, equaling or exceeded by the inflorescence, the blades 0.3–0.5 mm wide, strongly folded to involute and nearly terete; bract lacking. **INFL** a solitary spike, erect, androgynous, 1.3–2.5 cm long, the staminate part usually equaling or longer than the pistillate part, commonly 8–13 mm long; scales light brown or brown with broad white hyaline margins, the pistillate ones wider and longer than the perigynia. **PERIGYNIA** usually 5–15, 3–4.5 mm long, obovoid to ellipsoid, filled by the mature achene, minutely hirtellous at least on the upper 1/2; rachilla subequal to the achene; stigmas 3. **ACHENES** trigonous. $2n = 50$. *Cowania*-juniper, piñon-juniper, ponderosa pine–oak communities. NMEX: McK, SJn. 1920–2225 m (6300–7300'). Flowering: Apr–Jul. Yukon to Manitoba south to California and Texas.

Carex geophila Mack. (earth-loving) White Mountain sedge. Similar to *C. rossii*, with the following differences: **LEAVES** appearing more rigid; base of plants brownish, without or with some reddish color; old sheaths perhaps becoming more fibrillose at the base. **INFL** with bract subtending the upper pistillate and staminate spikes shorter than or slightly longer than the spikes (this feature does not apply to the basally borne spikes); pistillate scales commonly with 1–3 perigynia. Ponderosa pine–oak communities. COLO: LPl; NMEX: McK, RAr, SJn; UTAH. 1890–2650 m (6200–8720'). Flowering: May–Jul. Colorado to New Mexico, Arizona, and Mexico.

Carex geyeri Boott (for Charles A. Geyer, Austrian botanical collector) Elk sedge. Plants 15–30 (50) cm tall, more or less caespitose and with short to elongate rhizomes. **LEAVES** basal and cauline, the lower ones often reduced to bladeless sheaths, the blades 1–3 mm wide, flat or nearly so, evergreen, the tips often turning yellow or brown but the lower parts remaining green through at least one winter; bract lacking or in robust specimens to 1.5 cm long. **INFL** a solitary spike, erect, androgynous, the staminate part 1–2 (3) cm long, linear, the pistillate part usually with 1 or 2 plump perigynia, these proximal to or somewhat remote from the staminate part; scales light brown, with broad hyaline margins, the pistillate ones usually equaling or to 4 mm longer than the perigynia. **PERIGYNIA** 5–6 mm long, 2-ribbed, greenish or light brown, ellipsoid or obovoid, solitary or, if 2, rather remote, with the internode subequal to or longer than the perigynia; rachilla obsolete or less than 1/2 as long as the achene; stigmas 3. **ACHENES** trigonous, filling the perigynium. Ponderosa pine, Douglas-fir–oak, grass-forb, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: RAr, SJn; UTAH. 2250–3400 m (7380–11200'). Flowering: Jun–Jul. Alberta and British Columbia south to California and Colorado. This winter-green sedge is highly selected by elk and perhaps other ungulates in the late fall and winter.

Carex haydeniana Olney (for Ferdinand V. Hayden, geologist and leader of the Hayden Survey) Cloud sedge. Plants 9–33 cm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower culm, the blades 1–4 mm wide; lowest bract lacking or, if present, not over 1/2 as long as the inflorescence. **INFL** a head 1–1.5 cm long,

ovoid to nearly orbicular in outline, with internodes of the rachis about 0.5–1 mm long, usually truncate at the base, surpassing the leaves; spikes 3–8, gynaecandrous, 7–11 mm long, ovate or nearly so, sessile, densely congested, hardly if at all discernible without dissecting the head, 7–10 times longer than the internodes of the rachis; pistillate scales shorter and narrower than the perigynia, dark brown to blackish, with a lighter brown or green midrib, the margins narrowly hyaline or not. **PERIGYNIA** 4–6 (6.3) mm long, (1.7) 2.2–3 mm wide, 1.6–2.9 times longer than wide, ovate or lance-ovate to elliptic, brown, dark brown, or blackish, nearly as dark as the scales or somewhat lighter and sometimes the margins green, faintly nerved dorsally, nerveless or faintly nerved ventrally, strongly flattened except where distended by the achene, the margins thin and winged, serrulate except on the subterete beak tip; stigmas 2. **ACHENES** lenticular, commonly 1.5–2 mm long. The two specimens seen are from alpine communities. COLO: Arc, LPl, SJn. 3595–4265 m (11800–14000′). Flowering: Jul–Aug. British Columbia and Alberta south to California and Colorado. This species is similar to and probably transitional with *C. microptera*.

Carex heteroneura W. Boott (variously nerved) Blackened sedge. Plants 2.5–10 dm tall; culms tufted; rhizomes lacking or short. **LEAVES** basal and on the lower culms, the blades 1.5–10 mm wide, flat; lowest bract mostly subequal to or shorter than the inflorescence, often leaflike. **INFL** 2–10 cm long; first internode of the rachis (0.5) 1–7 cm long or almost obsolete, shorter than to surpassing the spike; second internode about 1–8 mm long; spikes 3–5, 0.8–2.5 cm long, 4–8 mm wide, narrowly oblong to linear, the terminal one gynaecandrous, the lateral ones pistillate or infrequently gynaecandrous, the lowest one typically on a peduncle to 4.5 cm long, the upper pedunculate or sessile; pistillate scales shorter than to much longer than the perigynia, blackish, dark brownish purple, or blackish purple. **PERIGYNIA** 3–5 mm long, 1.7–4 mm wide, oblong, ovate, or nearly orbicular, olive-green, yellow-brown, or greenish marginally but often suffused with dark purple or purple-black; stigmas 3. **ACHENES** trigonous, commonly short-stipitate. [*C. atrata* L.]. Alpine tundra, wet meadows, krummholz, fell-fields, and talus. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn; UTAH. 3445–4240 m (11300–13900′). Flowering: Jul–Aug. Montana to Nevada and New Mexico. Based on the number of specimens seen (37) this is one of the more common sedges of the mountains of the Colorado part of the San Juan River drainage. All mature specimens seen were rather well placed with **var. *chalciolepis*** (Holm) F. J. Herm. [*C. chalciolepis* Holm; *C. atrata L.* var. *chalciolepis* (Holm) Kük.]. Several specimens from the San Juan Mountains had been identified as *C. albonigra*. For the most part these were immature specimens that were sympatric with mature specimens of *C. heteroneura* var. *chalciolepis*.

Carex hystericina Muhl. ex Willd. (from a porcupine) Bottlebrush sedge. Plants 3–6 (10) dm tall; culms clustered on rhizomes. **LEAVES** basal and on the lower culm, the lowermost leaves sometimes reduced to bladeless sheaths, the upper ones with flat blades 2–9 mm wide. **INFL** 6–10 cm long; terminal spike staminate or rarely gynaecandrous, 2–3 cm long; lateral spikes 1–3, pistillate, (1) 1.5–3 cm long, 12–15 mm wide, ascending to strongly spreading, on slender peduncles to 5 cm long or the upper one sessile or subsessile, the lowest subtended by a leafy bract usually exceeding the inflorescence, this usually sheathless or the sheath closed for up to 14 mm; pistillate scales equaling or much shorter than the perigynia not counting the awn, pale green or straw-colored in age, aristate-awned, the awn 2–6 mm long and serrulate-ciliolate. **PERIGYNIA** 5–7 mm long, pale green, prominently nerved, lanceolate or lance-ovate, slightly inflated, with a conspicuous narrow beak about 2 mm long, strongly spreading and giving a bristly appearance to the spikes; stigmas 3. **ACHENES** trigonous, much smaller than the perigynia; style continuous with, persistent on, and of the same firm texture as the achene, straight or bent in age. $2n = 58$. Moist and wet places. COLO: Arc, LPl, Min; UTAH. 1125–2590 m (3700–8500′). Flowering: Jun–Aug. Washington to New Brunswick and south to California and Virginia.

Carex illota L. H. Bailey (dirty or unwashed) Sheep sedge. Plants 10–42 cm tall, densely tufted; rhizomes lacking or short. **LEAVES** basal and on the lower culm, the blades 0.5–2.8 mm wide, flat; bracts not much larger than the scales. **INFL** 0.8–1.4 cm long, nearly or fully as wide as long, capitate, much surpassing the leaves; spikes 3–6, gynaecandrous, about 4–6 mm long, sessile, closely aggregated and scarcely evident from one another in the dense head, with 5–15 ascending or spreading perigynia; pistillate scales about 1/2–3/4 as long as the perigynia, blackish or black-brown, often with a greenish or yellow-brown midstripe and with or nearly without hyaline margins. **PERIGYNIA** 2.5–3 mm long, 1–1.4 mm wide, lanceolate to narrowly ovate, yellowish or greenish brown to blackish, dorsally and sometimes ventrally nerved, the nerves sometimes reddish, the margins entire, rounded or rather sharp, sometimes with very small wings in the distal portion, gradually to rather abruptly tapered to an ill-defined or conspicuous beak, the beak usually blackish, obliquely cleft, the dorsal suture conspicuous through the length of the beak and onto the distal part of the body, usually with an overlapping involute flap; stigmas 2. **ACHENES** lenticular. Wet and boggy meadows, flooded pond and lake margins, evaporated tarns, and along streams. COLO: Arc, Con, Hin, LPl, Min, RGr, SJn. 2925–3730 m (9600–12250′). Flowering: Jul–Aug. British Columbia to Montana, south to California and Colorado.

Carex inops L. H. Bailey (weak) Sun sedge. Plants 8–23 cm tall from thick rhizomes, reddish or brownish at the base, old leaf bases persistent and more or less forming a thatch. **LEAVES** basal or borne on the lower 1/5 of the culm, the blades equaling or exceeding the inflorescence or somewhat shorter, 1–2 mm wide; lowest bract obsolete to about 1/2 as long as the inflorescence. **INFL** terminal, 1.5–3 cm long, with a terminal staminate spike 10–18 mm long with peduncle 1.2–4.5 cm long, and 1 or 2 sessile, lateral, pistillate spikes 7–10 mm long, with 5–15 perigynial scales reddish brown with a pale, raised midrib, the lower pistillate scales acute or long-acuminate to aristate, the upper ones acute. **PERIGYNIA** pubescent, 2.8–4.6 mm long; stigmas 3. **ACHENES** trigonous. Oak, ponderosa pine, and subalpine communities. COLO: Arc, Hin, LPl, Mon; NMEX: McK, RAr, SJn. 2010–2775 m (6600–9100′). Flowering: May–Jul. British Columbia to Ontario south to New Mexico, Missouri, and Indiana. Plants of the Four Corners belong to **subsp. *heliophila*** (Mack.) Crins (sun-lover) [*C. heliophila* Mack.; C. *pensylvanica* Lam. subsp. *heliophila* (Mack.) W. A. Weber]. Used by the Ramah Navajo as a disinfectant for "eagle infections," and as a gastrointestinal aid to relieve discomfort from overeating.

Carex interior L. H. Bailey (inner) Inland sedge. Plants 17–45 cm tall, densely caespitose; rhizomes lacking. **LEAVES** borne on the lower 1/3 of the culms, the blades 1–2 mm wide. **INFL** 0.8–2 cm long, 4–6 mm wide, included in or exserted beyond the leaves, without a subtending bract; spikes (2) 3–4, sessile, gynaecandrous, the terminal one often clavate with a conspicuous slender staminate portion, rarely all staminate, 7–10 mm long, the lateral ones about 4–6 mm long and about as wide, with only a few staminate flowers and (1) 5–10 perigynia, rather closely spaced but readily discerned, subequal to or a little longer than the internodes of the rachis; pistillate scales shorter than the perigynia, pale green, stramineous or marked with brown, with broad hyaline margins. **PERIGYNIA** widely spreading, beaked but not conspicuously so as in *C. echinata* and the spikes not so bristly, 2.2–3.2 mm long including the shallowly bidentate serrulate beak, this 1/4–1/2 as long as the body, not winged or thin-margined, the marginal nerves prominent and slightly ridged, these displaced toward the flattened ventral surface, the dorsal surface convex; stigmas 2. **ACHENES** lenticular. $2n = 54$. Wet and moist sites in mountains. ARIZ: Apa; COLO: Arc, LPl, SJn. 2135–3350 m (7000–11000′). Flowering: Jun–Aug. British Columbia to Labrador and south to Mexico and Pennsylvania.

Carex lenticularis Michx. (lens-shaped) Kellogg sedge. Plants 15–61 cm tall, caespitose from fibrous roots, the larger roots covered with feltlike yellowish or yellow-brown hairs; rhizomes lacking or short. **LEAVES** mostly on the lower 1/4 of the culms, the blades 1–2.6 mm wide; lowest bract shorter than or exceeding the inflorescence, leaflike. **INFL** 4–13 cm long, with a solitary (or 2) staminate spike(s) 1–3 cm long above 2–4 cylindrical pistillate ones, these 0.6–4 cm long and 3–4 mm wide, the uppermost pistillate one sometimes reduced; pistillate scales shorter and narrower than the perigynia, blackish or black-purple with a green midrib, this not extending to the tip of the scale and neither excurrent nor ridged. **PERIGYNIA** 2–3 mm long, lanceolate, elliptic to ovate, more or less faintly nerved dorsally and ventrally, deciduous at maturity, usually with a well-defined stipe 0.1–0.4 mm long, green except for the often blackish beak, this 0.1–0.4 mm long, entire; stigmas 2. **ACHENES** lenticular. $n = 34, 44$. [*C. kelloggii* W. Boott]. Riparian communities. COLO: Arc, Mon, SJn. 1830–2440 m (6000–8000′). Flowering: Jun–Aug. Alaska to Labrador, south to California and Michigan. Our plants belong to **var. *lipocarpa*** (Holm) L. A. Standl. (fat-fruited).

Carex limosa L. (of mud) Mud sedge, quaking bog sedge. Plants 13–26 cm tall, often glaucous; culms arising singly or 2–3 together from slender rhizomes; roots covered with a yellowish or yellow-brown feltlike tomentum. **LEAVES** mostly on the lower 1/2 of the culms, the lower ones usually reduced to bladeless sheaths, the upper ones with blades 0.5–1.5 mm wide, more or less flat, the midrib strongly keeled below, often sharply serrulate. **INFL** mostly 3.5–6.5 cm long, shorter or longer than the subtending lowest bract; terminal spike staminate, (1) 1.5–2.1 cm long; lateral spikes 1 or 2, pistillate or occasionally with 1–2 apical staminate flowers, 8–18 mm long, spreading or drooping, on flexuous peduncles 5–22 mm long, or rarely the lowest spike on an elongate peduncle originating near the culm base; pistillate scales shorter than to slightly longer than and nearly as wide as the perigynia, greenish brown to dark reddish brown, with a green center, the margins not or scarcely hyaline, obtuse or acute to cuspidate. **PERIGYNIA** 2.9–3.5 mm long, 1.2–1.9 mm wide, substipitate, with a very short, more or less conspicuous beak, pale green and densely white-granular (the grains visible at high magnification); stigmas 3. **ACHENES** trigonous. $2n = 56, 64$. Sphagnum bogs and wet meadows. COLO: SJn (Johnston 2001). 3415–3535 m (11200–11600′). Flowering: Jul–Aug. Circumboreal, south in America to California and Colorado.

Carex magellanica Lam. (from Magellan) Poor sedge, boreal bog sedge. Plants 15–30 cm tall. Culms arising singly or few together from short to long rhizomes; roots covered with a yellowish or yellow-brown feltlike tomentum. **LEAVES** basal and cauline, mostly bearing blades, the blades usually 1–2 mm wide, flat, sometimes serrulate-ciliolate, especially

apically, the midrib more or less keeled below, this sometimes serrulate; lowest bract shorter than to longer than the inflorescence, this 2–5 cm long; terminal spike staminate or sometimes with 1 to several perigynia at or near the apex, 0.9–1.2 cm long; lateral spikes 1–3, pistillate or often with 1–3 staminate flowers at the base, 0.7–1.6 cm long, spreading-ascending to drooping, on slender flexible peduncles 1–2.5 cm long; pistillate scales longer and slightly narrower than the perigynia, acuminate, brown or dark purple-brown. **PERIGYNIA** 2.2–2.9 (3.5) mm long, 1.2–1.7 mm wide, sessile or substipitate, with the beak nearly obsolete, densely white-granular on a pale green background; stigmas 3. **ACHENES** trigonous. $n = 29$. [*C. paupercula* Michx.]. Infrequent to rare in bogs and wet meadows. COLO: Hin, LPl, SJn (Johnston 2001). 3320–3550 m (10890–11650'). Flowering: Jul–Aug. Circumboreal, south in America in the Rocky Mountains to Utah and Colorado and to the New England states. *Carex magellanica* is similar to *C. limosa*.

Carex microglochin Wahlenb. (small barb) Subulate sedge, few-seeded bog sedge. Plants (5) 15–25 cm tall; culms arising few together from slender rhizomes, the few leaves mostly toward the base. **LEAVES** with blades about 0.5–0.8 mm wide, channeled or nearly terete; bract lacking. **INFL** a solitary spike, androgynous, about 0.5–1 cm long, 3–5 mm wide, erect; scales brownish or tinged with purple, the pistillate ones almost 1/2 as long as the perigynia, quickly deciduous. **PERIGYNIA** awl-shaped or linear-lanceolate, with the rachilla conspicuously exserted from the orifice, 3–5 mm long including the rachilla, about 1 mm wide at the base, strongly spreading, soon deflexed and deciduous; stigmas 3. **ACHENES** elongate, nearly cylindrical, or obtusely trigonous. $2n = 58$. Calcareous habitats in the alpine. COLO: SJn. 3290 m (10800'). Flowering: Jul–Aug. Greenland to Alaska and south in the Rocky Mountains to Utah and Colorado, and to Quebec.

Carex microptera Mack. (small wing) Small-wing sedge. Plants 2–8 dm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower culm, the blades 1–5 mm wide, flat or nearly so. **INFL** a head, 1.2–2.5 cm long, and as wide, orbicular or nearly so, usually truncate at the base, the internodes of the rachis about 0.5–2 mm long or the lower one to 3 (4) mm long, without a subtending leafy bract or this rarely to about 1/2 as long as the inflorescence; spikes (2) 5–15 (21), gynaecandrous, commonly 5–11 mm long, sessile, densely congested, hardly if at all discernible without dissecting the head, much longer than the internodes of the rachis; pistillate scales shorter than and narrower than the perigynia, brownish. **PERIGYNIA** (2.5) 3–5 mm long, 1.3–2.2 mm wide, 2–3 (4) times longer than wide, greenish or brownish to dark brown in age, with a green or pale midstripe, lightly or obscurely nerved on both sides, strongly flattened, except where distended by the mature achene, the margins thin, winged, serrulate except on the more or less terete beak-tip, not hyaline or very narrowly so; stigmas 2. **ACHENES** lenticular, commonly 1.1–1.5 mm long. [*C. limnophila* F. J. Herm.; *C. macloviana* d'Urv. var. *microptera* (Mack.) B. Boivin; *C. festivella* Mack.]. Moist and wet places in many montane plant communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2050–3400 m (6760–11150'). Flowering: Jun–Aug. British Columbia to Saskatchewan, south to California and New Mexico. This is one of the most common and widespread sedges in the area. It is often confused with some other members of section *Ovales*. *Carex microptera* forms a series of intergrades with *C. ebenea*, *C. haydeniana*, and *C. pachystachya*, and all of the above listed species except *C. ebenea* have been reduced previously to varietal status under *C. macloviana* d'Urv. (Cronquist et al.1977). Specimens with small heads and small perigynia with transverse folds ventrally have been recognized as *C. limnophila*. However, such specimens seem to occur at random through much of the range of *C. microptera*. This intergrading phase seems reasonably included in an expanded concept of *C. microptera*. Used as a ceremonial medicine and emetic by the Ramah Navajo.

Carex nardina Fr. (spikenard) Spikenard sedge. Plants 3–14 cm tall, densely caespitose, without rhizomes, the culms and leaves fasciculate. **LEAVES** basal and on the lower rounded culm, mostly surpassing the inflorescence, the blades 0.3–0.7 mm wide, folded to involute and nearly terete; bract lacking. **INFL** a solitary spike, erect, androgynous, 0.5–1 cm long, the staminate part shorter than the pistillate part, exserted beyond the perigynia by 2–3 mm; scales brown with green or pale center and hyaline margins, the pistillate ones as wide or a little wider than the perigynia. **PERIGYNIA** about 5–15, 3.5–4.5 mm long, elliptic, lanceolate or oblong-obovate, with conspicuous, more or less flattened margins, the margins usually serrulate-ciliolate, not wholly filled by the achene; rachilla subequal to the achene; stigmas 2 or 3. **ACHENES** accordingly lenticular or trigonous. $2n = 68$. [*C. hepburnii* Boott] Dry alpine communities. COLO: Hin, LPl, SJn. 3725 to 4265 m (12220–14000'). Flowering: Jul–Aug. Circumboreal, south to Washington and Colorado.

Carex nebrascensis Dewey (of Nebraska) Nebraska sedge. Plants (1) 2–11.5 dm tall or taller, from robust, long-creeping, scaly rhizomes; culms somewhat tufted or more often arising singly or 2–3 together. **LEAVES** borne on the lower 1/4 of the culms, the blades 3–11 mm wide. **INFL** 4–25 cm long, mostly exceeding the leaves, but often sur-

passed by some of the foliose bracts, with 1–3 staminate spikes above 2–4 pistillate spikes, the transitional ones occasionally androgynous; terminal staminate spike 1.5–5 cm long, lateral staminate spikes, if present, to 2.5 cm long; pistillate spikes (1.5) 2–6 (10) cm long, 5–8 mm wide, cylindrical, the lower one pedunculate, the upper sessile or short-pedunculate; pistillate scales mostly longer and narrower than the perigynia, lanceolate or narrowly awl-shaped, glabrous or occasionally ciliolate apically, blackish or black-purple, with a narrow green or at least pale line in the center, this extending with the midrib to the apex; midrib prominent, often slightly ridged dorsally and excurrent as a mucro or aristate point, this glabrous or occasionally antrorsely ciliolate. **PERIGYNIA** 2.6–4.1 mm long including the beak, elliptic to obovate, with some conspicuous dorsal and ventral nerves plus the marginal nerves, not as flattened as in *C. aquatilis*, greenish at first, yellowish brown in age, sessile or nearly so, persistent, the beak (0.2) 0.4–0.6 mm long, more or less bidentate and ciliolate; stigmas 2. **ACHENES** lenticular. Two specimens seen (*R. Fleming 1214, O'Kane and Heil 5647*, both SJNM) from near Mancos. Swamps, wet meadows, and ditches. ARIZ: Apa; COLO: Mon, SJn; UTAH. 2135–2390 m (7000–7850'). Flowering: Jun–Aug. Washington to South Dakota and south to California and New Mexico. The distribution map provided by Johnston (2001) demonstrates much of the San Juan River drainage as a void in the distribution of this sedge that is widespread and common in much of the western United States.

Carex nelsonii Mack. (for Aven Nelson) Nelson sedge. Plants 10–35 cm tall, caespitose; rhizomes lacking or short. **LEAVES** basal and on the lower culm, the blades not over 12 cm long, 1–2.5 mm wide, flat. **INFL** capitate, 8–15 mm long, 5–12 mm wide, mostly much surpassing the leaves and bract if present; spikes 2 or 3, sessile, congested and sometimes appearing solitary, 5–10 mm long, 4–8 mm wide, ovate to oblong, the terminal one gynaecandrous, usually larger than the lower pistillate ones; pistillate scales shorter than or equal to the perigynia, blackish or black-purple, occasionally with a pale midrib, the margins sometimes narrowly hyaline. **PERIGYNIA** 3–3.8 mm long, 1.1–1.8 mm wide, elliptic, narrowly ovate or obovate, subsessile or with a stipe to 1 mm long, rather gradually tapered to a beak 0.5 mm long, cellular-striate on the faces and minutely papillate, at least apically; stigmas 3. **ACHENES** sharply trigonous, the angles more or less nerved, the nerves slightly ridged. Alpine communities. COLO: Con, Hin, LPl, SJn. 3350–3990 m (11100–13100'). Flowering: Jul–Aug. Montana to Utah and Colorado.

Carex nigricans C. A. Mey. (blackish) Black alpine sedge Plants 7–21 cm tall; culms arising few together from short to elongate rhizomes, with few to several leaves mostly borne toward the base; leaf blades 1–3 mm wide, flat or slightly channeled; bract lacking. **INFL** a solitary spike, erect, 0.8–1.8 cm long, 5–8 mm wide, androgynous, the staminate portion about 1/4–1/2 as long as the pistillate; scales blackish purple with scarious margins, the staminate ones erect, persistent, the pistillate ones spreading with the perigynia and soon deciduous. **PERIGYNIA** 3–4.5 mm long, lanceolate, often greenish except blackish purple on the beak, soon strongly spreading to reflexed, often deciduous after maturity, stipitate, the stipe about 0.5 mm long; rachilla obsolete; stigmas 3. **ACHENES** trigonous. $2n = 72$. Subalpine and alpine communities, often of moist to wet places. COLO: Arc, Con, Hin, LPl, Min, RGr, SJn. 3125–3900 m (10255–12800'). Flowering: Jul–Aug. Alaska and the Siberian coast and south to California and Colorado. *Carex nigricans* is an indicator of snowbeds.

Carex norvegica Retz. (Norwegian) Scandinavian sedge. Plants 12–68 cm tall, densely caespitose, rhizomes lacking or very short. **LEAVES** basal and on the lower culm, the blades 1–4 mm wide, flat. **INFL** (1) 1.5–3.5 (6) cm long, mostly surpassing the leaves and exceeding or exceeded by a leaflike bract; spikes mostly 3 (2–4), 0.5–1.3 cm long, about 4 mm wide, ovoid to nearly cylindrical, erect or strongly ascending, the terminal one gynaecandrous, equal to or longer than its peduncle, the lower spikes pistillate, mostly longer than their slender peduncles, or the lowest 1 rarely on an elongate peduncle arising on the lower 1/3 of the culm, the intermediate 1 or 2 often nearly or quite sessile, crowded toward the terminal one, and longer than their internodes, with the lowest shorter to longer than its internode; pistillate scales shorter than the perigynia, blackish or blackish purple, the midrib inconspicuous and rarely pale, sometimes papillate or ciliate, the margins often white-hyaline. **PERIGYNIA** 2–2.8 mm long, including the short beak, elliptic to narrowly obovate, green, except for the dark beak, strongly contrasting with the dark scales, becoming greenish brown in age, cellular-striate; stigmas 3. **ACHENES** trigonous, the angles slightly rounded, not strongly nerved. $2n = 54, 56$. [*C. media* R. Br.] Wet areas. COLO: Arc, Hin, LPl, RGr, SJn; NMEX: RAr. 2750–3655 m (9000–12000'). Flowering: Jul–Aug. Circumboreal, south in America to Quebec and New Mexico.

Carex nova L. H. Bailey (new) Blackhead sedge. Plants (6) 16–72 cm tall, densely caespitose; rhizomes lacking or very short; culms erect to somewhat flexuous and nodding. **LEAVES** basal and on the lower culm, the blades 1–5.5 mm wide; bract lacking or more often present and immediately subtending the inflorescence or to 3 cm below it. **INFL** a head, 0.9–2.5 cm long, 9–20 mm wide, with 3 or 4 spikes, usually surpassing the leaves; spikes mostly sessile, or on

peduncles to 3 mm long, 5–15 mm long, 3–8 mm wide, ovoid to oblong, the terminal one gynaecandrous, usually slightly larger than the lateral pistillate ones; pistillate scales shorter than or equaling the perigynia, and much narrower, black or purple-black, rather glossy. **PERIGYNIA** 3.5–4.9 mm long, 2–3 mm wide, broadly elliptic, obovate, to ovate-orbicular, flattened, with broad margins, conspicuously wider than the achene, greenish at first, but soon blackish or blackish purple, more or less glossy, glabrous or the upper margins ciliolate; stigmas 3. **ACHENES** trigonous. [*C. pelocarpa* F. J. Herm.] Riparian communities within spruce-fir forests, alpine tundra, willow carrs, ledges, and scree. ARIZ: Apa; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn. 2710–4250 m (8900–13900'). Flowering: Jul–Aug. Oregon to Montana and south to Nevada and New Mexico. Plants with flexuous, nodding culms and smooth-margined perigynia have been recognized as *C. nova* var. *pelocarpa* (F. J. Herm.) Dorn.

Carex obtusata Lilj. (blunt) Blunt sedge. Plants 7–20 cm tall; culms usually arising singly from and well spaced (commonly 1–5 cm apart) along very dark brown to purplish black creeping rhizomes. **LEAVES** basal or nearly so, the blades about 1–1.5 mm wide, flat or loosely folded. **INFL** a solitary spike, erect, androgynous, 5–17 mm long, linear to nearly ovoid, the staminate portion longer or shorter than the pistillate portion; scales brownish with hyaline margins, the pistillate ones mostly shorter and narrower than the perigynia. **PERIGYNIA** usually 1–6, 3–4 mm long, narrowly ovoid or ellipsoid, thick-walled, brown or blackish brown, glossy, obscurely to conspicuously ribbed, conspicuously beaked; rachilla subequal to or longer than the achene, often with a flattened, hyaline, apical appendage; stigmas 3. **ACHENES** trigonous, filling the perigynia. $2n = 52$. Dry plains, ridges, and rocky, open slopes. ARIZ: Apa; COLO: Mon. 2135–3350 m (7000–11000'). Flowering: Jun–Jul. Yukon to Manitoba, south to New Mexico and South Dakota; also in Eurasia.

Carex occidentalis L. H. Bailey (of the west) Western sedge. Plants 2–8 dm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower culm, the blades 1–3 mm wide; lowest bract lacking or less than 1/2 as long as the inflorescence. **INFL** (1) 1.5–4.5 cm long, about 5–10 mm wide, spicate or capitate, oblong to linear-oblong or linear, at least the lower spikes usually separated, the first internode of the rachis about 2–10 mm long; spikes about 4–10, androgynous, not over 5 mm long, sessile, with about 4–12 perigynia. Pistillate scales equal to and nearly concealing the perigynia, brownish with a green midstripe and hyaline margins. **PERIGYNIA** 3–3.8 mm long, 1.6–2 mm wide, elliptic to ovate or ovate-orbicular, the body greenish or brownish with greenish, slightly winged, serrulate (use 20×) margins at least in the upper 1/2 and beak, this bidentate, the teeth about 0.3 mm long, the marginal nerves on the winged edges or scarcely displaced to the ventral surface, the faces faintly nerved or essentially nerveless; stigmas 2. **ACHENES** lenticular. Piñon-juniper, ponderosa pine–oak communities, aspen and spruce-fir parklands. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2040–2985 m (6700–9800'). Flowering: Jun–Jul. Montana and North Dakota south to California and Texas. This is one of the more frequently collected sedges of the Four Corners. Due to abundance, western sedge is likely an important forage species for ungulates. However, it can be expected to be of low or moderate palatability.

Carex pachystachya Cham. ex Steud. (thick spike) Chamisso sedge. Plants 3–10 dm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** borne on the lower 1/2 of the culms, the lower ones reduced to bladeless sheaths, the upper ones with essentially flat blades 2–6 mm wide; lowest bract lacking. **INFL** 15–23 cm long, 13–16 mm wide, usually oblong, but sometimes ovoid, surpassing the leaves or sometimes subequal to or surpassed by them, the internodes of the rachis concealed by the dense spikes or apparent and 2–4 mm long; spikes 4–12, gynaecandrous, 6–9 mm long, closely aggregated, hardly evident without dissecting the head but usually more conspicuous than in *C. microptera*; pistillate scales shorter and narrower than the perigynia, brown, with or without white hyaline margins to 0.1 mm wide. **PERIGYNIA** 3.5–4.3 (5) mm long, 1.1–2 mm wide, ovate, plano-convex to concavo-convex, lightly nerved dorsally, nerveless or lightly nerved and infrequently with a transverse fold ventrally, greenish and soon stramineous or brownish to copper-colored, usually widely spreading at maturity and often deciduous, the winged margins rather narrow, serrulate, rather abruptly narrowed into a short, darkened, more or less terete, smooth beak; stigmas 2. **ACHENES** lenticular, 1.5–2 mm long, nearly filling the perigynial cavity. [*C. macloviana* d'Urv. var. *pachystachya* (Cham. ex Steud.) Hultén] Douglas-fir, ponderosa pine–dogwood, and spruce-fir communities, usually in moist or wet soil. COLO: Arc, Hin, LPl, Min, Mon, SJn. 2925–3400 m (9600–11140'). Flowering: Jul–Aug. Alaska, Yukon, Saskatchewan south to California and Colorado. Plants of this taxon are similar to those of *C. microptera*. They differ in general from *C. microptera* in being less common and restricted to wetter places. The perigynia of *C. pachystachya* are plano-convex with the achene more nearly filling the cavity, and they are not so strongly flattened as in *C. microptera*. Also, the perigynia are more widely spreading to deflexed and much sooner deciduous, and the achenes are commonly larger (1.6–2 mm long versus 1.1–1.5 mm).

Carex parryana Dewey (for Charles C. Parry, British-American botanist and explorer) Parry sedge. Plants 18–50 cm tall; culms densely tufted or arising a few together from short to rather elongate rhizomes. **LEAVES** basal and on the lower culm, the blades 1–4 mm wide; lowest bract shorter than or subequal to the inflorescence. **INFL** 1.8–6 cm long, 5–10 mm wide, with (1) 2–4 (6) spikes, the lowest internode of the rachis about 0.5–2 times as long as the lowest spike, the upper ones usually equal to or shorter than the spikes; terminal spike gynaecandrous with a short staminate portion or occasionally nearly or entirely staminate or all pistillate, 1.2–3 cm long, 3–5 mm wide, subsessile or on a peduncle to 1.5 cm long; lateral spikes pistillate, 0.7–2.4 cm long, about 4–5 mm wide, ovoid to cylindrical, sessile or essentially so, or the lowest on a peduncle to 4 cm long; pistillate scales shorter than or subequal to the perigynia and narrower apically, blackish or dark brown-purple, with greenish or pale midrib, sometimes ciliolate apically. **PERIGYNIA** 1.9–3 (3.6) mm long, more or less obovate, glabrous to papillate, or occasionally ciliolate to strigose-hirtellous, the dorsal surface greenish marginally and basally and usually blackish purple in the center near the beak; stigmas mostly 3 but sometimes 2. **ACHENES** mostly trigonous. $2n = 54$. Hanging gardens, and seep and spring communities mostly in canyons of the Colorado River. COLO: Hin; UTAH. 1150–1860 m (3780–6100'). Flowering: May–Jul. Alaska to Ontario and south to Nevada and Colorado. Most specimens are from the canyons of the Colorado River, but *L. Lundquist et al. 269* SJNM is montane. Some plants have at least some flowers with two stigmas and lenticular achenes. These are features of *C. specuicola* J. T. Howell, and some collections from Utah have been identified as *C. specuicola*. However, all mature specimens I have seen from Utah seem to fit better with *C. parryana* than with *C. specuicola*. See also the discussion under *C. specuicola*.

Carex pellita Willd. (covered with skin) Woolly sedge. Plants 24–80 cm tall or taller; culms arising singly or more often few together or in small tufts from thick, creeping rhizomes. **LEAVES** mostly borne on the lower 1/2 of the culms, the lower ones often reduced to bladeless sheaths, the upper ones with flat blades 2–6 mm wide. **INFL** 8–21 cm long, leafy-bracteate, the first and sometimes the second bracts equaling to much surpassing the inflorescence, mostly not sheathing but the lowest one sometimes with a closed sheath to 17 mm long; terminal spike staminate, 1.7–4.5 cm long, cylindrical, sessile or subsessile or on peduncles to 7 cm long, often subtended by 1–2 smaller staminate spikes; lateral pistillate spikes 1–3 (4), 1–4.8 cm long, 5–7 mm wide, the lower ones well spaced and mostly shorter than their internodes, sessile or nearly so, or on peduncles up to 8 cm long, with many perigynia; pistillate scales usually shorter and narrower than the perigynia, acute or awn-tipped, brownish or purplish, typically with a green or pale midstripe. **PERIGYNIA** densely pubescent, 3.3–5 mm long, ovoid to subglobose, with an abrupt, conspicuous, bidentate beak, many-ribbed, thick-walled; stigmas 3. **ACHENES** trigonous, loosely filling the perigynium. $2n = 78$. [*C. lanuginosa* Michx.; *C. lasiocarpa* Ehrh. var. *lanuginosa* (Michx.) Kük.]. Riparian and wetland communities, including hanging gardens, and montane areas. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: RAr, SJn; UTAH. 1125–2590 m (3700–8500'). Flowering: May–Jul. British Columbia to New Brunswick and south to California and Arkansas. Plants of this widespread taxon have passed under the name of *C. lanuginosa* in a number of floras. The type of *C. lanuginosa* is *C. lasiocarpa* Ehrh., leaving *C. pellita* the name of priority.

Carex perglobosa Mack. (spherical) Globe sedge, Mount Baldy sedge. Plants 6–20 cm tall, loosely caespitose from slender, creeping rhizomes. **LEAVES** clustered at the base of the culms, the blades 0.7–1.5 mm wide; bracts lacking. **INFL** a globose head about 1 cm in diameter, usually equaling or surpassing the leaves; spikes 6–15, androgynous, not evident individually in the crowded head, less than 1 cm long, the staminate flowers inconspicuous; pistillate scales subequal to the perigynia, brownish with hyaline margins. **PERIGYNIA** 4–4.8 mm long, 1.7–2.3 mm wide, ovate-elliptic, inflated, gradually tapered to a bidentate beak; stigmas 2. **ACHENES** lenticular. Alpine communities. 3690–4235 m (12100–13900'). Flowering: Jul–Aug. COLO: Con, LPl, Min, SJn. Colorado and the La Sal Mountains of Utah.

Carex petasata Dewey (prepared for a journey or having a cap on) Liddon sedge. Plants 2–7 dm tall, caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower culm, the blades 1–4 mm wide, flat or channeled; lowest bract lacking. **INFL** 2.2–5 cm long, 8–12 mm wide, spicate, surpassing the leaves, the lowest internode of the rachis 4–7 mm long, the second lowest subequal; spikes 3–6, gynaecandrous, 10–22 mm long, 5–7 mm wide, more or less clavate, sessile, loosely aggregated and evident without dissecting the inflorescence, about 2–3 times longer than the internodes of the rachis; pistillate scales largely concealing the perigynia, stramineous or light reddish brown, with a green or pale midstripe and hyaline margins. **PERIGYNIA** (5.7) 6–7.5 (8) mm long, 1.5–2.8 mm wide, lanceolate, narrowly ovate or nearly elliptic, greenish or light brown, plano-convex, with thin winged margins, serrulate at least in the distal 1/2, gradually tapered to an obliquely cleft beak, conspicuously nerved on both sides; stigmas 2. **ACHENES** lenticular. Montane communities. COLO: Arc, Hin, Mon. The one specimen seen (*Heil et al. 13366*, SJNM) is from Piedra Trail below Ice Cave Ridge. UTAH. 2590–2895 m (8500–9500'). Flowering: Jun–Jul. British Columbia to Saskatchewan

and south to California and Arizona. This plant passes into *C. praticola* and perhaps into *C. phaeocephala*. Additional study of this complex is indicated.

Carex phaeocephala Piper (dusky head) Dunhead sedge. Plants (10) 15–30 (55) cm tall, densely caespitose; rhizomes lacking. **LEAVES** basal and on the lower culm, the blades about 1–3 mm wide, flat, channeled, or involute; lowest bract lacking or occasionally present and subequal to the inflorescence or longer. **INFL** 1.4–3 cm long, rarely shorter, 5–15 mm wide, equaling or surpassing the leaves; spikes (1) 2–5 (7), gynaecandrous, 8–15 mm long, 5–7 mm thick, sessile, approximate but mostly evident without dissecting the head, mostly twice or more as long as the internodes; lowest internode of the rachis commonly 4–7 mm long; pistillate scales as long and almost as wide as the perigynia, largely concealing them (sometimes pressed to one side in herbarium specimens), brown to dark brown, with green or pale midstripe and usually conspicuous hyaline margins. **PERIGYNIA** 4–5.5 mm long, 1.5–2.2 mm wide, lanceolate to ovate-elliptic, brownish or stramineous, with greenish stramineous, thin-winged margins, finely but conspicuously nerved dorsally and often ventrally, gradually or rather abruptly tapered to a bidentate beak; stigmas 2. **ACHENES** lenticular. Krummholz spruce, rocky alpine tundra, and talus. COLO: Con, Hin, LPl, Min, Mon, SJn. 2820–3900 m (9260–12800′). Flowering: Jul–Aug. British Columbia to Alberta and south to California and Colorado.

Carex praeceptorum Mack. (teacher) Slope sedge. Plants 10–31 cm tall, densely to loosely tufted, with short or somewhat prolonged rhizomes. **LEAVES** basal and on the lower culm, the blades 1.5–3 mm wide; lowest bract lacking or shorter than the lowest spike. **INFL** 1–2.7 cm long, about 5–8 mm wide, usually equaling or surpassing the leaves; spikes 4–6, gynaecandrous, 5–12 mm long, 3–4 mm wide, sessile, approximate or the lower ones somewhat separate, but usually twice as long as the internodes or occasionally equaling them; pistillate scales shorter than the perigynia, brown to dark brown, with a green midstripe and narrow to rather broad hyaline margins. **PERIGYNIA** 1.7–2.2 (2.5) mm long, 1–1.2 mm wide, elliptic to elliptic-ovate, more or less flattened, but with rounded, wingless margins, yellow-green or brownish green, (10) 15–25 per spike, slightly granular-roughened, infrequently serrulate on the beak, finely nerved on both sides, the nerves frequently reddish or brown-red, sometimes only faintly so, the dorsal suture conspicuous on the beak and extending barely onto the body; stigmas 2. **ACHENES** lenticular. Moist and wet meadows. COLO: Con, Hin, LPl, Min, SJn. 3130–3660 m (10270–12000′). Flowering: Jul–Aug. Washington to Montana and south to Nevada and Colorado. Plants of *C. praeceptorum* are similar to those of *C. canescens*. A combination [*C. canescens* L. var. *praeceptorum* (Mackenzie) Bailey] has been made.

Carex praegracilis W. Boott (very slender) Black creeper sedge. Plants (1) 1.5–7 dm tall, dioecious (and forming clones) or monoecious; culms arising singly or few together or occasionally tightly clustered, from robust blackish or dark brown rhizomes 2–4 mm thick, these covered with scales that often become filamentous in age. **LEAVES** with the lowest reduced to bladeless sheaths, these often dark brown or blackish, the upper leaves borne on the lower 1/4 of the culms, with blades 1–3.5 mm wide. **INFL** 1.5–4.3 cm long, about 5–15 mm wide, simple or compound, capitate or spicate, usually surpassing the leaves, without a subtending leaflike bract or this to about 1/2 as long as the inflorescence; spikes about 6–25, androgynous, staminate or pistillate, to about 1 cm long, closely aggregated, or the lower one somewhat separate, all longer than the rachis internodes, sessile; pistillate scales mostly as long and as wide as the perigynia and largely concealing them, these and the staminate ones brown with a green or paler midrib and hyaline margins. **PERIGYNIA** 2.8–3.5 mm long, 1.1–1.7 mm wide, ovate or lance-ovate to elliptic, usually short-stipitate, the margins rather thin when young, firm in age and slightly turned toward the ventral surface; beak of the perigynium 0.6–1.3 mm long, obliquely cleft, serrulate, the minute teeth often extending onto the body of the perigynium; stigmas 2. **ACHENES** lenticular. $2n = 60$. Riparian and palustrine communities including hanging gardens and irrigated pastures. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Mon, SJn; NMEX: RAr, SJn; UTAH. 1400–2665 m (4600–8750′). Flowering: May–Jul. Yukon to Quebec and Maine, south to California and Virginia; Mexico.

Carex praticola Rydb. (meadow dweller) Meadow sedge. Plants 30–80 cm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower culm, the blades 2–4 mm wide, flat. **INFL** (2.5) 3–4 cm long, 1–1.5 cm wide, spicate, more or less flexuous, sometimes more or less secund; overtopping the leaves and without a leafy bract or this shorter than the inflorescence; the lowest internode about 5–12 mm long, the second one as long or nearly so; spikes (2) 4–7, gynaecandrous, (8) 10–15 mm long, about 5–7 mm wide, usually clavate, sessile, loosely aggregated and evident without dissecting the inflorescence, about 1–2 times as long as the internodes, or the lower one slightly shorter, and the upper ones to about 3 times as long; pistillate scales subequal to and as wide as the perigynia, largely concealing them, dull reddish brown with a green midstripe and broad hyaline margins. **PERIGYNIA** (4) 4.5–5.7 (6) mm long, 1.2–2.1 mm wide, plano-convex, with thin-winged margins, serrulate, gradually tapered to a shallowly bidentate

beak, finely nerved dorsally, faintly nerved ventrally, the beak more or less terete and not serrulate at least in the distal portion; stigmas 2. **ACHENES** lenticular. $2n = 64, 70$. Ponderosa pine–Gambel's oak communities. COLO: Arc (*Heil & Mietty 13313* SJNM). 2440 m (8000'). Flowering: Jun–Jul. Alaska to Labrador, south to California and Quebec. Plants of this taxon pass imperceptibly into those of *C. petasata.*

Carex pyrenaica Wahlenb. (of the Pyrenees) Pyrenean sedge. Plants 5–15 cm tall, densely caespitose, without rhizomes, the culms and leaves often fasciculate. **LEAVES** 2–4 per culm, the lower bladeless, the upper with blades 0.5–1.5 mm wide, flat or loosely to strongly channeled; bract lacking. **INFL** a solitary spike, erect, androgynous, 0.7–2 cm long, 4–7 mm thick, the staminate portion about 2–4 mm long; pistillate scales tan to dark brown, the margins hyaline, subequal to the perigynia, deciduous in age. **PERIGYNIA** usually (5) 10 or more, about 2.5–4 mm long, lanceolate, somewhat stipitate and jointed to the rachis, ascending, or sometimes reflexed in age, readily deciduous; rachilla lacking; stigmas 3 (in ours). **ACHENES** trigonous (in ours). Late-melting alpine snowbeds. COLO: Con, Hin, LPl, SJn. 3500–4100 m (11400–13400'). Flowering: Jul–Aug. Alaska to California and Colorado; Eurasia. Our plants are referable to **subsp. *micropoda*** (C. A. Mey.) Hultén (small foot) [*C. crandallii* Gand.]. Most of our specimens appear to have three stigmas and trigonous achenes.

Carex retrorsa Schwein. (twisted or bent) Knotsheath sedge, reflexed sedge. Plants 3–10 dm tall; culms densely clustered on short rhizomes. **LEAVES** mostly borne on the culms, the blades 4–10 mm wide. **INFL** 5–13 cm long, with 1 staminate, gynaecandrous, or androgynous spike above 4–6 pistillate spikes, these 1.5–4.5 cm long, about 1.5–2 cm thick, cylindrical, closely spaced and much longer than the internodes of the rachis or the lowest one widely spaced but still longer than its internode, each subtended by leafy bracts that much surpass the inflorescence; pistillate scales shorter and narrower than the perigynia, greenish or stramineous, narrowly acute, acuminate, or short-awned. **PERIGYNIA** widely spreading, giving a bristly appearance to the spikes, 7–10 mm long, shiny, greenish, conspicuously nerved, the body inflated, ellipsoid to subglobose, narrowed to a conspicuously bidentate beak 2–3 (4) mm long; stigmas 3. **ACHENES** trigonous, much smaller than the perigynia, the style continuous with, persistent on, and of the same firm texture as the achene, contorted in age. $2n = 70$. Infrequent in marshes, wet meadows, or along river bottoms. The two specimens seen are from Opal Lake Trail (*Heil 11453*, SJNM) and upper Price Lakes (*Heil 12668*, SJNM). COLO: Arc, Hin, LPl, Mon. 2650–2745 m (8700–9000'). Flowering: Jun–Aug. British Columbia to Quebec and south to Oregon, Colorado, and New Jersey.

Carex rossii Boott (for Edith A. Ross, botanical collector) Ross sedge. Plants 5–32 cm tall, densely caespitose, with or without short rhizomes, often deep reddish purple basally. **LEAVES** basal and on the lower culm, mostly overtopping the inflorescence, the blades 0.5–3 mm wide. **INFL** essentially the length of the culms, with the lowest spike borne on a slender peduncle arising near the culm base and much removed from the rest of the inflorescence; terminal spike staminate, 5–12 mm long; lateral spikes mostly 2–5, very short, with only 1–6 perigynia, bracteate or leafy-bracteate, the lower bracts (excluding those of the basal spike) usually exceeding the inflorescence; pistillate scales shorter than the perigynia, with a greenish, keeled, often scabrescent-ciliolate midrib, this flanked by stripes of brown or brownish purple and then by broad hyaline margins. **PERIGYNIA** sparsely to densely puberulent, 2.7–4.5 mm long including the oblique beak, this 0.7–1.8 mm long, the body plump, with 2 prominent marginal nerves; stigmas 3. **ACHENES** trigonous, filling the perigynia. $2n = 36$. [*C. brevipes* W. Boott] Mountain brush and piñon-juniper, Douglas-fir, and aspen communities. ARIZ: Nav; COLO: Arc, Dol, Hin, LPl, Mon, SJn, SMg; NMEX: SJn; UTAH. 2040–3540 m (6685–11600'). Flowering: Jun–Jul. Alaska to California and Arizona and east to Michigan. This is a widespread and common to abundant species to the north and west, but it is rarely collected in the Four Corners region.

Carex saxatilis L. (growing among rocks) Russet sedge. Plants 21–40 (56) cm tall; culms arising singly or rather closely spaced on creeping rhizomes. **LEAVES** mostly borne on the lower 1/2 of the culms and sometimes higher, the blades 1.5–3 mm wide, flat. **INFL** 4–9 cm long, with 1–2 (3) staminate spikes 1–3 cm long borne above 1–2 pistillate spikes 1–2.6 cm long and about 5–8 mm wide, the lateral staminate ones well spaced, subequal to or shorter than the rachis internodes, the pistillate ones sessile or on slender, spreading or drooping peduncles to 3 cm long, each subtended by a leafy bract, the lowest bract usually overtopping the inflorescence; pistillate scales slightly to conspicuously shorter than the perigynia, acute, very dark brown, purple-black, or black, sometimes with a pale midstripe, the margins whitish hyaline at least toward the often erose tip. **PERIGYNIA** 3.2–5.2 mm long, 1.5–3.3 mm wide, lanceolate to nearly orbicular, slightly inflated, soon black or blackish purple at least where exposed beyond the scale, with marginal or sometimes dorsal nerves conspicuous, nerveless ventrally, tapering to a short beak, the beak nearly entire or with inconspicuous teeth, these not over 0.5 mm long and easily broken off; stigmas 2 or occasionally 3, sometimes both

in the same spike. **ACHENES** accordingly lenticular or trigonous, the style continuous with, persistent on, and of the same firm texture as the achene, often strongly bent or recurved back against the achene in age. $2n = 78?$ 80. [*C. physocarpa* J. Presl & C. Presl] Peaty wetlands of evaporated tarns and other wetlands. COLO: Con, Hin, LPl, SJn. 3290–3720 m (10800–12200'). Flowering: Jul–Aug. Circumboreal; south in America to Utah and Colorado.

Carex scirpoidea Michx. (scirpuslike) Spike-rush sedge. Plants 4–30 cm tall, unisexual; culms arising singly or few together from rather short but conspicuous rhizomes. **LEAVES** basal and on the lower culm, the blades 1.5–3.5 cm long, 3–7 mm wide, linear. **INFL** a solitary spike, wholly staminate or wholly pistillate, about 1.5–3.5 mm long; scales mostly rounded at the apex, blackish purple with hyaline, ciliolate margins, sometimes sparsely pubescent dorsally, the pistillate ones mostly longer and wider than the perigynia; anthers 3–5 mm long. **PERIGYNIA** obovoid, 2–4 mm long including the beak, pubescent; rachilla obsolete.

1. Plants 4–34 cm tall; spike to 4 mm wide when pressed; krummholz and alpine ..... **var. *pseudoscirpoidea***
1′ Plants 20–45 cm tall; spike 2.5–3 mm wide when pressed; montane ..... **var. *scirpoidea***

var. *pseudoscirpoidea* (Rydb.) Cronquist (false scirpuslike) Krummholz and alpine tundra communites. COLO: Con, Hin, LPl, Mon, SJn. 3500–3900 m (11500–12800'). Flowering: Jul–Aug. Labrador to Alaska, south to New Hampshire and California.

var. *scirpoidea* The one specimen seen is from a calcareous fen north of Haviland Lake (*K. Heil & A. Clifford 26644* SJNM). COLO: LPl. 2620 m (8600'). Flowering: Jul–Aug. Alberta to Manitoba, south to North Dakota, Utah, and Colorado.

Carex scopulorum Holm (of the cliff) Mountain sedge. Plants 22–67 cm long; culms arising singly or few together or somewhat tufted, from robust, scaly rhizomes. **LEAVES** basal and mostly on the lower culm, the blades (2) 3–7 mm wide. **INFL** 2.5–9 cm long, exceeding the lowest foliar bract, with 1 or 2 staminate spikes 1–2.2 cm long above 2–4 cylindrical or ovoid pistillate spikes 1–3 cm long and 5–10 mm wide, the intermediate spikes occasionally androgynous; pistillate scales shorter than or longer than the perigynia and mostly narrower at least toward the apex, black or purple-black. **PERIGYNIA** 1.8–3.3 mm long, elliptic to broadly obovate, nerveless except for the 2 marginal nerves, blackish to dark reddish brown at least distally, sessile or nearly so, the beak nearly obsolete; stigmas 2 or rarely 3. **ACHENES** respectively lenticular or trigonous. Wet meadow, krummholz, and alpine communities. COLO: Arc, Con, Hin, LPl, Min, SJn. 3445–3870 m (11300–12700'). Flowering: Jul–Aug. British Columbia to California and east to Colorado. In addition to the features listed in the key, *C. scopulorum* is distinguished from the similar *C. aquatilis* with comparatively crowded spikes that are shorter on average.

Carex siccata Dewey (dry) Silvertop sedge. Plants 19–36 cm tall; culms arising singly or few together and loosely to rather closely clustered on stout rhizomes. **LEAVES** clustered on the lower 1/4 of the culms, the lower ones often reduced to bladeless sheaths, the upper ones with blades 1–2 mm wide, flat, the longer ones subequal to or shorter than the inflorescence; lowest bract subequal to the lowest spike. **INFL** 1–3 (6) cm long, 5–10 mm wide, linear or clavate or occasionally orbicular; spikes sessile, congested or interrupted, about 5–12 mm long, the lower ones gynaecandrous or pistillate, some (especially the middle ones) staminate, the upper one often pistillate and closely subtended by a staminate spike and thus falsely appearing to be gynaecandrous; scales light brown with broad hyaline margins, the pistillate ones subequal to the body of the perigynia but surpassed by the beak. **PERIGYNIA** 4.5–6.2 mm long including the prominent beak, flattened, serrulate to near the middle and sometimes below, slightly wing-margined below, the body more or less elliptic; stigmas 2. **ACHENES** lenticular, filling the perigynia, sometimes rupturing it at maturity. $2n = 70$ [*C. foenea* sensu Svenson, not Willd.]. Ponderosa pine–oak, aspen, spruce-fir, and subalpine communities. COLO: Arc, Con, Hin, LPl, Min, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 1765–3800 m (5800–12400'). Flowering: Jun–Aug. Yukon to Quebec and south to Arizona, New Mexico, and Maine.

Carex simulata Mack. (likeness) Lookalike sedge. Plants 22–45 cm tall, dioecious (and commonly forming unisexual clones) or monoecious, the culms mostly arising singly from, and closely to remotely spaced on long, whitish or light brown rhizomes. **LEAVES** cauline, mostly borne on the lower 1/4 of the culms, the lower ones reduced to bladeless sheaths, the upper ones with blades 1.5–4 (6) mm wide; bracts subequal to the spikes or the lower 1–3 from 1/2 as long to equaling the inflorescence, long acuminate-caudate. **INFL** 1.8–3.5 cm long, 7–25 mm wide, simple or occasionally compound, capitate or spicate, linear to oblong or occasionally ovate, subequal to or surpassing the leaves; spikes commonly 10–20, unisexual or androgynous, crowded and usually concealing the rachis, more or less evident without dissecting the inflorescence; pistillate scales longer than the perigynia, brownish, with narrow to rather broad

pale hyaline margins, the midrib sometimes green. **PERIGYNIA** 1.7–2.6 mm long, elliptic-ovate, or nearly orbicular, shining brown, sessile or occasionally very short-stipitate, the margins rounded, not thin, the dorsal surface with a few raised nerves extending to about 1/2 or more to apex or occasionally nerveless, the ventral nerves like the dorsal ones but mostly shorter and more often lacking, the wall thick and coriaceous, the beak 0.2–0.6 mm long, inconspicuously winged and serrulate near the confluence with the body; stigmas 2. **ACHENES** lenticular. Wet meadows and swamps. The one specimen seen (*Rich Fleming 1210*, SJNM) is from west of Puett Reservoir. The other specimen (*Peggy Lyon 114* SJNM), was collected from an iron bog at Chattanooga, Colorado. COLO: LPl, Mon, SJn. 2165–3145 m (7100–10320'). Flowering: Jun–Jul. Washington to Saskatchewan and south to California and New Mexico.

Carex specuicola J. T. Howell (cave-dweller) Navajo sedge, hanging garden sedge. Plants (15) 20–40 (66) cm tall, densely to loosely caespitose with short rhizomes. **LEAVES** basal and borne on the lower 1/5–1/3 of the culm, the blades 0.5–2 (3) mm wide, lax. **INFL** 2–4.2 (10) cm long with 2–3 spikelets, the terminal 6–15 (23) mm long, gynaecandrous or sometimes staminate or with a pistillate apex and base and staminate middle, the lateral spikes 5–15 mm long, often of uniform length, pistillate. **PERIGYNIA** 2.5–3 (3.5) mm long, greenish or straw-colored after maturity; stigmas mostly 2, sometimes 3. **ACHENES** mostly lenticular, sometimes trigonous. Seeps and springs of hanging gardens in sandstone alcoves. ARIZ: Apa, Nav. 1495–1980 m (4900–6500'). Flowering: May–Jul. Arizona. Specimens from hanging gardens of San Juan County, Utah, have also been identified as *C. specuicola*. However, mature specimens examined from San Juan County, Utah, have mostly trigonous achenes. They also tend to have lateral spikes with considerable variability in size. These are features of *C. parryana*. Some immature specimens from Utah might have features of *C. specuicola*. However, these specimens are more or less sympatric with mature specimens that are dominated by features of *C. parryana*. Perhaps *C. parryana* grades into *C. specuicola* in the Four Corners region near the Arizona-Utah border. The transition from three to two stigmas in *C. parryana* begins as far north as Juab County, Utah, where a specimen from Mt. Nebo (*Collins & Harper 937* BRY) has some flowers with two stigmas and others with three stigmas, and in Desolation Canyon, Uintah County, Utah, where a collection with two stigmas (*Atwood 25765* BRY) was made near a collection (*Atwood 24445* BRY) with three stigmas. Occasional presence of two stigmas continues southerly in Emery County, Utah, up to 3110 m (*M. E. Lewis 5125* BRY) and to San Juan County (*A. Clifford 00–216* SJNM). Although some immature specimens from Utah (*A. Clifford 93–125* SJNM) might have features of *C. specuicola*, I am reluctant to include that taxon for Utah without seeing mature specimens that clearly verify its presence there. *Carex parryana* and *C. specuicola* share a number of features including terminal spikes that are gynaecandrous, sometimes staminate, and sometimes pistillate at the apex and base with a staminate center. There appears to be little more than dominance of stigma number and achene shape, and perhaps uniform versus variable length of spikes to serve as diagnostic features. However, several specimens from Arizona consistently show narrower, flaccid leaves, smaller diameter culms, and smaller spikelets than most specimens from Utah. These seem to be additional features that help separate plants of the two taxa. However, a collection (*M. A. Porter 4199* SJNM, BRY) from the type locality (Inscription House, Coconino County, Arizona) has leaves as wide as those in typical *C. parryana*. Much of the interpretation of the *C. specuicola* side of this complex is based on specimens collected by Arnold Clifford, who, apparently, has made more collections of *C. specuicola* than all other collectors combined.

Carex stipata Muhl. ex Willd. (with a stipe) Prickly sedge, owlfruit sedge. Plants 28–75 cm tall or taller, caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower 1/2 of the culms, the lower culm leaves reduced to bladeless sheaths, the upper ones with blades 4–8 (11) mm wide, flat, the ventral side of the sheath membranous, usually cross-corrugated; lowest bract not much if any longer than the lowest branch of the inflorescence, more or less awnlike, usually broken off in older specimens. **INFL** (2.5) 3–5.5 cm long, 1–2 cm wide, compound but spikelike, with many short, crowded spikes, appearing bristly from the widely spreading, narrowly beaked perigynia; spikes crowded, androgynous, to about 1 cm long and nearly as wide; pistillate scales mostly shorter than the perigynia, pale or brownish, rather scarious, with the more or less greenish or pale midrib sometimes exserted as an awn-tip. **PERIGYNIA** (3.6) 4–5.2 mm long, widely spreading, lance-triangular or lance-ovate, broadest at the sometimes abruptly truncate, somewhat spongy-thickened base, gradually tapered to a long, minutely serrulate beak, conspicuously nerved at least dorsally, subsessile to conspicuously stipitate; stigmas 2. **ACHENES** lenticular. $2n = 52$. Riparian areas including ditches. COLO: Arc, Hin, LPl, Min, Mon; NMEX: SJn. 1615–3050 m (5300–10000'). Flowering: Jun–Jul. Alaska to Newfoundland and south to California and Texas. Our plants are referable to **var. *stipata***.

Carex tahoensis Smiley (of Tahoe) Tahoe sedge. Plants 20–45 cm tall, caespitose, from short, stout rhizomes. **LEAVES** with blades 2–3 mm wide; lowest bract generally lacking. **INFL** 2–4 cm long, 7–15 mm wide, more or less spikelike, usually much surpassing the leaves; internodes of the rachis obscured by the dense spikes or sometimes discernible, the lower 2 collectively 8–18 mm long; spikes 3–6, gynaecandrous, 8–17 mm long, sessile, approximate but usually

readily evident without dissecting the inflorescence, about twice as long as the internodes of the rachis; pistillate scales shorter to longer than the perigynia, reddish brown with a greenish midstripe and hyaline margins. **PERIGYNIA** 4.2–7 (7.4) mm long, 1.9–2.8 mm wide, elliptic or ovate, slightly to strongly plano-convex, lightly to evidently many-nerved on both sides, or the ventral side nerveless or with few nerves, wing-margined to the tip of the ill-defined flattened beak, serrulate, greenish, stramineous, or pale brown; stigmas 2. **ACHENES** lenticular. $2n = 68$. Forb-grass communities and open woods. ARIZ: Apa; UTAH. 2500–2600 m (8300–8500'). Flowering: Jun–Jul. Yukon to Alberta and south to California and Arizona. Plants of this taxon have routinely been included in *C. xerantica* L. H. Bailey (Flora of North America Editorial Committee 2002), which is known to the north of our area.

Carex utriculata Boott (with bladders) Bladder-sac sedge. Plants 6–14 dm tall; culms arising singly or 2–3 together from robust, scaly, long-creeping rhizomes, often spongy-thickened and to 1 cm thick near the base. **LEAVES** mostly borne on the lower 1/2 of the culm, the lower sheaths septate-nodulose, the blades 3–12 mm wide, flat; ligule tapering across the ventral surface of the blade at a very rounded angle, not noticeably projected into a point. **INFL** 15–45 cm long, with 2–4 staminate spikes borne above 2–3 (5) pistillate ones, the intermediate ones sometimes androgynous; terminal staminate spike (2) 3–8.5 cm long, the lateral staminate ones somewhat to much shorter, approximate to widely separated; pistillate spikes 2.5–10.5 cm long, 6–13 mm wide, cylindrical, sessile or on peduncles to 3 (7) cm long, rarely compound at the base in large spikes, well spaced and much shorter to longer than the rachis internodes, each subtended by a foliose bract, the bracts often equaling or exceeding the inflorescence; pistillate scales shorter than or subequal to and narrower than the perigynia, greenish, turning red-brown to purple-brown, with a paler median, narrowly acute to acuminate or short-awned. **PERIGYNIA** strongly spreading, glossy, light brown to very dark brown, 4–7 mm long, the body inflated, broadly ellipsoid to subglobose, rather abruptly contracted to a prominent, conspicuously bidentate beak 1–2 mm long, the teeth 0.2–1 mm long; stigmas 3. **ACHENES** trigonous, much smaller than the perigynia, the style continuous with, persistent on, and of the same firm texture as the achene, twisted or abruptly bent. $2n = 70, 72, 76$. [*C. rostrata* Stokes ex Withering] Ponds, lakes, wet meadows, and along streams in ponderosa pine, willow, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr, SJn; UTAH. 2105–3110 m (6900–10200'). Flowering: Jul–Sep. Circumboreal, south in America to California and Delaware.

Carex vallicola Dewey (living in a valley) Valley sedge. Plants 15–56 cm tall, densely caespitose; rhizomes lacking or very short. **LEAVES** basal and on the lower culms, the blades 0.5–2.5 mm wide. **INFL** 0.8–3 cm long, 5–9 mm wide, capitate, shortly interrupted or more often continuous, with the individual spreading perigynia more evident than the individual spikes; spikes 2–10, to 5 mm long, with about 2–7 perigynia, sessile, androgynous, the staminate portion inconspicuous; pistillate scales shorter than the perigynia, with greenish or brownish centers and hyaline margins. **PERIGYNIA** 3.3–3.75 mm long, 1.7–2.3 mm wide, oblong-elliptic, with more or less rounded, wingless margins, pale green or straw-colored, the marginal nerves somewhat displaced onto the ventral surface, otherwise nerveless or nearly so, the body entire, rather abruptly contracted to a very finely serrulate beak 0.6–1 mm long, this slightly or not at all bidentate; stigmas 2. **ACHENES** lenticular, filling the perigynia and sometimes rupturing it at maturity. Gambel's oak and other communities. COLO: Con, Hin, LPl, Min, Mon; NMEX: RAr. 2225–2530 m (7300–9535'). Flowering: Jun–Jul. California to South Dakota, south to Mexico. This taxon is rather easily confused with *C. occidentalis*.

Carex vernacula L. H. Bailey (of the spring) Alpine blackhead sedge. Plants 5–25 cm tall; culms arising singly or 2 or 3 together from rhizomes. **LEAVES** basal and on the lower culms, the blades 2–4 mm wide, flat or nearly so. **INFL** a globose or ovoid head 8–16 mm long, surpassing the leaves, without a subtending bract or this shorter than the inflorescence; spikes usually 10 or more, androgynous, about 4–7 mm long, sessile, very densely crowded and mostly not evident in the head, concealing the very short internodes of the rachis; pistillate scales subequal to the perigynia, dark brown with paler midrib and hyaline margins. **PERIGYNIA** 3.3–4.7 mm long, 1–1.6 mm wide, lanceolate to narrowly elliptic, usually brownish, often with paler greenish margins, flattened, with the marginal nerves prominent, faintly nerved toward the base on both sides, conspicuously beaked; stigmas 2. **ACHENES** lenticular. Alpine communities. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn. 3200–3900 m (10500–12800'). Flowering: Jul–Aug. Washington to Wyoming and south to California and Colorado. This taxon is similar to the European *C. foetida* All., and it is often combined with it. The number of collections from our area indicate that it is not common in the San Juan Mountains.

Carex viridula Michx. (green) Green sedge. Plants 12–33 cm tall, densely caespitose; rhizomes lacking. **LEAVES** basal and on the lower culm, the blades 1–3 mm wide, flat or nearly so. **INFL** 2–5 (10) cm long, exceeded by the leafy bracts; terminal spike 7–21 mm long, staminate or with a few perigynia at the base or intermixed with the staminate flowers;

lateral spikes 2–4, pistillate, 0.5–1 cm long, about 5 mm wide, the upper ones aggregated, closely subtending the terminal spike, and sessile or nearly so, the lowest one approximate and sessile to widely spaced (the internode 5–12 cm long) and on a peduncle to 2.3 cm long, this enclosed in the sheath (to 2 cm long) of the subtending bract; pistillate scales much shorter than the perigynia, pale green, mostly hyaline. **PERIGYNIA** 2.2–3.5 mm long, including the conspicuous beak, pale green or yellow-green, strongly ribbed, obovoid; stigmas 3. **ACHENES** trigonous, filling the lower part of the perigynia only. $2n = 70, 72$. Wet places from foothills to subalpine. COLO: LPl, SJn (Johnston 2001). 1830–2745 m (6000–9000′). Flowering: Jun–Aug. Alaska to Newfoundland and south to California, Arizona, and the New England states; Eurasia, Japan. Our plants are referable to **var. *viridula.***

Carex vulpinoidea Michx. (like a fox) Fox sedge. Plants 20–100 cm tall, caespitose from short, tough rootstocks; culms stiff, sharply triangular but roughened on the angles above, usually shorter than the leaves. **LEAVES** flat, 2–6 mm wide, long-attenuate, the sheaths cross-rugulose ventrally. **INFL** compound, spikelike, interrupted with lower branches more or less separate; spikes numerous, subtended by setaceous-elongate bracts, androgynous but the stamens few and inconspicuous; pistillate scales awned. **PERIGYNIA** 1.7–3 mm long, about 1–2 mm wide, with thickened edges and base, tapering gradually into a serrulate beak 1/2 as long as the body or longer. **ACHENES** lenticular. Infrequent in swampy habitats. Three of the four specimens seen are from a riparian community at Sambrito wetlands near Navajo Lake. COLO: Arc, LPl. 1860–2080 m (6100–6820′). Flowering: Jun–Aug. British Columbia to Newfoundland, and south to Oregon, Arizona, and Florida.

Cladium P. Browne Sawgrass

Plants perennial from robust rhizomes, with hollow, leafy stems. **INFL** a compound umbel with numerous spikelets, these few-flowered, scales spirally arranged, the lower ones empty or staminate. **FLOWERS** perfect, solitary at the apex of the spikelet; perianth bristles lacking; stamens 2; style cleft with 2 or 3 branches. **FRUIT** an achene. Two species. North America and cosmopolitan. Used for thatching.

Cladium californicum (S. Watson) O'Neill (of California) California sawgrass. Culms 1–2 m tall, subterete to subtriangular, about 1–1.5 cm thick. **LEAVES** 0.8–1.5 cm wide; flat, serrulate, the teeth cartilaginous. **INFL** of 3–10 or more umbels, with several rays and numerous spikes 3–4 mm long; scales few, reddish brown, the lower ones empty, the middle ones empty of subtending staminate flowers, the terminal one subtending a perfect flower. **ACHENES** ovoid, about 2 mm long, without a tubercle. Hanging gardens along Lake Powell. UTAH. 1125–1160 m (3700–3800′). Flowering: Jun–Jul. Rising water of Lake Powell has drowned most of the sites discovered for this plant. The few surviving relics are perched just above the high water mark of the lake. California to southern Utah and south to Mexico. Used for basketry.

Cyperus L. Flatsedge, Umbrella-sedge

(from *kypeiros*, the ancient Greek name) Plants annual or perennial. **LEAVES** linear, mostly basal and on the lower 1/2 of the culm. **INFL** of few to several clusters of spikelets, the terminal cluster commonly sessile and exceeded by lateral ones, these borne on short to elongate peduncles originating in the axils of the leafy involucral bracts; involucres commonly of well-developed, sheathless, leafy bracts, these sometimes larger than the leaves and commonly exceeding the inflorescence; spikelets with few to several scales subtending flowers, the axis of the spikelet (rachilla) winged or wingless, persistent or deciduous and breaking at the base as a unit or at the nodes as multiple units. **FLOWERS** lacking; stamens 1–3; stigmas 2 or 3. **ACHENES** lenticular or trigonous with a short stylar point but without a tubercle. About 600 species, tropical and warm regions. *Cyperus papyrus* was used as paper in Egypt.

Other species expected include *Cyperus acuminatus* Torr. & Hook., *C. schweinitzii* Torr., *C. strigosus* L., and *C. odoratus* L.

1. Rachis more or less visible between loosely arranged racemose spikelets; larger bracts commonly over 15 cm long and over 3 mm wide ..... (2)
1′ Rachis mostly concealed by a dense, capitate cluster of spikelets; bracts various but often shorter than 15 cm and narrower than 3 mm ..... (3)

2. Plants annual; spikelets 3–8 (11) mm long ..... ***C. erythrorhizos***
2′ Plants perennial from elongate stolons; larger spikelets commonly 10–20 mm long or longer ..... ***C. esculentus***

3. Plants perennial from rhizomes; culms arising singly or few together, commonly over 20 cm tall ..... ***C. fendlerianus***
3′ Plants annual, culms often clustered from fibrous roots, commonly less than 20 cm tall (in ours) ..... (4)

4. Scale with a squarrose awn-point 0.3–1 mm long, with (5) 7–9 nerves.....***C. squarrosus***
4' Scale entire or with a minute, blunt point, with 2–3 nerves.....***C. bipartitus***

Cyperus bipartitus Torr. (2 parts) Shining flatsedge, slender flatsedge. Plants tufted, annual, 5–20 (30) cm tall. **LEAVES** on the lower 1/4 of the culms slender, 0.5–2 mm wide; involucral bracts 1–2 (3), similar to the leaves. **INFL** of spicate or headlike clusters of ascending or spreading spikelets, the clusters sessile or nearly so, or some on rays to 2.5 cm long, or rarely longer; spikelets 1–10 per cluster, (3) 7–12 mm long, linear or ovate, persistent on the rachis; rachilla wingless; scales crowded, about 14–18 per spikelet, mostly 2–2.5 mm long, blunt, with a prominent pale midrib and otherwise anthocyanic at maturity, deciduous from the persistent rachilla; stamens 2, rarely 3; style deeply bifid. **ACHENES** lenticular, 1–1.3 mm long, olive or blackish, minutely roughened or cross-ridged at maturity. [*C. rivularis* Kunth]. Shorelines, ditches, often in disturbed places. The one specimen seen (*Rich Fleming 427* SJNM) is from a riparian area at Aztec. NMEX: SJn. 1705 m (5600'). Flowering: Sep. Widespread in the United States, southeastern Canada, and South America.

Cyperus erythrorhizos Muhl. (red root) Redroot flatsedge. Plants annual, 10–73 cm tall; culms sharply triangular, arising singly or few to several together. **LEAVES** crowded toward the base of the culms, the blades elongate, 2–10 mm wide. **INFL** compact, or open and umbel-like, the clusters of spikelets elongate, sometimes cylindrical, 1–3 cm long, the terminal sessile, the others borne on rays to 9 cm long; involucral bracts commonly 4–10, unequal, the larger ones to 40 cm long, sometimes wider than the leaves; spikelets 3–8 (11) mm long, 1–1.5 mm wide, spirally arranged; rachilla narrowly hyaline-winged, the wings readily deciduous in short segments at maturity; scales about 1–1.5 mm long, broadly rounded or blunt apically, with 3–5 faint lateral nerves, closely overlapping, eventually deciduous, the midrib scarcely excurrent as a blunt mucro; stamens 3; styles 3-branched for about 1/4–1/2 their length. **ACHENES** trigonous, pale, shiny, 0.7–1 mm long. Mudflats of reservoirs and other disturbed riparian sites and sometimes associated with agriculture. COLO: Arc, LPl; NMEX: SJn; UTAH. 1100–1850 m (3600–6100'). Flowering: Sep. United States and southern Canada.

Cyperus esculentus L. (edible) Chufa flatsedge. Plants perennial, 30–70 cm tall; culms sharply triangular, usually arising singly from numerous fibrous roots and slender rhizomes which terminate in small tubers. **LEAVES** few to many, clustered toward the base of the culms, the blades elongate, 3–8 mm wide. **INFL** umbel-like and congested to open and elongate with the terminal spikelet sessile, the others on rays to 10 cm long; involucral bracts about 3–6, unequal, from shorter than to much exceeding the inflorescence; spikelets slender, 5–20 mm long, 1–2 mm wide, with about 12–28 flowers; rachilla narrowly hyaline-winged; scales 2–3 (4) mm long, several-nerved, overlapping about 1/2 their length, deciduous at maturity; stamens 3; styles 3-branched for about 1/2–3/4 their length. **ACHENES** unequally trigonous, 1.3–2 mm long. $n = 48, 54, 104$. Disturbed soils. Only two specimens seen. COLO: LPl; NMEX: SJn. 1705 m (5600') Flowering: Aug. Widespread in tropical and warm-temperate regions. Used as a ceremonial emetic and ceremonial medicine by the Ramah Navajo.

Cyperus fendlerianus Boeck. (for Augustus Fendler, German-American botanical collector) Fendler flatsedge. Plants perennial from tuberlike rhizomes mostly not over 1 cm long, mostly 20–70 cm tall (about 40 cm in ours). **LEAVES** 2 or 3, commonly 20–40 cm long, about 2 mm wide (in ours). **INFL** capitate, without rays, mostly 2–3 cm long; involucral bracts 2 or 3, unequal, the longer ones up to about 15 cm long, 1–2 mm wide (in ours); spikelets sessile, 5–8 mm long, about 2–3 mm wide; scales 3–6 mm long, several-nerved, overlapping 1/2 or more their length; stamens 3; styles 3-branched. **ACHENES** trigonous. Riparian communities and ephemeral pools of slickrock communities with stunted ponderosa pine and cliffrose. ARIZ: Apa, Coc; COLO: LPl, Min, SJn; NMEX: McK, SJn. 2150–2660 m (7100–8740'). Flowering: Sep. Wyoming, Colorado, and south to Arizona and Texas. The rayless inflorescence coupled with the perennial, tuberous-rhizomatous habit readily sets this species apart from other flatsedges of the area. Flowers and seeds salted and fed to horses by the Chiricahua and Mescalero Apache.

Cyperus squarrosus L. (spreading horizontally) Bearded flatsedge. Plants annual, 2–15 cm tall, tufted, with fibrous roots. **LEAVES** borne near the base of the culms, mostly 0.5–2.5 mm wide. **INFL** with involucral bracts commonly 2–6, foliose, some or all exceeding the inflorescence; spikelets 4–10 mm long, flattened, in capitate clusters, the terminal cluster sessile, the others, if present, on slender rays to 2 cm long; scales about 1–2 mm long, with (5) 7–9 more or less raised nerves, deciduous with age, the narrowed apex awnlike, 0.3–1 mm long, spreading to somewhat recurved; rachilla wingless, persistent; stamen solitary; style 3-branched. **ACHENES** trigonous, 0.6–1 mm long. [*Cyperus aristatus* Rottb.]. Streams, terraces, and potholes in piñon-juniper and ponderosa pine communities. ARIZ: Apa, Coc; NMEX: McK, SJn; UTAH. 1100–2285 m (3600–7500'). Flowering: Jul–Sep. More or less cosmopolitan except at high latitudes.

Eleocharis R. Br. Spike-rush

(from the Greek *helos*, a marsh, and *charis*, grace) Plants annual or perennial. **CULMS** angular, flattened, or terete. **LEAVES** reduced to bladeless sheaths, or the sheaths bristle-tipped, basal or nearly so. **INFL** a solitary, terminal spikelet; involucral bracts lacking; scales spirally arranged, the lower empty or with flowers. **FLOWERS** perfect; perianth lacking or of up to about 10 bristles; stamens 1–3; styles 2 or 3, thickened toward the base, the thickened part persistent on the achene as a tubercle, this confluent with or sharply differentiated from the achene. **ACHENES** lenticular to more or less trigonous.

1. Stigmas 2 ..... ***E. palustris***
1′ Stigmas 3 ..... (2)

2. Tubercle constricted at the base, more or less forming a cap on the achene, or at least wider than high ..... (3)
2′ Tubercle not constricted at the base, confluent with and not forming a cap on the achene, as high as or higher than wide ..... (5)

3. Achenes yellowish, brown, or blackish in age, without cross corrugations; spikelets 5–16 cm long, usually with more than 15 flowers ..... ***E. parishii***
3′ Achenes whitish or pale gray, longitudinally many-ribbed with cross corrugations forming ladderlike configurations; spikelets 2.5–9 mm long, 3–15 flowers ..... (4)

4. Plants perennial, with slender rhizomes; anthers 0.7–1.3 mm long; spikelet 2.5–9 mm long ..... ***E. acicularis***
4′ Plants annual; rhizomes lacking or rarely developed; anthers 0.2–0.4 mm long; spikelet 1.5–3 mm long ..... ***E. bella***

5. Achenes 0.9–1.3 mm long; scales 1.5–2.5 mm long; spikelets 2.5–6 mm long ..... ***E. parvula***
5′ Achenes 1.9–2.8 mm long; scales 2.5–5.5 mm long; spikelets 4–11 mm long ..... (6)

6. Plants mostly 40–80 cm tall; from ascending or vertical stout rhizomes; larger culms 1–2 mm thick; spikelets 5–13 mm long; with mostly 10–20 flowers ..... ***E. rostellata***
6′ Plants mostly 7–20 cm tall; from slender rhizomes; spikelets 4–8 mm long, with mostly 3–9 flowers ..... ***E. quinqueflora***

Eleocharis acicularis (L.) Roem. & Schult. (needlelike) Slender spike-rush, needle spike-rush. Plants perennial, 2–15 (20) cm tall; culms 0.3–0.5 mm thick, tufted, from very slender rhizomes, usually with a solitary sheath about 3–15 mm long. **INFL** a spikelet, 2–8 mm long, with about 4–25 flowers; scales (1.3) 1.5–2.2 mm long, blackish purple, typically with a green midstripe and hyaline margins. **FLOWER** perianth bristles commonly 3–4, equaling or surpassing the achene or sometimes reduced or lacking; anthers 0.7–1.3 mm long; stigmas 3. **ACHENES** white to pale gray, rounded-trigonous, 0.7–1.1 mm long including the low-conic or more or less triangular-conic, basally constricted tubercle, with 8–18 longitudinal ribs, and with numerous cross corrugations connecting the ribs. $2n = 20$. [*Scirpus acicularis* L.]. Ephemeral pools and ponds, margins of permanent ponds and lakes, and riparian communities, often in drying mud. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2315–3050 m (7600–10000′). Flowering: Jun–Aug. Circumboreal, south in America to Florida and Mexico.

Eleocharis bella (Piper) Svenson (beautiful) Pretty spike-rush. Plants annual but forming dense tufts and appearing perennial, rarely with slender rhizomes, 1–8 cm tall; culms about 0.2 mm thick, usually with a solitary short sheath. **INFL** a spikelet, 1.5–3 mm long, with 3–15 flowers; scales 1–1.3 mm long, with a green or pale midstripe and hyaline margins and sometimes with dark purplish stripes flanking the green midstripe. **FLOWER** perianth bristles lacking; anthers 0.2–0.4 mm long; stigmas 3. **ACHENES** white or nearly so, rounded-trigonous, with several longitudinal ribs and numerous cross corrugations connecting the ribs, these forming ladderlike configurations, 0.6–0.8 mm long including the low-conic, basally constricted tubercle. [*E. acicularis* (L.) Roem. & Schult. var. *bella* Piper]. Borders of marshes and lakes. An immature specimen (*Reeves 9773* SJNM) from near Berland Lake appears to belong to this taxon. NMEX: SJn. 2660 m (8730′). Flowering: Sep. Washington to Idaho, south to California and New Mexico.

Eleocharis palustris (L.) Roem. & Schult. (from a swamp or marsh) Common spike-rush. Plants perennial, 1–7 (10) dm tall; culms arising singly or few together or more or less tufted, from slender creeping rhizomes, 0.5–3 (4) mm thick, usually with 2 sheaths, at least the lower one usually reddish or dark purple, the upper one extending up to about 2–15 cm on the culm. **INFL** a spikelet, 5–25 mm long, linear to lance-ovate in outline, with several to many flowers; scales 2–4.5 mm long, brownish purple, with a greenish midstripe and hyaline margins, the lower 1 or 2 empty. **FLOWER**

perianth bristles 4 (5 or 6), retrorsely barbellate, a little longer than the achene or sometimes reduced or lacking; anthers 1.3–2.5 mm long (dry); stigmas 2. **ACHENES** lenticular, green-yellow, yellow, or medium brown, finely cellular-roughened, about 1.5–2.5 mm long including the tubercle; tubercle constricted at the base, rather elongate-conic, 0.4–0.7 mm long. $2n = 14, 16, 18, 38$. [*Scirpus palustris* L.; *E. calva* Torr.; *E. erythropoda* Steud.; *E. macrostachya* Britton; *E. uniglumis* (Link) Schult.]. Ephemeral pools, margins of ponds and lakes, other riparian and palustrine communities, and hanging gardens; tolerant of saline conditions. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1100–2745 m (3600–9000'). Flowering: May–Jul. Widespread in the Northern Hemisphere. A conservative approach for this complex that has been divided into several taxa is followed here. The various taxa of the complex have been separated on small differences, and in most cases the segregates intergrade morphologically and lack clear ecogeographic correlations on anything beyond a local basis (Cronquist et al. 1977).

Eleocharis parishii Britton (for Samuel Bonsall Parish) Plants perennial, 7–40 cm tall; culms to about 1 mm thick, arising singly or few together from slender rhizomes; sheaths usually 2 per culm, reddish or purplish at least in part, the upper one extending to as much as 4.5 cm up the culm, usually at least a few of them ending in a mucro to 0.8 mm long. **INFL** a spike, 5–16 mm long, about 3–7 times longer than wide, with about 20–40 flowers; scales usually 2.4–3 mm long, purplish or brownish purple, usually with a green or pale midstripe and hyaline margins, the lowest one tending to be shorter and broader than the others and empty. **FLOWER** perianth bristles usually 6–7, white or brown, retrorsely barbellate, longer or shorter than the achene; stigmas 3. **ACHENES** plano-convex or unequally trigonous, greenish yellow when young, yellow or brownish to blackish when mature, 1–1.2 mm long, the tubercle more or less elongate-conic, much like that of *E. palustris* but perhaps not quite so noticeably constricted at the base. Wet places in desert regions and moist meadows in the mountains. ARIZ: Apa; COLO: Hin; NMEX: SJn; UTAH. 1125–2550 m (3700–8530'). Flowering: Jun–Sep. Oregon to Utah and south to California and Texas, also in Nebraska.

Eleocharis parvula (Roem. & Schult.) Link ex Bluff, Nees & Schauer (very small) Small spike-rush. Plants perennial, from very slender, inconspicuous rhizomes, 2–7 (10) cm tall; culms about 0.5–1 mm thick, densely tufted, sometimes forming mats, usually with only 1 sheath, this to about 1 cm long. **INFL** a spikelet, 2.5–5 mm long, with 2–9 (20) flowers; scales 1.5–2 (2.5) mm long, the lowest one empty. **FLOWER** stigmas 3. **ACHENES** 0.9–1.3 mm long, usually unequally trigonous; tubercle confluent with the achene, not constricted, very short. Wet, alkaline sites. The one specimen seen (*S. L. O'Kane et al. 6609* SJNM) is from drying mud at Totten Lake shore. COLO: Mon. 2105 m (6900'). Flowering: Jun–Sep. British Columbia to Newfoundland, and south to South America; Europe.

Eleocharis quinqueflora (Hartmann) O. Schwarz (five-flowered) Fewflower spike-rush. Plants perennial, 7–20 (30) cm tall; culms 0.2–1 mm thick, arising singly or few together or occasionally tufted, from slender rhizomes, usually with 1 or 2 sheaths, these entire, pale or reddish, the upper one extending 1–2 cm up the culm. **INFL** a spikelet 4–8 mm long, with about 3–9 flowers; scales 2.5–5.5 mm long, commonly purplish to purple-black, with hyaline margins, often without a green or pale midstripe, the lowest 2 or 3 from 1/2 to 3/4 as long as the spikelet or longer. **FLOWER** perianth bristles equaling or exceeding the achene or sometimes reduced, finely retrorsely barbellate; stigmas 3. **ACHENE** 1.9–2.6 mm long, equally or unequally trigonous or plano-convex, broadest above the middle; tubercle confluent with the achene, not constricted, higher than wide. $n = 68$. [*E. pauciflora* (Lightf.) Link var. *fernaldii* Svenson]. Fens, wet meadows, and seeps. COLO: Arc, Con, Hin, LPl, SJn. 2680–3700 m (8800–12150'). Flowering: Jul–Aug. Circumboreal, south in America to California and New Jersey.

Eleocharis rostellata (Torr.) Torr. (with a small beak) Beaked spike-rush. Plants perennial, (1.5) 4–8 (10) dm tall; culms usually 1–2 mm thick, few together or densely clustered, from a thick, ascending or nearly vertical rhizome, some of the culms often arching and rooting from an apical bulbil (proliferous). **LEAVES** with sheaths usually 2 per culm, brownish or occasionally reddish or purple, the upper one extending about 2–8 cm up the culm. **INFL** a spikelet (5) 8–11 mm long, with (5) 10–20 (25) flowers; scales purplish to black-purple, with broad pale hyaline margins, with or without a green or pale midstripe, about 3–4 mm long; lowest scale a little larger than the others, rarely over 1/2 as long as the spikelet, empty. **FLOWER** perianth bristles somewhat shorter to a little longer than the achene, retrorsely barbellate; stigmas 3. **ACHENES** 1.9–2.8 mm long, rounded-trigonous to plano-convex, smooth or slightly cellular-roughened, greenish, the tubercle confluent with the body of the achene, not constricted, medium to high-conic. [*Scirpus rostellatus* Torr.]. Baltic rush–arrowgrass communities and other lowland saline communities. COLO: Arc, LPl; NMEX: SJn; UTAH. 1615–2500 m (5300–8200'). Flowering: Jul–Aug. British Columbia to Nova Scotia, south to South America. The arching vegetative stems, rooted at both ends, catching one's feet when walking, are unusual features of this taxon. Ceremonial emetic and ceremonial medicine of the Ramah Navajo.

Eriophorum L. Cotton-grass, Cotton-sedge

(bearing wool or cotton) Perennial, grasslike plants with mostly solid culms. **LEAVES** with leaf sheaths closed, the blades grasslike or the upper ones sometimes lacking; bracts subtending the inflorescence scalelike to leaflike. **INFL** a spikelet, 1 to several in a terminal inflorescence; scales of spikelets spirally arranged, not awned. **FLOWER** perianth of numerous persistent bristles, these elongate at least in fruit and forming a cottonlike tuft; stamens 3; styles 3. **ACHENES** unequally trigonous, with a usually slender apiculate tip. Twenty species. North-temperate.

1. Spikes (2) 3–6 (8); leaves with well-developed blades 2–6 mm wide ..... ***E. angustifolium***
1′ Spikes solitary; leaves with reduced blades, these mostly not over 1 mm wide ..... (2)

2. Anthers not longer than 1.5 mm; perianth bristles bright white; spikelets broadly obovoid to subglobose in fruit ..... ***E. scheuchzeri***
2′ Anthers 1 mm or longer; perianth bristles red-brown to white; spikelets globose in fruit ..... ***E. chamissonis***

Eriophorum angustifolium Honck. (narrow-leaved) Manyhead cotton-grass. Plants perennial, 20–60 cm tall; culms mostly arising singly, from long-creeping rhizomes. **LEAVES** with usually well-developed blades, mainly 2–6 mm wide, flat or narrowed and channeled to triangular distally. **INFL** a spikelet (2) 3–6 (8) cm, mostly on slender peduncles to 2.5 cm long, or rarely sessile or nearly so, in an umbellate inflorescence; lowest involucral bract more or less leaflike, 2.5–5.5 cm long, often dark purple, at least toward the base, the upper bracts much smaller; scales greenish, brownish, or purplish, with hyaline margins. **FLOWER** perianth bristles numerous, white, forming cottonlike tufts 2–3.5 cm long. **ACHENES** blackish, 2–3 mm long, oblanceolate to obovate. $2n = 58, 60$. [*Eriophorum polystachion* L. (a rejected name)]. Wet meadows and peaty bogs. COLO: Arc, Hin, LPl, RGr, SJn. 2680–3595 m (8800–11800′). Flowering: Jul–Aug. Circumboreal, south in America to Oregon, New Mexico, and New York. Our plants belong to **var. *angustifolium***.

Eriophorum chamissonis C. A. Mey. (for Ludolf Karl Adalbert von Chamisso, German literature) Rusty cotton-grass. Plants perennial, 20–80 cm tall; colonial from long-creeping rhizomes. **LEAVES** with filiform blades, trigonous-channeled, 3–10 cm long, 1–2 mm wide. **INFL** a solitary spikelet, erect, globose in fruit, 1.5–4 cm; involucral bracts absent; scales blackish to purplish brown, margins white or paler. **FLOWER** perianth bristles 10 or more, red-brown to white, 20–40 mm long. **ACHENES** oblong-obovoid, 2–2.7 mm, as wide as long, apex apiculate. $2n = 58$. Peat bogs and marshes. Two records. Peat fen on Endlich Mesa and one mile southeast of Grizzly Peak. COLO: LPl, SJn. 3525–3810 m (11560–12500′). Flowering: Jul–Aug. Greenland, Alberta, British Columbia south to Idaho and Colorado.

Eriophorum scheuchzeri Hoppe **CP** (after the naturalist Johann Jakob Scheuchzer, 1672–1733) Singlehead cotton-grass, white cotton-grass. Plants perennial, 13–40 cm tall; culms mostly arising singly from long-creeping rhizomes. **LEAVES** with blades to 8 cm long and 1 mm wide, channeled or triangular, often much reduced or lacking, especially the upper one. **INFL** a solitary spike, ovoid to subglobose; subtending involucral bracts scalelike, 3–8 mm long, blackish or black-purple; fertile scales blackish, with broad white hyaline margins, acute. **FLOWER** perianth bristles numerous, white, forming cottonlike tufts 2–3.5 cm long. **ACHENES** brown or blackish, about 2 mm long. Tundra, wet peat, marshy ground, peaty soils, and pond shores. COLO: Hin, LPl, SJn. 3290–3830 m (10800–12560′). Flowering: Jul–Aug. Circumboreal, south in America to Colorado and Newfoundland. *Eriophorum russeolum* Fr. has been reported for the area. Four subspecific names for this taxon are treated as synomyns of *E. chamissonis*, but *E. russeolum* is not formally recognized for North America by the Flora of North America Editorial Committee (2002).

Fimbristylis Vahl Fimbry

(fringed style) Plants annual or perennial; culms leafy at the base. **INFL** a loose umbel or capitate cluster of spikelets, subtended by 1 to several leafy, sheathless involucral bracts; spikelets with spirally arranged scales. **FLOWERS** all perfect; perianth bristles lacking; stamens 1–3; style with 2–3 branches, enlarged toward the base. **FRUIT** an achene. Two hundred fifty species. Warm regions.

Fimbristylis spadicea (L.) Vahl (brown) Fimbry. Plants perennial, 20–90 cm tall. **LEAVES** basal and on the lower 1/5 of the culms, the sheaths more or less closed, glabrous or pubescent, the ventral side membranous, often with minute brownish or reddish spots, the blades 1–4 mm wide. **INFL** simple or more often compound, with the terminal spikelet sessile and subtended by an involucral bract, the lateral spikelets on rays or peduncles mainly 1–7 cm long; spikelets 8–23 mm long, 3–5 mm thick, elliptic-cylindrical, many-flowered; scales 3–5 mm long, usually ciliate to pubescent over the back, reddish brown or grayish, the midrib lighter and prolonged into a mucro or short awn; stamens 3; style 2-lobed about 1/4 the length. **ACHENES** about 1.5 mm long, obovate, minutely apiculate, finely many-ribbed and cross-rugulose. $n = 10$. [*Scirpus spadiceus* L.; *F. puberula* (Michx.) Vahl; *F. thermalis* S. Watson]. Wetlands in valleys and

lowlands. The one specimen seen (*Cottam 9546* BRY) is from Bluff Cliffs. UTAH. 1370 m (4500'). Flowering: May–Jun. Tropical America north to California, Ontario, and New York. The name *F. spadicea* is used here to encompass this complex as a broadly defined species.

Kobresia Willd. Kobresia

Plants perennial, densely caespitose, grasslike; culms obtusely triangular, solid. **LEAVES** with closed sheaths and narrow blades. **INFL** of 1 (in ours) to several spikes with few to several spikelets with spirally arranged scales. **FLOWERS** imperfect, without a perianth, staminate and pistillate borne together throughout the spike (unlike *Carex*) or sometimes separately; stamens 3; stigmas 3. **ACHENES** subtended by 2 small bracts, the lower bract more or less corresponding to the lower bracteate scale in *Carex* and the inner bract corresponding to the perigynium but with unsealed margins and exposing the achene. Thirty-five species. North-temperate.

Kobresia myosuroides (Vill.) Fiori (like a mouse) Bellard kobresia. Plants 5–20 cm tall, caespitose. **LEAVES** basal and on the lower stem, the blades tighly involute or channeled, wiry, about 0.4–0.8 mm wide. **INFL** a solitary spike, 1–2 cm long, 2–3 mm wide, with the terminal spikelet staminate; the lateral spikelets mostly with 2 flowers, mostly androgynous, occasionally pistillate; scales 3–4 mm long, brownish, largely scarious. **ACHENES** about 2.5 mm long, brownish with a darker, persistent, apiculate style base. [*Carex bellardii* All.; *C. myosurioides* Vill.; *K. bellardii* (All.) Degl. ex Loisel.]. Moderately windswept alpine benches and convex slopes where snow accumulation is comparatively shallow over the winter. COLO: Arc, Con, Hin, RGr, SJn. 3535–3900 m (11600–12800'). Flowering: Jul–Aug. Circumboreal and south in western North America to Idaho and Colorado. This plant is sometimes confused with *Carex elynoides*. However, the split perigynium and flower arrangement (pistillate and staminate flowers borne throughout the spike) provide strong (although not readily conspicuous) separation of the two.

Rhynchospora Vahl Beak Rush

(nose-seed) Ours perennial, perfect or monoecious, caespitose to shortly rhizomatous. **LEAVES** 3-ranked, with blades short to elongate, the sheaths closed. **INFL** a spikelet aggregated in a dense, headlike cluster. **FLOWERS** solitary, in axils of scales, few to several per spikelet, the lower perfect, the upper imperfect; ovary lacking an enclosed scale; stigmas 2; stamens mostly 3; perianth of 9–15 bristles. **FRUIT** a lens-shaped achene (Welsh 1974). Over 250 species worldwide, mostly in wet, acidic soils.

Rhynchospora alba (L.) Vahl (white, referring to the white scales) Plants caespitose, with short rhizomes. **STEMS** 1.5–3.5 dm tall. **LEAVES** with straw-colored sheaths, persistent, blades 0.3–1 mm broad, linear; lowermost bract 0.5–6 cm long, sheathless or with a closed cylindrical sheath 1–15 mm long. **INFL** a spikelet, aggregated into 1–4 dense, headlike clusters; scales ovate to lance-ovate, whitish, bristles retrorsely barbed, about as long as the brownish tuberculate achene. **ACHENES** 1.5–2.5 mm long, topped by an acuminate tubercle about 1/3–1/2 as long as the achene. Wet, boggy fens. COLO: LPl. 3050 m (8600'). Flowering/Fruit: Jul–Aug (Sep). Alaska disjunctly to Newfoundland and south to California, Idaho, Illinois, Ohio, and North Carolina.

Scirpus L. Bulrush

Plants annual or perennial, rhizomatous or tufted. **LEAVES** with well-developed linear blades or reduced to bladeless sheaths. **INFL** capitate, spicate, paniculate, or umbellate; involucre of 1–several scalelike or leaflike bracts; spikes or spikelets 1 to many; scales spirally arranged, with or without an excurrent awn. **FLOWERS** perfect; perianth of 1–6 bristles, these sometimes obsolete; stamens 3 (rarely fewer); stigmas 2. **ACHENES** lenticular or 3 and trigonous; with or without a stylar apiculus, but without a tubercle. As represented in the Four Corners, the eight species of *Scirpus* could be split into four genera. However, variation and relationships within *Scirpus* as a diverse genus are adequately treated at the sectional level without requiring an expanded binomial nomenclature. Thus a broad interpretation of *Scirpus* is followed in this treatment. About 200 species. Cosmopolitan.

1. Involucre with 2 or more leaflike, spreading bracts ..... (2)
1' Involucre a single leaflike bract, this often erect or nearly so and more or less appearing as a continuation of the culm ..... (4)

2. Spikelets mostly 3–25, 10–35 mm long, sessile in 1–5 headlike clusters ..... ***S. maritimus***
2' Spikelets often over 100, mostly 3–6 mm long, in an open umbellate inflorescence ..... (3)

3. Stigmas 2; midrib of scales abruptly contracted into a short mucro ..... ***S. microcarpus***
3' Stigmas 3; midrib of scales tapered into a short awn ..... ***S. pallidus***

4. Inflorescence with conspicuous branches with more than 20 spikelets; culms terete, 80–300 cm tall; leaves reduced to bladeless sheaths or the blades short and erect ..... (5)
4' Inflorescence spicate with spikes attached directly to the culm; culms subangular to sharply 3-angled, 10–100 cm tall or rarely taller ..... (6)

5. Scales dull orange or reddish brown, 2–3 (3.5) mm long and equaling or slightly surpassing the achenes ..... ***S. validus***
5' Scales dull gray-brown, 3.5–4 mm long and well exceeding the achenes ..... ***S. acutus***

6. Achenes entire at the apex, not apiculate; scales mostly entire at the apex, the midrib hardly (if at all) exserted; spikelets 1 (in ours) ..... ***S. nevadensis***
6' Achenes apiculate; scales notched at the apex, with the midrib extending beyond the notch as a mucro; spikelets mostly more than 1 ..... (7)

7. Upper leaf blade shorter than, equaling, or rarely 1.5 times longer than the sheath; apical notch of spikelet scales narrow and mostly exceeding a straight mucro; culms sharply triangular, ridged to nearly winged on the angles, conspicuously concave on the sides (these culm features work best with unpressed specimens) ..... ***S. americanus***
7' Upper leaf blade usually over 1.5 times longer than the sheath; apical notch of spikelet scales broad and mostly shorter than a straight or curved mucro or awn; culms subterete to sharply triangular but not concave on the sides ..... ***S. pungens***

Scirpus acutus Muhl. ex Bigelow (sharpened to a point) Hardstem bulrush, tule. Plants perennial, commonly 10–30 dm tall, from robust rhizomes; culms terete, about 5–20 (30) mm thick. **LEAVES** borne on the lower 1/4 of the culms, reduced to bladeless sheaths, or the upper one with a blade up to 12 cm long. **INFL** compact, umbellate, subtended by a greenish involucral bract that simulates a continuation of the culm, this commonly shorter than or equaling the inflorescence, rarely longer, also with additional inconspicuous bracts; spikelets usually numerous, more or less grayish or gray-brown, commonly 8–15 mm long; lower scales (3) 3.5–4 mm long, mostly gray-hyaline except for the greenish midrib, the gray-hyaline background sharply contrasting with reddish brown short lines, the margins ciliolate or lacerate. **FLOWER** perianth bristles retrorsely barbellate, subequal to or slightly exceeding the achene; styles 2-branched for about 3/4 their length. **ACHENES** 2.2–2.5 mm long, plano-convex, more or less completely hidden by the scales. $2n = 36$. [*Schoenoplectus acutus* (Muhl. ex Bigelow) Á. Löve & D. Löve]. Margins of ponds and lakes, marshes, washes, and floodplains. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: RAr, SJn; UTAH. 1000–2650 m (3300–8700'). Flowering: Jun–Aug. Temperate North America. Used as a ceremonial emetic and ceremonial medicine by Ramah Navajo and for basketry by Northern Paiute.

Scirpus americanus Pers. (of America) American threesquare, chairmakers bulrush. Plants to 1 m tall from robust rhizomes; culms very sharply triangular, ridged or winged on the 3 edges, often conspicuously concave on the sides, easily flattened in pressing, mostly thicker than in *S. pungens*, commonly 5–10 mm thick toward the base. **LEAVES** commonly 1–4, borne on the lower 1/3 of the culm, the lower ones often reduced to bladeless sheaths, the upper ones with blades to 10 cm long, rarely longer, the blades usually strongly folded, to 6 mm wide when pressed, gradually tapered. **INFL** spicate or capitate, appearing lateral to a solitary leaflike involucral bract that appears to be a continuation of the culm, this 1–3.5 (5) cm long and commonly 1–3 times longer than the inflorescence; spikelets 2–15, sessile, usually 6–15 mm long; scales yellowish brown, reddish brown, or purplish brown, hyaline, with a narrow apical notch, the midrib firm and commonly exserted into the notch as a straight mucro that is shorter than the notch. **FLOWER** perianth bristles 4 (6), usually retrorsely barbellate; styles 2. **ACHENES** 2–3 mm long including the apiculus, 1.4–1.7 mm wide, plano-convex. $n = 39$. [*Schoenoplectus americanus* (Pers.) Volkart ex Schinz & R. Keller]. Often alkaline sites; marshes and wet meadows. The one specimen seen (*D. Loebig 320* SJNM) is from along a stream in Cross Canyon, Colorado. ARIZ: Nav; COLO: Dol, Mon. 1525–1980 m (5000–6500'). Flowering: Jun–Aug. British Columbia to Maine and south to Mexico.

Scirpus maritimus L. (of the sea coast) Alkali bulrush, bulbous bulrush. Plants perennial, 2–15 dm tall, from robust rhizomes, these commonly bearing tubers; culms sharply triangular, often with concave sides, 3–13 mm thick toward the base. **LEAVES** commonly 4–8, borne on the lower 1/2 (3/4) of the culm, mostly all with well-developed folded or flat blades (5) 10–40 cm long or longer and to 1 cm wide, the lower 1 or 2 sometimes reduced to bladeless sheaths. **INFL** of sessile and pedunculate clusters of spikelets, subtended by (1) 2–4 leaflike, unequal involucral bracts, the longest bract up to 34 cm long; scalelike involucral bracts usually few to several, the larger ones commonly with the green midrib exserted as a caudate awn; spikelets 3–25 or rarely more, 10–35 mm long, 5–10 mm thick, all sessile in a compact cluster or 1–4 additional clusters borne on peduncles to 6 cm long; scales tan or light brown, rarely dark

brown, scarious, minutely hirtellous on the back, the firm midrib exserted as a mucronate awn, this commonly 1–3 times longer than the apical notch of the scale. **FLOWER** perianth bristles few, minutely retrorse-barbellate, about 1/4–1/2 (3/4) as long as the achenes; styles 2-branched for about 1/3 the length. **ACHENES** lenticular, 2.5–4 mm long, minutely cellular-reticulate. $n = 55$. $2n = 40, 90$. [*S. paludosus* A. Nelson; *Bolboschoenus maritimus* (L.) Palla]. Tolerant of alkaline and saline conditions, riparian and palustrine communities. COLO: Dol, LPl, Mon; NMEX: RAr, SJn; UTAH. 1220–2225 m (4000–7300'). Flowering: May–Jul. Widespread in the Northern Hemisphere. Seeds were parched and ground into flour and made into mush by Northern Paiute.

Scirpus microcarpus C. Presl (small fruits) Panicled bulrush. Plants perennial, (3) 6–15 dm tall, from robust rhizomes; culms obtusely triangular, 6–15 (20) mm thick toward the base. **LEAVES** well distributed on the stems, the sheaths often reddish purple in part, the blades well developed, flat, 15–60 cm long, 6–20 mm wide; leaflike involucral bracts 3–5, to 27 cm long. **INFL** a compound umbellate, terminal cyme, subtended by 3–7 leaflike involucral bracts, the longer bracts to 27 cm long; spikelets very numerous, 3–6 (8) mm long, borne in small clusters of mostly 5–20 at the ends of rather slender branches or some of the clusters sessile; scales with a green midrib and broad scarious margins, flecked with dark purple and appearing greenish black, the midrib hardly, if at all, exserted as a mucro. **FLOWER** perianth bristles 4–6, rather sparsely retrorsely barbellate, subequal to the achene; styles 2-branched for about 1/2–3/4 their length. **ACHENES** lenticular, about 1 mm long. $n = 33$. $2n = 67$. Riparian communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon; NMEX: RAr, SJn; UTAH. 2000–2880 m (6200–9450'). Flowering: Jun–Aug. Canada south to California and West Virginia.

Scirpus nevadensis S. Watson (of Nevada) Nevada bulrush. Plants perennial, 1–2.5 dm tall (in ours), with creeping rhizomes; culms subterete. **LEAVES** few to several, clustered near the base of the culms, the lower ones sometimes reduced to bladeless sheaths, the upper ones with channeled or flat blades to 12 cm long (in ours) and 1–3 mm wide; leaflike involucral bract solitary, about 1 cm long (in ours); scalelike involucral bracts 1 or more, sometimes with the firm midrib exserted as an awn shorter than the body. **INFL** 1 spikelet (in ours), up to 10 elsewhere, sessile, 1–2.2 cm long; scales shining brown, with white, hyaline, sometimes ciliolate margins, the apex entire, the midrib firmer than the body and greenish, not exserted as a mucro. **FLOWER** perianth bristles 1–3 (4), retrorsely barbellate, mostly less than 1/2 as long as the achene; styles 2-branched for about 1/2 their length or less. **ACHENES** plano-convex, about 2 mm long, cellular-reticulate, not at all apiculate. [*Amphiscirpus nevadensis* (S. Watson) Oteng-Yeb.]. Alkaline/saline wet and cienega meadows, with saltgrass and other halophytes. ARIZ: Apa. 1400–1525 m (4600–5000'). Washington to Saskatchewan, south to California and Arizona; Argentina. Flowering: Jun–Jul. The plants of the two collections seen (*S. L. O'Kane et al. 5591* and *A. Clifford et al. 01–713*, both SJNM) all have a single spike with the bract shorter than the inflorescence. Although unusual for the species, these features are not unique, and the achenes clearly belong to *S. nevadensis*.

Scirpus pallidus (Britton) Fernald (pale) Pale bulrush. Plants perennial, 40–150 cm tall, from robust rhizomes; culms triangular, 6–15 (20) mm thick toward the base. **LEAVES** cauline, the sheaths not marked with reddish purple, the blades well developed, flat, commonly 20–60 cm long, 6–20 mm wide. **INFL** a compound umbellate, terminal cyme; involucral bracts leaflike, commonly 3–5, mostly 3–15 cm long or longer; spikelets very numerous, 3–4 mm long, borne in sessile or pedunculate clusters averaging larger than in *S. microcarpus*, about (20) 40 or more per cluster; scales with a green midrib and scarious margins flecked with dark purple and appearing greenish black, the midrib exserted as a short mucro. **FLOWER** perianth bristles mostly 6, minutely retrorse-barbellate above the middle, subequal to or shorter than the achene. **ACHENES** trigonous, with the ventral side the widest, about 1 mm long. Wet, low ground. The only specimen seen (*Heil 19547*, SJNM) is from a riparian community. COLO: Arc, LPl. 1860 m (6100'). Flowering: Jun–Aug. Washington to Minnesota and south to Texas and Missouri. Used as a ceremonial emetic and ceremonial medicine by Ramah Navajo.

Scirpus pungens Vahl (spiny) Common threesquare. Plants perennial, 1.3–11.6 dm tall, from robust rhizomes; culms subterete to sharply triangular, the sides not concave, 2–5 (7) mm thick. **LEAVES** commonly 2–4, borne on the lower 1/3 of the culms, the lower ones often reduced to bladeless sheaths, the upper ones with blades commonly (5) 8–25 (38) cm long, the blades flat to involute, 0.5–4 mm wide, linear, well developed. **INFL** spicate or capitate, appearing lateral to a solitary leaflike involucral bract (rarely 2) that appears to be a continuation of the culm, this 2–11 cm long and commonly 3–7 times longer than the inflorescence, these also accompanied by 1 or 2 smaller, empty, scalelike bract(s), these often blackish purple and usually with an awn from about 1/3 to as long as the body; spikelets 1–6, sessile or essentially so in a compact cluster, commonly 7–20 mm long; scales yellowish brown to reddish brown, some (especially the lower ones) often blackish purple, rather scarious, the midrib prominent and exserted as a straight or

curved mucro, the mucro longer than the broad, apical notch of the scale. **FLOWER** perianth bristles 4–6, retrorsely barbellate; stigmas 2 or 3. **ACHENES** lenticular or trigonous, 2.2–3.3 mm long including the conspicuous apiculus, 1.6–2.3 mm wide. $n = 39$. $2n = 74$. [*Schoenoplectus pungens* (Vahl) Palla]. Tolerant of saline and alkaline conditions, along floodplains, ditches, and in seeps, springs, hanging gardens, and other riparian and palustrine communities with saltgrass and other halophytes. ARIZ: Apa, Nav; COLO: Arc, Dol, Mon; NMEX: RAr, SJn; UTAH. 1370–2010 m (4500–6600'). Flowering: May–Jul. Alaska, southern Canada, throughout the United States and to South America, Europe, Australia, and New Zealand. Unfortunately the name *S. americanus* Pers. has generally been misapplied to this species. While plants of the two taxa are apparently closely related, they are strikingly different in the field. Our plants are referable to **var. *longispicatus*** (Britton) Cronquist [*S. americanus* var. *longispicatus* Britton]. Seeds ground lightly into a flour and boiled into a mush by Northern Paiute.

Scirpus validus Vahl (robust) Softstem bulrush, tule. Plants perennial, commonly 8–12 dm tall, from robust rhizomes; culms terete, about 5–10 (15) mm thick. **LEAVES** borne on the lower 1/4 of the culms, reduced to bladeless sheaths or the upper one with a mostly erect blade to 9 cm long and 4 mm wide. **INFL** commonly umbellate, subtended by a greenish involucral bract that simulates a continuation of the culm, this shorter or longer than the inflorescence, also with additional inconspicuous bracts; spikelets usually numerous, more or less orange-brown or reddish brown, commonly 6–10 (15) mm long, borne singly or 2–3 together; scales (2) 2.5–3 (3.5) mm long, with red-brown short lines that hardly, if at all, contrast with the red-brown background color of the scales except on the sometimes pale hyaline margins, the margins entire or shortly fringed-ciliolate to somewhat lacerate. **FLOWER** perianth bristles retrorsely barbellate, subequal to the achenes; styles 2-branched for about 3/4 their length. **ACHENES** about 1.8–2.3 mm long, plano-convex, the margins usually not covered by the scales. [*Schoenoplectus tabernaemontani* (C. C. Gmel.) Palla]. Riparian and palustrine communities. COLO: Arc, Dol, LPl, Mon, SMg; NMEX: Mon, SJn; UTAH. 1705–2350 m (5600–7700'). Flowering: May–Jul. Temperate North America and into tropical America. American plants might be lumped with *Scirpus tabernaemontani* C. C. Gmel. of Europe, which was published in 1805, as was *S. validus*. If lumped, the name of priority might be difficult to determine. The lower end of the stalk eaten raw by Hopi.

DROSERACEAE Salisb. SUNDEW FAMILY

David W. Jamieson

Annual or perennial, insectivorous herbs. **LEAVES** alternate and basal, petioles longer than the variously shaped blades; blades bearing dark-colored digestive glands at the tips of long, red, multiseriate stalks. **INFL** arranged singly or a secund raceme on a long scape. **FLOWERS** regular and hypogynous, or sometimes perigynous; sepals 5, separate or connate at the base; petals 5, white; stamens 4–20; gynoecium of 3–5 carpels united into a single pistil with parietal placentation or 3–5-loculed with axile placentation; styles 3–5 and deeply bifurcate for much of their length. **FRUIT** a loculicidal capsule. **SEEDS** numerous.

Drosera L. Sundew

(Greek *droseros*, dewy) Annual or mostly perennial, insectivorous herbs of bogs and marshes. **LEAVES** basal and alternate and usually clearly differentiated into petioles and blades; petioles longer and narrower than the blades; blade shape variable, but characteristically covered ad- and abaxially by long, multiseriate, glandular hairs with enlarged, terminal glands which secrete insect-digesting fluids. **FLOWERS** as described for the family. *Drosera rotundifolia* L. is thus far known in Colorado only from iron fens northwest of Crested Butte but should be sought in the San Juan Mountains.

Drosera anglica Huds. (English) English sundew. Perennial herbs. **LEAVES** alternate and basal, 1–6 cm long, typically ascending to erect; blades variously obovate to mostly oblanceolate or spatulate, green, bearing abundant long, red, stalked, multicellular hairs with large, terminal, blackish secretory digestive glands; bases slightly expanded and bearing several to many long, marginal and adaxial, multicellular, hyaline hairs, reminiscent of, but devoid of the red pigmentation and terminal digestive glands of hairs on the leaf blades; petioles long and slender, dark red to reddish black, and bearing widely but ± evenly spaced short, hyaline, uniseriate, multicellular, glandular hairs. **INFL** of a single terminal flower, or 2–3-flowered secund racemes, on a scape 3–16 mm tall. **FLOWERS** hypogynous and 5-merous; sepals 4–6 mm long, connate at the base; corolla apopetalous and white, up to 8 mm long, petals narrowly oblanceolate; stamens 5, shorter than the petals; gynoecium of 3 united carpels with parietal placentation; styles 3 and each bifurcate for much of its length. **CAPSULES** loculicidal. **SEEDS** with a dark flattened testa. Peat bogs surrounded by spruce-fir forests. Known from one location near Durango Mountain Ski Resort. COLO: LPl. 2625 m (8610'). Flowering: Jul–Aug. Cordilleran northwestern North America, across Canada south of Hudson Bay from the Maritime Provinces to

Alberta, Great Lakes states. Our location is new for Colorado and is disjunct from the Yellowstone-Teton areas of Wyoming.

ELAEAGNACEAE Juss. OLEASTER FAMILY

Kenneth D. Heil

Shrubs or trees with lepidote or stellate trichomes. **LEAVES** alternate or opposite, simple, entire. **INFL** in axillary clusters. **FLOWERS** perfect or imperfect, regular, mostly 4-merous; perianth 4-lobed; stamens 4–8; pistil 1; ovary superior, 1-loculed; style 1; stigma 1. **FRUIT** a drupe or berrylike, dry, indehiscent achene. **SEEDS** mostly single, little or no endosperm. $x = 6, 10, 11, 13$. Three genera, 45 species. Northern Hemisphere to tropical Asia and Australia. Uses include drugs, food, fiber, and jewelry. Often planted as ornamentals.

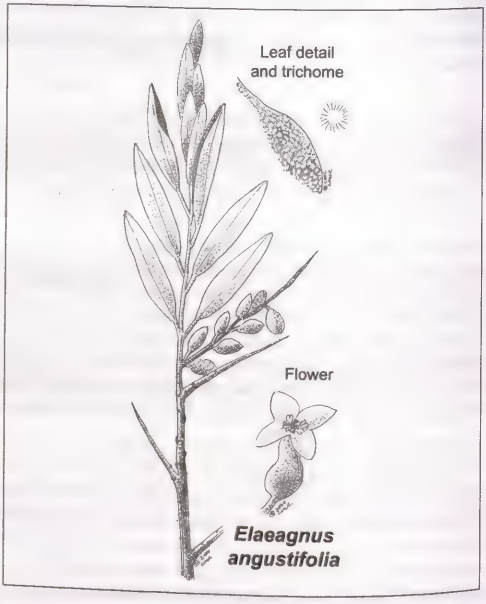
1. Leaves alternate; stamens 4 ..... ***Elaeagnus***
1′ Leaves opposite; stamens 8 ..... ***Shepherdia***

Elaeagnus L. Oleaster

(Greek *elais*, olive, + *agnos*, the chaste-tree) Trees or shrubs, young twigs with dense lepidote-stellate trichomes. **LEAVES** alternate. **INFL** small axillary clusters on the twigs of the current year. **FLOWERS** perfect or imperfect, actinomorphic, stamens 4. **FRUIT** drupelike, with persistent hypanthium base, dry and mealy. Forty species in Europe, Asia, and North America.

1. Leaves mostly 3–8 times as long as wide; branchlets and leaves with silvery peltate scales only; cultivated and escaped; widespread; mostly thorny ..... ***E. angustifolia***
1′ Leaves mostly 1.5–3 times as long as wide; branchlets with both silvery and brown peltate scales; native; rare; no thorns ..... ***E. commutata***

Elaeagnus angustifolia L. (narrow-leaved) Russian olive, oleaster. Rapid-growing, mostly thorny, small to large trees, up to 12 m tall, trunks 1–5 dm thick. **LEAVES** lance-linear or narrowly elliptic, mostly 3–10 cm long, 0.5–1.5 cm wide, silvery and densely stellate or lepidote-stellate beneath, less so above, therefore bicolored. **FLOWERS** sickly fragrant, 8–12 mm long, silvery and with yellow corolla lobes, slightly stellate-hairy; stamens 4. **FRUIT** ellipsoid, mostly 1 cm long, at first covered with white scales; however, at full maturity dull orange-yellow with scattered scales. $2n = 12$, 28. Introduced from Europe and found along roadsides, streams, and other moist sites. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1180–2145 m (3900–7080′). Flowering: May–Jun. Fruit: Sep–Oct. Widespread in the United States. Russian olive is an example of what can happen when an invasive plant is not controlled. At lower elevations it has found a natural niche along most, if not all, of the Four Corners waterways.



Elaeagnus commutata Bernh. (commutative, pertaining to *Elaeagnus*) Silverberry. Unarmed shrub, mostly 2–5 m tall; young branches with brownish lepidote scales. **LEAVES** mostly 2–7 cm long, 1–3 cm wide, elliptic to oblanceolate or lanceolate, acute, obtuse, or rounded apically, silvery on both sides but greener above than beneath. **INFL** 1–4 per axil. **FLOWERS** 1–1.5 cm long, corolla lobes yellowish; stamens 4. **FRUIT** ellipsoid, 9–14 mm long, silvery, covered with scales. [*E. argentea* Pursh, not Moench]. $2n = 28$. Stream banks with willow and Russian olive. COLO: LPl; UTAH. 1950–2230 m (6400–7350′). Flowering: Jun. Fruit: Aug. Quebec west to Alaska, south to Minnesota, North Dakota, Wyoming, and Idaho. A native ornamental.

Shepherdia Nutt. Buffaloberry, Soapberry

(for John Shepherd, 1764–1836, curator of the Liverpool Botanic Gardens and friend of Thomas Nuttall) Shrubs, young twigs densely lepidote-stellate, brownish to silvery. **LEAVES** opposite. **INFL** axillary on twigs of the previous year. **FLOWERS** perfect or imperfect, actinomorphic, sepals persistent in fruit; pistillate flowers with the hypanthium constricted at the summit; staminate flowers with 8 stamens alternating with the nectary glands. **FRUIT** berrylike.

1. Leaves evergreen, blades oval to orbicular, rounded, up to 3.5 cm long, less than twice as long as wide; fruit dry, densely lepidote-stellate ..... ***S. rotundifolia***
1′ Leaves deciduous, blades variously shaped, more than twice as long as wide; fruit juicy, red or yellow, with scattered stellate scales ..... (2)

2. Leaf blades mostly 3–7 cm long, 1.5–4 cm wide, mostly acute at the base; fruit red, edible; plants often thorny ..... ***S. argentea***
2′ Leaf blades mostly 2–5 cm long, 0.5–2.5 cm wide, mostly rounded at the base; fruit yellowish red, unpalatable; plants unarmed ..... ***S. canadensis***

Shepherdia argentea (Pursh) Nutt. (silvery) Silver buffaloberry. Often thorny, deciduous shrub or small tree 2–5 m tall; branchlets covered with silvery peltate scales. **LEAVES** short-petiolate, blades 0.5–6 cm long, mostly 3–14 mm wide, oblong or oblong-lanceolate to oblong-elliptic, mostly acute at the base, silvery with lepidote-stellate scales on both sides. **FLOWERS** subsessile, 2.5–4 mm long, corolla lobes yellowish. **FRUIT** 4–7 mm long, red, edible. $2n = 22, 26$. [*Hippophae argentea* Pursh; *Lepargyrea argentea* (Pursh) Greene]. Stream banks and other moist sites. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: RAr, SJn; UTAH. 1600–2320 m (5300–7650′). Flowering: May. Fruit: Jun–Jul. British Columbia to Manitoba, Minnesota west to California, Nevada, and North Dakota. The berries are used to make jam and jelly.

Shepherdia canadensis (L.) Nutt. (white) Soapberry. Unarmed, highly branched deciduous shrub, up to 2 m tall; branchlets with brown peltate scales. **LEAVES** short-petiolate, blades 0.5–1 cm long, 1.5–4 cm wide, ovate to lanceolate, rounded apically and basally, green above, brownish lepidote beneath. **INFL** 1 to several per leaf axil. **FLOWERS** 2–3 mm long, the lobes brownish. **FRUIT** ellipsoid, fleshy, bright red or yellow, bitter, 4–7 mm long. $2n = 22$. [*Hippophae canadensis* L.; *Lepargyrea canadensis* (L.) Greene]. Ponderosa pine, Douglas-fir, white fir, aspen, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, SJn; NMEX: McK, RAr, SJn; UTAH. 2500–3270 m (8250–10800′). Flowering: May–Jul. Fruit: Jul–Sep. Newfoundland to Alaska, south to New York, South Dakota, Oregon, and northern California.

Shepherdia rotundifolia Parry (nearly circular leaves) Buffaloberry. Unarmed, free-branched, evergreen shrub, up to 2 m tall; branchlets stellate-hairy with white or yellow trichomes. **LEAVES** short-petiolate, larger ones 1.5–3.5 cm long, 1–3 cm wide, ovate to orbicular or lanceolate, rounded apically, the base rounded to obtuse, silvery green above, pale beneath. **INFL** 1 to few per axil. **FLOWERS** 3.5–5 mm long, corolla lobes yellowish. **FRUIT** dry, ellipsoid, 5–8 mm long, densely covered with silvery stellate hairs. $n = 15$. [*Lepargyrea rotundifolia* (Parry) Greene; *Elaeagnus rotundifolia* (Parry) A. Nelson]. Blackbrush, sagebrush, and piñon-juniper communities. ARIZ: Apa, Coc, Nav; UTAH. 1180–2450 m (3900–8100′). Flowering Apr–May. Fruit: Jun–Aug. A Colorado Plateau endemic. This beautiful, silvery shrub has excellent potential for xeric landscaping.

ELATINACEAE Dumort. WATERWORT FAMILY

C. Barre Hellquist

Small annual or perennial herbs. **LEAVES** opposite, simple, with membranous stipules. **FLOWERS** small, actinomorphic, axillary; persistent or withering, but persistent sepals and petals imbricated in the bud; stamens the same number as the petals, alternate with them or twice the number; ovary with 2–5 locules, placenta in the axis. **FRUIT** a capsule; valves alternate with ovary partitions. **SEEDS** oblong-cylindric, straight or curved, usually with a reticulate surface pattern, the testa nearly filled by the cylindric embryo (Tucker 1986). Two genera, about 40 species worldwide, especially in temperate regions.

Elatine L. Waterwort

(from a classical name of a low, creeping plant, transferred to this genus) Annual, erect or prostrate, flaccid to succulent plants up to 10 cm long, aquatic, amphibious, or terrestrial dwarf plants. **LEAVES** opposite, sessile or petioled, with hyaline or toothed stipules; glabrous, blades linear-spatulate to oblong or orbicular-obovate, the margin obscurely and remotely crenate. **INFL** nodal, 1 or 2 flowers per node. **FLOWERS** sessile or pedicelled, 2-, 3-, or 4-merous; sepals

2–4, obtuse, or unequal in size, withering, persistent in some species; petals 2–4, hypogynous, usually orbicular in outline; stamens as many as or twice as many as petals or reduced to 1; styles or capitate stigmas 2–4. **FRUIT** a membranous capsule, 2–4-celled, several- to many-seeded, 2–4-valved, partitions left attached to the axis or evanescent. **SEEDS** are needed for a correct identification. The plants often appear quite different when submersed or emergent. About 20 species.

1. Seeds 20 or more per locule; pits 25–35 per row per seed ..... ***E. chilensis***
1' Seeds up to 15 per locule; pits 16–25 per row per seed ..... ***E. triandra***

Elatine chilensis Gay (of Chile) Creeping aquatic or terrestrial plants to 10 cm long, rooting at the nodes. **LEAVES** obovate to spatulate, rounded at summit, 3–4 mm long and 1–3 mm wide, narrowed at base to a petiole with hyaline stipules. **FLOWERS** solitary in leaf axils, sessile; sepals 2, sometimes with a third, much reduced, oblong; petals white to pink, orbicular; stamens 3, alternate with the carpels. **SEEDS** 20 or more per cell, borne at the base of the placental axis, slightly curved, with 25–35 pits broader than long. In shallow water or on mud of shores of lakes and ponds. ARIZ: Apa; NMEX: SJn; UTAH. 1685–2760 m (5125–9100'). Flowering: Jul–Sep. Fruit: Jul–Sep. California, Utah, and Arizona; South America.

Elatine triandra Schkuhr (with three stamens) Matted, creeping, aquatic or terrestrial plants. **LEAVES** linear, narrowly lanceolate or narrowly spatulate, mostly truncate or emarginate, to 7 mm long and 3 mm wide. **FLOWERS** sessile, 3-merous. **SEEDS** 15 or fewer per cell, slender-cylindric and curved, with pits broader than long. In shallow water or on mud of ditches, lakes, and ponds. COLO: Hin, LPl; NMEX: McK, SJn. 2000–2735 m (6600–9030'). Flowering: Jul–Aug. Fruit: Jul–Aug. Washington east to Wisconsin, Massachusetts, and Maine, south to California, Colorado, and Texas; Mexico.

ERICACEAE Juss. HEATH FAMILY

John L. Anderson

Shrubs, subshrubs, perennial herbs (in ours), or small trees, some without chlorophyll and mycoheterotrophic. **LEAVES** usually petiolate, lacking stipules, simple, evergreen or deciduous, some scalelike or lacking, alternate or rarely opposite, entire or toothed. **INFL** usually bracteate racemes or corymbs or solitary and terminal or axillary. **FLOWERS** usually perfect, actinomorphic or nearly so and hypogynous, usually pedicellate; sepals 4 or 5, distinct or shortly connate; petals 4 or 5, distinct or connate with short lobes; stamens as many as the corolla lobes and alternate to them or often twice as many; anthers dehiscing by terminal pores or less often by longitudinal slits, often with awnlike appendages called spurs; pollen in monads, dyads, or more often tetrads; ovary superior or sometimes inferior, pistil and style 1, stigma 1 and capitate or lobed, mostly 4- or 5-locular and with axile placentation. **FRUIT** a capsule or sometimes a berry or drupe, seeds small. $x = 6–23$ (Copeland 1947; Haber 1974, 1992; Freudenstein 1999; Kron et al. 2002; Wallace 1975). About 124 genera and 4100 species. Worldwide in cool, temperate, and subtropical regions. The heath family has many important horticultural ornamentals, rhododendrons, and heaths, as well as commercially important edible species (blueberries and cranberries).

1. Plants green, with chlorophyll, autotrophic; with large leaves ..... (2)
1' Plants not green, without chlorophyll, mycoheterotrophic; leaves absent or scalelike ..... (3)

2. Petals united; plants woody (suffrutescent in *Gaultheria*) ..... (4)
2' Petals distinct; plants herbaceous (or suffrutescent in *Chimaphila* and *Orthilia*) ..... (6)

3. Corolla of united petals; stem over 20 cm tall, red-brown; inflorescence a long raceme ..... ***Pterospora***
3' Corolla of separate petals; stem shorter; plant pale yellow or pinkish; flowers in a nodding terminal cluster ..... ***Monotropa***

4. Fruit a mealy drupe with 1–10 seeds ..... ***Arctostaphylos***
4' Fruit a fleshy berry with many seeds ..... (5)

5. Plants woody and freely branching ..... ***Vaccinium***
5' Plants herbaceous to slightly woody, creeping and rooting at the nodes ..... ***Gaultheria***

6. Flowers solitary ..... ***Moneses***
6' Flowers several, more than one ..... (7)

7. Flowers in corymbs; stems leafy; leaves oblanceolate; staminal filaments dilated at base ..... ***Chimaphila***
7' Flowers in racemes; stems scapose or nearly so, the leaves mostly basal, ovate to orbicular; staminal filaments slender ..... (8)

8. Racemes secund, 1-sided; style straight, 3–5 mm long; 10-lobed nectary disc present at the base of ovary; tubercles present on the adaxial base of petals ..... ***Orthilia***
8' Racemes spiral, not 1-sided; style curved, or if straight, 2 mm long; nectary disc absent from the base of ovary; tubercles absent from the adaxial base of petals ..... ***Pyrola***

Arctostaphylos Adans. Manzanita, Bearberry

(Greek *arktos*, bear, + *staphyle*, bunch of grapes; fruits eaten by bears) Plants evergreen shrubs. **STEMS** prostrate to erect with bark thin, smooth, exfoliating, and red- to orange-brown. **LEAVES** evergreen, leathery, alternate, margins usually entire, petioles short or the blade subsessile. **INFL** terminal racemes or panicles. **FLOWERS** perfect, actinomorphic; sepals 5, imbricate and distinct; corolla white to pink, urceolate, sympetalous with 5 lobes; stamens 10, included, anthers spurred; filaments dilated, hairy; ovary superior with hypogynous disc at base, 5–8-locular, with 1 ovule. **FRUIT** fleshy, berrylike drupe with 2–10 nutlets. $x = 13$ (Wells 2000). Primarily western North America including Mexico.

1. Shrubs with low, creeping stems, less than 2 dm tall; leaves obovate; berries bright red ..... ***A. uva-ursi***
1' Shrubs with tall, erect or spreading stems, more than 1 m tall; leaves orbicular or elliptic; berries dull orange .. (2)

2. Axis of inflorescence white-puberulent; inflorescence a raceme (rarely few-branched) ..... ***A. pungens***
2' Axis of inflorescence glandular to glandular-pubescent; inflorescence a dense panicle ..... ***A. patula***

Arctostaphylos patula

Arctostaphylos patula Greene (outspread) Greenleaf manzanita. Broad shrub, 1–2 m tall. **STEMS** with rigid, spreading branches, lower ones at ground level rooting and forming low thickets, bark reddish brown, smooth, branchlets glandular-pubescent. **LEAVES** bright green, shiny, petiole 7–15 mm long, pubescent, blade 1.2–4 cm long, 1.5–4 cm wide, mostly orbicular to elliptic and narrowly elliptic, base rounded to truncate, tip obtuse to acute, margin entire, glabrous. **INFL** a dense panicle, glandular-pubescent, bracts 1–4 mm long, acuminate. **FLOWERS** pedicellate, 2–8 mm long; sepals glabrous, lobes ovate, 2 mm long; corolla white to pink, 5–8 mm long, urceolate; ovary glabrous. **FRUIT** a drupe, 8–12 mm wide, depressed-globose, glabrous, dull orange to brown. $2n = 26$. [*A. platyphylla* (A. Gray) Kuntze; *A. pungens* Kunth var. *platyphylla* A. Gray; *A. parryana* Lemmon var. *pinetorum* (Rollins) Wiesl. & B. Schreib; *A. pinetorum* Rollins]. Open forests, often in ponderosa pine savanna, and also piñon-juniper woodlands. ARIZ: Nav; NMEX: SJn; UTAH. 1890–2710 m (6200–8890'). Flowering: Mar–Jul. Washington and Montana south to Baja California, east to Arizona and Colorado. Greenleaf manzanita berries are edible and can be made into jelly and cider or the seeds ground into flour.

Arctostaphylos pungens Kunth (terminating in a sharp point) Point-leaf manzanita, Mexican manzanita. Erect, broad shrub, 1–2 m tall. **STEMS** with rigid, spreading branches, branchlets densely pubescent, bark reddish brown, smooth. **LEAVES** bright green, shiny, petiole 4–9 mm long, blade 1.5–4 cm long, 0.5–2 cm wide, elliptic to lance-

elliptic, base acute to rounded, tip acute and mucronate, margin entire (young leaves may be toothed), glabrous. **INFL** simple or few-branched racemes, densely puberulent, bracts 1.5–4 mm long, acuminate. **FLOWERS** pedicellate, 2.5–6.5 mm long, glabrous; sepals glabrous, lobes 1–2 mm long, reflexed; corolla white to pink, 5–8 mm long, urceolate; ovary glabrous. **FRUIT** a drupe, 5–11 mm wide, depressed-globose, orange to brownish red. $2n = 26$. Rocky slopes in foothills with piñon-juniper woodlands and openings in ponderosa forest. ARIZ: Nav; UTAH. 2210–2805 m (7250–9200'). Flowering: May–June. Mexico north to Texas, New Mexico, Arizona, California, Nevada, and Utah.

Arctostaphylos pungens

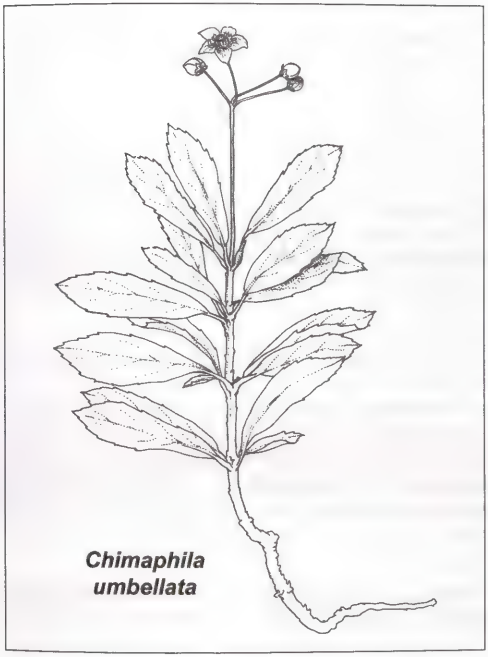
Arctostaphylos uva-ursi (L.) Spreng. (bunch of grapes + bear) Bearberry, kinnikinnik. Prostrate shrub 0.1–0.2 m tall. **STEMS** with trailing branches along the ground rooting and forming mats, branchlets glabrous to puberulent. **LEAVES** dark green above, light green below, petiole 2–5 mm long, glandular, blade 1–2.5 cm long, 0.3–1 cm wide, oblanceolate to obovate, base wedge-shaped, tip rounded, not mucronate, margin entire, glabrous. **INFL** simple or few-branched raceme, densely puberulent; bracts acuminate, 1.5–4 mm long. **FLOWERS** pedicellate, 2–4 mm long, glabrous; sepals glabrous, lobes reflexed, 1–2 mm long; corollas white to pink, 4.5–8 mm long, urceolate; ovary glabrous. **FRUIT** a drupe, 6–12 mm wide, depressed-globose, glabrous, bright red. $2n = 26$. [*A. uva-ursi* var. *adenotricha* Fernald & J. F. Macbr.; *A. adenotricha* (Fernald & J. F. Macbr.) Á. Löve, D. Löve & B. M. Kapoor; *Arbutus uva-ursi* L.] Ground cover under coniferous forest in dry and moist sites. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1900–3200 m (6250–10500'). Flowering: May–Aug. Circumboreal. Bearberry leaves have many reported medicinal uses. A variable species with many taxa named based on pubescence characters that have been shown to have continuous variation (Rosatti 1987). Hybrids with *A. patula* have been reported scattered throughout their common ranges. In our area this hybrid has been collected from Navajo Mountain, San Juan County, Utah (*Holmgren et al. 10,622* UTC).

Chimaphila Pursh Prince's Pine

J. Mark Porter

(Greek *chemim*, winter, + *philos*, loving, referring to the evergreen habit) Perennial, suffruticose, semiherbaceous plants, 10–30 cm tall, from creeping rhizomes. **STEMS** erect to ascending, terete, glabrous. **LEAVES** persistent, evergreen, simple, coriaceous to leathery, alternate to subverticillate or apparently whorled. **INFL** a 1–7-flowered, umbellate corymb. **FLOWERS** actinomorphic, pedunculate; sepals 5, free nearly to the base, persistent; petals 5, distinct, rotate-campanulate, waxy, white to pink; stamens 10, the filaments dilated below, ciliate at the base, anthers subapically attached, 2-celled, opening by short tubelike pores; ovary 5-celled, the styles united, straight or curved, persistent; stigma 5-lobed and peltate. **FRUIT** a depressed-globose capsule, loculicidally dehiscent. **SEEDS** many. $x = 13$. Four to five species, circumboreal, south to Central America (Blake 1917; Freudenstein 1999).

Chimaphila umbellata (L.) W. P. C. Barton (having a simple umbel) Pipsissewa, prince's pine. Perennial plants, evergreen, suffruticose. **STEMS** spreading-ascending, the fertile branches erect, from creeping rhizomes, 10–25 (30) cm tall, glabrous. **LEAVES** bright leathery green, pale green below, simple, subverticillate or whorled, 3–6 per node, 2–6 cm long, 0.5–1.8 cm wide, petioles 3–6 mm long, exstipulate, blade elliptic to oblanceolate, cuneate, the margins sharply serrate and slightly revolute; upper surface glabrous. **INFL** a terminal umbellate corymb, 4–8 flowers, the peduncles erect, 4–7 cm long, glabrous to glandular-puberulent. **FLOWERS** 1–1.6 cm in diameter, perianth 5-merous; sepals 5, pink-purple, basally connate, the lobes 1–2 mm, ovate, erose-ciliate; corolla 4–7 mm long, distinct, white to pink, waxy, concave, broadly ovate with ciliate margin; stamens 10, the filaments dilated below,



ciliate, abruptly narrowed, the short, glabrous upper portion 2 mm long; anthers plump, 2-celled, opening by 2 wide, basal pores, appearing apical by inversion; ovary 5-celled, the style short; stigma 2 mm wide, peltate, 5-lobed, persistent. **FRUIT** a capsule, 5–6 mm in diameter, loculicidally dehiscent from the apex. $2n = 26$. [*C. occidentalis* Rydb.]. Our material represents **subsp.** ***occidentalis*** (Rydb.) Hultén. Rich, rocky or sandy substrate in dry, coniferous forests. ARIZ: Apa; COLO: LPl, Min. 2195–3050 m (7200–11650'). Flowering: Jun–Aug. Fruit: Jul–Sep. Circumboreal, in North America south to Central America and the Caribbean.

Gaultheria L. Wintergreen

(named for Jean Francois Gaultier, 18th-century physician and botanist of Quebec) Plants low or creeping, rooting at the nodes and forming mats, slightly woody to herbaceous. **LEAVES** evergreen, alternate, margins serrate or crenate. **INFL** solitary flowers in leaf axils (in ours) or in racemes. **FLOWERS** perfect, actinomorphic, sepals 5, deeply lobed, persistent; petals 5, white, urn-shaped to campanulate; stamens 10, included, filaments dilated, anthers dehiscing by terminal pores, not spurred; ovary superior (ours) or inferior, 4–5-celled. **FRUIT** a many-seeded capsule, loculicidal, enclosed by the expanded fleshy calyx forming a dry berrylike fruit. About 115–200 species in cool and temperate regions worldwide. *Gaultheria* is a natural source of oil of wintergreen used in making tea and flavoring candies, chewing gum, and medicines. Now, commercial oil of wintergreen is synthetically produced or comes from *Betula lenta* L., sweet birch.

Gaultheria humifusa (Graham) Rydb. (spread out over the ground) Alpine wintergreen, creeping wintergreen. Shrublet, suffruticose, mostly herbaceous, less than 2 dm long. **STEMS** creeping and rooting along the ground, forming mats, glabrous or puberulent to sparsely pilose. **LEAVES** leathery, not persistent, with a short petiole, blade 0.8–2 cm long, 5–15 mm wide, oval to elliptic, margin entire at base and setose-serrulate near tip, base and tip rounded. **FLOWER** sepals glabrous; corolla white to pink, 3–4 mm long, campanulate; filament glabrous, anthers awnless (ours); ovary superior (ours). **FRUIT** berrylike, 5–7 mm wide, subglobose, red. [*G. myrsinites* Hook.; *Vaccinium humifusum* Graham]. Acidic, moist, mossy soil, meadows and stream banks, under subalpine forest. COLO: Hin, LPl, Min, Mon, SJn. 2635–3810 m (8640–12500'). Flowering: late Jun–Aug. British Columbia and Alberta south to California and Colorado.

Moneses Salisb. ex Gray Wood Nymph, Wax Flower, Single-delight

J. Mark Porter

(Greek *mono*, single, + *hesis*, delight, referring to the solitary flower) Rhizomatous, herbaceous perennials. **STEMS** short, glabrous. **LEAVES** chlorophyllous, coriaceous, persistent, mainly basal, but sometimes opposite or in whorls. **INFL** composed of a solitary, nodding flower, borne on a long peduncle. **FLOWER** sepals usually 5, persistent; petals usually 5, distinct, spreading; stamens usually 10, the filaments tapering to the apex, the anthers awnless, nodding, opening by means of apparently terminal pores; ovary superior, 5-loculed, the stigma borne on an elongate, glabrous style. **FRUIT** a loculicidal capsule. **SEEDS** many. $n = 13$ (Knudsen and Tollsten 1991; Freudenstein 1999). This monotypic genus has been shown to be closely related (i.e., a sister group) to *Chimaphila*, in spite of the morphological similarity with *Pyrola*. The exclusion of *Moneses* from *Pyrola* is unquestionable. Circumboreal.

Moneses uniflora (L.) A. Gray **CP** (one flower) Wood nymph, wax flower, one-flowered wintergreen, single-delight. Perennial herbs, from slender, creeping rhizomes. **STEMS** solitary, ascending to a slender scape, 3–10 (–12) cm tall,

recurved above. **LEAVES** 2–10, opposite or in clusters of 3, crowded, petiole 5–10 mm long, as long as to shorter than the blade; blade 1–2.5 cm long, 6–20 mm wide, ovate-elliptic to obovate, crenate to finely serrate or subentire, retuse or rounded at the apex, tapered decurrently to the petiole. **INFL** composed of a solitary, nodding flower, borne on a long peduncle, 3–15 cm long, 1 (2) ovate scales, 2–3 mm long at or below the recurved portion of peduncle. **FLOWERS** 1.3–2.5 cm in diameter; sepals (4) 5, 15–25 mm long, greenish white to yellowish, the lobes ovate, reflexed, ciliate, the apex rounded, persistent; petals (4) 5, fragrant, waxy-white or tinged with pink, 7–12 mm long, spreading, orbicular or broadly ovate; stamens (8) 10, filaments 5–6 mm long, subulate, dilated below, incurved; anthers 2–3.5 mm long, attached subapically, each theca narrowed above the filament to a tubular pore; style prominent, 2–4 (6) mm long, straight, persistent, thickened distally, stigma peltate, (4) 5-lobed, lobes radiating. **FRUIT** (4) 5-celled, 5–8 mm in diameter, depressed-globose, dehiscing loculicidally from the summit. **SEEDS** numerous. $2n = 22, 24, 26, 32$. [*M. reticulata* Nutt.; *M. uniflora* var. *reticulata* (Nutt.) S. F. Blake; *Pyrola uniflora* L.]. Moist, mossy areas, boggy stream banks under coniferous forests. COLO: Arc, Hin, LPl, Min, Mon, SJn. 2100–3600 m (6900–11900′) Flowering: Jul–Aug. Fruit: late Jul–Sep. Circumboreal.

Monotropa L. Pinesap, Indian-pipe
Gary D. Wallace

(Greek *mono*, one, + *tropos*, direction, referring to the one-sided inflorescence) Plants lacking chlorophyll, white to reddish; arising from a ball-like cluster of matted roots. **STEMS** fleshy, with reduced scalelike leaves. **INFL** a raceme of solitary flowers. **FLOWERS** perfect; sepals 2–5, separate and bractlike; petals 3–6, erect, scalelike, often saccate at base, distinct; stamens 6–12, twice as many as the petals, anthers disclike. **FRUIT** a capsule. **SEEDS** numerous. Two species, circumboreal (Wallace 1975). Recent research indicates that the two species may warrant separation into two distinct genera. Achlorophyllous mycoheterotrophic species that obtain their nutrients through an ectomycorrhizal association with green plants (usually oaks or conifers).

Monotropa hypopitys L. (beneath pines) **INFL** a raceme, rarely scapose, generally under 30 cm tall. **FLOWERS** yellow to orange or reddish, never white; sepals unlike the petals in form; petals yellow to orange or reddish, 4 or 5, 8–17 mm long, broader at apex and narrowly saccate at base, often pubescent within; anthers hippocrepiform, under 1.5 mm long; stigma not funnelform, often subtended by a ring of hairs; style slender, elongate; ovary elongate-ovoid to occasionally ovoid, nectary lobes short and stout. **FRUIT** elongate, 6–10 mm long, 4–8 mm wide, ovoid, walls thin and often deciduous. Coniferous forests. ARIZ: Apa; COLO: Arc, Min; NMEX: McK, SJn. 1800–3350 m (6000–11000′). Flowering: Jul–Sep. Circumboreal with southern extensions in mountains and highlands.

Orthilia Raf. Sidebells
J. Mark Porter

(Greek *orthos*, straight, + *helix*, spiral, referring to the one-sided raceme) Herbaceous perennials or subshrubs with long slender rhizomes. **STEMS** usually solitary, erect, to 5–25 (–30) cm tall. **LEAVES** simple, alternate or subopposite, clustered in (1) 2–4 pseudowhorls at the base of the stem; blades with slightly revolute, crenulate, serrulate, or rarely entire margins, subcoriaceous. **INFL** strongly 1-sided (secund) racemes; bracts (0) 4–7; pedicellate. **FLOWERS** nodding; calyx persistent in fruit; corolla as long as or longer than broad, actinomorphic, petals distinct, broadly ovate, greenish white, yellowish green, or white, with 2 inconspicuous, basal, adaxial tubercles; stamens included or slightly exserted; filaments flattened, tapering smoothly to their bases, glabrous, light brown; anthers oblong, wrinkled and papillate, the pores large and elongate; ovary subtended by a 10-lobed, nectariferous disc; style straight, exserted; stigma pale green, peltate, with 5 prominent, spreading lobes. **FRUIT** a depressed-globose capsule, light greenish brown, pendent, the pedicel and scape eventually becoming erect, the dehiscence incomplete, the margins of the valves cobwebby. **SEEDS** light golden brown, the testa pitted. $x = 19$. Monotypic genus. Circumboreal.

Orthilia secunda (L.) House (having organs, i.e., flowers, toward the same side) One-sided wintergreen. Herbaceous to somewhat woody perennials, rhizomes slender and creeping. **STEMS** solitary, rarely 3, scape 6–19 (21) cm tall, with 1–3 lanceolate bracts; basal bracts below and among the mostly basal leaves. **LEAVES** light green, 2–10, somewhat scattered with conspicuous internodes on the ascending stem, petiole 0.6–2 cm long; blade thin, ovate to elliptic, blades 1.3–4 (–5) cm long, 1–3 cm wide, crenulate-serrulate, rounded to slightly tapering at the base, acute to rounded at the apex, longer than the petiole. **INFL** a secund raceme, 2–15-flowered, pedicels slender, 2–5

(–7) mm long, at first horizontal, then drooping, bractlets ciliate, light green, ascending, lanceolate, 2–4 mm long. **FLOWERS** actinomorphic, 4–6 mm wide; sepals 0.5–1.5 mm long, spreading, persistent, the lobes ciliate-triangular; petals white to greenish yellow, oblong, longer than wide, 3.5–5 (6) mm long, each with 2 small tubercles basally on the inner face, campanulate; stamens included, about as long as the petals, filaments slender, not declined, the anthers 1.5 mm long, not apiculate, the pores sessile; style straight, slender, (2) 3–5 mm long, in fruit to 9 mm long, exserted, lacking a collar but the stigma peltate, 5-lobed; ovary with a 10-lobed, hypogynous disc. **FRUIT** a capsule, 4–5 mm wide, depressed-globose, loculicidally dehiscing from the base. **SEEDS** many. $2n = 38$. [*Pyrola secunda* L.; *Ramischia secunda* (L.) Garcke; *Actinocyclus secundus* (L.) Klotzsch; *P. secunda* var. *obtusata* Turcz.; *Orthilia secunda* var. *obtusata* (Turcz.) House; *P. secunda* var. *pumila* Paine; *P. secunda* forma *eucycla* Fernald]. Moist woods in ponderosa pine, Douglas-fir, aspen, spruce-fir. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; UTAH. 2000–3400 m (6600–11300'). Flowering: Jun–Aug. Fruit: Jul–Sep. Circumboreal, south to Mexico.

Pterospora Nutt. Pinedrops

Gary D. Wallace

(Greek *ptero*, wing, + *sporo*, seed, referring to the membranous wing on the seed) Plants without chlorophyll, purplish brown or chestnut-colored. **STEMS** absent. **LEAVES** absent, reduced or scalelike. **INFL** a raceme, 1.5–17 dm long, persistent after seed dispersal. **FLOWERS** perfect, many, pendulous; calyx of 5 slightly united sepals; corolla urceolate, globose, the petals united with short spreading lobes; stamens 10, included, anthers longitudinally dehiscent; style stout. **FRUIT** a 5-lobed capsule. **SEEDS** numerous, broadly winged. $x = 8$ (Wallace 1975). A genus with one species in North America. An achlorophyllous mycoheterotrophic species that obtains its nutrients through an ectomycorrhizal association with green plants (usually oaks or conifers).

Pterospora andromedea Nutt. **CP** (Greek *Andromeda*, daughter of Cepheus and Cassiope) Pinedrops. Achlorophyllous, mycoheterotrophic perennial with inflorescences arising annually from persistent roots. **STEMS** absent. **LEAVES** absent. **INFL** an elongate raceme to 20 dm tall, emerging from soil in an erect position, conspicuously glandular-pubescent, viscid, persistent to next year as a brown stalk. **FLOWERS** actinomorphic, pendulous on recurved pedicel; sepals 5; corolla 6–9 mm long, urceolate, cream to yellowish, sympetalous, 5 lobes reflexed; stamens of alternating lengths, anthers awned on back; stigma 5-lobed; style short, straight; ovary superior, 5-carpellate, nectary inconspicuous at base. **FRUIT** pendulous, capsular, oblate-spheroidal, 7–10 mm wide, persistent, opening from base. **SEEDS** minute, each with a membranous wing several times the size of the seed. $2n = 16, 48$. Various types of coniferous forests, growing in litter. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2135–2895 m (7000–9500'). Flowering: Jun–Aug. North America especially west of the Rocky Mountains including western Canada, disjunct in the northeast from Michigan to New Hampshire and adjacent eastern Canada, also in scattered areas of Mexico. Used as an emetic or ceremonially smoked in the kiva by Pueblo peoples.

Pyrola L. Wintergreen, Shinleaf

J. Mark Porter

(Latin diminutive of *pyrus*, pear, referring to the leaf shape) Herbaceous, somewhat suffruticose perennials, rhizomatous. **STEMS** scapose, mostly simple, 5–30 cm tall, glabrous. **LEAVES** chlorophyllous, simple, coriaceous, persistent, 6–12, alternate or opposite, basal or apparently basal, rarely absent, petiolate; blades broadly ovate to orbicular, entire to toothed, glabrous. **INFL** scapose, 2–several-flowered bracteate racemes or solitary and terminal, the pedicels 8–12 mm long, spreading or recurved. **FLOWERS** actinomorphic (bell-shaped) or zygomorphic (bowl-shaped); calyx (4) 5-lobed, connate at the base; corolla broadly bowl-shaped, the petals spreading or concave, distinct, white to pink or greenish, deciduous; stamens (8) 10, the filaments narrow or basally dilated, erect or declined; anthers 2-celled, opening by 2 pores or irregular slits; ovary (4) 5-merous, the style straight or declined and curved upward at the end, with 5 spreading stigmatic lobes, persisting in fruit. **FRUIT** a loculicidal capsule. $x = 23$ (Copeland 1947; Haber 1987; Freudenstein 1999). Fifteen species. Circumboreal and extending south to the northern tropics.

1. Styles straight, short, less than 2 mm long, stigmas much wider than the styles; anther pores sessile with no evident subtending tube ..... ***P. minor***
1' Styles declined or bent, longer than 4 mm, stigmas little wider than the styles; anther pores usually borne on short tubes ..... (2)

2. Leaves mottled on the upper surface and with pale streaks associated with the main veins; blades broadly ovate, the apex acutely pointed ..... ***P. picta***
2' Leaves uniformly green above, blades elliptic to orbicular ..... (3)

3. Petals rose-pink to purple; leaves usually more than 3 cm long or wide ..... ***P. asarifolia***
3' Petals greenish white; leaves usually less than 3 cm long or wide ..... ***P. chlorantha***

Pyrola asarifolia Michx. (*Asarum*-like leaves) Round-leaved wintergreen, liverleaf wintergreen. Plants with extensively creeping, scaly rhizomes. **STEM** a scape, 13–30 (40) cm tall, with 2 or 3 widely spaced bracts. **LEAVES** bright green above, lustrous-coriaceous, pale below, petioles mostly longer than the blade, 1–9 cm long, 3–7, blade simple, basal, persistent, 1.3–7.5 cm long, 1.1–7.4 cm wide, oval to reniform-orbicular with a rounded apex, entire to crenulate or serrulate. **INFL** an elongate raceme, (2) 4–12 (20)-flowered, pedicels 3–8 mm long, slightly exceeding the lanceolate bractlets. **FLOWERS** 1–1.5 cm wide; calyx similar in color to the petals, the lobes (1.5) 2–4 mm long, lance-deltoid; corolla campanulate, pink to purplish, the petals broadly ovate, (5) 6–8 mm long, veins prominent; stamens included, the filaments glabrous, declined, anthers 2 mm long, contracted to an apiculate tip at the lower end, dehiscing by tubular pores; style 5–7 mm long, sharply curved downward immediately above the ovary, tapered to a collar, broader and just below the stigma. **FRUIT** a capsule, 4–8 mm in diameter, depressed-globose, loculicidally dehiscing from the base. **SEEDS** many. $2n = 46$. [*P. rotundifolia* L. var. *bracteata* (Hook.) A. Gray; *P. asarifolia* var. *bracteata* (Hook.) Jeps.; *P. rotundifolia* var. *purpurea* Bunge; *P. asarifolia* var. *purpurea* (Bunge) Fernald; *P. incarnata* Fisch.; *P. asarifolia* var. *ovata* Farw.; *P. uliginosa* Torr. & A. Gray ex Torr.; *P. rotundifolia* var. *uliginosa* (Torr. & A. Gray) A. Gray; *P. asarifolia* var. *uliginosa* (Torr. & A. Gray) A. Gray; *P. elata* Nutt.; *P. bracteata* Hook. var. *hillii* J. K. Henry]. Moist, shady woods and boggy stream banks in subalpine forests, mountain brush, aspen, and spruce-fir . COLO: Arc, Hin, LPl, Mon, SJn; NMEX: SJn. 1675–3200 m (5500–10500'). Flowering: Jul–Aug. Fruit: Aug–Sep. Newfoundland and Prince Edward Island, west to Alaska, and south to California, Utah, New Mexico, South Dakota, and New England; also in Asia.

Pyrola chlorantha Sw. (green flower) Green-flowered wintergreen. Herbaceous perennials from widely spreading, slender rhizomes. **STEMS** solitary (occasionally 2), a scape (6) 9–25 cm tall. **LEAVES** thick, coriaceous, pale green, 4–11, in dense basal cluster, petiole 0.8–6 cm long, blade elliptic, reniform to suborbicular, 0.6–3.5 cm long, 0.5–3 cm wide, obscurely crenate, apex rounded, base rounded or broadly cuneate, not decurrent on the petiole. **INFL** a cylindrical raceme, 3–9-flowered, rarely more, with 1 or 2 lance-shaped bracts, pedicels spreading, 3–8 mm long, bractlets almost as long. **FLOWERS** 8–12 mm across; calyx 0.5–1.5 mm long, lobes about 1 mm long, rounded, broader than long, persisting; corolla open-campanulate, greenish but becoming pale yellow-white at anthesis, petals (4) 5–7 mm long, spreading-ascending, oval, obtuse; stamens mostly included, 4 mm long; filaments subulate, dilated below; anthers 2–3 mm long, terminal pores forming elongate tubes; style 5–7 mm long, deflexed and then arched upward toward the apex, a flaring collar below the stigma, persistent. **FRUIT** a capsule, 5–8 mm in diameter, depressed-globose, loculicidally dehiscing from the base. **SEEDS** many. $2n = 46$. [*P. virens* Schreber]. Moist to dry, upland woods; ponderosa pine, aspen, spruce-fir, and subalpine communities. ARIZ: Apa; COLO: Arc, LPl, Min, Mon, RGr, SJn; NMEX: McK; UTAH. 2225–3050 m (7300–10000'). Flowering: Jun–Jul (early Aug). Fruit: Jul–Sep. Ranging from Labrador and Newfoundland west to Alaska, south to Maryland, New Mexico, and Arizona; also in Eurasia. Kayenta Navajo employed *P. chlorantha* to treat bloody diarrhea in infants as well as other blood-related disorders; it is an ingredient for paint used in the Nightway ceremony.

Pyrola minor L. (smaller, lesser) Lesser wintergreen. Herbaceous perennials from slender rhizomes. **STEMS** solitary, rarely 2, scapes 8–25 (30) cm tall, with 1–2 (3) lanceolate, scarious bracts, 6–8 mm long, scattered. **LEAVES** dark green, thin, 3–7, mostly basal in a rosette, petioles shorter than the blade, 0.2–3 cm long, blade (0.4) 1.1–3.3 cm long, (0.6) 0.9–2.5 cm wide, the blades rounded-ovate to suborbicular or elliptic, margins entire to remotely crenate, apex obtuse to rounded, base short-cuneate, tapering decurrently to the petiole. **INFL** a cylindrical raceme, (5) 6–13-flowered, pedicels spreading to arching, 2–3 (5) mm long, the lanceolate bracts scarious, almost equaling the pedicel. **FLOWERS** 1–1.5 cm in diameter, calyx spreading, the lobes oblong-lanceolate, erose to subentire, 1–1.5 mm long, persistent; petals 3.5–4.5 mm long, creamy white to pale pink, fragrant, leathery, rounded-obovate; stamens included, 4–6 mm long, filaments flat, anthers 2–3 mm long, the pores sessile; style straight, short, 1.3–2 mm long, the 5-lobed stigma peltate, persisting. **FRUIT** a capsule, 4.5–6 mm in diameter, depressed-globose, loculicidally dehiscing from the base. **SEEDS** many. 2n = 46. [*Amelia minor* (L.) Alef.; *Erxlebenia minor* (L.) Rydb.; *P. minor* var. *conferta* Cham. & Schltdl.; *P. conferta* (Cham. & Schltdl.) Fisch. ex Ledeb.]. Moist, mossy sites in montane aspen,

spruce, and subalpine forests. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn; NMEX: McK. 2255–3420 m (7400–11200'). Flowering: Jul–Aug. Fruit: Aug–Sep. Circumboreal.

Pyrola picta Sm. **CP** (colored or painted) Picture-leaf wintergreen. Herbaceous perennials from slender, scaly rhizomes. **STEMS** reddish brown, solitary or 2, 10–25 cm tall, with 1–3 lanceolate bracts. **LEAVES** coriaceous, dull green with mottled gray or white areas along the main veins, lavender on the lower surface, 2–several on sterile stems, 0–4 on fertile stems, basal, the petiole shorter than the blade, 0.3–3.5 cm long; blade 2–7 cm long, 1–3.5 cm wide, ovate to elliptic, obtuse to rounded apically, acute at base, the margins thick, entire to denticulate. **INFL** a cylindrical raceme, (2) 5–10 (20)-flowered, the pedicels 3–8 mm long, spreading, with lanceolate bractlets almost as long. **FLOWERS** about 1 cm in diameter; sepals reddish green, the lobes triangular-acute, (1) 1.5–2 mm long; petals 6–8 mm long, ovate, creamy yellow to greenish or purplish; stamens included, curved inward, the anthers contracted below the pores, forming a tubelike pore; style 6–7 mm long, deflexed at the base and arched upward, with a flaring collar below the stigma, stigma small, persistent. **FRUIT** a capsule, 5–7 mm in diameter, depressed-globose, loculicidally dehiscing from the base. **SEEDS** many. $2n = 46$. [*P. pallida* Greene]. Moist woods, in deep shaded ravines of the San Juan Mountains; ponderosa pine, fir, and aspen communities. COLO: Hin, Min; NMEX: RAr. 2530–2930 m (8100–9700'). Flowering: Jul–Aug. Fruit: Aug–Sep. British Columbia to Montana, south to California, Arizona, and Colorado.

Vaccinium L. Blueberry, Cranberry

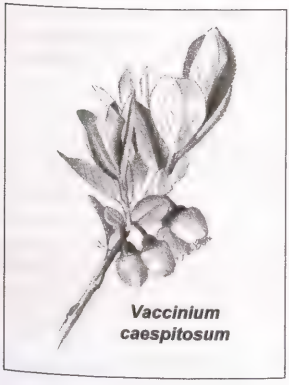
(Latin *bacca*, berry) Plants shrubs. **STEMS** recumbent to erect. **LEAVES** evergreen or deciduous, alternate, margins entire or serrulate. **FLOWERS** perfect, actinomorphic, solitary or few in axils or terminal racemes; calyx sepals 4–5 with small lobes or fused, persistent; corolla white to pinkish, shallowly 4–5-lobed, urn-shaped to cylindrical or campanulate; stamens 10, twice as many as the corolla lobes, usually included, at the base of the corolla, anthers dehiscing terminally, with a pair of spurs; ovary inferior, 4–5 locules, style slender. **FRUIT** a berry with many seeds. $x = 12$ (ours) (Vander Kloet 1992; Vander Kloet and Dickinson 1999). About 400 species in temperate, subtropical, and tropical montane regions worldwide. *Vaccinium* contains commercially important shrubs with edible fruits: blueberries and cranberries.

1. Plants tall, more than 4 dm; pedicels long (5–16 mm); leaves wide (15–35 mm) ..... ***V. membranaceum***
1' Plants low, less than 4 dm; pedicels short (less than 4 mm); leaves narrow (less than 15 mm) ..... (2)

2. Branchlets of current year's growth reddish green or yellowish green, terete or slightly angled ..... ***V. caespitosum***
2' Branchlets of current year's growth bright green, sharply angled ..... (3)

3. Berries red; plants with broomlike habit; leaves short (up to 1.5 cm) ..... ***V. scoparium***
3' Berries blue; plants with flexuous branches; leaves long (1–4 cm) ..... ***V. myrtillus***

Vaccinium caespitosum Michx. (forming dense patches) Dwarf blueberry, dwarf bilberry, dwarf whortleberry. Low shrubs, 5–30 cm tall. **STEMS** densely branched, forming dense patches from rhizomes, branchlets reddish green or yellowish green, not bright green, puberulent to glabrous, terete or slightly angled. **LEAVES** deciduous, thin, short-petiolate to sessile, usually glabrous or sparsely glandular; blade 15–35 mm long, 4.5–15 mm wide, obovate to elliptic, base tapered to cuneate, tip obtuse to rounded, margins serrulate to near base. **INFL** solitary in leaf axils of current year's growth. **FLOWERS** pedicellate, 1.2–3.5 mm long; sepals glabrous, lobes none to obscure; corollas white to pink, 4–6 mm long, 3–5 mm wide, urn-shaped to globose; filaments glabrous, anthers awned. **FRUIT** a berry, 6–8 mm wide, subglobose, blue-glaucous. $2n = 24$. Mountain slopes and alpine tundra, edges of coniferous woods, meadows, and steamsides. COLO: Hin, LPl, Min, Mon, SJn. 2250–3600 m (7500–12000'). Flowering: Jun–Aug. Across Canada, Alaska south to California and Colorado.



Vaccinium caespitosum

Vaccinium membranaceum Douglas ex Torr. (thin) Mountain bilberry, thinleaf bilberry. Tall shrubs, 4–12 dm. **STEMS** rigid and clump-forming, not rhizomatous, branchlets reddish green, terete to slightly angled, glabrous. **LEAVES** deciduous, very thin, blade 2–5.5 cm long, 1.5–3.5 cm wide, ovate to elliptic, base rounded, tip acute, margins serrate, green, pubescence of scattered hairs.

INFL solitary in leaf axils of current year's growth. **FLOWERS** pedicellate, 5–16 mm long; sepals glabrous, lobes none or obscure; corollas white to pinkish, 3–6 mm long, 4–7 mm wide, urn-shaped to cylindrical; filaments glabrous, anthers awned. **FRUIT** a berry, 6–11 mm wide, purple to black, not glaucous. $2n = 48$. [*V. globulare* Rydb.]. Mountain slopes, coniferous woods, and wet meadows. COLO: Arc, Hin, Mon. 1600–3100 m (5300–10250'). Flowering: Jun–Jul. Alaska south to California and Colorado, east to Minnesota, Michigan, and Ontario.

Vaccinium myrtillus L. (little myrtle) Blueberry, bilberry, whortleberry. Shrubs 10–40 cm tall. **STEMS** openly branched and forming open colonies from woody rhizomes, branchlets bright green, glabrous, sharply angled, flexuous. **LEAVES** deciduous, thin, short-petiolate; blade 1–4 cm long, 7–16 mm wide, ovate to elliptic, base obtuse, tip acute, margins serrulate to base, green above, glabrous or with scattered glandular hairs. **INFL** solitary in leaf axils of current year's growth. **FLOWERS** pedicellate, 2–4 mm long; sepals glabrous, lobes none to obscure; corolla white or pink, 4–5 mm long, 5–7 mm wide, globose; filaments glabrous, anthers awned. **FRUIT** a berry, 5–9 mm wide, blue or blue-black. $2n = 24, 48$. [*V. myrtillus* var. *oreophilum* (Rydb.) Dorn; *V. oreophilum* Rydb.]. Mountain slopes, coniferous woods, and openings. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn. 2300–3500 m (7600–11500'). Flowering: Jun–Jul. British Columbia and Alberta south to Arizona and New Mexico; Eurasia. Hybrids occur between diploid races in *Vaccinium* section *Myrtillus*. In our area, hybrids between *V. myrtillus* and *V. caespitosum* have been collected in Hinsdale and San Juan counties, Colorado.

Vaccinium scoparium Leiberg ex Coville (in the form of a broom) Grouseberry, dwarf red whortleberry. Erect shrubs, 1–3 dm tall. **STEMS** narrowly branched, with broomlike habit, forming colonies from woody rhizomes, branchlets green, glabrous, sharply angled, rigid. **LEAVES** deciduous, thin, blade 0.5–1.5 cm long, 3–7 mm wide, ovate to elliptic; base obtuse, tip acute, margins serrulate, pale green, glabrous. **INFL** solitary in leaf axils of current year's growth. **FLOWERS** pedicellate, 1.5–3.5 mm long; sepals glabrous, lobes none to obscure; corolla pinkish, 2–4 mm long, 3–4 mm wide, broadly urn-shaped; filaments glabrous, anthers awned. **FRUIT** a berry 3–6 mm wide, bright red. $2n = 24$. [*V. myrtillus* L. var. *microphyllum* Hook.; *V. microphyllum* (Hook.) Rydb.; *V. erythrococcum* Rydb.]. High mountains, edges of subalpine coniferous forest, and alpine meadows. COLO: Arc, Hin, LPl, Min, Mon, SJn. 2100–3500 m (7000–11500'). Flowering: Jun–Aug. British Columbia and Alberta south to California, Nevada, and Colorado, east to the Black Hills, South Dakota.

EUPHORBIACEAE Juss. SPURGE FAMILY

David L. Bleakly

(*eys*, good, + *phorbe*, feed, pasture, or fodder, from Euphorbus, a 1st-century A.D. physician to Juba, a king of Mauretania, an ancient country in northwestern Africa) Annual or perennial herbs (ours), woody elsewhere, ours taprooted or rhizomatous; sap mostly milky; vestiture none, simple, or rarely stellate hairs (*Croton texensis*) or stinging hairs (*Tragia ramosa*). **LEAVES** simple, entire, serrulate, or serrate. **INFL** various, cyathium, raceme, or compact cymules. **FLOWERS** monoecious or rarely dioecious; petals lacking in all of ours; sepals lacking or present; stamens 1 to numerous, distinct (most of ours) or connate; pistils 1, carpels 3, united, styles 3, distinct or united, often bifid or divided. **FRUIT** a capsular schizocarp with 3 locules and 3 lobes. **SEEDS** 1 or rarely 2 per locule, sometimes with a caruncle. About 8100 species, perhaps the sixth largest plant family, essentially cosmopolitan, but most taxa in the tropics and subtropics. Considering the size of the family, relatively few species are of economic value. The most important species are *Manihot esculenta* (manioc, cassava, or yuca; tapioca and Brazilian arrowroot are derivatives), *Hevea brasiliensis* (Pará rubber), *Ricinus communis* (castor bean), *Aleurites* species (tung oil), and *Euphorbia pulcherrima* (Christmas poinsettia). A number of other species are of mostly minor importance as ornamentals and as sources of oils, dyes, fruits, and timber. Many species produce toxic or poisonous proteins and/or alkaloids. Those with milky sap (particularly *Euphorbia*) can cause dermatitis or poisoning in susceptible people (Webster 1994a, 1994b).

1. Herbage with stinging hairs; leaves serrate, 1–4 cm long; plants perennial; ovules 1 per locule; fruit usually with 3 seeds; sap not milky ..... ***Tragia***
1' Herbage glabrous or pubescent, but never with stinging hairs; leaves entire, or if serrate, then usually less than 1 cm long; sap milky or not; plants annual or perennial ..... (2)

2. Herbage usually densely (or sparsely) covered with stellate hairs; plants dioecious annuals; leaves entire; ovules 1 per locule; fruit usually with 3 seeds; sap not milky ..... ***Croton***
2' Herbage glabrous or pubescent but never with stellate hairs; plants monoecious; sap milky or not ..... (3)

3. Inflorescences axillary to leaves on lateral branches only, composed of cymules, each cymule consisting of 1 pistillate flower and a few staminate flowers, all dark reddish purple; plants glabrous annuals; leaves entire, linear; ovules 2 per locule; fruit usually with 6 seeds; sap not milky ..... ***Reverchonia***
3' Inflorescences in stem forks or congested axillary clusters, or terminal, composed of cyathia, cuplike structures containing separate male flowers (which are single stamens) and 1 female flower; plants glabrous or pubescent, annuals or perennials; sap milky ..... (4)

4. Leaves all opposite, bases usually distinctly asymmetric; stipules usually present and apparent, sometimes inconspicuous; inflorescences in stem forks or congested axillary clusters ..... ***Chamaesyce***
4' Leaves below inflorescence alternate, leaf bases always symmetric; stipules lacking or minute and more or less glandular; inflorescences terminal ..... ***Euphorbia***

Chamaesyce Gray Prostrate Spurge, Spurge, Sandmat

(Greek *chamai*, on the ground, + *sykon*, fig, referring to the commonly prostrate habit and the milky sap which also occurs in *Ficus*, and perhaps to the vaguely figlike shape of the fruits of *Chamaesyce*) Annual or perennial taprooted herbs; sap milky. **STEMS** prostrate or erect, rarely winged (*C. serpyllifolia*), annuals usually branching near ground level, sometimes above, perennials often branching below the ground surface. **LEAVES** simple, cauline, short-petiolate, base usually asymmetric, margins entire, serrulate, or serrate, stipules usually apparent. **INFL** composed of cyathia, solitary or congested, in stem forks or leaf axils, often present through most of stem length. **CYATHIUM** solitary, axillary. **GLANDS** 4; appendages usually present. **FLOWERS** pistillate, few to numerous, each consisting of a single stamen. **FRUIT** 3-loculed and 3-angled, glabrous or pubescent, smooth, loculicidal and septicidal, columella persistent. **SEEDS** 1 per locule, smooth, ridged, or with irregular pits or bumps, small, often with white coating, without a caruncle. *Chamaesyce*, which is often considered a subgenus of *Euphorbia*, contains approximately 250 species, mostly in tropical America and Africa, but also more or less cosmopolitan in temperate and subtropical habitats, then often as weeds. Photosynthesis in *Chamaesyce* apparently follows the C_4 photosynthetic pathway, while *Euphorbia* uses the C_3 pathway. In addition to the usual plant parts, a specimen should have seeds for accurate identification (Wheeler 1941).

1. Leaves toothed at least near apex, sometimes very inconspicuously; plants annual ..... (2)
1' Leaves entire; plants annual or perennial ..... (4)

2. Herbage pubescent ..... ***C. serrula***
2' Herbage glabrous ..... (3)

3. Seeds usually smooth (occasionally faintly wrinkled or pitted); most internodes (or at least the distal parts of some) almost always narrowly winged and/or appearing flattened and sometimes striate or ridged; leaves variable in size and shape, sometimes with reddish blotch; stamens 5–18; stems prostrate to erect ..... ***C. serpyllifolia***
3' Seeds, on all faces, with 4–6 (8) coarse, transverse ridges; internodes round, rarely slightly flattened; leaves never with reddish blotch; stamens usually 4; stems prostrate, rarely ascending ..... ***C. glyptosperma***

4. Plants perennial, glabrous; stems prostrate to erect, rather wiry, to 15 cm; leaves orbicular to broadly ovate to lanceolate, <10 mm long ..... ***C. fendleri***
4' Plants annual, glabrous; stems erect, ascending, or prostrate, bushy-branching, (5) 10–30+ cm; leaves linear, apex rounded and mucronate, margins sometimes folded or revolute, 1–2.5 (3.5) cm long ..... ***C. parryi***

Chamaesyce fendleri (Torr. & A. Gray) Small (for the German Augustus Fendler, 1813–1883, who collected this plant and others in the Santa Fe area in 1847) Fendler's prostrate spurge. Perennial, glabrous herbs from branched, underground woody caudex. **STEMS** several to numerous, sometimes prostrate, usually decumbent or ascending to erect, slender or wiry, often reddish or purplish, to about 15 cm long. **LEAVES** orbicular to broadly ovate to lanceolate, entire, 3–10 mm long; stipules separate, linear. **CYATHIUM** 1–2 mm long; appendages absent, shorter than gland width, or conspicuous, lanceolate or deltoid and 1–3 times as long as gland width; sometimes reddish; margin entire or irregular; stamens (15) 25–35. **FRUIT** glabrous, 2.2–2.5 mm long. **SEEDS** quadrangular, usually smooth, sometimes faintly wrinkled, white, 1.4–2 mm long. $2n = 28$. Sandy or gravelly soil in deserts, shrublands, woodlands, and ponderosa forests. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1525–1860 m (5000–6100'). Flowering: May–Sep. Widespread in the southwestern United States, from the western Great Plains and Texas to southern Nevada, southeastern California, and northern Mexico. In our area, this is the only *Chamaesyce* which is perennial and glabrous. Navajos used an infusion for stomachaches and diarrhea; plant parts were used topically for

poison ivy and warts and to stimulate breast milk production; poultices were applied for toothaches and to cuts as a hemostatic. Hopis fed roots to babies whose mother's milk was failing.

Chamaesyce glyptosperma (Engelm.) Small (carved seed, referring to the ridged seeds) Ribseed prostrate spurge. Annual, glabrous, taprooted herbs. **STEMS** prostrate to ascending, 5–40 cm long, much-branched, round and wingless. **LEAVES** mostly at least partly serrate, some may be entire, mostly oblong, 2–12 (15) mm long, often falcate, apex obtuse; stipules subulate, laciniate or dissected, sometimes entire, to about 1 mm long. **CYATHIUM** 0.5–1 mm long; appendages short, to about as long as gland width, entire or erose; stamens usually 4. **FRUIT** glabrous, about 1.5 mm long. **SEEDS** sharply quadrangular, faces and sometimes angles with 4–6 (8) coarse, transverse ridges, 1–1.5 mm long. $2n = 22$. Dry or mesic open places, in deserts, shrublands, woodlands, ponderosa pine forests, sometimes near streams or hanging gardens, sometimes weedy in gardens and roadsides. ARIZ: Apa, Coc, Nav; COLO: Dol, SMg; NMEX: McK, RAr, SJn; UTAH. 1125–1950 m (3700–6400'). Flowering: Jun–Sep. Widespread in North America. Similar to *C. serpyllifolia*, but *C. glyptosperma*'s wingless stems and strongly ridged seeds are distinguishing.

Chamaesyce parryi (Engelm.) Rydb. (for Charles Christopher Parry, 1823–1890) Parry's prostrate spurge. Annual, glabrous, taprooted herbs. **STEMS** erect, ascending, or decumbent, occasionally prostrate, 5–50 cm long, branches on erect plants often bushy. **LEAVES** more or less linear, 1–2.5 (3.5) cm long, 1–3 mm wide, apex rounded and mucronate, margins entire, sometimes folded or revolute; stipules distinct and linear, sometimes entire, to about 1 mm long. **CYATHIUM** 1–2 mm long; appendages typically short and erect (sometimes forming a cup), but sometimes as long as or much longer than the gland is wide and spreading (short and long appendages sometimes on same plant); stamens 35–55. **FRUIT** glabrous, 1.5–2.5 mm long. **SEEDS** plumply ovoid-triangular, smooth or slightly roughened, mottled brown and white, 1.4–1.8 mm long. Sandy places, dunes, along washes, in deserts and shrublands. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: RAr, SJn; UTAH. 1490–1890 m (4900–6200'). Flowering: May–Sep. Trans-Pecos Texas, western New Mexico, eastern and northern Arizona, southern Utah, southern Nevada. Very similar to and maybe not distinct from *C. missurica* (Raf.) Shinners, which occurs east of our area. Despite its range of habits, *C. parryi*'s longevity, glabrous foliage, plump, essentially smooth seeds, and linear leaves are unique in our area.

Chamaesyce serpyllifolia (Pers.) Small (from *Thymus serpyllum* + Latin *folium*, leaf; referring to the shape of the leaves) Thymeleaf prostrate spurge. Annual, glabrous, taprooted herbs. **STEMS** prostrate or erect, much-branched, 5–35 cm long; most, some, or at least the distal parts of some or most internodes almost always narrowly winged and/or appearing flattened and sometimes striate or ridged. **LEAVES** variable in size and shape, but oblong to elliptic or elliptic-oblanceolate; usually serrate, at least at rounded or almost truncate apex, 2–12 (15) mm long, often falcate, sometimes with a reddish blotch; stipules distinct, linear, entire or divided, 1–1.5 mm long. **CYATHIUM** 0.5–1.5 mm long; appendages short, white, entire or crenulate; stamens 5–18. **FRUIT** glabrous, 1.5–2 mm long. **SEEDS** quadrangular, usually smooth, sometimes faintly wrinkled or pitted, 1–1.5 mm long. $2n = 22, 28$. Common in dry or moist open places, in many substrates, in shrublands, woodlands, often weedy in gardens and roadsides. ARIZ: Apa, Coc, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1190–2165 m (3900–7100'). Flowering: Jun–Sep. Widespread in the north-central and western United States, from Michigan to Washington, south to California, Texas, and northern Mexico. The combination of winged internodes and more or less smooth seeds, along with toothed leaves and glabrous vestiture, is diagnostic. Navajos used an infusion for stomachaches and diarrhea; plant parts were used topically for poison ivy and warts and to stimulate breast milk production; poultices were applied for toothaches and to cuts to stop bleeding. Hopis fed roots to babies whose mother's milk was failing.

Chamaesyce serrula (Engelm.) Wooton & Standl. (*serra*, saw, + *ula*, little, referring to the serrulate leaves) Sawtooth prostrate spurge. Annual, pilose, taprooted herbs. **STEMS** prostrate to decumbent, much-branched, to 25 cm long. **LEAVES** mostly oblong, but sometimes elliptic or obovate-oblong; serrate, smaller leaves may be entire, often falcate, 5–10 mm long; stipules distinct, deltoid-attenuate, trilobate, 1–2 mm long. **CYATHIUM** about 1 mm long; appendages 1–4 times as long as gland width, entire to crenulate; stamens 7–13. **FRUIT** glabrous, 2–2.5 mm long. **SEEDS** quadrangular, smooth, whitish, 1.5–2 mm long. Grows in gravelly desert soils. NMEX: SJn. 1600 m (5250'). Flowering Aug–Oct. Trans-Pecos Texas, New Mexico, Arizona, south to central Mexico. Apparently rare in our area. This is the only hairy *Chamaesyce* in the study area.

Croton L. Croton

(Greek *kroton*, tick; *Croton* was originally applied to what is now called *Ricinus*, the seeds of which resemble ticks; Linnaeus apparently arbitrarily transferred *Croton* to this group of plants as a replacement for an earlier name, *Ricinoides*) Annual herbs (ours) or elsewhere perennial herbs, shrubs, trees. Hairs usually stellate, but may be lepidote,

glandular, and/or tomentose. Plants dioecious or monoecious (ours). Foliage often ill-smelling or sometimes fragrant; sap not milky. **LEAVES** simple, alternate, stipulate or not (ours). **INFL** androgynous (male flowers above a few female flowers) in a terminal spike or raceme in monoecious species; staminate and pistillate flowers on separate plants in dioecious species. **MALE FLOWERS** with sepals only (ours) or sepals and petals, usually 5-lobed; stamens few to numerous. **FEMALE FLOWERS** with sepals but no petals; carpels 1–3, styles usually distinct. **FRUIT** a capsule, usually with persistent columella. **SEEDS** carunculate (ours) or not. About 750 species, most in New World tropics. A few species are used medicinally (especially *C. tiglium* L., croton oil, one of the most purgative substances known), others as scents or flavorings (*C. eluteria* (L.) W. Wright, cascarilla, and *C. niveus* Jacq., copalchi), one as a host plant for lac insects (*C. laccifer* L.), and a few for timber (Ferguson 1901).

Croton texensis (Klotzsch) Müll. Arg. (belonging to Texas) Texas croton, doveweed, skunkweed. Annual, taprooted, malodorous, dioecious herbs with sparse to dense stellate pubescence which may give the plants a grayish or yellowish cast. **STEMS** erect, 2–8 dm tall, often branched above. **LEAVES** linear- to broadly lanceolate, elliptic, or oblong, entire, mostly 1.5–5 cm long and 0.5–1.5 cm wide, petiole length about equal to leaf width. **INFL** a raceme on separate plants. **FLOWER** calyx 2–4 mm wide, sepals 1–2 mm long; male flowers 1–2 cm long at branch ends; stamens 8–12; female flowers 1–4, about 1 cm long; styles 3, about 2 mm long, with many branches. **FRUIT** a capsule 4–6 mm long, stellate-tomentose, usually warty. **SEEDS** 1–3, 3.5–4 mm long, caruncle conspicuous, about 1 mm long. Dry, sandy sites, disturbed areas. ARIZ: Apa, Nav; UTAH. 1220–1830 m (4000–6000'). Flowering: May–Sep. Often common from the central United States to Wyoming, Utah, Arizona, New Mexico, Texas, and into northern Mexico. The habit, leaf shape and size, and degree of hairiness is quite variable. The species is toxic to livestock. The seeds are apparently eaten by doves. The Hopis have used it as an emetic and eyewash. Various western Indian tribes used the plant primarily as a purgative or to relieve gastrointestinal distress.

Euphorbia L. Spurge

(for Euphorbus, a 1st-century A.D. physician to Juba, king of Mauretania, an ancient country in northwestern Africa) Annual or perennial, glabrous or pubescent, taprooted or rarely rhizomatous herbs (ours), woody or succulent shrubs or trees elsewhere; sap milky. **STEMS** erect or ascending (ours), prostrate elsewhere. **LEAVES** cauline, mostly alternate, rarely opposite, entire to dentate; stipules lacking or minute and glandlike. **INFL** composed of cyathia (see glossary for details about this structure); more or less dichotomously divided or umbellate, essentially terminal. **GLANDS** 1 or 4–5; appendages none (or present on *E. marginata*). [*Esula*, *Galarhoeus*, *Poinsettia*, and *Tithymalus*].

1. Appendages white, conspicuous, petaloid, 1.5–2 mm long; glands usually 4; leaves of inflorescence broadly white-margined; plants robust annuals ..... ***E. marginata***
1' Appendages lacking; glands 1 (rarely 2) or 4–5; annuals or perennials ..... (2)

2. Glands 1 (rarely 2), deeply cupped; inflorescence never branching into symmetrical 3–several-rayed cymes ..... (3)
2' Glands 4 or 5, entire or crescent-shaped, flat or convex, not cupped; inflorescence branching into 3–several-rayed cymes, which resemble umbels ..... (4)

3. Leaves widest near middle, linear-elliptic to broadly elliptic; petioles often nearly as long as blades at midstem; vestiture stiffly pubescent, hairs ascending, hairs on lower leaf surface stiff, strongly tapered, with a broad basal cell; seeds angular in cross section, unevenly tuberculate, (2) 2.3–2.7 mm long ..... ***E. davidii***
3' Leaves usually widest below middle, narrowly to broadly lanceolate or ovate to trowel-shaped; petioles usually not more than 1/3 as long as blade at midstem; vestiture mostly short-hairy, more or less retrorse or strigose, some longer and multicellular, hairs on lower leaf surface weak, filiform, lacking broad basal cell; seeds rounded in cross section, evenly tuberculate, 1.7–2 (2.2) mm long ..... ***E. dentata***

4. Plants annual; capsules (and ovaries) verrucose (warty with low bumps), 2–3 mm long ..... ***E. spathulata***
4' Plants perennial; capsules smooth (never warty), 3–4 mm long ..... (5)

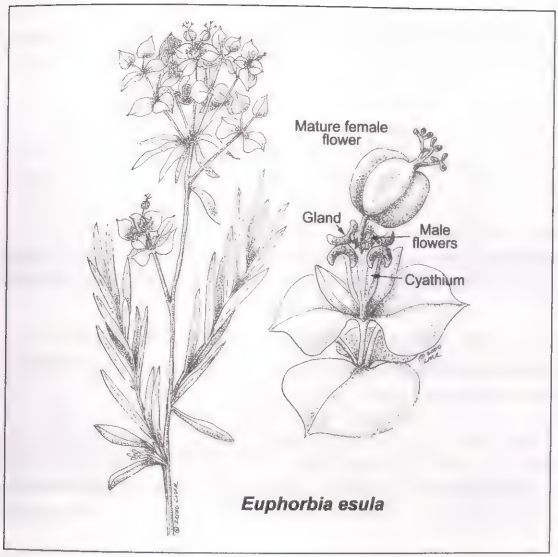
5. Cauline leaves broadly linear or lanceolate-linear to narrowly oblong or narrowly oblanceolate, 3–9 cm long, 2.5–7 (10) mm wide; inflorescence bracts orbicular, starkly contrasting with the narrow cauline leaves, often conspicuously yellowish; capsule finely granular or rugose-tuberculate, glabrous, 3–3.5 mm long; plants strongly rhizomatous, colonial, weedy, invasive ..... ***E. esula***
5' Cauline leaves variable, oblong-spatulate or elliptic to broadly elliptic or rotund-ovate, not linear, 0.7–2.5 cm long, 3–20 mm wide; inflorescence bracts similar to but slightly larger than cauline leaves, green (not yellowish); capsules glabrous or short-hairy, smooth, about 4 mm long; plants from semiwoody crown, not rhizomatous, widespread native plants ..... ***E. brachycera***

Euphorbia brachycera Engelm. (short-horned, referring to the hornlike extensions of the gland) Horned spurge. Perennial herbs from a robust, semiwoody taproot. **STEMS** usually several, branching below ground level from root crown, 1–4 dm tall, glabrous or velvety-puberulent. **LEAVES** variable, oblong-spatulate or elliptic to broadly elliptic or rotund-ovate, entire, sessile, 0.7–2.5 cm long, 3–20 mm wide; leaves subtending entire inflorescence usually larger and whorled; those subtending distal inflorescence branches paired, green (not yellowish). **INFL** umbellate, the rays 3–5 (8), each ray divided one or more times; 2 foliose bracts subtend each fork. **CYATHIUM** 2–3 mm long; stamens several. **GLANDS** usually 4, yellowish, often with conspicuous horns, but sometimes hornless and the margin crenate, sometimes both types on same plant; appendages none. **FRUIT** glabrous or short-hairy, smooth, about 4 mm long. **SEEDS** grayish, with irregular shallow pitting, 1.8–3 mm long, caruncle conspicuous. $2n = 28$. [*E. lurida* Engelm.; *E. montana* Engelm.; *E. robusta* (Engelm.) Small; *Tithymalus brachycerus* (Engelm.) Small]. Sandy, gravelly, or rocky slopes, shrublands, woodlands, to mixed confer forests. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Mon, SJn; NMEX: McK, SJn. 1525–2600 m (5000–8500'). Flowering: May–Aug. The variation in leaf shape throughout its wide range led earlier botanists to recognize several taxa where in fact there is only one. Despite its variation in leaf shape and gland morphology, its perennial, nonrhizomatous growth and smooth capsules make this plant readily identifiable. The Navajo used an infusion of the plant as a purgative and during childbirth; leaves and stems were used as a liniment and topical analgesic; the root sap was rubbed on clothing for good luck.

Euphorbia davidii Subils (for David L. Anderson of Villa Mercedes, Argentina, who collected one of the paratypes) Toothed spurge. Annual herbs from taproots, with stiff, tapered hairs. **STEMS** erect, usually branched, 1–4 (8) dm tall. **LEAVES** mostly opposite, widest near middle, linear-elliptic to broadly elliptic; petioles often nearly as long as blades at midstem, 2–7 cm long, hairs on lower leaf surface stiff, strongly tapered, with a broad basal cell. **INFL** terminal on main stem and branches, congested, bracteal leaves sometimes pale at base. **CYATHIUM** 2–2.5 mm long; stamens many. **GLANDS** 1, cupped, fleshy; appendages none. **FRUIT** smooth, usually glabrous, rarely sparsely hairy, 4–5 mm wide, 2–3 mm long. **SEEDS** angular in cross section, unevenly tuberculate, (2) 2.3–2.7 mm long, caruncle 1–1.4 mm long. $2n = 56$. Dry, open, often disturbed places, in valleys and foothills. COLO: Arc, LPl, Mon; NMEX: SJn. 1525–2150 m (5000–7000'). Flowering: Jul–Sep. Apparently introduced to the Four Corners study area by human activities from the central United States (east of the Rocky Mountains); now fairly widespread in North and South America. Only recently was this species realized to be distinct from what has traditionally been called *E. dentata*. Most plants in our area are *E. davidii*. The general appearance of the two plants is very similar, but they are usually distinguishable if a reasonably complete specimen is available.

Euphorbia dentata Michx. (with toothlike projections, referring to the toothed leaves) Western toothed spurge. Annual herbs from taproots, with retrorse or strigose, weak hairs. **STEMS** erect, 1–4 (6) dm tall, usually branched. **LEAVES** broadest below middle, narrowly to broadly lanceolate or ovate to trowel-shaped, petioles not usually more than 1/3 as long as blade at midstem, 1–9 cm long, hairs on lower leaf surfaces weak, filiform, lacking broad basal cell. **INFL** terminal on main stem and branches, congested, bracteal leaves sometimes pale at base. **CYATHIUM** 2–3 mm long; stamens many. **GLANDS** 1, cupped, fleshy; appendages none. **FRUIT** smooth, glabrous, 4–5 mm wide, 2–3 mm long. **SEEDS** rounded in cross section, evenly tuberculate, 1.7–2.2 mm long, caruncle to about 1 mm long. $2n = 28$. Usually in moister places, often a weed in gardens, etc. NMEX: SJn. 1525–1825 m (5000–6000'). Flowering: Jul–Sep. Apparently introduced to the Four Corners region from the eastern United States by human activities. It is seemingly rare in our area. Until recently, the plants in our area were known by this name, but now it is understood that most are actually *E. davidii*.

Euphorbia esula L. (origin uncertain; two possibilities: Latinized form of Celtic name for sharp, referring to the acrid juice; or from German *esel*, donkey, perhaps referring to the similarity of the long, narrow leaves to donkeys' ears) Leafy spurge, wolf's milk (German: Esels-Wolfsmilch). Perennial, glabrous, rhizomatous herbs, typically colonial and invasive. **STEMS** erect, branching, 3–6 (9) dm tall, arising in clumps from semiwoody crowns connected by often deeply growing rhizomes. **LEAVES** broadly linear or lanceolate-linear to narrowly oblong or narrowly oblanceolate, entire, glabrous, sessile, 3–6 (9) cm long, 2.5–7 mm wide; inflorescence bracts usually broad and short (starkly contrasting with the narrower, longer, cauline leaves) and often conspicuously yellowish; whorled at base of entire inflorescence, paired at base of each dichotomy. **INFL** an umbel with 7–15 rays, each ray repeatedly dichotomous. **CYATHIUM** 2–3 mm long; stamens 12–25. **GLANDS** 4, yellowish green, horned; appendages none. **FRUIT** finely granular to rugose-tuberculate, glabrous, 3–3.5 mm long, sometimes becoming reddish at maturity. **SEEDS** essentially smooth, 2–2.5 mm long. $2n = 16, 20, 48–60, 64$. Weedy and invasive in mesic areas, roadsides, pastures. COLO: Arc, LPl, Mon, SJn; NMEX: SJn. 1525–2285 m (5000–7500'). Flowering: May–Sep. Introduced from Eurasia, initially to New England in the early



Euphorbia esula

1800s and many times subsequently to other areas in the United States from various Old World populations. Grows from England to Russia, south to Spain and Italy; introduced nearly worldwide, except for Australia; particularly abundant and troublesome in the north-central United States and adjacent Canada. This species is a member of an aggregate of very similar if not conspecific taxa in the Old World (species distinguishable only by leaf shape). Similarly, because of the extensive overlap in features, some recent European authorities do not recognize subspecific designations within *E. esula*. Since it is very difficult to control once it has become established, this plant is considered to be a noxious, invasive weed wherever it is found in the United States and elsewhere outside of its native range. Plants contain the alkaloid euphorbon, which is toxic to cattle and horses; however, goats and sheep are unaffected and are sometimes used to control infestations.

Euphorbia marginata Pursh (having a border, referring to the white leaf margins) Snow on the mountain. Stout, annual, taprooted, typically villous, annual herbs. **STEMS** erect, simple below inflorescence, 3–8 dm tall. **LEAVES** cauline, sessile, alternate, oblong to ovate or elliptic, entire, 3–8 (10) cm long, 1–3 cm wide; inflorescence leaves broadly white-margined. **INFL** umbel-like, usually 3-rayed, each ray branched several times. **CYATHIUM** villous, about 4 mm long; stamens 35–60. **GLANDS** 5, cupped; appendages conspicuously showy, white, petaloid. **FRUIT** hairy, 4–6 mm long. **SEEDS** tuberculate, about 4 mm long. $2n = 56$. Apparently rare in the Four Corners; weedy in disturbed sites, often in calcareous soils. COLO: LPl; NMEX: SJn. 1525–1825 m (5000–6000′). Flowering: Jun–Oct. Introduced from the central United States. Native range from Montana to Minnesota, south to western Texas and eastern New Mexico. Sometimes grown in gardens for showy bracts, occasionally escaping and establishing. This plant's suite of characteristics make it unmistakable.

Euphorbia spathulata Lam. (*spathula* or *spatula*, shoulder blade, referring to the leaf shape) Warty spurge. Glabrous, annual herb. **STEMS** simple or branched, erect, 1–4+ dm tall. **LEAVES** cauline, alternate, obovate to oblong-spatulate, serrulate, 1–4 cm long. **INFL** umbellate, rays usually 3, each repeatedly dichotomous. **CYATHIUM** glabrous, about 1 mm long; stamens 5–10. **GLANDS** 4, minute, appendages absent. **FRUIT** glabrous but warty, 2–3 mm long. **SEEDS** roundish, finely reticulate, 1.5–2 mm long. Apparently uncommon in many habitats, including grasslands, on slopes, stream banks, woodlands, and roadsides. COLO: Arc, Mon; NMEX: McK, SJn; UTAH. 1525–2285 m (5000–7500′). Flowering: May–Aug. Widespread in the central and western United States, Mexico, and South America. The combination of annual growth, serrulate leaves, warty fruit (and ovary), and reticulate seeds is diagnostic.

Reverchonia A. Gray Sand Reverchonia, Sand Spurge

(for the Frenchman Julien Reverchon, 1837–1905, who collected in Texas) A monotypic genus. Glabrous, monoecious, annual herbs from taproots. **LEAVES** alternate, simple, entire, short-petiolate, stipulate. **INFL** in small, dark reddish purple, bracteolate cymules in leaf axils of lateral branches, never on the main stem. **INFL** a cymule with 1 central female flower and 4–6 lateral male flowers. **FLOWERS** pedicellate and having sepals but no petals; staminate calyx 4-lobed, stamens 2; pistillate calyx 6-lobed, pistil with 3 united carpels. **FRUIT** 3-locular, columella usually deciduous. **SEEDS** 2 per locule, grooved along ventral margin (Webster and Miller 1963).

Reverchonia arenaria A. Gray (sand or sandy place; refers to the species' restriction to sandy habitats) Sand spurge, sand reverchonia. **STEMS** erect, 1–3 (5) dm tall, branches numerous and spreading; sap not milky. **LEAVES** narrowly elliptic to linear, 1.5–4 cm long, 2–8 mm wide; stipules lanceolate, acuminate, 1–2 mm long, often dark reddish. **FLOWER** sepals 1.5–2.5 mm long. **FRUIT** subglobose, smooth, 7–10 mm wide, hanging on a curved pedicel 2–5 mm

long. **SEEDS** 4–6.5 mm long. $2n = 16$. Restricted to sand dunes and very sandy soils. ARIZ: Apa, Nav; UTAH. 1525–1830 m (5000–6000'). Flowering: Jun–Aug. Western Kansas, Oklahoma, and Texas west to northern Arizona and southern Utah, south to Chihuahua. The color and insertion of the cymules, narrow leaves, and sandy habitat preference make this plant readily recognizable.

Tragia L. Noseburn

[for the German herbalist Hieronymus Bock (German: buck, male deer), 1498–1554, whose name was Latinized after the Greek as Tragus, he-goat] Perennial, monoecious herbs from semiwoody taproots, with stinging and other types of hairs throughout. **LEAVES** alternate, petiolate or sessile, margins entire to serrate (ours) or toothed. **INFL** androgynous (female flowers at lowest 1–2 nodes, male flowers above) racemes, opposite leaves or terminal on lateral branches. **FLOWERS** bracteolate and pedicellate, with sepals, but not petals; male flower stamens 2–4 (10); female flower carpels 3, stigmatic surfaces smooth, roughened, or papillate. **FRUIT** a capsule, explosively dehiscent, columella persistent. **SEEDS** 1 per locule, without a caruncle.

Tragia ramosa Torr. (*ramus*, branch, + *-osa*, full of, referring to the habit) Branched noseburn. **STEMS** usually many, ascending to erect, 1–3 dm long; sap not milky. **LEAVES** narrowly deltoid or linear-lanceolate to ovate, 1–4.5 cm long, 4–20 mm wide, base often truncate or obtuse, margins serrate, petioles 1–5 (10) mm long; stipules lanceolate to ovate, 1–4.5 mm long. **FLOWERS**: staminate calyx lobes 3–4 (6), 1–2 mm long, stamens mostly 3–4; pistillate calyx lobes (5–) 6 (–7), 1.5–2.5 mm long, stigma tips slender, recurved, surfaces not or barely papillate. **FRUIT** 3-lobed, 2–4 mm tall, 6–8 mm wide. **SEEDS** globose, smooth, brownish, 2.5–3 mm long. Rocky, open areas. ARIZ: Apa; COLO: Arc, LPl; NMEX: McK, SJn. 1525–2130 m (5000–7000'). Flowering: May–Aug. Missouri to Texas, west to southeastern California, southern Nevada, and southern Utah; also northern Mexico. Except for *Urtica dioica*, the only plant with stinging hairs in the Four Corners region.

FABACEAE Lindl. LEGUME FAMILY

(LEGUMINOSAE)

S. L. Welsh & N. D. Atwood

Herbs, shrubs, or trees. **LEAVES** alternate, pinnately or palmately compound, or simple, stipulate. **INFL** usually a raceme. **FLOWERS** perfect, irregular or regular, usually borne in racemes; calyx 5-lobed; petals 5 (a banner, 2 wings, and 2 keels) or fewer, less commonly reduced to 1 (banner), or lacking; stamens 10 or 5, or numerous, diadelphous, monadelphous, or distinct; pistil 1, the ovary superior, 1- or 2-loculed, 1-carpelled, the style and stigma 1. **FRUIT** (pod) a legume or loment, sessile, subsessile, stipitate, or with a gynophore, dehiscent or indehiscent. $x = 5–14$. [Leguminosae Juss.]. The family as here constituted consists of some 677 genera worldwide (Isely 1998; Welsh 1978).

1. Flowers regular, in dense heads or compact spicate racemes; stamens 5 or numerous (subfamily Mimosoideae) ..... **Key 1**
1' Flowers irregular (only slightly so in some); stamens 10 or fewer ..... (2)

2. Corolla not papilionaceous, sometimes nearly regular, the upper petal enclosed by the others; stamens 10 or fewer, commonly distinct (subfamily Caesalpinoideae) ..... **Key 2**
2' Corolla papilionaceous, the upper petal (banner) enclosing the wing and keel petals in bud, lacking in *Dalea*, *Psorothamnus*, and *Parryella*; stamens 10 or 5 (subfamily Papilionoideae) ..... (3)

3. Plants woody; trees, shrubs, or woody vines ..... **Key 3**
3' Plants herbaceous perennials or annuals ..... (4)

4. Leaves even-pinnate ..... **Key 4**
4' Leaves odd-pinnate, simple, or palmate ..... (5)

5. Leaflets 3 only ..... **Key 5**
5' Leaflets 5 or more, or the leaves simple ..... **Key 6**

KEY 1

Flowers regular; stamens 10 or numerous (Mimosoideae)

1. Stamens distinct, not united at the base; plants mainly 3–10 dm tall ..... ***Acacia***
1' Stamens basally connate, the filaments united into a tube; plants mainly 1–2 dm tall ..... ***Calliandra***

KEY 2

Corolla not papilionaceous (Caesalpinoideae)

1. Leaves simple, the blades rotund-ovate; flowers pink, appearing before the leaves ..... ***Cercis***
1′ Leaves once or twice compound; flowers yellow, white, or greenish, appearing after the leaves ..... (2)

2. Herbs; flowers with yellow petals, the stamens exserted or not; plants indigenous ..... ***Caesalpinia***
2′ Trees; flowers with yellow, white, or greenish yellow petals, the stamens included or not much exserted; distribution broad ..... ***Gleditsia***

KEY 3

Trees, shrubs, or woody vines (Papilionoideae)

1. Leaves simple; plants suffruticose, with axillary, spine-tipped, sterile branchlets and raceme axes; flowers red ..... ***Alhagi***
1′ Leaves compound or simple; plants shrubs or trees, but not with axillary spine-tipped sterile branchlets and raceme axes; flowers variously colored but not red ..... (2)

2. Plants trees or less commonly low and somewhat shrubby; armed with stipular spines ..... ***Robinia***
2′ Plants shrubby, unarmed, or armed only with stems modified as thorns ..... (3)

3. Petals lacking; leaflets linear ..... ***Parryella***
3′ Petals present; leaflets broad ..... ***Psorothamnus***

KEY 4

Leaves even-pinnate (Papilionoideae)

1. Style bearded down 1 side; wings of corolla essentially free from the keel ..... ***Lathyrus***
1′ Style bearded in a tuft or ring at apex; wings of corolla adherent to the keel ..... ***Vicia***

KEY 5

Leaflets 3 (Papilionoideae)

1. Leaves palmate, the terminal leaflet neither stalked nor jointed ..... (2)
1′ Leaves pinnate, the terminal leaflet stalked or jointed ..... (4)

2. Flowers golden yellow, the banner orbicular, large; legumes narrowly oblong, erect or ascending; staminal filaments distinct ..... ***Thermopsis***
2′ Flowers ochroleucous to white or pink to pink-purple, the banner not orbicular, moderate to small in size; staminal filaments diadelphous ..... (3)

3. Leaflets usually toothed; flowers mostly in heads, commonly pink or white ..... ***Trifolium***
3′ Leaflets entire; flowers not in heads, commonly ochroleucous or pink ..... ***Astragalus***

4. Herbage glandular-punctate; indigenous plants with usually linear to oblanceolate leaflets ..... (5)
4′ Herbage not glandular-punctate; indigenous or cultivated plants with spatulate to obovate or oblanceolate to ovate leaflets ..... (6)

5. Plants caulescent, with 5 or more developed internodes; pods not included in the calyx at maturity ..... ***Psoralidium***
5′ Plants acaulescent or short-caulescent, usually with fewer than 5 developed internodes; pods included in the calyx at maturity ..... ***Pediomelum***

6. Leaflets entire ..... (7)
6′ Leaflets toothed (except in some *Trifolium* species) ..... (8)

7. Flowers in umbels, loosely capitate, or solitary in leaf axils, yellow or suffused with orange ..... ***Lotus***
7′ Flowers in interrupted racemes or panicles, purplish ..... ***Phaseolus***

8. Flowers usually in heads; corolla persistent, investing the fruit; fruit straight ..... ***Trifolium***
8′ Flowers usually in racemes; corolla not persistent; fruit straight or curved to coiled ..... (9)

9. Leaflets toothed along the distal 1/2 or more; racemes elongate, several times longer than broad ..... ***Melilotus***
9′ Leaflets toothed along the distal 1/3 only; racemes compact or loose, seldom more than twice longer than broad ..... ***Medicago***

KEY 6

Leaflets (4) 5 or more, or leaves simple (Papilionoideae)

1. Leaves palmately compound, with usually 5–11 leaflets, long-petiolate ..... (2)
1' Leaves pinnately compound or, if rarely palmately compound (as in some *Lotus* species), sessile or with only 4 leaflets or the leaves simple ..... (4)

2. Herbage not glandular-dotted; leaflets usually 7–11, variously shaped; stamens monadelphous; pods several-seeded ..... ***Lupinus***
2' Herbage glandular-dotted; leaflets usually 5, broadly obovate-spatulate; stamens usually diadelphous; pods 1-seeded ..... (3)

3. Plants caulescent, usually with 5 or more developed internodes; pods not included within the calyx at maturity ..... ***Psoralidium***
3' Plants subacaulescent to short-caulescent, usually with fewer than 5 developed internodes; pods included within the calyx at maturity ..... ***Pediomelum***

4. Herbage glandular-dotted ..... (5)
4' Herbage not glandular-dotted ..... (6)

5. Racemes spicate; legumes 1-seeded, not bearing appendages; stamens 5; petals (except banner) inserted on staminal tube ..... ***Dalea***
5' Racemes not spicate; legumes several-seeded, bearing hooked appendages, or rarely glabrous; stamens 10; petals not inserted on staminal tube ..... ***Glycyrrhiza***

6. Leaves simple; plants suffruticose, armed with axillary, thorn-tipped, sterile branchlets and raceme axes; flowers red ..... ***Alhagi***
6' Leaves mainly compound or the plants not otherwise as above ..... (7)

7. Margin of leaflets toothed; corolla persistent, investing the fruit ..... ***Trifolium***
7' Margin of leaflets entire; corolla usually deciduous ..... (8)

8. Flowers in umbels, loosely capitate, or solitary in leaf axils; petals yellow, often suffused with orange, or pink ..... ***Lotus***
8' Flowers in racemes, loose or rather dense, but not in umbels; petals typically white to pink or various shades of pink-purple ..... (9)

9. Keel petals much longer than the wings; fruit a flattened loment ..... (10)
9' Keel petals subequal to the wings or shorter; fruit a legume (a terete loment in *Sophora*) ..... (11)

10. Fruit 4- to several-seeded, not spiny; plants indigenous ..... ***Hedysarum***
10' Fruit 1- to 2-seeded, more or less spiny-toothed; plants adventive, cultivated and escaping ..... ***Onobrychis***

11. Staminal filaments distinct; fruit a terete to somewhat flattened loment; plants with blue or white flowers, usually of sandy sites ..... ***Sophora***
11' Staminal filaments diadelphous or monadelphous; fruit a legume; plants from a caudex and/or taproot, rarely rhizomatous; habitats various ..... (12)

12. Keel with a porrect beak; ventral suture of legume forming a partial or complete partition; plants usually acaulescent ..... ***Oxytropis***
12' Keel beakless, or the beak diverging from the floral axis; ventral suture usually not produced internally, the dorsal usually produced in bilocular fruits; plants usually caulescent ..... (13)

13. Flowers red-orange when fresh; plants adventive ..... ***Sphaerophysa***
13' Flowers pink, pink-purple, lavender, or white to ochroleucous; plants indigenous, or rarely adventive ..... ***Astragalus***

Acacia Mill. Acacia

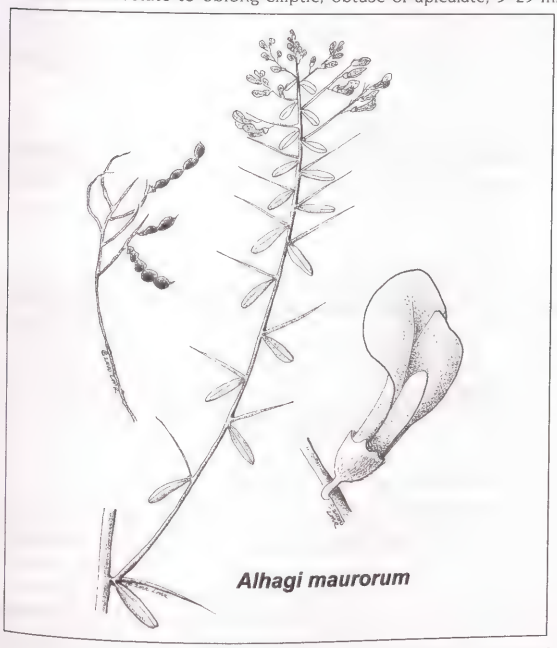
(*akakie*, thorny tree) Armed trees, or in ours suffruticose herbs. **LEAVES** alternate, often clustered on short axillary shoots, bipinnate, petiolate, the pinnae bearing several leaflets; lacking internodal spines; stipules small, slender and soon deciduous. **INFL** borne in numerous flowering capitate spikes or umbels. **FLOWER** calyx 5-lobed; corolla regular, 5-lobed, inconspicuous; stamens numerous, exserted.

Acacia angustissima (Mill.) Kuntze (narrow) Prairie acacia. Sufffrutescent unarmed perennial, arising from a ligneous root crown. **STEMS** sprawling to erect, mainly 3–10 (20) dm tall, hirsute (in ours). **LEAVES** bipinnate, with 4–12 pairs of pinnae; pinnae with 10–24 (30) pairs of leaflets, these oblong and more or less asymmetric, the secondary venation scarcely discernible; stipules inconspicuous, acicular but herbaceous and soon deciduous. **INFL** of pedunculate, capitate umbels mainly 1–1.5 cm thick, arising 1–3 per axil, or many aggregated into a terminal racemose cluster. **FLOWERS** 4–10 (15) per umbel, the sepals whitish, the petals pale greenish or yellowish; stamens numerous, distinct or closely aggregated and appearing connate, whitish (sometimes fading orangish). **PODS** indehiscent, oblong, flat, 3–6 cm long and 6–10 (12) mm wide, straight or sinuate, the valves membranous, glabrous or puberulent. [*Mimosa angustissima* Mill.]. Roadsides in alkaline soils. Evidently established along a field margin east of Shiprock, two miles west of The Hogback (*K. Heil & A. Clifford 19310*, SJNM xerograph BRY). NMEX: SJn. 1525 m (5000'). Flowering: Jun–Jul. Native to the southern United States (Arizona east to Florida); Mexico, Central America. The solitary specimen examined apparently belongs to var. *angustissima*.

Alhagi Gagnebin

(Arabic *al-hajji*, the pilgrim) Much-branched, bushy, suffruticose herbs, armed with sterile axillary thorns and spine-tipped raceme axes. **LEAVES** simple, of 1 petiolulate leaflet, soon deciduous. **INFL** of few-flowered racemes, the flowers minutely bracteate, and with bracteoles. **FLOWER** calyx campanulate, short-toothed; corolla papilionaceous, reddish, the petals all free; stamens diadelphous; style filiform, glabrous, the stigma terminal. **PODS** short-stipitate, linear, incurved, torulose (constricted between the essentially round seeds), indehiscent. $x = 8$.

Alhagi maurorum Medik. (of North Africa) Camel thorn. Suffruticose armed herbs. **STEMS** mainly 3–10 dm tall, from a deep-set rhizome and root system; freely branched, armed at the nodes with stiff, spreading to ascending, leafless thorns, these 1–3.5 cm long; stipules 0.5–3 mm long, subulate to lance-ovate, caducous. **LEAVES** of 1 petiolulate leaflet, oblanceolate to oblong-elliptic, obtuse or apiculate, 3–25 mm long, 1–8 mm wide, pale beneath, minutely red-dotted above. **INFL** a raceme, (1) 2- to 7-flowered, the axis prolonged as a thorn; bracts 0.5–1 mm long, subulate; pedicels 1–2 mm long. **FLOWER** petals reddish purple, 7–9.5 mm long; calyx 2.5–3.2 mm long, glabrous, the margin sometimes puberulent and with low broad teeth 0.2–0.5 mm long; bracteoles 2. **PODS** stipitate, the stipe as long as the persistent calyx, the body with (1 or 2) 3–8 seeds, indehiscent, glabrous. $2n = 16$. [*Hedysarum alhagi* L.; *Alhagi camelorum* Fisch.]. Sandy sites along the San Juan River and its side canyons. ARIZ: Apa; NMEX: SJn; UTAH. 1370 to 1630 m (4495–5350'). Flowering: Jun–Jul. Texas west to Nevada and California. The plant, which is spreading and subdominant along the San Juan River, is armed with nodal thorns, is difficult to eradicate, and is regarded as a noxious weed in Arizona and California. Camel thorn, a provider of valued spring forage in the Near Eastern deserts of the Old World, has become well established in saline meadows, sandbars, and playas in widely scattered portions of the American Southwest. The rhizomes can penetrate several inches of asphalt paving.



Alhagi maurorum

Astragalus L. Milkvetch

(from the classical Greek word for ankle bone) Milkvetch, locoweed. Acaulescent, subacaulescent, or caulescent annual or perennial herbs, rarely somewhat suffruticose at the base, arising from a taproot and aerial, caespitose, or subterranean caudex. **PUBESCENCE** of basifixed or malpighian (dolabriform) hairs, or glabrous. **LEAVES** alternate,

odd-pinnate, digitately 3-foliolate, or unifoliolate, the leaflets entire, petiolulate or sessile, or decurrent; stipules adnate to the petiole or free, or connate opposite the petiole, especially on lowermost reduced leaves; bracts often small, membranaceous, subtending the pedicels; bracteoles 1 or 2, very small or lacking, borne when present on the calyx base. **INFL** borne in racemes or spikes, or rarely subumbellately disposed, rarely solitary; peduncles axillary, or apparently arising from the caudex. **FLOWERS** papilionaceous, violet, purplish, white, pale yellow, or yellow-white to greenish; calyx campanulate to cylindric, with 5 subequal teeth, or the lowermost the longest; petals mostly long-clawed, the banner erect, ovate, oblong, or panduriform, recurved through 20–180°, the wings oblong, usually shorter than the banner and longer than the keel, the keel usually shorter than the wings, suberect, obtuse or acute; stamens diadelphous, 9 connate and 1 (vexillar) free, the alternate anthers of 2 slightly different sizes; ovary sessile or stipitate, or borne on a gynophore, 2 to many-ovulate, the style filiform, straight or incurved, smooth, the small stigma terminal. **PODS** sessile or stipitate, or borne on a gynophore, deciduous or persistent, often deciduous with the calyx and pedicel, the body unilocular or partially or completely bilocular by intrusion of the dorsal inferior suture, varying from linear to globose, or even broader than long, straight or incurved, or more rarely decurved or coiled inward, dehiscent throughout or only at the apex; ovules 2-seriate, 2 to many, borne on slender funicles sometimes united at base by a membrane or funicular flange simulating a septum, but issuing from the seminal suture. **SEEDS** mostly reniform. $x = 8, 11, 12$. Two thousand species, mostly in western North America.

KEY 1. Key to groups.

1. Leaves with 5–7 spinulose-tipped, decurrent leaflets; plants prostrate to ascending or erect ..... ***A. kentrophyta***
1′ Leaves simple, 3-foliolate, or plurifoliolate, but the leaflets not spinulose-tipped; plants of various habit ..... (2)

2. Plants with malpighian (dolabriform) pubescence ..... **Key 2**
2′ Plants with hairs basifixed ..... (3)

3. Plants annual or winter-annual ..... **Key 3**
3′ Plants perennial (sometimes short-lived) ..... (4)

4. Leaves all, or at least the upper, with terminal leaflet not jointed to the rachis ..... **Key 4**
4′ Leaves all with the terminal leaflet jointed to the rachis ..... (5)

5. Lowermost stipules and sometimes all connate-sheathing or -clasping ..... (6)
5′ Lowermost stipules distinct as are the others ..... (7)

6. Pods stipitate or with a gynophore more than 1 mm long ..... **Key 5**
6′ Pods sessile or subsessile ..... **Key 6**

7. Pods stipitate or with a gynophore 0.5 mm long or longer ..... **Key 7**
7′ Pods sessile or subsessile, the stipe if present less than 1 mm long ..... (8)

8. Plants acaulescent or subacaulescent, the stem axis aboveground lacking or, when present, shorter than leaves or inflorescence ..... **Key 8**
8′ Plants caulescent, the main stem axis longer than the longest leaf or inflorescence ..... **Key 9**

KEY 2

Leaves unifoliolate, plurifoliolate, or some 3-foliolate; pubescence malpighian or incipiently so

1. Terminal leaflets of at least some upper leaves continuous with the rachis (the upper leaves often reduced to phyllodia consisting of a subfiliform rachis); plants definitely caulescent ..... (2)
1′ Terminal leaflets all jointed, the leaves typically all odd-pinnate ..... (3)

2. Raceme and peduncle together surpassing the length of the stem, much surpassing the leaves; plants smelling of selenium, of southeast Utah and northern Arizona ..... ***A. moencoppensis***
2′ Raceme and peduncle together not or seldom surpassing the length of the stem, or if so not much surpassing the leaves; plants of various or other distribution ..... ***A. ceramicus***

3. Pods fully bilocular, erect or declined; plants distinctly caulescent ..... ***A. falcatus***
3′ Pods unilocular, or if bilocular, the plants acaulescent, subacaulescent, or caulescent. ..... (4)

4. Wing petals deeply cleft at apex; plants definitely acaulescent, with scapiform peduncles; pods oblong, compressed-triquetrous, fully bilocular ..... ***A. calycosus***
4′ Wing petals entire or obscurely emarginate; pods variously unilocular or bilocular ..... (5)

5. Stipules, at least at the lowermost 1–3 nodes, connate into a bidentate sheath ..... (6)
5′ Stipules all distinct (though fully amplexicaul in some); plants acaulescent or shortly to definitely caulescent ..... (9)

6. Plants prostrate-spreading ..... (7)
6′ Plants erect or ascending, not prostrate-spreading, when low still more or less tufted and acaulescent or subacaulescent ..... (8)

7. Racemes 1- to 3-flowered; flowers pink-purple; leaflets mostly 7–11; plants of sandstone escarpments in southern Utah, southwest Colorado, and northern Arizona ..... ***A. sesquiflorus***
7′ Racemes 7- to many-flowered; flowers dull purplish; leaflets mostly 11–17; plants rather widespread in western and southwestern New Mexico, Arizona, southern Nevada, and southern Utah ..... ***A. humistratus***

8. Peduncles (3) 5–23 cm long, usually longer than the subtending leaf; plants flowering mainly in springtime (sometimes again in autumn), in southwest Colorado, southeast Utah, northwest New Mexico, and northeast Arizona ..... ***A. flavus***
8′ Peduncles 1.5–4 (5.5) cm long, much shorter than the subtending leaf; plants flowering in summer, of northeastern Arizona, northern New Mexico, and La Plata County, Colorado. ..... ***A. albulus***

9. Plants mat-forming, pulvinate, or in tiny tufts, of rimrock, northwest New Mexico and southwest Colorado; flowers tiny; leaves tiny; pods ovoid, 3–4.5 mm long; ovules 4–6 ..... ***A. humillimus***
9′ Plants definitely caulescent, or subacaulescent to acaulescent and loosely tufted to somewhat mat-forming, but then not with tiny leaves, pods, and flowers; distribution various ..... (10)

10. Pods narrowly oblong to oblong-ellipsoid, straight or nearly so, laterally compressed when ripe, bicarinate by the sutures; plants of plains and the eastern foothills of the Rocky Mountains, extending west only in the upper San Juan Basin; southwest Colorado, northwest New Mexico, and adjacent Arizona ..... ***A. missouriensis***
10′ Pods plumply ovate to broadly lanceolate in outline, scarcely to moderately incurved, 9–22 mm long, laterally compressed only in the beak; flowers 11–18.5 mm long, whitish or tinged purplish; plants of northern Arizona and southeast Utah ..... (11)

11. Pods readily deciduous; plants widespread from Clark and Lincoln counties, Nevada, through southern Utah, and northern Arizona to southwest Colorado and west Texas ..... ***A. amphioxys***
11′ Pods persistent or very tardily deciduous; plants of southwest Colorado and adjacent Utah, northeast Arizona, and northwest New Mexico ..... ***A. missouriensis***

KEY 3

Leaves unifoliolate, plurifoliolate, or some 3-foliolate; pubescence basifixed; plants annual (or flowering as annual)

1. Pods stipitate, the body ovoid-ellipsoid, erect-ascending; plants selenophytes, of San Juan County, Utah ..... ***A. cutleri***
1′ Pods sessile or stipitate, of various shape and habit, but if as above, not of San Juan County, Utah ..... (2)

2. Pods obovoid- to oblong-ellipsoid, 10–18 mm long; flowers 4–7 mm long, the flowers recurved through 90°; plants scattered throughout the Four Corners region ..... ***A. brandegeei***
2′ Pods either obliquely ovoid to subglobose, half-elliptic, lunately elliptic, or linear-oblong in outline; flowers various, but if of that size, the banner not reflexed so greatly ..... (3)

3. Racemes all (or all except some subterminal and obviously depauperate ones) more than 10-flowered ..... (4)
3′ Racemes (1) 2- to 10-flowered (seldom some with more flowers) ..... (5)

4. Banners reflexed through about 90°; ovules 21–32; plants typical of sandy desert shrublands in southeast Utah, northwest Arizona, and northwest New Mexico ..... ***A. fucatus***
4′ Banners recurved through about 50°; ovules 10–21; plants of various or other distribution; pods subsymmetrically ovoid, ovoid-ellipsoid, or subglobose, the beak short and obscure, not well differentiated from the body; plants of southwest Colorado and northwest New Mexico ..... ***A. wootonii***

5. Pods villous or hirsute, the hairs 0.7–2.2 mm long; plants of southeast Utah and northwest New Mexico ..... ***A. sabulonum***
5′ Pods glabrous or strigulose, if loosely strigulose the hairs not over 0.7 mm long ..... (6)

6. Pods loosely strigulose, the hairs spreading, incumbent, or curly ..... ***A. sabulonum***
6′ Pods truly strigulose, the hairs straight and appressed ..... ***A. nuttallianus***

KEY 4

Plants perennial (sometimes short-lived); pubescence basifixed; leaves all, or at least the upper terminal leaflet, continuous with the rachis

1. Ovaries and pods stipitate, the stipe mostly 2.5–12 mm long.....(2)
1. Ovaries and pods sessile or subsessile.....(5)

2. Flowers lemon-yellow, concolorous, the calyx not strongly contrasting in color with the petals; plants local in Archuleta County, Colorado.....***A. ripleyi***
2' Flowers not lemon-yellow, if ochroleucous, as in *A. lonchocarpus*, the calyx contrasting in color with the petals; plants of various distribution.....(3)

3. Pods pendulous, stipitate, the stipe 3.5–6 mm long, the body narrowly oblong, 20–32 mm long, 3.5–4.5 mm thick, dorsoventrally compressed, strigose, unilocular; plants intricately branched, forming birdsnest-like clumps.....***A. nidularius***
3' Pods various, but not simultaneously as above; plants not excessively branched, usually with a small number of stems arising from the superficial caudex.....(4)

4. Body of pods laterally compressed, bicarinate, the valves flat or almost so.....***A. coltonii***
4' Body of pods dorsiventrally more or less compressed, flattened or openly grooved dorsally, the valves convex.....***A. lonchocarpus***

5. Flowers 14.5–30 mm long; calyx tubes mostly over 5 mm long, campanulate to cylindric; calyx inflated, densely silky-pilose, enclosing the small, ventrally bisulcate pods; plants of the upper San Juan Valley, New Mexico, and adjacent Colorado.....***A. oocalycis***
5' Flowers mostly 4.3–12.5 mm long; calyx tubes (1.2) 2–5 mm long, campanulate; pods laterally or dorsally compressed, uni- or bilocular.....(6)

6. Flowers 4.3–6.1 mm long; calyx tubes 1.2–1.8 mm long; pods 9–12 mm long, 2.5–3.5 mm wide, strongly laterally compressed; plants of McKinley County, New Mexico.....***A. cliffordii***
6' Flowers 5–12.5 mm long; calyx tubes 1.8–5 mm long; pods various, sometimes strongly laterally compressed..(7)

7. Plants more or less rushlike, the leaflets linear (see also *A. moencoppensis*, next lead), known from southeast Utah, northeast Arizona, and southwest Colorado.....***A. episcopus***
7' Plants of various habit, the leaflets often broader than linear, known from various or other distribution.....(8)

8. Stems arising from branched aerial caudex; plants either dwarf and tufted, or moderately tall selenophytes.....***A. moencoppensis***
8' Stems arising from subterranean or superficial caudex, often pale and leafless at the base; plants of various habit and distribution.....***A. wingatanus***

KEY 5

Plants perennial (sometimes short-lived); pubescence basifixed; leaves with terminal leaflet jointed with the rachis; lowermost stipules connate; pods stipitate or on a definite stipelike gynophore

1. Body of pods unilocular and bladdery-inflated, terete or shallowly sulcate along the sutures but not laterally angled.....***A. hallii***
1' Body of pods uni- or bilocular, not inflated or if swollen then scarcely bladdery or also angled laterally or bluntly so.....(2)

2. Flowers at once nodding, retrorsely imbricate, and relatively large, (12.5) 14–23.5 mm long; stipe of pods 4–22 mm long.....(3)
2' Flowers of various orientation, but if nodding then often loosely and openly racemose (or becoming so) and if retrorsely imbricate then smaller; stipe of pods various.....(4)

3. Flowers of moderate size, ochroleucous; body of pods merely triquetrous; plants not with the odor of selenium, montane; widespread throughout the Four Corners.....***A. scopulorum***
3' Flowers small, ochroleucous; body of pods depressed ventrally, rounded dorsally, the ventral suture between parallel grooves.....***A. bisulcatus***

4. Flowers nodding and retrorsely imbricate; body of pods depressed ventrally, the suture between parallel grooves; herbage smelling of selenium. ***A. bisulcatus***
4' Flowers with various orientation, if nodding then openly racemose or becoming so; body of pods not as above; herbage not smelling of selenium; plants variously distributed ..... (5)

5. Pods laterally compressed, 2-sided, the faces plane or low-convex, the cavity unilocular ..... (6)
5' Body of pods subterete to obcompressed or trigonous or, if laterally compressed, then swollen and the valves inflexed dorsally as a narrow partial septum ..... (7)

6. Stipules and ripe pods commonly black or blackish; racemes often paired in leaf axils; flowers 5.5–10 mm long; body of pods 7–17 mm long, 2.5–4.5 mm wide; plants widespread ..... ***A. tenellus***
6' Stipules and pods not blackening; racemes 1 per leaf axil; plants widespread throughout the Four Corners ..... ***A. wingatanus***

7. Flowers 6–7.2 mm long, mostly 12–40 on an axis 4–17 mm long that elongates in fruit; leaflets 7–11; pods 6- to 13-ovulate; plants of northwest New Mexico and southwest Colorado ..... ***A. proximus***
7' Flowers 7 mm long or more, variously numerous, the axis elongating as above or not; leaflets mostly 11 or more; pods pubescent or glabrous, with 10 or more ovules; plants of various distribution ..... (8)

8. Flowers 7–11 mm long, mostly 7–26 on an axis that elongates in fruit; plants of the lower mountains; southwest Colorado, southeast Utah, and northwest New Mexico. ..... ***A. flexuosus***
8' Flowers often more than 11 mm long, various in number, the axis not or much elongating in fruit; plants typically of higher montane sites ..... ***A. alpinus***

KEY 6

Plants perennial (sometimes short-lived); pubescence basifixed; leaves with terminal leaflet jointed with the rachis; lowermost stipules connate; pods sessile or the stipe or gynophore less than 1 mm long

1. Flowers at once narrowly ascending or erect and crowded into heads or short, spicate racemes; stems arising from subterranean caudex or rhizomelike caudex branches ..... (2)
1' Flowers variously oriented, but if erect at anthesis then often loosely racemose or becoming so and often spreading or soon declined; stems sometimes as above, but the caudex superficial in many species (see exceptions below) .. (3)

2. Stems mostly less than 2.5 dm tall; flowers purple or lavender; leaflets commonly 13–21; pod ovoid- or oblong-ellipsoid, scarcely swollen, obtusely trigonous, dorsally sulcate; plants of moist sites, often in meadows, widely distributed ..... ***A. agrestis***
2' Stems 3–15 dm tall; petals ochroleucous; leaflets 17–31; pod broadly ovoid or globose, inflated, but firm, sulcate ventrally, black at maturity; plants introduced for reclamation, and to be expected throughout the West ..... ***A. cicer***

3. Flowers and pods both erect-ascending and laxly racemose, the axes of the lower peduncle and raceme together longer than the primary stem; raceme axis 3–23 cm long ..... ***A. moencoppensis***
3' Flowers and/or pods finally spreading or declined, the raceme shorter or the axes of the longest peduncle and raceme together shorter than the primary stem; plants of various distribution ..... (4)

4. Plants either strongly or definitely caulescent or of different distribution, or both ..... (5)
4' Plants low, tufted, of sandy habitats in southeast Utah, northeast Arizona, and northwest New Mexico ..... (6)

5. Calyx 2–3.5 mm long; the tube 1.2–2.5 mm long; flowers 4–6.2 mm long; plants of McKinley County, New Mexico ..... ***A. heilii***
5' Calyx much more than 5 mm long, the tube 3–13.5 mm long; flowers 9–26 mm long; plants of southeast Utah, northeast Arizona, rare in northwest New Mexico ..... ***A. zionis***

6. Pods at once laterally flattened and unilocular, bicarinate, narrowly oblong-elliptic or linear-oblanceolate; plants widespread throughout the Four Corners ..... ***A. wingatanus***
6' Pods terete, triquetrous, obcompressed, or bladdery-inflated or bilocular or subbilocular (or both), or if laterally compressed and unilocular, the valves convex or produced into a ridge parallel to the dorsal suture, or not bicarinate ..... (7)

7. Plants strongly caulescent, with stems mainly (1.5) 2–9 dm long ..... (8)
7' Plants not strongly caulescent, mainly dwarf clump-formers with stems less than 2 dm long ..... (10)

8. Pods (3) 4–12 mm thick, stiffly cartilaginous to coriaceous; plants of northeast Arizona, southwest Colorado, and northwest New Mexico ..... ***A. hallii***
8' Pods linear-oblanceolate or elliptic and 3–5 mm thick, tumid or bladdery and typically more than 5 mm thick and the distribution otherwise ..... (9)

9. Pods oblong-oblanceolate or elliptic in outline, 3–5 mm thick; plants from southeast Utah and northeast Arizona eastward and northward ..... ***A. flexuosus***
9' Pods tumid or bladdery, (4) 5–27 (35 when pressed) mm thick; plants typical of sandy desert shrublands; widely scattered throughout the Four Corners. ..... ***A. fucatus***

10. Plants rather loosely tufted, or if densely so, not mat-forming; leaves and leaflets various in size and arrangement; plants forming small tufts 5–10 cm tall, known only from Mesa Verde, Colorado. ..... ***A. deterior***
10' Plants forming compact mats, known from slopes of degraded sandstone or bases of sandstone buttes in New Mexico ..... (11)

11. Leaves mostly 4–10 (rarely to 20) mm long; leaflets (3) 5–9, subpalmately crowded, mostly 1–4 mm long; known from bases of sandy escarpments in San Juan, Rio Arriba, and McKinley counties, New Mexico ..... ***A. micromerius***
11' Leaves mostly (10) 15–40 mm long; leaflets (7) 9–15, not especially crowded, 0.7–3 (4) mm long; racemes 4- to 10-flowered; plants of the Chuska Mountains; Apache County, Arizona, and McKinley and San Juan counties, New Mexico ..... ***A. chuskanus***

KEY 7

Plants perennial (sometimes short-lived); pubescence basifixed; leaves with terminal leaflet jointed with the rachis; lowermost stipules distinct; pods elevated on a stipe or gynophore more than 0.5 mm long

1. Pods elevated on, and jointed to, a stipelike gynophore ..... (2)
1' Pods elevated on, and continuous with, a true stipe or stipelike neck ..... (4)

2. Plants typically caulescent, not especially tuft-forming; pods bladdery-inflated ..... ***A. oophorus***
2' Plants subacaulescent, tuft-forming; pods not bladdery-inflated ..... (3)

3. Pods sparingly strigulose; plants of southeast Utah, southwest Colorado, and northwest New Mexico ..... ***A. naturitensis***
3' Pods more or less spreading-hirsute; plants of various distribution ..... ***A. desperatus***

4. Body of pods laterally compressed, bicarinate by the sutures, with 2 flat or convex faces, unilocular ..... (5)
4' Body of pods either trigonously or dorsiventrally compressed, or subterete (and in some bicarinate), if rarely laterally compressed or appearing so, then fully bilocular or the faces convex or both ..... (6)

5. Body of pods erect-ascending, 22–30 mm long, 6–9 mm wide, from an erect-ascending stipe 12–19 mm long, this contorted through almost a half circle, the pods thus inverted; plants from near Towaoc, Montezuma County, Colorado ..... ***A. tortipes***
5' Body of pods descending or pendulous, various in length and width, from a descending or pendulous, noncontorted stipe of various length; plants of other distribution. ..... ***A. coltonii***

6. Pods at once strongly inflated or swollen and fully unilocular but not bladdery; plants smelling of selenium ..... (7)
6' Pods either not inflated or, if inflated, then at least incipiently bilocular; plants smelling of selenium or not ..... (10)

7. Flowers with both petals and calyx white or the calyx greenish; pods erect and more or less woody at maturity; plants widespread throughout the Four Corners ..... ***A. praelongus***
7' Flowers with petals white to purple, the calyx often purple; pods erect or spreading, merely cartilaginous; plants of various distribution ..... (8)

8. Flowers white or pale purple; plants along San Juan River, San Juan County, Utah ..... ***A. cutleri***
8' Flowers purple, often drying dark purple; plants of various distribution, if partially as above, then often flowering as an annual or forming large clumps ..... (9)

9. Pods erect or narrowly ascending from the erect peduncle; stems erect and incurved-ascending, 1–4 (4.4) dm tall; plants from northeast Arizona, northwest New Mexico, and southeast Utah ..... ***A. preussii***

9′ Pods horizontally spreading, declined, or only weakly ascending, borne on weakly ascending or reclining peduncle; stems various in attitude and height; plants from southeast Utah ..... ***A. eastwoodiae***

10. Flowers ochroleucous, the keel tip purple; pod erect, succulent, becoming woody, subbilocular; plants with odor of selenium ..... ***A. praelongus***

10′ Flowers variously colored, the keel tip maculate or not; pods otherwise or, if erect, not succulent; plants not smelling of selenium ..... (11)

11. Flowers ochroleucous; body of pods (25) 30–40 mm long, triquetrous, the stipe 5–10 (12) mm long; plants local on Mesa Verde, Montezuma County, Colorado ..... ***A. schmolliae***

11′ Flowers ochroleucous, greenish white, lilac, or red or pink-purple; body of pods mostly less than 30 mm long, variously shaped, the stipe length various; plants of other distribution ..... ***A. robbinsii***

KEY 8

Plants perennial (sometimes short-lived); pubescence basifixed; leaves with terminal leaflet jointed with the rachis; lowermost stipules distinct; pods sessile or the stipe less than 1 mm long; plants acaulescent or subacaulescent

1. Calyx 2.5–9 mm long; flowers 6.5–16 mm long. ..... (2)

1′ Calyx 9.5–16 (19) mm long; flowers 17–25 (26) mm long ..... (3)

2. Flowers 11–17 mm long; calyx 6.2–8 mm long; the tube 4.8–6.7 mm long ..... ***A. cottamii***

2′ Flowers 8–10 mm long; calyx 3.6–4.5 mm long, the tube 3.1–3.5 mm long ..... ***A. monumentalis***

3. Pods bilocular below the beak ..... ***A. mollissimus***

3′ Pods unilocular ..... (4)

4. Plants strictly acaulescent, the bases thatched with marcescent stipules and leaf bases; pods both hirsute and tomentose; plants widespread in the Four Corners ..... ***A. newberryi***

4′ Plants sometimes as above, but mostly with bases not thatched with marcescent stipules and leaf bases, but if so, not strictly acaulescent; pods not at once both hirsute and tomentose ..... (5)

5. Pods at once papery-membranous and hirsute with long lustrous hairs; plants of rimrock habitats ..... ***A. desperatus***

5′ Pods firm, either leathery or woody, the pubescence various; plants of various substrates and distribution ..... (6)

6. Pods strigulose or thinly villosulous, with appressed or incumbent hairs less than 1 mm long; flowers 13–15.5 mm long; pods more or less trigonous, 13–22 mm long ..... ***A. naturitensis***

6′ Pod bodies either simply hirsute or at once hirsute and tomentulose, the longer hairs more than 1 mm long, or shaggy-villous, or glabrous, and not otherwise as above. ..... (7)

7. Leaflets more than 21 in at least some mature leaves ..... ***A. iodopetalus***

7′ Leaflets not more than 21 on any leaves. ..... ***A. zionis***

KEY 9

Plants perennial (sometimes short-lived); pubescence basifixed; leaves with terminal leaflet jointed with the rachis; lowermost stipules distinct; pods sessile or the stipe less than 1 mm long; plants definitely caulescent

1. Pods nodding, ellipsoid, 2.5–5 mm thick, slightly decurved, the ventral suture more convex than the dorsal; stems arising from a superficial caudex. ..... (2)

1′ Pods of various orientation, either straight or incurved, or more than 5 mm thick, if at once decurved and less than 5 mm thick, the stems from a subterranean caudex ..... (3)

2. Pods bilocular or semibilocular, the septum at least 1 mm wide; plants smelling of selenium; plants widespread throughout the Four Corners ..... ***A. praelongus***

2′ Pods unilocular or essentially so, the septum, if present, less than 1 mm wide; plants of southwest Colorado and northwest New Mexico ..... ***A. wootonii***

3. Pods at once inflated or swollen (ovoid to cylindroid) and bilocular or almost so; plants widespread in the Four Corners ..... ***A. lentiginosus***

3' Pods not or scarcely inflated, unilocular, imperfectly bilocular, or bilocular; compressed-trigonous or subterete and grooved dorsally ....(4)

4. Pods bladdery-inflated, (18) 23–40 mm long, (10) 12–20 mm thick, terete or somewhat dorsiventrally compressed, or openly sulcate ventrally; plants not smelling of selenium ....***A. wootonii***
4' Pods not bladdery-inflated, or if so, mainly smaller than above and of other distribution; plants smelling of selenium ....(5)

5. Stems from a subterranean caudex; pods pendulous or spreading-declined; plants sprawling, known from San Juan County, Utah, and Montezuma County, Colorado. ....***A. cronquistii***
5' Stems from a superficial caudex; pods humistrate or stiffly erect; plants more widespread ....(6)

6. Petals purple; pods strictly unilocular, the valves stiffly chartaceous; plants uncommon; northeast Arizona, northwest New Mexico ....***A. preussii***
6' Petals ochroleucous, the keel tip purple or white; pods initially fleshy, becoming ligneous, the septum narrow or lacking ....(7)

7. Flowers pure white; calyx tube deeply campanulate or short-cylindric, 6–9 mm long, the lobes broadly spreading ....***A. pattersonii***
7' Flowers ochroleucous, the keel tip maculate; calyx tube campanulate, mostly 4.5–6.5 mm long, the lobes erect-ascending ....***A. praelongus***

Astragalus agrestis Douglas ex G. Don (field) Field milkvetch. Perennial, caulescent, 9–43 cm tall, from a subterranean caudex and long, rhizomelike caudex branches. **PUBESCENCE** basifixed, strigulose to villous-pilose. **STEMS** erect to decumbent-clambering; stipules (1) 2–11 mm long, at least the lowermost connate-sheathing. **LEAVES** 2–10 cm long; leaflets 13–23, 4–18 mm long, 2–5 mm wide, narrowly elliptic to lance-oblong, obtuse to retuse or acute, strigulose above and below. **INFL** a raceme, subcapitate, 5- to 15-flowered, the flowers ascending-erect at anthesis, the axis 0.5–2.5 cm long in fruit; bracts 3–7 mm long; pedicels 0.5–1.5 mm long; bracteoles 0; peduncles 1.5–15 cm long. **FLOWERS** 17–24 mm long, pink-purple, ochroleucous, or almost white, the banner recurved through about 25°; calyx 7–12.5 mm long, the tube 5–7.8 mm long, cylindric, villous, the teeth 2.5–5.5 mm long, linear. **PODS** erect, short-stipitate, the stipe 0.3–1 mm long, the body 7–10 mm long, 2.8–4.5 mm thick, oblong-ellipsoid, triquetrous, bilocular, silky-villous; ovules 14–26. $2n = 16$. [*A. hypoglottis* Hook.; *A. dasyglottis* Fisch. ex DC., non *A. dasyglottis* Pallas; *A. hypoglottis* var. *dasyglottis* (DC.) Ledeb.; *A. goniatus* Nutt. ex Torr. & A. Gray; *A. hypoglottis* var. *polyspermus* Torr. & A. Gray; *A. agrestis* G. Don var. *polyspermus* (Torr. & A. Gray) M. E. Jones; *A. virgultulus* E. Sheld.; *A. agrestis* f. *virgultulus* (E. Sheld.) B. Boivin; *A. hypoglottis* var. *bracteatus* Osterh.; *A. agrestis* var. *bracteatus* (Osterh.) M. E. Jones; *A. tarletonis* Rydb.]. Meadows, prairies, stream banks, and openings in sagebrush and aspen. COLO: Arc, LPl; NMEX: RAr. 2285–2535 m (7500–8320'). Flowering: May–early Sep. Southern Yukon east to Manitoba and south to northeast California, northern Nevada, Utah, western Nebraska, northwest Iowa, and central to western Minnesota; widely dispersed in eastern and central Asia.

Astragalus albulus Wooton & Standl. (whitish) Cibola milkvetch. Tall, robust, caulescent perennial, 15–70 cm tall, from a branching caudex. **PUBESCENCE** strigulose to pilose, malpighian. **STEMS** erect or ascending, numerous and forming bushy clumps; stipules 2.5–10 mm long, all connate-sheathing. **LEAVES** 3–10 (14) cm long; leaflets (7) 11–23, (2) 4–27 (45) mm long, linear, linear-oblanceolate, or narrowly elliptic, acute to subobtuse, strigose below, glabrous and green on the upper surface. **INFL** a raceme, 9- to 47-flowered, the flowers ascending at anthesis, the axis (2) 3–15 (20) cm long in fruit; bracts (2) 3–7 mm long; pedicels 0.3–1.2 mm long; bracteoles 0–2; peduncles 1–4 (5.5) cm long. **FLOWERS** 13–17.2 mm long, whitish, the keel tip faintly maculate, the banner recurved through about 45°; calyx (7.2) 7.5–11 mm long, the tube (5.4) 5.7–7.4 mm long, short-cylindric, strigulose to pilose, the teeth (1.5) 1.8–3.6 mm long, lance-subulate. **PODS** declined or pendulous, stipitate, the stipe 0.7–2.5 mm long, the body 9–12 mm long, 3.3–5 mm thick, narrowly ellipsoid or lance-ellipsoid, gently incurved, laterally compressed, keeled ventrally, sulcate dorsally, strigose or glabrous, unilocular. $n = 11$. [*Batidophaca albula* (Wooton & Standl.) Rydb.]. Gullied badlands and sandy clay talus under cliffs, in seleniferous substrates. ARIZ: Apa, Nav; COLO: LPl; NMEX: McK, RAr, San, SJn. 1820–2265 m spring flowering season and flower instead from midsummer onward.

Astragalus alpinus L. (alpine) Alpine milkvetch. Low, caulescent or short-caulescent perennial, 2–30 cm tall, from a subterranean caudex and rhizomatous caudex branches. **PUBESCENCE** strigulose to villosulous, basifixed. **STEMS**

decumbent to ascending, subterranean for a space of 2–15 cm or more; stipules 1.5–8 mm long, at least the lowermost connate-sheathing. **LEAVES** (2) 3–15 cm long; leaflets (11) 15–25 (27), (2) 6–20 (24) mm long, 2–10 mm wide, ovate to elliptic or oblong, retuse to rounded, strigulose above and below. **INFL** a raceme, 5- to 17 (23)-flowered, the flowers erect to declined at anthesis, the axis 0.5–5 (7) cm long in fruit; bracts 1–2.5 mm long; pedicels 0.5–2.3 mm long; bracteoles 0; peduncles 3–15 (17) cm long. **FLOWERS** (6.2) 7–12 (13.1) mm long, pink-purple (rarely white), the banner abruptly incurved through 75°–90°; calyx 3.2–6.5 mm long, the tube 2–4 mm long, campanulate, strigulose, the teeth 1–3.2 mm long, subulate. **PODS** pendulous, stipitate, the stipe 2–5 mm long, the body oblong-lanceolate in outline, 7–17 mm long, 1.5–4 mm thick, strigulose, semibilocular; ovules 5–11. $2n = 16, 32$. [*Phaca astragalina* DC. f. *occidentalis* Gand.; *A. andinus* M. E. Jones; *A. alpinus* var. *parvulus* J. Rousseau; *A. alpinus* subsp. *alaskanus* Hultén; *A. alpinus* f. *lepageanus* J. Rousseau; *A. alpinus* var. *alaskanus* f. *albovestitus* Lepage]. Arctic and alpine tundra, and woods, riverbeds, terraces, or moraines. COLO: Arc, LPl, Min, RGr, SJn; NMEX: SJn. 2530–3810 m (8300–12500'). Flowering: mid-Apr–Sep. Alaska, Yukon, east to Newfoundland, south to Utah, southwest Colorado, South Dakota; Eurasia. San Juan River drainage materials belong to **var. *alpinus***.

Astragalus amphioxys A. Gray (sharp at both ends, referring to the pods) Crescent milkvetch. Perennial (rarely flowering the first year), subacaulescent to shortly caulescent, 2–35 cm tall, from a weak caudex. **PUBESCENCE** malpighian. **STEMS** lacking or up to 20 cm long, the internodes often concealed by stipules; stipules 2–13 mm long, all distinct or the lowermost sometimes connate-sheathing. **LEAVES** 2–13 mm long; leaflets (1) 5–21, 3–20 mm long, 1–9 mm wide, elliptic to obovate or oblanceolate, obtuse to acute, strigose on both sides. **INFL** a raceme, 2–13-flowered, the flowers ascending at anthesis, the axis (0.5) 1–6.5 cm long in fruit; bracts 2.5–8 mm long; pedicels 0.6–2.5 mm long; bracteoles 0–2; peduncles (1) 2–15 (20) cm long. **FLOWERS** 12.8–31 mm long, pink-purple, rarely white, the banner recurved through about 40°; calyx 6.3–14.2 mm long, the tube 5.2–10.5 mm long, cylindric, strigose, usually purplish, the teeth 1.1–4.5 mm long, subulate. **PODS** ascending, sessile, 1.5–5 cm long, 5–12 mm thick, usually curved, mostly dorsiventrally compressed, unilocular, strigose; ovules 42–70. [*A. shortianus* Nutt. var. *minor* A. Gray; *Xylophacos amphioxys* (A. Gray) Rydb.; *A. amphioxys* var. *typicus* Barneby; *A. crescenticarpus* E. Sheld.; *A. selenaeus* Greene; *Xylophacos aragalloides* Rydb.; *A. amphioxys* × *layneae* M. E. Jones; *Xylophacos melanocalyx* Rydb., non *A. melanocalyx* Boiss.]. Used as a snakebite remedy by Zunis.

1. Flower small, the calyx 6.3–9.5 mm, the banner (9.5) 11–16 mm, the keel 8–13 mm long; plants of the Lake Powell region of Utah ..... **var. *modestus***
1′ Flower large, the calyx 9.3–14 mm, the banner (16.4) 19–28 mm, the keel (13.2) 14.3–23.7 mm long; range of the species ..... (2)

2. Flower variable in size, but the banner less than twice or barely twice the length of the calyx; keel (13.2) 14.3–18.8 mm long; range of the species (if led hither by material from southwest Colorado or southeast Utah, cf. *A. missouriensis* var. *amphibolus*) ..... **var. *amphioxys***
2′ Flower always large, the banner 2–2 1/2 times the length of the calyx; keel 19–23.6 mm long; ..... **var. *vespertinus***

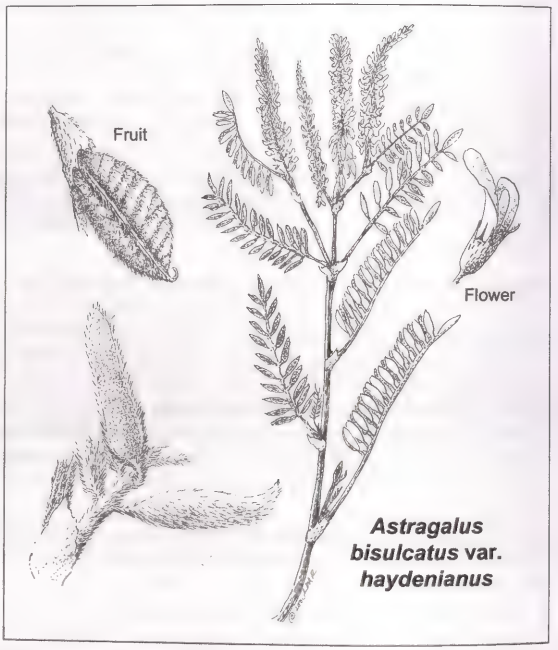
var. *amphioxys* **FLOWERS** (16.2) 19–24.5 mm long; calyx (5.8) 7–10.5 mm long, 3.2–4.2 (4.7) mm in diameter, the teeth 1.5–3.7 (4.5) mm long. **PODS** as described for the whole species; ovules (42) 44–56, averaging ± 50; $n = 11$. Sandy valleys, plains, gravelly hillsides, sometimes on dunes, rarely on gumbo clay flats, without apparent rock preference (except locally). ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1160–2285 m (3800–7500'). Flowering: late Mar–Jun. North of the Mogollon Escarpment into central New Mexico, south along the Rio Grande into extreme west Texas and adjoining Chihuahua. (If led hither by material from southwest Colorado or southeast Utah, cf. *A. missouriensis* var. *amphibolus*.)

var. *modestus* Barneby (unassuming) **FLOWERS** up to 16 mm long; calyx 6.3–9.5 mm, the teeth 1.1–2.6 mm long. **PODS** 3–4 cm; ovules 44–58. Blackbrush, saltbush, Indian ricegrass, old man sagebrush, and mixed grass communities. UTAH. 1280 m (4200'). Mohave County, Arizona, to southern Utah. Flowering: Mar–May. Known only from valleys affluent to the Colorado River.

var. *vespertinus* (E. Sheld.) M. E. Jones (evening) Evening milkvetch. Habit of var. *amphioxys*. **FLOWERS** a little larger, and the petals less strongly graduated; 23–27 (28) mm long, 7.8–12.7 mm wide; calyx tube 8.8–13.2 mm long, 3.8–5.2 mm in diameter, the teeth 1.3–3 mm long. **PODS** 3–3.5 cm long, gently incurved; ovules 50–70 (averaging ± 60). [*A. vespertinus* E. Sheld.; *Xylophacos vespertinus* (E. Sheld.) Rydb.]. Sandy valley floors, ledges under cliffs, and gravelly hillsides, in sagebrush or juniper forest, mostly on sandstone. COLO: Mon; NMEX: SJn; UTAH. 1150–1820 m (3770–5970'). Flowering: Apr–Jun. Locally plentiful within the Colorado Basin, south of the Tavaputs Escarpment, southwest Colorado

and southeast Utah, extending west to the Grand Canyon and Kanab Plateau, northwest Arizona, and northwest New Mexico.

Astragalus bisulcatus (Hook.) A. Gray (two grooved, of the pod) Two-grooved milkvetch, skunkweed. Clump-forming, caulescent perennial, 15–70 cm tall, from a branching caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** erect or ascending, several or numerous; stipules 2.5–10 (12) mm long, at least the lowermost connate-sheathing. **LEAVES** 3–13.5 cm long; leaflets (7) 15–35, 5–33 mm long, 1.5–11 mm wide, lance-oblong to oblong, elliptic, or oblanceolate, glabrous above or nearly so. **INFL** a raceme, 35- to 80-flowered, the axis (4) 5.5–25 cm long in fruit; bracts 2.5–6 mm long; pedicels 1–3.5 mm long; bracteoles 0–2; peduncle 2.5–13 cm long. **FLOWERS** 8–11 mm long, white or whitish, the banner recurved through 45°; calyx typically pallid, the tube 3.1–4 mm long, the teeth 1–2.7 mm long, subulate. **PODS** pendulous, stipitate, stipe 1.4–3 mm long, about equaling the calyx tube, the body (5) 6.5–9.5 mm long, 2–4 mm wide, ellipsoid or oblong-ellipsoid, transversely rugose-reticulate, strigulose; ovules 5–8. $n = 12$. [*Phaca bisulcata* Hook.]. Fruit used as a ceremonial emetic and as an eye and toothache medicine by Ramah Navajos.



1. Flowers bright pink-purple; calyx purple; plants of San Juan County, New Mexico; rare ..... **var. *bisulcatus***
1′ Flowers ochroleucous or whitish, the keel often purple-tipped; calyx ochroleucous, whitish, or greenish; widespread throughout the Four Corners region ..... **var. *haydenianus***

var. *bisulcatus* Plants typically stout, thinly pubescent or with glabrous stems. **LEAVES** with leaflets 17–29, (5) 10–25 (32) mm long. **INFL** a raceme, 25–75-flowered, the axis 5–18 cm long in fruit; bracts (2) 2.5–7 mm long. **FLOWERS** 13–17.5 mm long, pink-purple, pallid and tipped or suffused with purple or lilac, or white or whitish with maculate keel tip; calyx typically red-purple, the tube 3.3–5.7 mm long, the teeth mostly 1.5–4.5 (6) mm long, subulate. **PODS** with stipe 3–5 mm long, the body (8) 10–17 (20) mm long, 2–4.5 mm wide, linear- or narrowly oblong-ellipsoid, smooth or faintly reticulate, glabrous or strigulose; ovules 10–14 (15). $n = 11, 12$. Fine-textured, saline or seleniferous substrates, in prairies and plains, or in steppes. In our area, along roadsides. NMEX: SJn. 1615 m (5300′). Flowering: May–Aug. Southern Alberta and Saskatchewan to southwest Manitoba, southward through Montana, eastern Idaho, eastern Kansas. In addition to containing the element selenium, which is poisonous to livestock, the plants of both vars. *bisulcatus* and *haydenianus* are reported to contain the indolizidine alkaloid swainsonine (Kingsbury 1964).

var. *haydenianus* (A. Gray) Barneby (for F. V. Hayden, leader of the United States Geological and Geographical Survey of the Territories, 1867–1879) Hayden's milkvetch. **STEMS** mostly decumbent and radiating. **LEAVES** with leaflets (13) 21–35, 0.5–2.7 cm long. **INFL** a raceme, 35–80-flowered; bracts (2.5) 3–5 mm long. **FLOWERS** 9–11 mm long, ochroleucous or whitish; calyx ochroleucous, whitish, or greenish, the tube 3.1–4 mm long, the teeth mostly 1–2.7 mm long. **PODS** with stipe 1.4–3 mm long, the body (5) 6.5–9.5 mm long, 2–4 mm wide, ellipsoid or oblong-ellipsoid; ovules 5–8. [*A. haydenianus* A. Gray ex Brandegee; *Tragacantha haydeniana* (A. Gray) Kuntze; *Diholcos haydenianus* (A. Gray) Rydb.; *A. grallator* S. Watson; *Homalobus grallator* (S. Watson) Rydb.]. Sagebrush–mountain brush communities, in fine-textured, often saline, seleniferous substrates. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1935–2500 m (6350–8200′). Flowering: May–Jul. Utah and Wyoming south to northeastern Arizona and northern New Mexico.

Astragalus brandegeei Porter (for Townshend S. Brandegee, botanist) Brandegee's milkvetch. Delicate, low, caulescent perennial, though sometimes flowering as an annual, 5–35 (40) cm tall, from a superficial branching caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** prostrate-spreading, very slender; stipules 1.5–5 mm long, at least the lowermost usually connate-clasping. **LEAVES** (1) 2–11.5 (15) cm long; leaflets 5–15, 5–27 mm long, 0.5–2.6 mm wide, linear-filiform to narrowly oblong, acute to obtuse, strigose beneath, glabrous above. **INFL** a raceme, 1- to 5 (7)-flowered, the flowers ascending at anthesis, the axis 0.5–6 (8) cm long in fruit; bracts 1–2 mm long; pedicels 1.2–4 mm long; bracteoles 2; peduncles 2.5–14 (17) cm long, very slender. **FLOWERS** 4.5–6 (7) mm long, ochroleucous or tinged violet, the banner abruptly curved through 90°; calyx 2.7–4 mm long, the tube 1.8–2.5 mm long, campanulate, black-strigose, the teeth 0.9–2 mm long, subulate. **PODS** pendulous to ascending, sessile or subsessile, the body obovoid to oblong-ellipsoid, 10–18 mm long, 3.5–5 mm thick, slightly dorsoventrally compressed, semibilocular, the septum 1.2–2 mm wide, strigose. $n = 11$. [*Tragacantha brandegeei* (Porter) Kuntze; *Atelophragma brandegeei* (Porter) Rydb.]. Growing on various gravelly substrates in mixed shrublands, piñon-juniper, or oak brush. ARIZ: Apa; NMEX: McK, San, SJn. 1830–2320 m (6000–7610'). Flowering: May–Sep. Utah and in south-central to southwest Colorado, New Mexico, and east-central to central and northern Arizona. This is a cryptic plant that is seldom collected, probably because of its inconspicuous, tiny flowers, slender peduncles, and slender, prostrate stems. When first seen, the small, sausage-like pods seem to float in the air; only careful examination reveals the slender pedicels and peduncles attached to an inconspicuous, small plant.

Astragalus calycosus Torr. ex S. Watson (with a conspicuous calyx) Torrey's milkvetch. Perennial, low, acaulescent herbs, 1–12 cm tall, from a branching caudex. **PUBESCENCE** malpighian. **STEMS** lacking or to 2 cm long, the internodes concealed by stipules; stipules 1.5–6 mm long, all distinct. **LEAVES** 1–8 (12) cm long; leaflets (1) 3–13, 2–19 mm long, 1–7 mm wide, obovate, oblanceolate, or elliptic, obtuse to acute, silvery strigose on both sides. **INFL** a raceme, 1- to 8-flowered, the flowers ascending to spreading at anthesis, the axis 0.2–2.5 cm long in fruit; bracts 0.5–2 mm long; pedicels 0.7–3 mm long; bracteoles lacking or minute; peduncles 0.5–10 cm long, rarely longer. **FLOWERS** 10–16.5 mm long, varicolored, ochroleucous to shades of pink and purple, with white or pale wing tips, the wings bilobed apically, the banner recurved through about 45° or 90°; calyx 5–8.5 mm long, the tube 4–6.7 mm long, campanulate to short-cylindric, strigose, the teeth 1–4.2 mm long, subulate. **PODS** ascending, sessile, narrowly oblong, usually curved, 8–25 mm long, 3–4.5 mm thick, laterally compressed, bilocular, strigose; ovules 13–28. $2n = 22$.

1. Leaves with 3–13 leaflets along a rachis usually less than 1 cm long; scapes ascending or decumbent, 1–7 cm long; raceme axis less than 2 cm long; plants of various distribution.....**var. *calycosus***
1' Leaves with 5–13 leaflets along a rachis usually more than 1 cm long; scapes erect-ascending, usually over 7 cm long; raceme axis usually over 2 cm long; plants widespread throughout the Four Corners region.....**var. *scaposus***

var. *calycosus* Plants tufted or forming mounds, low. **LEAVES** 1–7 cm long, with 3–7 leaflets; scapes either shorter or longer than the leaves. **INFL** a raceme (1) 2- to 6 (8)-flowered, the axis 2–20 (25) mm long. **FLOWERS** 10–16.5 (20.8) mm long, whitish to pink-purple; calyx 5.2–10.6 mm long, the tube 4–6.4 (6.7) mm long, the teeth (1) 1.5–4.2 mm long. [*Tragacantha calycosa* (Torr.) Kuntze; *Hamosa calycosa* (Torr.) Rydb.; *A. brevicaulis* A. Nelson]. Mixed desert shrublands, sagebrush, piñon-juniper, and ponderosa pine woods. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, SJn; UTAH. 1650–2255 m (5410–7400'). Flowering: May–early Jul. Wyoming, Idaho, and Nevada to California and Arizona.

var. *scaposus* (A. Gray) M. E. Jones (scapose, referring to the peduncles) Scapose milkvetch. Plants tufted. **LEAVES** 1–9 cm long, with (1) 7–13 leaflets; scapes longer than the leaves. **INFL** a raceme, (1) 2- to 6 (8)-flowered, the axis 2–20 (25) mm long. **FLOWERS** 10.5–14 mm long, pink-purple except the whitish wing tips; calyx 5.2–10.6 mm long, the tube 4–6.4 (6.7) mm long, the teeth 1–2 mm long. [*A. scaposus* A. Gray; *Hamosa scaposa* (A. Gray) Rydb.; *A. candicans* Greene]. Juniper, piñon-juniper, and mixed desert shrub communities. ARIZ: Apa; COLO: LPl, Mon; NMEX: McK, SJn; UTAH. 1345–1980 m (4420–6500'). Flowering: Apr–Jun. Nevada to northern Arizona, southwest Colorado, and northwest New Mexico. This is the most showy phase of Torrey's milkvetch. The white wing tips contrast with the rather bright pink-purple of the remainder of the flower. Used as a lotion and poultice applied to injuries from hailstones by the Navajos.

Astragalus ceramicus E. Sheld. (referring to pottery, the painted pod) Painted milkvetch. Slender, caulescent perennial, 3–40 cm tall, from elongate, rhizomelike caudex branches and deeply buried caudex (in sandy sites often extensively branched and pervasive). **PUBESCENCE** malpighian. **STEMS** sprawling to erect, subterranean for a space of 3–40 cm or more. **LEAVES** 2–17 cm long; leaflets 3–13 or only 1, the terminal continuous with the rachis, 3–50 (80) mm long or longer, 0.3–3 mm wide, filiform to narrowly oblong, obtuse to retuse or acute; stipules 1.5–9 mm long, at least some of the lowermost ones connate-sheathing. **INFL** a raceme, 2–15 (25)-flowered (rarely more), the flowers

ascending to declined at anthesis, the axis 1–12 cm long in fruit; bracts 1–2.5 mm long; pedicels 0.7–3.1 mm long; bracteoles 0; peduncle 0.7–7.5 cm long. **FLOWERS** 6.3–10.8 mm long, dull purplish to pink or rarely whitish, the banner abruptly recurved through about 85°–90°; calyx 3.1–4.5 (6) mm long, the tube 2.1–3.3 mm long, campanulate, strigose, the teeth 1–2.4 mm long, subulate. **PODS** pendulous, sessile to subsessile or stipitate, the stipe 1–3.3 mm long, the body bladdery-inflated, ellipsoid to glabrous, unilocular; ovules 12–29. $2n = 22$. [*Phaca picta* A. Gray; *A. filifolius* Smyth; *A. pictus* var. *foliolosus* A. Gray; *A. foliolosus* (A. Gray) E. Sheld.; *A. pictus* var. *angustus* M. E. Jones; *A. pictus* var. *magnus* M. E. Jones; *Tragacantha picta* (A. Gray) Kuntze; *A. angustus* var. *pictus* (A. Gray) M. E. Jones; *A. angustus* var. *ceramicus* (E. Sheld.) M. E. Jones; *A. ceramicus* var. *jonesii* E. Sheld.; *A. angustus* (M. E. Jones) M. E. Jones]. Hopi children ate the roots as candy.

1. Vesture of the stems and herbage composed entirely or very largely of malpighian hairs; calyx mostly 3.1–4.2 mm, rarely up to 5.7 mm long; body of the pod (1) 1.5–3 cm long, 5–15 mm in diameter; ovules 12–16, rarely up to 26; plants widespread throughout the Four Corners region ..... **var. *ceramicus***

1′ Vesture composed entirely of basifixed hairs (rarely a few minutely spurred at base); calyx mostly 4–6 mm long; body of the pod (2) 3–5 cm long, 1.4–2.6 cm in diameter; ovules (17) 20–29; plants of the Great Plains and east slope of the Rocky Mountains, rare in the Four Corners ..... **var. *filifolius***

var. *ceramicus* **LEAVES** 2–12 cm long, at least the lowest and sometimes all bearing 1–6 pairs of lateral leaflets, the uppermost ones quite often reduced to the naked rachis. **INFL** a raceme, 6–15 (25)-flowered, the axis (1) 1.5–8 (15) cm long in fruit. **FLOWERS** 6.3–8.3 (9.5) mm long; calyx 3.1–4.2 mm long, the tube 2.1–2.6 (3.3) mm long, the teeth 1–1.8 mm long. **POD** stipe (1) 1.5–3.3 mm long. Dunes and other sandy sites in piñon-juniper, sagebrush, stream bank, grassland, and mixed desert shrub communities. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: McK, San, SJn; UTAH. 1540–2155 m (5050–7065′). Flowering: late Apr–Jul. In some sandy sites along washes, where the plants are easily excavated, the caudex branches have been demonstrated to form extensive subterranean systems that support numerous aboveground stems.

var. *filifolius* (A. Gray) F. J. Herm. (with threadlike leaves) Bradbury's milkvetch. **LEAVES** 2.5–17 cm long, commonly all reduced to the filiform rachis, only some lower ones with 1 or 2 (3) pairs of lateral leaflets. **INFL** a raceme, 2–7-flowered, the axis 1–4.5 (5.5) cm long in fruit. **FLOWERS** 7.4–10.8 mm long; calyx (3.7) 4–6 mm long, the tube (2.3) 2.5–3.5 mm long, the teeth (1.4) 1.6–3 mm long. **POD** stipe 1.5–3 mm long. [based on: *Psoralea longifolia* Pursh; *Orobus longifolius* (Pursh) Nutt.; *Physondra longifolia* (Pursh) Raf.; *Phaca longifolia* (Pursh) Nutt. ex Torr. & A. Gray; *A. ceramicus* var. *imperfectus* E. Sheld., an improper substitute; *A. angustus* (M. E. Jones) M. E. Jones var. *longifolius* (Pursh) M. E. Jones; *A. longifolius* (Pursh) Rydb.; *A. angustus* var. *imperfectus* (E. Sheld.) M. E. Jones; *A. filifolius* Smyth; *A. pictus* var. *filifolius* (A. Gray) A. Gray; *A. mitophyllus* Kearney, a legitimate substitute]. Dunes and sandy hollows in rolling plains, sometimes in sandy fields or on sandbars of intermittent streams. NMEX: SJn. 1820 m (6000′). Flowering: late Apr–Jul. In the higher Great Plains, from western North Dakota and eastern Montana, south through eastern Wyoming and Nebraska to the Arkansas Valley in Colorado and western Kansas, and into the Oklahoma panhandle. A specimen from San Juan County, New Mexico (*A. Clifford 350*, BRY), appears, on the basis of basifixed hairs and large pods, to belong here. However, the calyx is somewhat small for the variety.

Astragalus chuskanus Barneby & Spellenb. **CP** (of the Chuska Mountains) Chuska milkvetch. Prostrate, caulescent, evidently long-lived perennial, forming mats or cushions 8 dm wide, radiating from a branching caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** numerous, 10–35 (40) cm long or more; stipules 2–5.5 mm long, all connate-sheathing. **LEAVES** (1) 1.5–5.5 cm long; leaflets (7) 9–15, 1.5–10 mm long, 0.7–3 (4) mm wide, obovate- or oblong-elliptic, abruptly acuminate, pilosulous on both sides. **INFL** a raceme, compactly 4–10-flowered, the flowers ascending-spreading at anthesis, the axis very short in fruit, 3–15 mm long; bracts 2–3.5 mm long; pedicels 0.9–1.5 mm long; bracteoles 0; peduncle 1.5–3.5 (4) cm long, shorter than the leaf. **FLOWERS** 7.3–8.7 (8–10) mm long, whitish fading ochroleucous, the banner recurved through about 40°; calyx 4.5–5.3 (5.5–6.9) mm long, the tube 2.5–3.2 (3–3.8) mm long, campanulate, pilosulous, the teeth 1.5–2.6 (2–3.1) mm long, subulate. **PODS** humistrately ascending, sessile, obliquely semiovoid, about 6 mm long and 3 mm wide, triquetrously compressed, strigulose; ovules 4–6. $n = 24$. Slopes of degraded Chuska Sandstone, with ponderosa pine, Douglas-fir, and Rocky Mountain juniper; endemic to the Chuska Mountains. ARIZ: Apa; NMEX: McK, SJn. 2135–2865 m (7000–9400′). Flowering: Jun–Jul. There are evidently two rather distinctive morphological phases within the rather numerous specimens now available for examination, which were described so succinctly by Barneby and Spellenberg. One is rather more compact and more obviously gray-hairy, and has the calyx 4.5–5.3 mm long, with tube 2.5–3.2 mm and teeth 1.5–2.6 mm long; the second has the calyx 5.5–6.9

mm long, with tube 3–3.8, and teeth 2–3.1 mm long. Banner length in the first phase is 7.3–8 mm and in the second is 8–10 mm. Perhaps they represent nothing more than responses to differences in ecology, possibly only shade versus open sunlight. Further work is indicated. A Four Corners flora endemic.

Astragalus cicer L. (generic name of the chickpea) Chickpea milkvetch. Perennial, caulescent, 30–90 (110) cm tall, from a subterranean caudex and long, rhizomelike caudex branches. **PUBESCENCE** basifixed, strigose-pilose. **STEMS** at first erect, finally decumbent-clambering. **LEAVES** 2–10 cm long; leaflets 17–29 (31), 5–35 mm long, 2–12 (15) mm wide, lance-elliptic or oblong, obtuse, mucronulate, or acute, strigulose on both sides or glabrescent above; stipules 2–8 mm long, at least the lowermost connate-sheathing. **INFL** a raceme, subcapitate, (6) 10- to 30-flowered, the flowers ascending, the axis (1.5) 2–5 cm long in fruit; bracts 2–6.5 mm long; pedicels 0.3–1.5 mm long; bracteoles 0; peduncle 3.5–11 cm long, shorter than the leaf. **FLOWERS** 12.5–16.5 mm long, ochroleucous, the banner slightly if at all recurved; calyx 6.5–9 mm long, the tube 5–6 mm long, subcylindric, strigulose, the teeth 1.6–3 mm long, triangular-acuminate. **PODS** ascending to spreading, short-stipitate, the stipe to 0.8 mm long, the body 6–14 mm long, 5–10 (12) mm thick, the body obovoid to subglobose, pilose, green becoming black; ovules 14–26. $2n = 16, 64$. [*Cystium cicer* (L.) Steven]. Mixed desert shrub, sedge-willow, piñon-juniper, sagebrush, aspen communities, and along roadsides. COLO: Mon; NMEX: SJn. 1525–2225 m (5000–7300'). Flowering: Jun–Sep. Southern Manitoba and southern Saskatchewan to western Nevada, Utah, and Colorado. This is a vigorous, introduced European species, now being spread about in reclamation plantings. It is a plant with stems ultimately sprawling, easily distinguished by its ascending ochroleucous flowers and ultimately black, swollen pods.

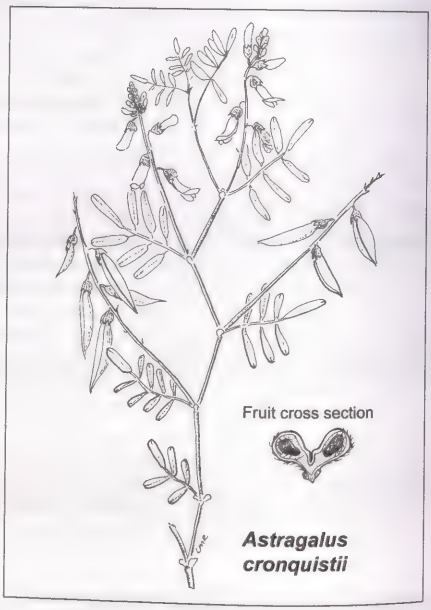
Astragalus cliffordii S. L. Welsh & N. D. Atwood (for Arnold Clifford, botanist of the Navajo Nation) Clifford's milkvetch. Perennial, caulescent, 35–65 cm tall, from a subterranean caudex. **PUBESCENCE** basifixed. **STEMS** buried for 1–8 cm or more, erect-ascending, forming diffuse clumps. **LEAVES** 3.5–6.5 cm long; leaflets 5–7 (9), 8–28 mm long, 0.4–1 mm wide, linear, acute, strigose; stipules 1.5–4.5 mm long, at least some lower ones connate-sheathing. **INFL** a raceme, very loosely 5–19-flowered, the flowers ascending at anthesis, the axis 3–10.5 (13.5) cm long in fruit; bracts 0.3–0.8 mm long; pedicels 2–2.5 mm long; bracteoles 0; peduncle 1.2–12 cm long. **FLOWERS** 4.3–6.1 mm long, pale, faintly suffused with purple, the keel maculate; calyx 1.8–3 mm long, the tube 1.2–1.8 mm long, campanulate, strigose, the teeth 0.6–1 mm long, triangular. **PODS** declined, subsessile or short-stipitate, the stipe to 0.2 mm long, the body elliptic to oblong in outline, straight or slightly curved, 9–12 mm long, 2.5–3 mm wide, compressed, glabrous, unilocular; ovules 4 or 5. Piñon-juniper and sagebrush communities. NMEX: McK. 1690–2140 m (5545–7015'). Flowering: May–Jun. A Four Corners flora endemic. The alliance of Clifford's milkvetch, as indicated by the smallish, laterally flattened pods, is evidently with *A. wingatanus*, but it differs from that entity in having both filiform peduncles and rachis, a confluent terminal leaflet, and tiny, evidently pale flowers, with lilac pencilled lines on the banner. It is a tall, clump-forming, rushlike plant with numerous stems arising from a subterranean caudex.

Astragalus coltonii M. E. Jones (for W. F. Colton) Colton milkvetch. Perennial, caulescent, 10–75 cm tall, from a branching caudex. **PUBESCENCE** basifixed. **STEMS** arising from a buried caudex, strigulose, cinereous, greenish cinereous, or canescent. **LEAVES** (2) 3–9 cm long; leaflets (5) 9–17 (19), (3) 5–20 mm long, oblong, cuneate-oblong, or ovate, obtuse, truncate, to retuse, brighter green and usually less densely pubescent above than beneath, all jointed or the joint obscure in upper leaves; stipules 1–7 mm long, all distinct. **INFL** a raceme, (6) 10–30-flowered, the flowers spreading-declined at anthesis, the axis 3–20 cm long in fruit; bracts 0.5–3.2 mm long; pedicels 0.8–2.5 mm long; bracteoles 0; peduncle (4) 6.5–21 cm long. **FLOWERS** 12–19 mm long, pink-purple, the banner recurved through about 35°–50°; calyx 4.5–8 mm long, the tube 4–6.7 mm long, cylindric, strigose, purplish, the teeth 0.6–2.3 mm long, broadly subulate. **PODS** pendulous, stipitate, the stipe 5–11 mm long, the body 19–35 mm long, (3) 3.5–6 mm wide, strongly laterally flattened, glabrous, unilocular; ovules 14–20. Our material belongs to **var. *moabensis*** M. E. Jones (for Moab, Utah) Moab milkvetch [*A. coltonii* var. *foliosus* M. E. Jones ex Eastw.; *Homalobus canovirens* Rydb.; *A. canovirens* (Rydb.) Barneby]. Bunchgrass, salt desert shrub, piñon-juniper, and mountain brush communities. ARIZ: Apa, Nav; COLO: Dol, Mon, SMg; NMEX: SJn; UTAH. 1600–2285 m (5250–7500'). Flowering: May–Jun. Disjunct in Uinta County, Wyoming. Despite its obvious relationship to *A. coltonii*, the Moab milkvetch should best be considered at species level. It has a distinctive morphology and geography.

Astragalus cottamii S. L. Welsh (for Walter Pace Cottam) Cottam's milkvetch. Perennial, sometimes flowering the first year, acaulescent or subacaulescent, 1.2–8 cm tall, from a branching caudex. **PUBESCENCE** basifixed. **STEMS** lacking or 0.5–6 cm long. **LEAVES** 1.2–8 cm long; leaflets (5) 9–19 (21), 2–9 mm long, 1–4.2 mm wide, elliptic to oval or oblanceolate, acute to obtuse, strigose on both sides or glabrous above; the internodes mostly obscured by stipules,

these 2–6 mm long, all distinct. **INFL** a raceme, 3- to 9-flowered, the flowers ascending at anthesis, the axis 0.5–2 cm long in fruit; bracteoles 0–2; peduncle 0.7–7 cm long. **FLOWERS** 11–17 mm long, pink-purple or bicolored; calyx 6.2–8 mm long, the tube 4.8–6.7 mm long, cylindric, strigulose, purplish, the teeth 1.2–2 mm long, subulate. **PODS** spreading-descending, sessile, curved, oblong to oblong-lanceolate in outline, triquetrous, the dorsal suture sulcate, bilocular, strigose, usually purple-blotched. [*A. monumentalis* Barneby var. *cottamii* (S. L. Welsh) Isely]. Rimrock and ledges of Cedar Mesa, Kayenta, Entrada, and Point Lookout Sandstone formations and in the sandy canyons cut from them. Piñon-juniper and blackbrush communities. ARIZ: Nav; COLO: LPl, Mon; NMEX: SJn; UTAH. 1320–1900 m (4325–6255'). Flowering: Apr–May. A Four Corners endemic. The longer calyx, with cylindric, not campanulate, tube and slightly longer flowers distinguish Cottam's milkvetch from the closely allied rimrock species *A. monumentalis*.

Astragalus cronquistii Barneby (for Arthur John Cronquist, noted botanist) Cronquist's milkvetch. Low, caulescent perennial, 1.5–4 dm tall, from a stout taproot and subterranean caudex. **PUBESCENCE** strigulose, basifixed, with some hairs flattened and scalelike. **STEMS** prostrate to decumbent-ascending, subterranean for a space of 5–14 cm; stipules 2–6 mm long, all distinct. **LEAVES** 1.5–4.5 cm long; leaflets 7–15, 6–23 mm long, 1.5–4 mm wide, oblong to narrowly elliptic, retuse to truncate, strigose beneath, glabrate above. **INFL** a raceme, 6–20-flowered, the flowers declined at anthesis, the axis 1.5–8.5 cm long in fruit; bracts 0.6–1.2 mm long; pedicels 1.5–2.5 mm long; bracteoles 1; peduncle 2–6.5 cm long. **FLOWERS** 8–9 mm long, dull pink-purple, the banner recurved through 90°–100°; calyx 3.8–5.3 mm long, the tube 3.3–4 mm long, campanulate, strigose, the teeth 0.5–1.3 mm long, triangular. **PODS** declined-pendulous, sessile or subsessile, the body narrowly elliptic in outline, 13–30 mm long, 3–4.8 mm wide, trigonous, grooved dorsally, strigose, semibilocular, the septum 0.3–0.6 mm wide. Blackbrush and salt desert shrub on Cutler, Morrison, and Mancos Shale formations. COLO: Mon; UTAH. 1440–1830 m (4720–6000'). Flowering: Apr–Jun. A Four Corners flora endemic. The species occupies two disjunct regions in San Juan County, Utah: Comb Wash (Cutler Formation type vicinity) and the Aneth vicinity (Morrison Formation). The principal distribution of the species, however, is in Montezuma County, Colorado (on Mancos Shale). Its preference for fine-textured, seleniferous substrates is evident.



Astragalus cutleri (Barneby) S. L. Welsh (for Hugh Carson Cutler) Cutler's milkvetch. Moderate, caulescent, short-lived perennial, often flowering as an annual, 10–30 (35) cm tall, from a superficial caudex. **PUBESCENCE** sparingly strigulose to subglabrous, basifixed. **STEMS** few to several, ascending to erect, forming bushy clumps. **LEAVES** 3–13 cm long; leaflets 5–17 (19), 3–17 (20) mm long, (3) 5–12 mm broad, elliptic to lanceolate, oblanceolate or obovate, acute to obtuse or mucronulate, strigulose to glabrous below, glabrous above; stipules 2–6.5 mm long, all distinct. **INFL** a raceme, 5- to 9-flowered; pedicels 1.5–2.5 mm long; bracteoles 2; peduncle 2.5–10 cm long; bracts 1.5–2.5 mm long. **FLOWERS** 15–16 mm long, white or tinged (or drying) purplish, the banner recurved through about 40°–45°; calyx (7.3) 7.5–8.5 (9) mm long, the tube 5.9–6.7 mm long, cylindric, pale purple or whitish, drying purplish, sparsely strigose, the teeth 1.3–1.7 (2.3) mm long, subulate. **PODS** ascending to erect, stipitate, the stipe 3–3.5 mm long, the inflated body oblong-ellipsoid, 14–18 mm long, 9–11 mm thick, the valves thinly cartilaginous, greenish suffused (sometimes) with purple, often drying stramineous, unilocular, glabrous; ovules 20–38. Saltbush and blackbrush communities on Permian formations. UTAH (Copper Canyon, San Juan arm of Lake Powell). About 1160–1260 m (3810–4125'). Flowering: Apr–May. A Four Corners endemic. This taxon when first characterized was known only from plants flowering as annuals. Later collections demonstrate that the plant is at least a short-lived perennial. The other characteristics hold, however, even if there is more overlap in leaflet number with *A. preussii* var. *latus* (q.v.) than previously known. Also, the pods are of thin texture, approaching *A. eastwoodiae* more so than *A. preussii*, with which it

shares features of ascending-erect pods. Cutler's milkvetch differs from *A. preussii* by about the same order of magnitude as does *A. eastwoodiae*.

Astragalus desperatus M. E. Jones (despairing) Rimrock milkvetch. Perennial, acaulescent or subacaulescent, 1–12 cm tall, from a branching caudex. **PUBESCENCE** basifixed. **STEMS** to 8 cm long, the internodes often obscured by stipules. **LEAVES** 1–12 cm long; leaflets (3) 7–17, 2–13 mm long, 1–5 mm wide, elliptic to oblanceolate or obovate, acute to obtuse, strigose on both sides or glabrate above; stipules 1.5–7 mm long, at least the lowermost connate-sheathing. **INFL** a raceme, 3- to 18-flowered, the flowers ascending to declined at anthesis, the axis 0.4–13 cm long in fruit; bracts (1) 1.5–5 mm long; pedicels 0.5–1.4 (2) mm long; bracteoles 0–2; peduncle 0.5–13 cm long. **FLOWERS** 6–9 mm long, pink-purple or bicolored, the banner recurved through about 45°; calyx 3.5–6 mm long, the tube 2.5–4.2 mm long, campanulate, strigose-pilose, the teeth 0.8–2.6 mm long, subulate. **PODS** declined to deflexed, sessile or short-stipitate, the stipe (gynophore) to 1.2 mm long, the body obliquely ovoid to lance-ellipsoid, curved, 6–19 mm long, 3–6 mm thick, hirsute with lustrous hairs, unilocular; ovules 16–28. [*Tium desperatum* (M. E. Jones) Rydb.; *Batidophaca desperata* (M. E. Jones) Rydb.; *A. desperatus* var. *typicus* Barneby]. Mixed desert shrub and piñon-juniper communities, often on rimrock. ARIZ: Apa, Nav; NMEX: SJn; UTAH. 1100–1950 m (3605–6400'). Flowering: Apr–Jun. Utah, Colorado, and Arizona. Our material belongs to **var. *desperatus***.

Astragalus deterior (Barneby) Barneby (meaner, by contrast with the genuine Naturita milkvetch) Cliff Palace milkvetch. Low, slender, subacaulescent or shortly caulescent, taprooted perennial. **PUBESCENCE** strigulose-cinereous, with narrowly ascending straight hairs up to 0.7 mm long. **STEMS** arising together from the root crown or from a shortly forking caudex, usually few, up to 7 cm long. **LEAVES** 2–20 cm long, slender-petioled, with 11–15 (17) linear-elliptic and acute or oblanceolate and obtuse, commonly folded leaflets 3–10 mm long; stipules ovate, papery-scarious, 1–4 mm long. **INFL** a raceme, loosely 2–5-flowered, the flowers ascending; bracts papery-scarious, ovate, 1.5–2.5 mm long; peduncle ascending at anthesis, mostly 2.5–8 cm long. **FLOWERS** ochroleucous, the keel top spotted with dull purple; banner recurved through about 45°; calyx 5–5.5 mm long, strigulose with black and white hairs, the subulate teeth 1.5–2 mm long. **PODS** ascending, gently incurved, 1.2–2 cm long, 3.5–5 mm in diameter, red-mottled; ovules 8–10. [*A. naturitensis* Payson var. *deterior* Barneby]. Sandy soil, bases of cliffs or in sandy pockets along the upper rim. COLO: Mon. Mesa Verde National Park. 1890–1940 m (6210–6365'). Flowering: May–Jun. A Four Corners endemic.

Astragalus eastwoodiae M. E. Jones (for Alice Eastwood, curator of botany at the California Academy of Sciences) Eastwood's milkvetch. Moderate, short-caulescent perennial, 8–20 cm tall, from a superficial caudex. **PUBESCENCE** lacking except on the calyx, strigulose, basifixed. **STEMS** few to several, decumbent to ascending, forming small bushy clumps. **LEAVES** 3–13 cm long; leaflets 13–25, 1–15 mm long, 1–5 mm broad, elliptic to lance-elliptic, oblanceolate or obovate, obtuse to truncate-emarginate, glabrous; stipules 2–6.5 mm long, all distinct. **INFL** a raceme, 3–7-flowered; bracts 1.5–4.5 mm long; pedicels 1.5–3.5 mm long; bracteoles 2; peduncle 2–10.5 cm long. **FLOWERS** 18–22 mm long, pink-purple, the banner recurved through about 45°; calyx 10–12.2 mm long, the tube 8–9.5 mm long, cylindric, purple, sparsely black-strigose, the teeth 1.3–2.7 mm long, subulate. **PODS** spreading to declined, stipitate, the stipe 1.5–4.5 mm long, the inflated body oblong-ellipsoid, 14–26 mm long, 7–14.5 mm thick, the valves papery and straw-colored, unilocular, glabrous; ovules 20–38. $2n = 24, 26$. [*A. preussii* A. Gray var. *sulcatus* M. E. Jones; *Phaca eastwoodiae* (M. E. Jones) Rydb.; *A. preussii* var. *eastwoodiae* (M. E. Jones) M. E. Jones]. Mixed desert shrub and piñon-juniper communities in seleniferous, often fine-textured soils. NMEX: McK; UTAH. 1455 m (4900'). Flowering: late Apr–Jun. Western Colorado, Utah, and New Mexico. The Eastwood milkvetch is closely allied to *A. preussii*; it differs mainly in the shorter stems, smaller leaflets, and spreading-descending, thin-textured pods. A specimen from McKinley County (*S. O'Kane et al. 4846b*, SJNM) looks like this species but is a late specimen with a solitary unattached, damaged pod.

Astragalus episcopus S. Watson (a bishop, a tribute to the collector Capt. F. M. Bishop) Bishop's milkvetch. Perennial, caulescent, rushlike, 20–45 cm tall, arising from a subterranean caudex; pubescence basifixed. **STEMS** erect or ascending. **LEAVES** 2–10 cm long, most of them reduced to the rachis, some with leaflets 3–13 in number, these 1–15 mm long and 0.5–2 mm wide, linear to elliptic or oblong, acute to obtuse or emarginate, strigose on both sides; stipules 2–13 mm long, all distinct. **INFL** a raceme, very loosely 6- to 30-flowered, the flowers ascending at anthesis, the axis 3–30 cm long in fruit; bracts 1.3–3 mm long; pedicels 1.5–3.5 mm long; bracteoles 0–2; peduncle 6–23 cm long. **FLOWERS** 10–15.5 mm long, pale pink or whitish to pink-purple, the banner recurved through about 40° 45°; calyx 4.1–8 (8.5) mm long, the tube 3.4–5.2 (6) mm long, short-cylindric, always much longer than broad, suffused with purple or very pale, white-strigose, the teeth 0.6–2.2 mm long, triangular to subulate. **PODS** pendulous, sessile or subsessile, the body oblong to lance-elliptic in outline, slightly curved to straight, 14–32 mm long, 4–8 mm wide, laterally compressed, glabrous to strigose, straw-colored, or suffused with purple or mottled, unilocular; ovules 16–26. $n = 11$.

[*Tragacantha episcopa* (S. Watson) Kuntze; *Homalobus episcopus* (S. Watson) Rydb.; *A. kaibensis* M. E. Jones; *Lonchophaca kaibensis* (M. E. Jones) Rydb.]. Mixed desert shrub and piñon-juniper communities, often in clay or silty soils derived from Carmel, Entrada, Chinle, Moenkopi, and other exposed, fine-textured strata. ARIZ: Apa, Nav; NMEX: SJn; UTAH. 1370–1555 m (4500–5100'). Flowering: May–Jun. Southeast Utah, Arizona, and New Mexico. Bishop's milkvetch is closely allied to the geographically contiguous *A. lancearius* A. Gray, and a case has been made for its inclusion within this entity at infraspecific level. It differs, however, in a similar manner as other species within sect. *Lonchocarpi*, subsect. *Lancearii*. The laterally flattened, pale pods protruding from short-campanulate calyces are characteristic for the species.

Astragalus falcatus Lam. (curved like a sickle) Russian sickle milkvetch. Perennial, caulescent, 40–90 cm tall from a branching caudex. **PUBESCENCE** malpighian. **STEMS** ascending to erect, forming large clumps. **LEAVES** 5–22 cm long; leaflets 19–37, 6–35 mm long, 1.5–10 mm wide, oblong to elliptic or oblanceolate, acute to apiculate, strigose below, glabrous above, green on both sides; stipules 2–12 mm long, at least some connate-sheathing. **INFL** a raceme, 20- to 70-flowered, the flowers declined at anthesis, the axis 3–20 cm long in fruit; bracts 2–5 mm long; pedicels 32–65 mm long, recurved in fruit; bracteoles 2; peduncle 6–17 cm long. **FLOWERS** 9–11 mm long, greenish white, sometimes suffused with purple; calyx 3.6–4.7 mm long, the tube 3–3.5 mm long, campanulate, strigose, the teeth 0.5–1.2 mm long, triangular. **PODS** decurved, subsessile, curved-oblong, 13–23 mm long, 2.5–4.5 mm wide, triangular, strigose, bilocular; ovules 12–14. $n = 8$. Introduced soil stabilization plant, sparingly naturalized in the western United States. COLO: Mon (Echo Basin Road). 2285 m (7500'). Flowering: Jun–Aug. This is a robust perennial, capable of surviving in harsh, fine-textured soils in mountain brush and piñon-juniper communities. The plant is also suspected of being poisonous to livestock.

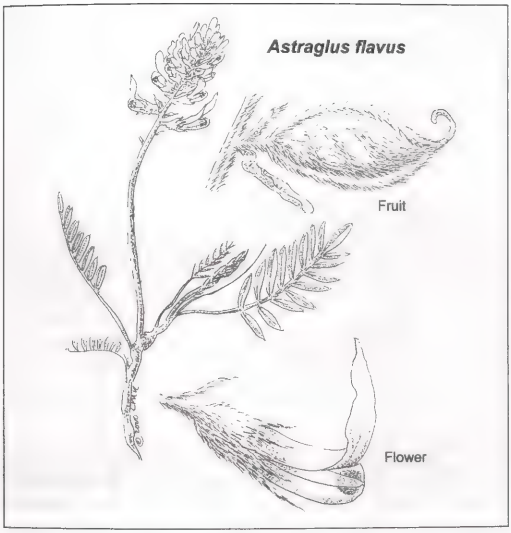
Astragalus flavus Nutt. ex Torr. & A. Gray (yellow) Yellow milkvetch. Perennial, caulescent, 5–30 (40) cm tall, from a typically superficial branching caudex. **PUBESCENCE** strigulose, malpighian. **STEMS** decumbent to ascending or erect. **LEAVES** 3–15 (18) cm long; leaflets (5) 9–21, 3–31 mm long, 0.5–6 mm wide, linear, narrowly oblong, or oblanceolate to ovate, obtuse to acute, silvery strigose (greenish) on both sides or glabrate to glabrous above; stipules 2–10 mm long, all connate-sheathing. **INFL** a raceme, 6- to 30-flowered, the flowers ascending at anthesis, the axis 2–12 cm long in fruit; bracts 1.5–5 mm long; pedicels 0.7–1.2 mm long; bracteoles 0; peduncle 3–23 cm long. **FLOWERS** 9–17.8 mm long, yellow to ochroleucous, whitish, lilac, or pink-purple, the banner recurved through 45 (90)°; calyx 5.5–9.5 mm long, the tube 3–5.2 mm long, campanulate, strigose to pilose, the teeth 2–6 mm long. **PODS** erect, sessile, oblong, 7–13 mm long, 3.5–5.5 mm thick, straight, dorsoventrally compressed, strigose, unilocular; ovules 6–17. $2n = 24, 26$. [*Cnemidophacos flavus* (Nutt.) Rydb.; *Tragacantha flaviflora* Kuntze; *A. flaviflorus* (Kuntze) E. Sheld.; *A. confertiflorus* var. *flaviflorus* (Kuntze) M. E. Jones; *A. flavus* var. *candicans* A. Gray; *A. confertiflorus* A. Gray; *Cnemidophacos confertiflorus* (A. Gray) Rydb.]. This species, including its infraspecific taxa, typically occupies fine-textured, seleniferous substrates. It is commonplace on exposures of the Chinle, Morrison, San Jose, and other formations composed of clays, muds, and silts exposed over great expanses of the West.

1. Calyx shaggy long-villous; flowers pink-purple; plants of northeast Arizona and San Juan County, Utah. **var. *argillosus***
1'. Calyx strigose to short-villous; flowers yellow to white or tinged purplish, rarely pink-purple ..... (2)

2. Peduncle mainly less than 12 cm long; raceme not or only somewhat elevated much above the leaves; flowers yellow or white; plants widespread ..... **var. *flavus***
2'. Peduncle mainly 12–23 cm long; raceme elevated much above the leaves; flowers white or tinged lilac or bluish; Utah, northern Arizona, and northwest New Mexico ..... **var. *higginsii***

var. *argillosus* (M. E. Jones) Barneby (clay) Clay milkvetch. [*A. argillosus* M. E. Jones]. Mancos Shale and Morrison formations, on saline clays and silts with salt desert shrubs. ARIZ: Apa, Nav; UTAH. 1235–1750 m (4060–5740'). Flowering: Apr–May. Southeastern Utah and adjacent Arizona. The specimens examined from southeastern Utah come from populations where the flowers are pink-purple throughout, not intermixed with the more typical ochroleucous to white-flowered plants of var. *flavus*. However, some specimens from San Juan County, Utah, assigned here have white flowers but bear the long shaggy-villous trichomes on the calyx. There is a collection from Navajo County, Arizona, with evident pink-purple coloring in the petals.

var. *flavus* Habit of the species, ultimately tuft-forming, the caudex branches often impacted by clay. **INFL** a raceme not much elevated above the leaves. **FLOWERS** 11–17.8 mm long, cream-colored to lemon-yellow, rarely suffused with pale pink or purple; calyx 4–7.5 mm long, the tube 3.2–5.2 mm long, campanulate, pilosulous or strigulose, the teeth shorter than the tube; ovules 8–17. Growing on seleniferous substrates composed of saline silts and clays in salt desert



shrub and piñon-juniper communities. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1765–2180 m (5800–7160'). Flowering: Apr–Jul (Sep). Southern Wyoming, western Colorado, to San Juan County, Utah; northern Arizona; and northern New Mexico. It was noted by Barneby (1964a: 399) to occur ". . . in places so abundant that it beautifies with it's prolific blossoms extensive tracts of alkaline bottomland and playa otherwise given over to the gray monotony of halophytic shrubs." Most plants of this variety have ochroleucous or indeed yellowish flowers, but plants with pink-purple flowers occur sporadically in its range, never as populations. Sheep poisoning attributable to var. *flavus* is known from the lower-elevation portions of the Uinta Basin in northeastern Utah.

var. *higginsii* S. L. Welsh (for Larry Charles Higgins, botanist) Larry's stinking milkvetch. Habit of the species, but forming smaller clumps when old, sometimes flowering the first season. **INFL** a raceme elevated above the leaves. **FLOWERS** with petals white to cream- or straw-colored; calyx 4–6.7 mm long, the tube 3.7–5.2 mm and 2.5–3.8 mm thick; ovules (6) 8–14. Chinle, Moenkopi, and other similar, fine-textured, seleniferous formations in salt desert scrub and piñon-juniper woodland communities. ARIZ: Apa; COLO: LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1465–2135 m (4800–7000'). Flowering: Apr–Jun. Southeast Nevada. Relegation of the concept of var. *candicans* to var. *flavus* leaves the Washington County, Utah, specimens, and the pale-flowered materials from adjacent Nevada, southeast Utah, and adjacent Arizona without a varietal designation. Although white or pale, or even lilac-flowered specimens occur elsewhere within the range of var. *flavus*, in a broad sense, they seldom have features of very elongate peduncles and racemes much elevated above the leaves, and they seldom occur as populations. This phase of the stinking milkvetch is commonly taller than elsewhere in the species, frequently more than 30 (to 40) cm tall.

Astragalus flexuosus (Hook.) Douglas ex G. Don (bend) Flexible milkvetch. Perennial, caulescent, 1–6 dm tall, from a branching buried caudex. **PUBESCENCE** strigulose to villosulous, basifixed. **STEMS** decumbent or ascending, buried for a space of 1–20 cm or more. **LEAVES** 1.5–9 cm long; leaflets (5) 9–25, (2) 3–19 mm long, linear or oblong to oblanceolate or obovate, obtuse to truncate or retuse, strigose to glabrate beneath, usually glabrous above; stipules 1–7 mm long, at least the lowermost connate-sheathing. **INFL** a raceme, 7- to 26-flowered, the flowers spreading at anthesis, the axis 0.6–4.5 cm long in fruit; pedicels 0.7–3.5 mm long; bracteoles 0–2; peduncles 1.5–14 cm long. **FLOWERS** 7–11 mm long, pink-purple to dull purplish, the banner recurved through 45°–90°; calyx 3.3–5.8 mm long, the tube 2.4–4.3 mm long, campanulate, strigose, the teeth 0.5–1.7 mm long, subulate. **PODS** descending to spreading, sessile or short-stipitate, the stipe 0.5–1.3 mm long, the body oblong to oblanceolate or elliptic in outline, 8–24 mm long, 2.7–4.8 mm thick, subterete or variously somewhat flattened, strigose to glabrous, unilocular; ovules 12–25. $2n = 22$. [*Phaca flexuosa* Hook.; *Tragacantha flexuosa* (Hook.) Kuntze; *Homalobus flexuosus* (Hook.) Rydb.; *Pisophaca flexuosa* (Hook.) Rydb.; *A. flexuosus* var. *albus* Douglas ex G. Don; *Phaca elongata* Hook.; *Phaca elongata* var. *minor* Hook.; *Phaca fendleri* A. Gray; *Pisophaca sierrae-blancae* Rydb.; *Pisophaca ratonensis* Rydb.; *Pisophaca saundersii* Rydb.].

1. Calyx 3.3–4.1 mm long; banner abruptly recurved through ± 90°; keel 5–5.5 mm long, the half-circular blades very strongly incurved through ±120°; pod 11–15 mm long, 3–4 (4.5) mm in diameter; plants of the Colorado River drainage, eastern Utah, western Colorado, northwest New Mexico, and Arizona; mostly below 1830 m ..... **var. *diehlii***

1'. Calyx 3.5–6 mm long; banner at full anthesis recurved through ± 45°–50°, sometimes further in withering; keel 5.3–8.2 mm long, the blades half-obovate, 3.4–5.2 mm long, incurved through 90°–100°; pods various; plants widespread from east-central Arizona and New Mexico but on the west slope in Colorado, mostly above 1830 m elevation ..... **var. *flexuosus***

var. *diehlii* (M. E. Jones) Barneby (for I. E. Diehl, a correspondent of M. Jones) Diehl's milkvetch. **STEMS** 1.5–3 dm tall, the herbage greenish cinereous. **LEAFLETS** (7) 11–17, mostly linear or narrowly oblong-oblanceolate. **INFL** a raceme, 12–26-flowered, the axis 2.5–9.5 cm long in fruit; peduncle 2.5–6 cm long. **FLOWERS** 7–9 mm long; calyx 3.3–4.1 mm long, the tube 1.9–2.3 mm long, the teeth 0.7–1.1 (1.4) mm long. **PODS** sessile, the body oblong-ellipsoid, the valves strigulose; ovules 12–18. [*A. diehlii* M. E. Jones; *Pisophaca diehlii* (M. E. Jones) Rydb.]. Salt desert shrub and piñon-juniper communities. NMEX: San, SJn. 1760–1860 m (5775–6105'). Flowering: late Apr–Jun. East-central Utah, western Colorado, northwest New Mexico, and northeast Arizona (Navajo County to Meteor Crater, Coconino County).

var. *flexuosus* **STEMS** 1.5–6 dm tall, the herbage greenish or silky canescent. **LEAFLETS** 11–25 (29), mostly linear or narrowly oblong-oblanceolate. **INFL** a raceme, (7) 12–26 (30)-flowered, the axis 3–13 cm long in fruit; peduncle 4–19 cm long. **FLOWERS** 7.4–11 mm long; calyx 3.5–5.8 mm long, the tube 2.7–4.3 mm long, the teeth 0.5–1.7 mm long. **PODS** stipitate or subsessile, the stipe 0.5–1.3 mm long, concealed by the marcescent calyx, the body linear-oblong, linear-oblanceolate, or narrowly oblong-elliptic in outline, (8) 12–24 mm long, 2.7–4.8 mm thick, the valves finely strigulose, villosulous, or rarely glabrous; ovules 14–20. $2n = 22$. Piñon-juniper, sagebrush-oak, ponderosa pine, and mountain brush communities. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: RAr, SJn; UTAH. 1780–2255 m (5840–7405'). Flowering: May–Aug. British Columbia east to southern Ontario and south to Utah, New Mexico, Nebraska, and Minnesota.

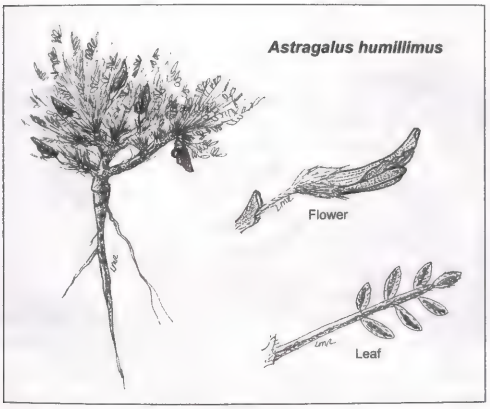
Astragalus fucatus Barneby (painted, referring to the mottled pod) Hopi milkvetch. Moderate, caulescent perennial (sometimes flowering as an annual), 7–45 (70) cm tall, from a subterranean to superficial caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** ascending to erect or sprawling, naked and buried for a space of (0) 1–4 cm. **LEAVES** 2–13 cm long; leaflets 9–17, 3–20 (25) mm long, 0.5–4 mm wide, obtuse to retuse, strigose beneath, glabrous above; stipules 1–5.5 mm long, the lowest connate-sheathing. **INFL** a raceme, 9- to 22-flowered, the flowers ascending to declined at anthesis, the axis 2–11.5 cm long in fruit; bracts 0.8–2 mm long; pedicels 0.7–3.5 mm long; bracteoles 0; peduncle 1–6.5 cm long. **FLOWERS** 6.4–8.7 mm long, pink-purple, the banner recurved through 90°; calyx 3.3–5.4 mm long, the tube 2.3–3.3 mm long, campanulate, strigose, the teeth 0.8–2.2 mm long. **PODS** spreading to declined, sessile, bladdery-inflated, ovoid, ellipsoid, or subglobose, 17–32 mm long, 12–20 mm wide (when pressed), mottled, strigose, unilocular; ovules 21–32. $n = 12$. [*A. subcinereus* A. Gray; *Phaca subcinerea* sensu Rydb.]. Mixed sandy desert shrub (resinbush, blackbrush, juniper) communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1315–1830 m (4320–6000'). Flowering: May–Jul (Sep). Widespread throughout the Four Corners region.

Astragalus hallii A. Gray (for Elihu Hall, Colorado botanist) Hall's milkvetch. Perennial, caulescent, 12–50 cm tall, from a subterranean caudex. **PUBESCENCE** strigulose to villosulous, basifixed. **STEMS** decumbent to ascending or erect, subterranean for a space of 1–8 cm. **LEAVES** 2–9 cm long; leaflets 11–27 (31), (1.5) 3–14 (15) mm long, 1–7 mm wide, obovate to oblanceolate or elliptic, retuse to truncate or obtuse, strigulose beneath, sparingly hairy or glabrous above; stipules 1–7 mm long, at least the lowermost connate-sheathing. **INFL** a raceme, (7) 9–28-flowered, the flowers spreading-declined at anthesis, the axis 1–7 cm long in fruit; bracts 1.5–5 mm long; pedicels 1.2–4 mm long; bracteoles 0–2; peduncle 3–9.5 (11) cm long. **FLOWERS** 12.4–15 (18.5) mm long, pink-purple, the banner reflexed through about 45°; calyx (5) 6–7 (9) mm long, the tube 5–6.2 mm long, the teeth 0.5–2.3 mm long, triangular-subulate. **PODS** spreading to declined, sessile or short-stipitate, the stipe 1.5–4 (4.5) mm long, the slightly to greatly inflated body cylindroid to obliquely ovoid-ellipsoid, 17–27 mm long, (3) 4–12 mm thick, strigulose to villosulous, unilocular; ovules 20–34. [*Tragacantha hallii* (A. Gray) Kuntze; *A. gracilentus* (A. Gray) A. Gray var. *hallii* (A. Gray) M. E. Jones; *Homalobus hallii* (A. Gray) Rydb.; *Pisophaca hallii* (A. Gray) Rydb.; *A. shearii* Rydb.; *Atelophragma shearii* (Rydb.) Rydb.]. Hillsides and meadows, nearly always in sagebrush, and in mixed conifer-aspen. ARIZ: Apa; COLO: LPl; NMEX: San, SJn. 2045–2345 m (6705–7700'). Flowering: Jun–Sep. Northeast Arizona, northern New Mexico, and Colorado. Four Corners material belongs to **var. *hallii***.

Astragalus heilii S. L. Welsh & N. D. Atwood **CP** (for Kenneth D. Heil, botanist) Heil's milkvetch. Tufted, low, subacaulescent perennial, about 2–4 cm long, from a superficial branching caudex, this clothed with marcescent leaf bases and peduncles. **PUBESCENCE** basifixed, strigulose. **STEMS** obscured by stipules and leaf bases. **LEAVES** 1–2.5 cm long; leaflets 7–13, 2–3.5 mm long, 1–1.6 mm wide, folded, elliptic, obtuse, strigulose on both sides; stipules 2–3 mm long, merely amplexicaul or the lowermost connate-sheathing. **INFL** a raceme (1) 2- to 4-flowered, the flowers ascending at anthesis, declined in age; peduncle 1–7 cm long, very slender. **FLOWERS** 4–5 mm long, whitish or tinged with violet, the banner recurved through about 45°–60°; calyx 2.3–3 mm long, the tube 1.7–1.9 mm long, campanulate,

white- or black-strigose, the teeth 0.7–0.9 mm long, subulate. **PODS** spreading or pendulous, substipitate, subinflated, 9–9.8 mm long, 4.5–4.6 mm thick, slightly dorsiventrally compressed, thin, red-mottled, becoming papery, unilocular; ovules 8–10. Piñon-juniper woodland communities on rocky ledges of the Mesa Verde Formation. NMEX: McK. 1980 m (6500'). A Four Corners endemic.

Astragalus humillimus A. Gray ex Brandegee (smallest of all) Mancos milkvetch. Perennial, tufted or matted, diminutive, forming cushions to 2 dm wide, acaulescent, 0.5–2 cm tall, from a superficial sand-impacted caudex, the branches clothed with a thatch of marcescent stipules and leaf bases (these spinose-persistent). **PUBESCENCE** malpighian, ashy strigulose. **STEMS** obscured by stipules and leaf bases. **LEAVES** 8–28 mm long; leaflets 7–11, 1–5 mm long, 0.3–0.8 mm wide, obovate-cuneate to oblong-elliptic, obtuse or subacute, folded, silvery strigulose on both sides; stipules 1–1.5 mm long, submembranous, all distinct. **INFL** a raceme, 1–3-flowered, the flowers ascending, the axis 1–2 mm long; bracts 0.6–0.8 mm long; pedicels 1–2.5 mm long; bracteoles 0; peduncle 2–4 mm long, shorter than the leaves. **FLOWERS** 9–12 mm long, pink-purple, the keel maculate; calyx 3.3–4.5 mm long, the tube 2.2–3.8 mm long, campanulate to subcylindric, strigulose, the teeth 0.5–1.3 mm long, subulate. **PODS** ascending to spreading, sessile, the body oblong-ellipsoid, 4.5–5.5 mm long, 2–2.5 mm wide, laterally compressed and bicarinate, greenish, densely strigulose, unilocular; ovules about 4. $2n = 22$. [*Tragacantha humillima* (A. Gray) Kuntze]. Ancient channel sandstone in hogbacks within the Point Lookout Sandstone of the Mesa Verde Group, with Bigelow sagebrush, matchweed, and widely spaced junipers. COLO: Mon; NMEX: SJn. 1545–1835 m (5075–6015'). Flowering: May–Jul. The species has been known since the initial collection by Brandegee in 1875 but was only recently rediscovered after a hiatus of more than a century. A Four Corners endemic.



Astragalus humistratus A. Gray (stretched out on the ground) Groundcover milkvetch. Prostrate, spreading, or ascending caulescent perennial, 7–80 cm long, radiating from a superficial caudex. **PUBESCENCE** strigose, malpighian. **STEMS** mostly sprawling. **LEAVES** 1–6 (7.5) cm long; leaflets (5) 9–17 (19), (2) 3–17 (19) mm long, 0.5–6 mm wide, elliptic to oblong or oblanceolate to obovate, acute or obtuse, strigose on both sides or glabrate to glabrous above; stipules 2–10 (12) mm long. **INFL** a raceme, 3- to 30-flowered, the flowers ascending at anthesis, the axis 1–12 (13) cm long in fruit; bracts 1.5–7 mm long; pedicels 0.4–2.2 mm long; bracteoles 0–2; peduncle 1–9 cm long. **FLOWERS** (5.9) 7–11.8 mm long, greenish to ochroleucous, often suffused or veined purplish, or pink-purple, the banner reflexed through 50°–85°; calyx 4.5–8.8 mm long, the tube 2.4–4.1 mm long, campanulate, strigose, the teeth 1.4–5 mm long. **PODS** sessile, ascending to spreading, obliquely ovoid or oblong-ellipsoid, 6–20 mm long, 3.5–5.7 mm wide, variously compressed, strigose, unilocular; ovules 6–26. $n = 12$. [*Tragacantha humistrata* (A. Gray) Kuntze; *Tium huministratum* (A. Gray) Rydb.; *Batidophaca humistrata* (A. Gray) Rydb.; *Pisophaca datilensis* Rydb.; *A. datilensis* (Rydb.) Tidestr.]. Ramah Navajos used the plant as a ceremonial chant lotion, a powder for sores, and as a "life medicine."

1. Pod (10) 13–20 mm long, 3.1–6.5 mm in diameter, 3–4 times longer than wide, dorsally sulcate its whole length up to the base of the beak ..... **var. *humistratus***
1' Pod 6–14 mm long, 2.5–5.7 mm in diameter, 1 1/2–2 1/2 times longer than wide, sulcate dorsally from the middle downward or esulcate ..... **var. *humivagans***

var. *humistratus* A. Gray **LEAFLETS** glabrate above. **COROLLA** 9.5–11.5 mm, generally pale, drying purple or pale. **PODS** oblong-lanceoloid, incurved, 15–18 × 4–6 mm, proximally triquetrous, dorsally obcompressed, sulcate entire length. Commonly disturbed sites. Piñon-juniper, ponderosa pine, roadsides. ARIZ: Apa; NMEX: McK, RAr, SJn. 2225–2780 m (7305–9130'). Flowering: May–Sep. To be sought in southwestern Colorado. Disjunct in the Davis Mountains, Texas, and south to Chihuahua.

var. *humivagans* (Rydb.) Barneby (spreading on the ground) **LEAFLETS** pubescent on both sides. **COROLLA** 7–10 mm, generally pale and remaining so, or becoming purple on drying. **PODS** shortly lunate, obcompressed at base;

laterally compressed above, 8–14 mm × 3.5–5 mm, conspicuously beaked; ventral suture conspicuous; dorsal face sulcate only at base. Piñon-juniper to ponderosa pine. ARIZ: Apa; NMEX: SJn; UTAH. 2315–2345 m (7600–7700'). Flowering: May–Sep. Northwest Arizona, Nevada, and Utah.

Astragalus iodopetalus (Rydb.) Barneby. (with violet-colored petals) Violet milkvetch. Caulescent or subacaulescent perennial, from a taproot and superficial root crown. **PUBESCENCE** basifixed, villous-villosulous. **STEMS** 1.5–10 (18) cm long, prostrate and radiating, the internodes either all concealed by stipules, or some of them developed and up to 0.5–2 (2.5) cm long. **LEAVES** (4) 5–15 (20) cm long; leaflets 7–31, 3–17 (20) mm long, oblanceolate, obovate, or elliptic, mostly obtuse or emarginate, flat or loosely folded; stipules submembranous, 2.5–12 cm long, distinct or nearly so. **INFL** a raceme, rather closely (10) 12–20 (25)-flowered, the axis (1.5) 2–8 cm long in fruit; bracts 2.5–8.5 mm long; pedicels 1.3–3.6 mm long; bracteoles 0; peduncle (1.5) 3–10 cm long, shorter than the leaf, prostrate in fruit. **FLOWERS** 17–23.5 mm long, bright reddish violet or merely tinged with violet or almost or quite white, the banner incurved 40°–50°; calyx 10–15 mm long, the tube (6.8) 7.5–10.5 mm long, cylindric to deeply campanulate, thinly villous-villosulous, the teeth 2.5–5.5 mm long, lanceolate to subulate. **PODS** ascending (humistrate), obliquely ovate, lance-elliptic, oblong-elliptic, or lanceolate in outline, (17) 20–30 mm long, 7–10 mm in diameter, straight or nearly so and obcompressed, the green, fleshy, glabrous valves becoming stiffly leathery or subligneous, brownish, or ultimately blackish, subunilocular, the narrow septum to 1.7 mm wide; ovules 30–44. [*Xylophacos iodopetalus* Rydb.; *A. iodopetalus* Greene ex M. E. Jones; *Xylophacos stipularis* sensu Rydb., non *A. arietinus* M. E. Jones var. *stipularis* M. E. Jones]. Dry, stony hillsides and benches, commonly on granite, often about oak thickets, in oak-piñon forest, or among sagebrush. COLO: Arc, Hin, LPl; NMEX: RAr. 2085–2530 m (6850–8300'). Flowering: May–Jul. Locally plentiful and not uncommon around the western and southern slopes of the Rocky Mountains in the valleys of the Dolores, Gunnison, and upper San Juan rivers in southwestern Colorado, extending more rarely southeast to the western tributaries of the Rio Arriba in Taos and Sandoval counties, New Mexico. A specimen, apparently belonging within the concept of *A. iodopetalus*, from Hinsdale County, Colorado (about 1/4 mile north of the Archuleta County line, 8 Jun 1996, *K. Heil 9882*, SJNM!), but with pale flowers and shorter calyx measurements, might represent a phase of the species worthy of taxonomic recognition. The flowers are about 18 mm long, the calyx 6.5–7.2 mm, with the tube 4–4.8 mm, and the teeth 2.2–3.2 mm.

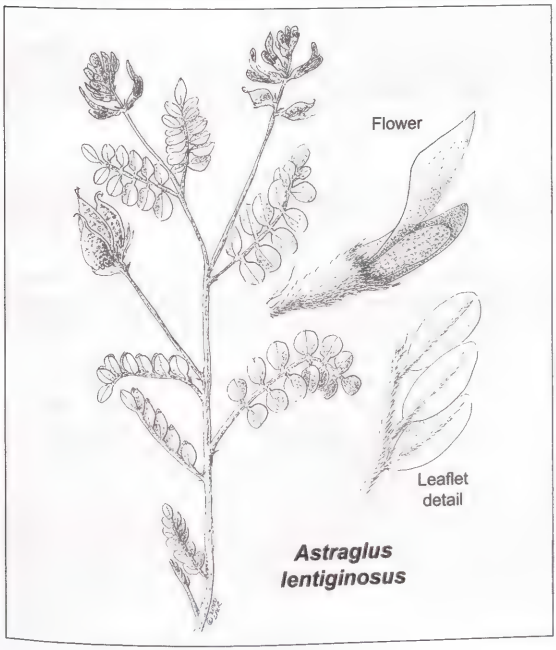
Astragalus kentrophyta A. Gray (spiny growth) Nuttall's kentrophyta. Perennial, caulescent, mat-forming to erect, 15–45 cm long, from a caudex and stolonlike, creeping stems. **PUBESCENCE** basifixed or malpighian. **STEMS** prostrate to erect, compact to elongate. **LEAVES** 0.4–2.6 cm long; leaflets 3–9, (1) 3–13 (17) mm long, 0.5–1.5 mm wide, linear to narrowly elliptic or lanceolate, all continuous with the rachis and spinulose-tipped, strigose on both sides; stipules 1.5–5 mm long, at least some connate-sheathing. **INFL** a raceme, 1- to 3-flowered, the flowers declined at anthesis, the axis to 0.5 cm long in fruit; bracts 0.8–3.5 mm long; pedicels 0.5–2 mm long; bracteoles 0; peduncle to 1.5 (3) cm long. **FLOWERS** 4.5–10 mm long, pink-purple or whitish, ochroleucous or purple-tinged, the banner recurved through about 45°; calyx 2.4–8.3 mm long, campanulate, strigose, the teeth 1.5–5 mm long, subulate. **PODS** declined or spreading, sessile, elliptic to oblong or lance-acuminate in outline, usually curved, 4–10 mm long, 1.3–4 mm wide, strigose, unilocular; ovules 2–8. $2n = 24$. [based on: *Kentrophyta montana* Nutt. 1838, Fl. N. Amer. 1: 353, not *Astragalus montanus* L. 1753; *Tragacantha montana* (Nutt.) Kuntze; *A. montanus* (Nutt.) M. E. Jones; *Kentrophyta viridis*

Nutt. ex Torr. & A. Gray; *A. kentrophyta* var. *viridis* (Nutt. ex Torr. & A. Gray) Hook.; *A. viridis* (Nutt.) E. Sheldon; *Phaca viridis* (Nutt.) Piper; *A. tegetarius* S. Watson var. *viridis* (Nutt. ex Torr. & A. Gray) Barneby]. Used as a ceremonial chant lotion, for rabies, and as a "life medicine" by the Navajos.

1. Pod ovate- or lance-acuminate in profile, gently incurved into a definite beak; calyx 3.4–4.4 mm long, the teeth 1.5–2.4 mm long ..... **var. *elatus***
1′ Pod ovoid-lenticular, beakless or nearly so; calyx 2.4–3.3 mm long, the teeth 0.7–1.3 mm long ... **var. *neomexicanus***

var. *elatus* S. Watson (tall) Tall kentrophyta. Suffruticulose and often bushy-branched at base, forming low, prickly bushes 10–45 cm tall. **PUBESCENCE** of stems and herbage strigulose, malpighian, with leaflets pubescent on both sides, or glabrous above. **LEAVES** 10–26 mm long; leaflets (3) 5–7, (2) 5–15 (17) mm long; stipules 1–1.2 mm long. **PEDUNCLES** 1–6 mm long. **FLOWERS** 4.8–6.2 mm long, whitish or faintly purplish-veined or -tinged; calyx 3.4–4.4 mm long, the tube 1.8–2.3 mm long, the teeth 1.5–2.4 mm long, subulate, spinulose. **PODS** (3.5) 4–7 mm long, 1.5–2 mm wide, narrowly ovoid-acuminate; ovules 2–4. [*A. viridis* Bunge var. *impensus* E. Sheld.; *A. viridis* var. *elatus* (S. Watson) Cockerell; *A. kentrophyta* var. *impensus* (E. Sheld.) M. E. Jones; *Kentrophyta impensa* (E. Sheld.) Rydb.; *A. impensus* (E. Sheld.) Wooton & Standl.; *A. montanus* (Nutt.) M. E. Jones var. *impensus* (E. Sheld.) M. E. Jones; *A. tegetarius* S. Watson var. *elatus* (S. Watson) Barneby; *A. kentrophyta* subsp. *elatus* (S. Watson) W. A. Weber]. Mixed desert and salt desert shrub, juniper-piñon, ponderosa pine, and pine-spruce communities, often in floodplains. ARIZ: Apa; NMEX: McK, SJn. 1830–2430 m (6000–8000′). Flowering: Jun–Sep. Inyo County, California; Elko, Nevada; west and south in Nevada; Sweetwater County, Wyoming; and southern and eastern Utah. Both erect and prostrate phases are known, but typically it is a small prickly bush that has borne, with good reason, the name of "barb-wire" kentrophyta. It is common on limestone in the ponderosa pine forests of southern Utah.

var. *neomexicanus* (Barneby) Barneby (of New Mexico) New Mexico spiny milkvetch. Decumbent and forming mats or cushions or erect and bushy-branched at base, and 4–30 (40) cm tall. **PUBESCENCE** of stems and herbage strigulose, malpighian, with leaflets pubescent on both sides. **LEAVES** 8–22 mm long; leaflets mostly 5, 3–13 mm long; stipules 1–1.5 (2.5) mm long. **PEDUNCLES** 1–3 mm long. **FLOWERS** 4.8–5.2 mm long, whitish; calyx 2.4–3.3 mm long, the tube 1.8–2.1 mm long, the teeth 0.7–1.3 mm long, subulate, spinulose. **PODS** 3–4 mm long, 1.8–2.4 mm wide, obliquely ovoid in outline; ovules 2 or 3. [*A. tegetarius* S. Watson var. *neomexicanus* Barneby]. Bluffs, badlands, and dunes, in mixed desert shrub and piñon-juniper communities. ARIZ: Apa; NMEX: McK, San, SJn. 1890–2265 m (6200–7435′). Flowering: Jun–Sep. A northwest New Mexico endemic.



Astragalus lentiginosus Douglas (referring to the freckled or spotted pod) Freckled milkvetch. Perennial, caulescent, mostly 1.5–6 dm tall, from a caudex. **PUBESCENCE** basifixed; stipules 1.5–7 mm long or more, all distinct. **LEAVES** 2.4–15 cm long; leaflets 9–23, 2–23 mm long, 1–13 mm wide, elliptic to ovate or lanceolate, obtuse to rounded, emarginate, or acute, pubescent to glabrous on one or both sides. **INFL** a raceme, (5) 11- to 30-flowered, the flowers ascending to declined at anthesis, the axis 1–18 cm long in fruit; pedicels 1–4 mm long; bracts 1.5–6 mm long; bracteoles 0–2; peduncle 1–14 cm long, sometimes more. **FLOWERS** 8.4–22 mm long, pink-purple, ochroleucous, whitish, or variously suffused with pink or purple; calyx 3.5–11.6 mm long, the tube 3–9 mm long, cylindric to short-cylindric, strigose, the teeth

0.6–2.5 mm long, subulate or triangular. **PODS** ascending to declined, sessile or with a gynophore, variable in outline, either inflated and ovoid (12–26 mm long, 5–20 mm thick) or not inflated and oblong in outline (15–25 mm long, 3–7.5 mm thick), strigose or glabrous, mottled or not, leathery to membranous, bilocular; ovules 16–38. $n = 11$. The freckled milkvetch, considered broadly, has more infraspecific taxa than any others in the genus. Of the great many, perphaps more than 50, varieties known within the species as a whole, 2 are present in the Four Corners region, probably all of which are poisonous to livestock. Indolizidine alkaloids are responsible for the syndrome known as locoism, which is responsible for death and spontaneous abortion in sheep, especially. As in other short-lived perennial species in the genus, populations of freckled milkvetch rise and fall cyclically, dependent on short-term climatic cycles with abundant seasonally critical precipitation followed by other drought periods. Poisoning of livestock occurs when the plants are most abundant. Plant used as a charm by Navajos and pods dried for winter use by Zunis.

1. Pods strongly (-slightly) inflated ..... **var. *diphysus***
1′ Pods not inflated, nearly straight to hamately incurved ..... **var. *palans***

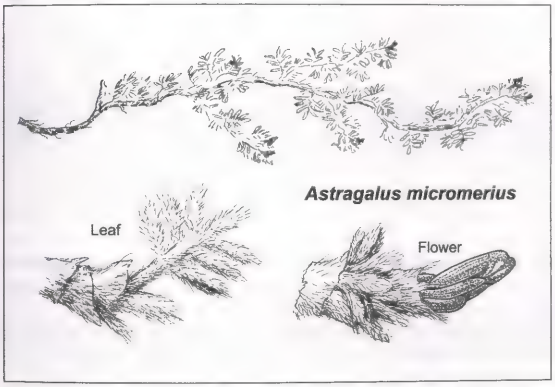
var. *diphysus* (A. Gray) M. E. Jones (double-bladdered, referring to the swollen, bilocular pod) Double bladder freckled milkvetch. Perennial. **STEMS** simple or branched at base, (1) 1.5–3.5 (4) dm long. **LEAVES** 3–10 (14) cm long; leaflets (11) 15–21 (23), 4–20 mm long, oblong-oblanceolate, obovate, rhombic-obovate, elliptic, or ovate-cuneate, truncate-emarginate, flat or loosely folded. **INFL** a raceme, shortly, at first rather densely, (10) 12–24-flowered, the axis not or little elongating, 1–4 (6) cm long in fruit; peduncle erect or incurved, (1.5) 2.5–8.5 cm long, shorter than or equaling the leaf. **FLOWERS** (12.6) 14.5–19 mm long, (5.8) 7–9.8 mm wide, pink-purple; calyx 7–10.4 mm, the cylindric or deeply campanulate tube (5.1) 5.5–8 mm long, (2.5) 2.7–3.5 (4) mm in diameter, the teeth 1.5–3.2 mm long. **PODS** (1) 1.4–2.7 (3) cm long, (6.5) 8–18 mm in diameter, the body mostly plumply ovoid or subglobose, the uni- or bilocular beak (3) 4–10 mm long, green, purple- or red-tinged, or brightly mottled, glabrous, becoming stiffly papery or leathery, semibilocular; ovules 28–35. $n = 11$. [*A. diphysus* A. Gray; *Tragacantha diphysa* (A. Gray) Kuntze; *Cystium diphysum* (A. Gray) Rydb.; *A. diphysus* var. *albiflorus* A. Gray; *A. lentiginosus* var. *albiflorus* (A. Gray) Schoener; *A. macdougalii* E. Sheld.; *A. lentiginosus* var. *macdougalii* (E. Sheld.) M. E. Jones; *Cystium macdougalii* (E. Sheld.) Rydb.]. Yucca-grassland, piñon-juniper forest, and other xeric communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1645–2285 m (5400–7500′). Flowering: Mar–Jun (Aug). Northern Arizona, south of the Little Colorado River; Henry Mountains, Utah; southwest Colorado; and northwestern and central New Mexico.

var. *palans* (M. E. Jones) M. E. Jones (straggling) Straggling milkvetch. **STEMS** 1.5–5 dm tall, glabrate. **LEAFLETS** broadly obovate to obovate-elliptic, 6–20 mm, sometimes folded. **PODS** turgid or slightly inflated, ovate-acuminate to linear-lanceolate, straight to hamately curved. [*A. palans* M. E. Jones; *Tium palans* (M. E. Jones) Rydb.; *A. bryantii* Barneby]. Salt desert shrub, blackbrush, juniper, piñon-juniper, and mixed desert shrub communities. ARIZ: Coc, Nav; UTAH. 1110–1845 m (3650–6050′). Flowering: Mar–Jun. Southern Utah, northern Arizona, western Colorado, and Nevada. The straggling milkvetch is the common phase of *A. lentiginosus* in the canyons of the lower San Juan River. It is distinctive in having oblong, usually curved pods, seldom more than 7 mm thick, pale pink-purple flowers, and elongate inflorescences. Specimens from along Glen Canyon in San Juan County, Utah, cited previously as *A. bryantii* Barneby, do not differ in any remarkable way from var. *palans*.

Astragalus lonchocarpus Torr. (with long pod) Great rushy milkvetch. Tall, slender, caulescent, clump-forming, evidently long-lived perennial, 30–85 (90) cm tall, from a shallowly subterranean caudex (this seldom collected). **PUBESCENCE** strigulose, basifixed. **STEMS** erect, often in dense clumps, buried for a space of 1–8 cm. **LEAVES** 2–13 cm long, the uppermost and sometimes all simple, the lower with leaflets 3–9 (11), 2–36 mm long, 0.5–4 mm wide, linear to narrowly oblanceolate, obtuse to acute, strigose on both sides or glabrous above; stipules 1–9 (10) mm long, all distinct. **INFL** a raceme, loosely 7- to 40-flowered (or more), the flowers spreading-declined at anthesis, the axis 3.5–45 cm long in fruit; bracts 0.8–2.5 mm long; pedicels 1.3–4.5 mm long; bracteoles 0; peduncle 6–24 cm long. **FLOWERS** 13–20 mm long, ochroleucous to almost white, concolorous, the banner recurved through about 50°; calyx 5.8–10.3 mm long, usually brown (and contrasting with the pale petals), the tube 5–8 mm long, cylindric, gibbous, strigose, the teeth 0.6–2.5 mm long, subulate. **PODS** pendulous, stipitate, the stipe 3–15 mm long, the body elliptic to oblong in outline, 22–50 mm long, 3.3–6.2 (7.5) mm wide, dorsiventrally compressed, the low, concave ventral face, or both faces, carinate by the sutures, the valves often brownish, strigose, unilocular; ovules 12–26. $2n = 22$. [based on: *Phaca macrocarpa* A. Gray; non *A. macrocarpus* Pall.; *Tragacantha lonchocarpa* (Torr.) Kuntze; *Homalobus macrocarpus* (A. Gray) Rydb.; *Lonchophaca macrocarpa* (A. Gray) Rydb.; *A. macer* A. Nelson; *Lonchophaca macra* (A. Nelson) Rydb.]. Salt desert shrub, blackbrush, and piñon-juniper communities; often on low-quality substrates (i.e., often in saline

shales and clays). ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1840–2450 m (6040–8045'). Flowering: May–Jul. Eastern Nevada, southern and western Utah. Plant used as an emetic and for goiter by the Navajos.

Astragalus micromerius Barneby (small in all parts) Chaco milkvetch. Prostrate, caulescent, evidently long-lived perennial, forming mats or cushions 1–6 dm wide, radiating from a branching caudex. **PUBESCENCE** villous-hirtellous, basifixed. **STEMS** 5–30 cm long or more, the older, subterranean portions accommodating burial, up to 30 cm long.



LEAVES 0.4–1 (2) cm long; leaflets (3) 5–9, 1–3.5 (6) mm long, 0.6–2 mm wide, oblong-elliptic to obovate, obtuse, pubescent on both sides; stipules 1–3 mm long, all connate-sheathing. **INFL** a raceme, 1–3 (5)-flowered, the flowers spreading at anthesis, the axis very short in fruit; bracts 1–2 mm long; pedicels less than 1 mm long; bracteoles 0; peduncle 0.3–1 cm long. **FLOWERS** 5.5–6.5 mm long, whitish, the wing tips tinged lilac, the keel purple-tipped, the banner recurved through about 45°; calyx 2.5–3.5 mm long, the tube 1.5–2.5 mm long, obconic-campanulate, the teeth 1–1.3 mm long, subulate. **PODS** spreading, sessile, the body 4–5 mm long, 2.5–3 mm wide, obliquely ovoid in outline, obcompressed and dorsally flattened or shallowly sulcate in part, hirsutulous; ovules 4. Shelving ledges of sandstone cliffs or on steep, boulder-strewn talus, often partly submerged in drifting sand, and on steep slopes of Mancos clay. NMEX: McK, SJn. 2020–2235 m (6635–7340'). Flowering: Jul–Aug. A northwest New Mexico endemic.

Astragalus missouriensis Nutt. **CP** (of the Missouri River) Missouri milkvetch. Perennial, low, loosely tufted or prostrate, shortly caulescent or subacaulescent, from a taproot and subterranean caudex. **PUBESCENCE** malpighian, strigose to strigulose. **STEMS** up to 1.5 (2) dm long, prostrate and radiating, the internodes often concealed by stipules; stipules (2) 3–9 mm long, distinct. **LEAVES** (2) 4–14 cm long; leaflets (5) 11–17 (21), 3.5–13 (17) mm long, 3–7 (8) mm wide, flat, elliptic to obovate, acute or mucronulate, or obtuse, pubescent on both sides. **INFL** a raceme, (3) 5–15-flowered, the flowers ascending to spreading, the axis (0.5) 1–4 cm long in fruit; bracts 2.5–8 mm long; pedicels 1–3.5 mm long; bracteoles 0–2; peduncles (1.5) 3.5–11 cm long, shorter to longer than the leaf. **FLOWERS** 9.5–22 (24) mm long, pink-purple (or white), the banner recurved through about 45°; calyx 5–12 mm long, the purple-tinged, strigulose tube cylindric or deeply campanulate, (4.1) 6.3–9 (10) mm long, the teeth (0.7) 1.4–3.3 mm long, subulate. **PODS** ascending, sessile and (commonly) persistent on the receptacle, subsymmetrically or obliquely oblong or oblong-elliptic in outline, 1.4–2.7 (3) cm long, (4) 5–9 (10) mm in diameter, variably compressed, straight or slightly incurved, strigulose, brownish and finally black, unilocular or subunilocular; ovules (33) 36–50 (56). [*Tragacantha missouriensis* (Nutt.) Kuntze; *Xylophacos missouriensis* (Nutt.) Rydb.; *A. missouriensis* var. *typicus* Barneby; *A. melanocarpus* Hook.; *A. missouriensis* f. *longipes* Gand.; *A. missouriensis* f. *microphyllus* Gand.; *A. missouriensis* f. *leucophaeus* Gand.]. Only in the Four Corners regions of southwest Colorado and adjacent southeast Utah, west-central to northwest New Mexico, and east-central to northeast Arizona has the species undergone taxonomically significant and geographically correlated morphological differentiation. Otherwise, in its immense range from the Canadian provinces of Alberta, Saskatchewan, and Manitoba southward along the prairies and high plains to Trans-Pecos Texas, it is remarkably uniform.

1. Pod subsymmetrically oblong-elliptic in outline, straight or nearly so, subcylindric when first formed, becoming laterally compressed and bicarinate, the lateral faces transversely dilated and convex; plants widespread east of the Continental Divide from southern Canada to west Texas, extending around the southern foothills of the Rocky Mountains to the upper San Juan River in northwest New Mexico, northeast Arizona, and southwest Colorado ..... **var. *missouriensis***

1′ Pod obliquely ellipsoid, lunately incurved, obcompressed below the incurved beak; plants of the western slope of the Rocky Mountains in southwest Colorado, southeast Utah, and northwest New Mexico (Rio Arriba County)...(2)

2. Plants subacaulescent to shortly caulescent, the stems to 10 cm long; racemes with 4–8 flowers; plants from La Plata and Montezuma counties, Colorado; San Juan County, Utah, and San Juan County, New Mexico ... **var. *amphibolus***

2' Plants rather definitely caulescent, the stems 10–15 (20) cm long, radiating from the root crown; racemes with 9–12 flowers; plants of La Plata and Archuleta counties, Colorado, and adjacent Rio Arriba County, New Mexico **var. *humistratus***

var. *amphibolus* Barneby (ambiguous, combining features of *A. missouriensis* and *A. amphioxys*) Missouri milkvetch. **FLOWERS** 15–22 mm long, pink-purple, rarely white; calyx 8.5–13 mm long, the tube 7–10 mm long, cylindric, strigose, the teeth 1.5–3 mm long, subulate. **PODS** ascending to descending, sessile, ellipsoid, (12) 15–25 mm long, 7–9 mm thick, curved, dorsiventrally compressed, strigose, unilocular; ovules 35–55. Piñon-juniper and sagebrush communities, on igneous or sandstone outcrops or substrates derived from them. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: RAr, SJn; UTAH. 1495–2430 m (4900–7970'). Flowering: May–Jul. On the west slope of the southern Rocky Mountains, Colorado, from Garfield County south through the Gunnison, Mancos, and San Juan River valleys, east to the head of the Rio Grande in Conejos County, west into the foothills of the La Sal and Abajo Mountains, Grand and San Juan counties, Utah.

var. *humistratus* Isely (on the ground) Archuleta milkvetch. **FLOWERS** 19–20.5 mm long, lavender, purple, or almost white, the wing tips often white; calyx 7.8–10 mm long, the tube 7–10 mm long, cylindric, strigose, the teeth 1.5–3 mm long, subulate. **PODS** ascending to descending, sessile, oblong-ellipsoid, 17–20 mm long, 7–9 mm thick, curved, dorsiventrally compressed, glabrous or sparsely pubescent, unilocular; ovules 33–40. Oak brush with scattered ponderosa pine on clay knolls. COLO: Arc, Hin; NMEX: RAr. 2010–2440 m (6600–8000'). Flowering: May–Jul. A Four Corners endemic. The banner much surpasses both the wing and keel petals, with the wings often pale or white or only faintly purplish apically.

var. *missouriensis* **FLOWERS** (14.5) 16–22 (24) mm long, (7.2) 8–12.5 mm wide; calyx 9–12 (14.3) mm long, the tube 6.3–9 (9.3) mm long, 3.3–4.6 (4.9) mm in diameter, the teeth 1.4–3.3 (5.3) mm long. **PODS** 1.5–2.7 (3) cm long, (4) 5–9 (10) mm in diameter, obtuse or sometimes cuneate at base, abruptly contracted distally into a subulate, pungent beak 1.5–4 mm long, at first subterete or a trifle dorsiventrally compressed, when ripe somewhat laterally dilated and obtuse-angled; ovules (33) 40–50 (56). Prairies, in dry, open places, most abundant on limestones, shales, and sandstones, often on gypsum. ARIZ: Apa; COLO: LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1560–2210 m (5115–7260'). Flowering: late Mar–Jul. Widespread and common over the Great Plains from southern Alberta, Saskatchewan, and southwest Manitoba to northwest and Trans-Pecos Texas, east to the Missouri Valley, western Iowa, central Kansas, and western Oklahoma, west to the upper Missouri, Montana, to Yellowstone Park, and thence south along the Rocky Mountain piedmont to the Rio Grande Valley; west in New Mexico, northeast Arizona (Apache County), and southwest Colorado to the headwaters of the San Juan River. Plants of the Missouri milkvetch are common in the shortgrass prairies of the plains states from Canada south to Texas and New Mexico. Eastern portions of its distribution in western Iowa are along the Missouri River bluffs, which support other plains species in those peculiar habitats. Not uncommonly, white-flowered specimens grow intermixed with the usual bright pink-purple ones.

Astragalus moencoppensis M. E. Jones (Moenkopi Wash) Moenkopi milkvetch. Slender, caulescent perennial, 9–60 cm tall, from a branching caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** erect or ascending, commonly shorter than the longest peduncles, numerous and forming clumps. **LEAVES** 4–16.5 cm long; leaflets 5–15, 2–23 mm long, 0.3–2 mm wide, filiform to linear or narrowly elliptic, acute to obtuse, the terminal often continuous with the rachis, strigose below, glabrous on the involute upper surface; stipules 1.5–7 mm long, at least some connate-sheathing. **INFL** a raceme, 6- to 34-flowered, the flowers ascending at anthesis, the axis 3–25 cm long in fruit; bracts 1.5–3.5 mm long; pedicels 0.3–2 mm long; bracteoles 0–1; peduncle 4–25 cm long. **FLOWERS** 8–11 mm long, pink-purple, the banner recurved through about 45°; calyx 5–7.5 mm long, the tube 3–4 mm long, campanulate, white-pilose, the teeth 1.8–3.5 mm long, lance-subulate. **PODS** ascending-spreading, sessile, ovoid to ellipsoid, 6–7 mm long, 2.3–3.4 mm thick, strigulose, unilocular. |*Cnemidophacos moencoppensis* (M. E. Jones) Rydb.|. Salt desert shrub, mixed desert shrub, and piñon-juniper communities, usually in saline, silty or clay, seleniferous soils. ARIZ: Nav; UTAH. 1340–2165 m (4390–7100'). Flowering: May–Jul. Southern Utah and adjacent Arizona. The Moenkopi milkvetch is a primary selenium indicator of distinctive mien and odor. The very elongate racemes of small pink-purple flowers borne on a sparsely foliose stem is diagnostic for this species. The odor is that of selenium, though it is not as strong as in some other selenophytes.

Astragalus mollissimus Torr. (referring to the vesture being very soft) Woolly locoweed. Perennial, acaulescent to subacaulescent, mainly 10–30 cm tall, from a taproot and superficial root crown. **PUBESCENCE** basifixed, villous-tomentose. **STEMS** when caulescent composed of several short internodes, up to 2 cm long, forming clumps. **LEAVES** (3) 6–26 cm long; leaflets 11–35, 3–45 mm long, suborbicular, ovate, obovate, or rhombic-elliptic, often thick-textured, pubescent on both sides; stipules 3–17 mm long, all distinct. **INFL** a raceme, (5) 7–45-flowered, the axis (0.5) 1–17 cm long in fruit; bracts 2.5–10 (12) mm long; pedicels 0.5–3 mm long; bracteoles commonly 0 (2); peduncle (1.5) 3–25 cm long. **FLOWERS** 12–24.5 mm long, pink-purple, dull pinkish lavender, yellowish suffused with lilac, or creamy white, the banner recurved through about 30°; calyx (6.8) 8–14 (15.3) mm long, the tube (4.5) 5–10 (11.2) mm long, cylindric to deeply campanulate, villous-tomentose, the teeth (1.7) 2–5.5 (6.8) mm long, lanceolate to subulate or subulate-setaceous. **PODS** spreading or ascending, commonly humistrate, the body obliquely ovate, lance-elliptic, lunate, or linear-oblong in outline, 9–25 mm long, 4–13 mm in diameter, sometimes decidedly inflated but never bladdery, terete when narrow, obcompressed and shallowly sulcate along both sutures when broad, nearly straight to incurved through 90° or slightly more, fleshy, stiffly papery, leathery, or subligneous, glabrous, strigose, or villous-tomentose, bilocular; ovules (12) 20–37 (41). The *mollissimus* complex has been variously interpreted as belonging to several species, combined in varietal status under one or more species, or split into species each with segregate varieties, and with peripheral taxa still represented at specific rank (Isely 1998). The present treatment follows Barneby (1964a), wherein the overall similarity of the included taxa seems to be best represented. Leaves used as a ceremonial emetic by Navajos.

1. Raceme (5) 7- to 12-flowered; peduncle mainly recurved in fruit; pod broadly ovoid, 12–18 mm long, 7–13 mm in diameter, shortly conic-beaked; longest hairs of calyx and herbage 1–2 mm long; plants of northwest New Mexico (Santa Fe to McKinley County) ..... **var. *matthewsii***

1′ Raceme (10) 12- to many-flowered; peduncle mainly erect or ascending in fruit; if of northwestern New Mexico either the pod less than 7 mm in diameter and the longest hairs of the calyx and herbage up to 2–3.5 mm long, or the pod strongly beaked and the beak unilocular; plants of various or other distribution ..... (2)

2. Pod mostly turgid, ovoid, the beak unilocular; plants of the Colorado Basin west through southern Utah to eastern Nevada ..... **var. *thompsoniae***

2′ Pod solid or nearly so, narrowly oblong- or lance-ellipsoid, 3–8 mm in diameter, the beak fully bilocular; plants of other distribution ..... **var. *bigelovii***

var. *bigelovii* (A. Gray) Barneby ex B. L. Turner (for John Milton Bigelow, botanist with the Whipple Expedition of 1853–1855). Bigelow's woolly locoweed. Shortly caulescent. **LEAVES** 9–26 cm long; leaflets (13) 19–27, 6–25 mm long, ovate, obovate, oval, or broadly elliptic, obtuse or subacute; stipules large and conspicuous, 6–20 mm long. **INFL** an oblong raceme, rather densely (15) 20–45-flowered, the flowers subcontiguous or interrupted proximally, the axis (4) 5–11 cm long in fruit; peduncle (5) 8–22 cm long. **FLOWERS** 17–22.5 mm long, 9–11.5 mm wide, pink-purple; calyx 10.5–13.5 cm long, the tube (8) 8.3–10.3 mm long, (3.2) 4–5.2 mm in diameter, the teeth (1.7) 2.6–4.4 mm long. **PODS** 10.5–13.5 cm long, the tube (8) 8.3–10.3 mm long, (3.2) 4–5.2 mm in diameter, the teeth (1.7) 2.6–4.4 mm long. **PODS** ovoid-acuminate or lance-ellipsoid, gently incurved or nearly straight, 1–1.5 cm long, (4) 4.5–8 mm in diameter, sometimes a little turgid, the stiffly papery or leathery valves densely villous-tomentulose, the longest hairs up to 1–1.6 mm long, the beak bilocular; ovules 20–31. $n = 11$. [*A. bigelovii* A. Gray; *Tragacantha bigelovii* (A. Gray) Kuntze; *A. bigelovii* var. *typicus* Barneby]. Dry plains and foothills, in desert- or mesquite-grassland, sometimes among junipers, apparently most abundant on calcareous soils but also in sandy loams of various origins and occasionally on basalt gravel, especially common on overgrazed and badly eroded cattle ranges. ARIZ: Apa; NMEX: San. 1225–1840 (rarely up to 2305) m (4025–6040′; 7560′). Flowering: Mar–Jun (also as early as Jan). Isely (1998) regards this at species level and includes within it the vars. *marcidus*, *matthewsii*, and *mogollonicus*, primarily on the basis of the completely bilocular pods.

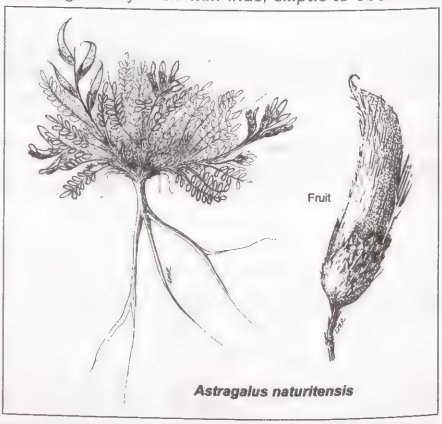
var. *matthewsii* (S. Watson) Barneby (for Washington Matthews, ethnobotanist and archaeologist; U.S. Army surgeon at Fort Wingate) Matthews woolly locoweed. Acaulescent or nearly so. **STEMS** not over 1.5 cm long, concealed by imbricated stipules. **LEAVES** (3) 5–12 cm long; leaflets 11–23, 3–12 mm long, obovate; stipules (3) 4–8 mm long. **INFL** a raceme, (5) 7–12-flowered, the axis (0.5) 1–4.5 cm long in fruit, not or scarcely surpassing the foliage; peduncle scapiform, (1.5) 2.5–8 cm long. **FLOWERS** 18.5–22.5 mm long, pale purple; calyx 10–13 mm long, the tube 7–8.6 mm long, 3.4–4.7 mm in diameter, the teeth 2.4–5.2 mm long. **PODS** broadly and plumply ovoid, widest near the obtuse or truncate base, 12–18 mm long, turgid and 7–13 mm in diameter, gently or rather abruptly incurved distally into the conical, obscurely compressed, fully bilocular beak; ovules 24–31. [*A. matthewsii* S. Watson; *A. bigelovii* A. Gray var. *matthewsii* (S. Watson) M. E. Jones]. Open slopes and hilltops, mostly in ponderosa pine forest, but descending along

canyons into the juniper-piñon belt, in light sandy or gravelly, sedimentary, granitic, or volcanic soils. ARIZ: Apa; NMEX: McK, San, SJn. 1735–2285 m (5700–7500'). Flowering: Apr–Jun. Uncommon and scattered in the mountains of the Four Corners region.

var. *thompsoniae* (S. Watson) Barneby (for Ellen P. Thompson, sister of Capt. John W. Powell) Thompson's woolly locoweed. Perennial, acaulescent, 6–45 cm tall, from a caudex. **PUBESCENCE** basifixed. **STEMS** mostly obscured by stipules. **LEAVES** 2–28 cm long; leaflets 15–35, 2–18 mm long, 1–14 mm wide, obovate to suborbicular or elliptic, obtuse to retuse or acute, densely woolly-tomentose on both sides; stipules 4–13 mm long, all distinct. **INFL** a raceme, 7–25-flowered, the flowers ascending at anthesis, the axis 1.5–18 cm long in fruit; bracts 2.5–8 mm long; pedicels 0.5–3 mm long; bracteoles 0–1; peduncles 2.5–24 cm long. **FLOWERS** 18–25 mm long, pink-purple; calyx 11–15.5 mm long, the tube 7.7–13 mm long, cylindric, villous, the teeth 2–4.2 mm long, subulate. **PODS** descending, sessile, ovoid, 11–23 mm long, 6–11 mm thick, curved, densely villous-tomentose, bilocular; ovules 28–38. [*A. thompsoniae* S. Watson; *Tragacantha thompsoniae* (S. Watson) Kuntze; *A. bigelovii* A. Gray var. *thompsoniae* (S. Watson) M. E. Jones; *A. syrticola* E. Sheld.]. Salt desert shrub, mixed desert shrub, grassland, and piñon-juniper communities; typically in sandy substrates. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. (760) 1340–2345 m (4400–7690'). Flowering: Mar–Jun (Dec). The variety apparently is transitional to var. *matthewsii* in northwestern New Mexico. It is regarded at specific rank by Isely (1998).

Astragalus monumentalis Barneby (of Monument Valley) Monument Valley milkvetch. Perennial, acaulescent or subacaulescent, 3–18 cm tall, from a branching caudex. **PUBESCENCE** basifixed or shortly malpighian. **STEMS** 1–6 cm long, ascending, the internodes commonly concealed by stipules. **LEAVES** 1.5–8 (11) cm long; leaflets oblanceolate, strigulose beneath, glabrous or glabrate above; stipules 2–4 mm long, all distinct. **INFL** a raceme, 3- to 9-flowered, the flowers ascending at anthesis, the axis 0.5–7 cm long in fruit; bracts 1.5–5 mm long; pedicels 0.8–2.2 mm long; bracteoles 0; peduncle 1–12 cm long. **FLOWERS** 8–9 mm long, pink-purple; calyx 3.6–4.5 mm long, the tube 3.1–3.5 mm long, campanulate, strigose, purplish, the teeth 0.5–1 mm long. **PODS** ascending, sessile or nearly so, narrowly oblong to lanceolate in outline, 12–21 mm long, 2.3–3 mm wide, straight or curved, triangular in cross section, the dorsal suture sulcate, strigose, bilocular, often mottled. Rimrock and other slickrock sites on Cutler and Cedar Mesa Sandstone formations in mixed desert shrub and piñon-juniper communities. ARIZ: Nav; UTAH. 1215–1900 m (3995–6235'). This is a mirror image congener of *A. cottamii*, differing in its smaller floral parts and overall flower size, and in the incipient malpighian pubescence.

Astragalus naturitensis Payson (of Naturita, Colorado) Naturita milkvetch. Perennial, subacaulescent, 4.5–16 cm tall, from a taproot and superficial caudex, the branches clothed with persistent leaf bases. **PUBESCENCE** basifixed, loosely strigulose. **LEAVES** 1.5–7 cm long; leaflets 9–17, 2–8 mm long, mainly 1–2.5 mm wide, elliptic to obovate or oblanceolate, mostly obtuse, strigulose on both sides or glabrescent above; stipules 2–7 mm long, distinct. **INFL** a raceme, 3–8 (11)-flowered, the axis 0.5–2.5 cm long in fruit; pedicels 0.7–1.8 mm long; bracteoles 0; peduncle 1–6.5 cm long, shorter than the leaves. **FLOWERS** (11.2) 13–15.5 mm long, bicolored, the banner whitish or suffused or lined with lilac, the wing and keel tips purple; banner recurved through about 40°; calyx 5–7.4 mm long, the tube cylindro-campanulate, strigulose, 4–6.2 mm long, the teeth 1–1.5 (2) mm long, triangular-subulate. **PODS** ascending (humistrate), sessile on a gynophore to 0.8 mm long, deciduous from the receptacle, obliquely ellipsoid, 13–22 mm long, 4–6 mm wide, incurved, dorsiventrally compressed to more or less trigonous, the dorsal suture depressed but not inflexed as even a partial partition, usually red-mottled, the valves coriaceous, strigulose, unilocular; ovules 22–31. [*A. arietinus* M. E. Jones var. *stipularis* M. E. Jones; *A. stipularis* M. E. Jones].



Astragalus naturitensis

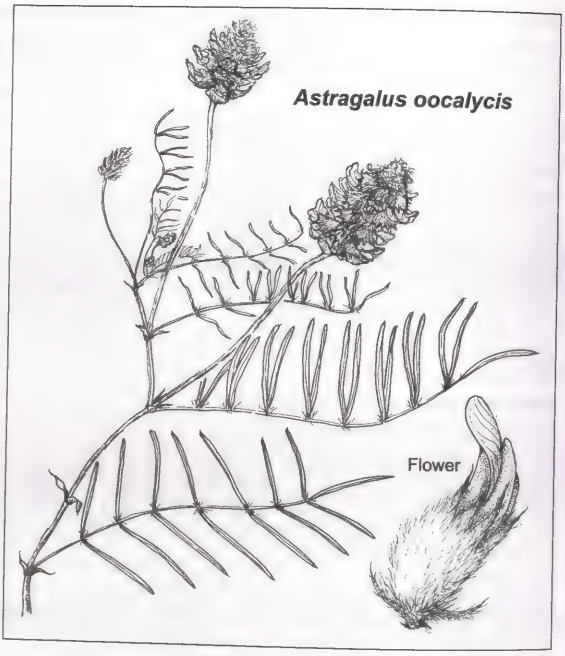
Sandstone outcrops in sagebrush and piñon-juniper communities. COLO: Mon; NMEX: McK; UTAH. 1660–2050 m (5445–6730'). Flowering: Apr–Jun. West-central Colorado (valleys of the Colorado and Dolores rivers and McElmo Creek; Mesa, Montrose, and Montezuma counties); San Juan County, Utah, and McKinley County, New Mexico. The flowers of the New Mexico materials average smaller than for the species as a whole but seem not to differ otherwise.

Astragalus newberryi A. Gray (for Dr. John Strong Newberry, geologist and naturalist) Newberry's milkvetch. Perennial, acaulescent, 2–12 cm tall, from a taproot and superficial caudex, the branches commonly clothed with a thatch of persistent leaf bases. **PUBESCENCE** basifixed, silky pilose. **LEAVES** 1.5–14 (15) cm long; leaflets (1) 3–15, 3–20 mm long, 2–14 mm wide, obovate to elliptic, oblanceolate, or orbicular, acute to obtuse or retuse, villous-tomentulose on both surfaces; stipules (2.5) 4–11 mm long, all distinct. **INFL** a raceme, 2- to 8-flowered, the flowers ascending, the axis 0.2–2.7 cm long in fruit; bracts 3.5–10 mm long; pedicels 1.4–5 mm long; bracteoles 0–2; peduncle 0.5–11 cm long, shorter than the leaf. **FLOWERS** 14–32 mm long, pink-purple or less commonly whitish with purple keel tip, the banner recurved through about 40°; calyx 11–14.5 mm long, the tube 9–11 mm long, cylindric, villous, the teeth 1.5–4 mm long, subulate to lanceolate. **PODS** ascending (humistrate), obliquely ovoid, curved, (13) 18–28 (36) mm long, 7–13 (17) mm thick, obcompressed, fleshy, thinly hirtellous to densely villous-tomentose, unilocular; ovules 27–40 (46). $n = 11$. [*Xylophacos newberryi* (A. Gray) Rydb.; *A. newberryi* var. *typicus* Barneby; *A. eriocarpus* S. Watson; *Tragacantha watsoniana* Kuntze; *A. newberryi* var. *escalantinus* Barneby]. Sagebrush, rabbitbrush, matchweed, juniper-piñon, shadscale, galleta communities in clays, sands, and gravels. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. (650) 1525–2350 m (5000–7710'). Flowering: Apr–Jun. Our material belongs to **var. *newberryi***. Utah, Arizona, and New Mexico.

Astragalus nidularius Barneby (like a bird's nest, referring to the many incurved and entangled branches and branchlets) Birds-nest milkvetch. Perennial, caulescent, 15–51 cm tall, from a subterranean caudex; pubescence basifixed. **STEMS** ascending to erect, often branched, subterranean for a space of 3–14 cm or more. **LEAVES** 1.5–7 cm long; leaflets 5–11 (13), 2–20 (25) mm long, 1.3–2 mm wide, linear to oblong, obtuse to emarginate or acute, the terminal leaflet of upper leaves continuous with the rachis, pubescent on both sides or glabrous above stipules 1–6 mm long, at least some connate-sheathing. **INFL** a raceme, (3) 8- to 33-flowered, the flowers rather widely spaced along the rachis, ascending to declined at anthesis, the axis 1.5–28 cm long in fruit; bracts 1.2–2.2 mm long; pedicels 1.2–3 mm long; bracteoles 0–2; peduncle 4–16 (28) cm long. **FLOWERS** 10–15 mm long, pink-purple, the banner reflexed through about 30°–45°; calyx 3.8–7 mm long, the tube 3.3–5.5 mm long, campanulate, strigose, the teeth (0.5) 1–2.2 mm long, subulate. **PODS** pendulous, stipitate, the stipe 3.5–6 mm long, the body narrowly oblong, 20–32 mm long, 3.5–4.5 mm thick, dorsoventrally compressed, strigose, unilocular; ovules (16) 20–26. Piñon-juniper and mixed desert shrub communities. ARIZ: Nav. 1655 m (5425'). Flowering: May–Jun. Utah, in San Juan, Garfield, and Wayne counties. The species is appropriately named, the plants having the appearance of an untidy bird's nest due to the entangled interlocking branches forming rounded clumps overtopped by the flowering racemes.

Astragalus nuttallianus DC. (for Thomas Nuttall, 1786–1859) Small-flowered milkvetch. Annual or winter-annual, caulescent, 3–18 (25) cm long, from a slender taproot and superficial root crown. **PUBESCENCE** basifixed, subglabrous, thinly strigulose, villosulous, or pilose. **STEMS** erect, ascending, prostrate, or decumbent. **LEAVES** 1.5–4.5 (6.5) cm long, dimorphic, those of the lower ones obovate or oblong, retuse or emarginate to obcordate, those of the upper ones mostly longer, oblanceolate, elliptic, or linear-oblong, all or at least the lateral ones obtuse to subacute, the terminal sometimes emarginate; leaflets (5) 7–19 (23), 2–14 (17) mm long, linear-elliptic to obcordate, acute to retuse, flat, pubescent beneath, glabrous or pubescent above; stipules (1) 1.5–6 (9) mm long, mostly herbaceous, all distinct. **INFL** a raceme, (1) 3- to 7-flowered, the axis not over (0) 0.5–2 cm long, the flowers ascending to declined, the axis 0–3 cm long (commonly less than 2 cm); bracts 0.5–2.5 mm long; pedicels 0.4–1.6 mm long; bracteoles 0 or 1; peduncle (1.5) 2.5–5.5 (6.5) cm long, typically surpassing the leaf. **FLOWERS** 3.7–10 (13) mm long, whitish, lilac, or pink-purple, the banner recurved through 40°–45°; calyx 3.4–4.7 mm long, loosely strigulose, the tube 2–2.8 mm long, the teeth (1.2) 1.5–2.2 (2.5) mm long. **PODS** ascending, spreading, or declined, rather hamately curved, the body linear or linear-oblanceolate in profile, (12) 14–20 mm long, 2.1–3.3 mm thick, triquetrous, glabrous, strigulose, or villosulous, bilocular; ovules 12–18. [substitute name for *A. micranthus* Nutt.]. Mixed salt desert and desert shrub, sagebrush, and piñon-juniper communities. ARIZ: Apa, Coc; COLO: Arc, LPl, Mon; NMEX: McK, SJn; UTAH. (1070) 1160–2025 m (3515'; 3800–6650'). Flowering: Apr–Jun. In the south and southeast portions of the Colorado Basin, from Grand Canyon, Arizona (also Apache County), San Juan County, Utah, and southwest Colorado, to the Rio Grande Valley, north-central New Mexico, and to the Arkansas River, southeast Colorado. San Juan River drainage material belongs to **var. *micranthiformis*** Barneby (small-flowered form).

Astragalus oocalycis M. E. Jones (with egg-shaped calyx) Arboles milkvetch. Coarse, caulescent perennial, (15) 25–40 cm tall, from a branching caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** erect or ascending, several to numerous, forming bushy clumps. **LEAVES** 5–15 (17) cm long; leaflets (9) 19–27, 3–35 mm long, linear- or linear-oblong, acute, or obtuse and mucronate, glabrous or glabrate above; stipules 2.5–6 mm long, at least the lowermost connate-sheathing.



INFL a raceme, 35- to 60-flowered, the flowers nodding at anthesis, the axis 4–8 (11) cm long in fruit; bracts 3–8 mm long; pedicels 2–5 mm long; bracteoles 0–2; peduncle 9–17 mm long. **FLOWERS** 14–17 mm long, ochroleucous, the banner recurved about 45°; calyx 10–11 mm long (accrescent to 14 mm long and 11 mm wide in fruit), finally ovoid and contracted apically, hirsute with long straight hairs, the teeth 2–3 mm long, subulate. **PODS** sessile on a stipelike gynophore about 1 mm long, included within the calyx, the body of the pod 6–7 mm long, about 3.5 mm thick, strongly obcompressed, bisulcate, the valves glabrous, unilocular. $2n = 24$. [*Diholcos oocalycis* (M. E. Jones) Rydb.; *Cnemidophacos urceolatus* Rydb.]. Knolls, hillsides, and plains in sagebrush and piñon-juniper communities; usually in seleniferous soils of the San Jose Formation. COLO: Arc, LPl; NMEX: RAr, SJn. 1925–2070 m (6320–6800'). Flowering: May–Jul. A Four Corners endemic. The Arboles milkvetch is one of the most distinctive species of North American *Astragalus*. Its most striking characteristic is its greatly inflated calyx, densely hairy with cream-colored hairs. The numerous flowers are sessile or subsessile, the inflorescence becoming thereby a massive, cylindroid, spiciform head. The greatly inflated, accrescent calyx enclosing the small, few-seeded pod is unmatched in the genus in North America.

Astraglus oophorus S. Watson (egg-bearing, for the large pods) Egg milkvetch. Perennial, caulescent, 15–30 cm tall, from a caudex; pubescence basifixed. **STEMS** decumbent to ascending, radiating from the caudex; stipules 1.5–7 mm long, all distinct. **LEAVES** 3–21 cm long; leaflets 9–25, 3–20 mm long, 2–11 mm wide, oval to obovate or orbicular, obtuse to retuse or mucronate, glabrous on both surfaces, often ciliate. **INFL** a raceme, 4- to 13-flowered, the flowers spreading at anthesis, the axis 1–8 cm long in fruit; bracts 1.5–5 mm long; pedicels 2–6 mm long; bracteoles 0–1; peduncles 4–13 cm long. **FLOWERS** 17–24 mm long; calyx 6–12 mm long, tube 4–8.5 mm long, cylindric or short-cylindric, glabrous or sparingly strigose, the teeth 2–5 mm long, subulate; petals ochroleucous or concolorous (ours). **PODS** spreading to pendulous, stipitate, the stipe (gynophore) 3.5–12 mm long, the body bladdery-inflated, ellipsoid, 25–55 mm long, 10–30 mm wide (when pressed), glabrous, unilocular, often mottled; ovules 28–54. $2n = 24$. Sagebrush, piñon-juniper, and mountain-brush communities. COLO: Arc, Mon. 1830–2110 m (6000–7000'). Flowering: May–Jun. Fruit: Jun–Jul. Our material belongs to **var. *caulescens*** (M. E. Jones) M. E. Jones (not fully with stem). [*A. megacarpus* (Nutt.) A. Gray var. *caulescens* M. E. Jones; *A. artipes* A. Gray; *Phaca artipes* (A. Gray) Rydb.; *A. oophorus* var. *artipes* (A. Gray) M. E. Jones]. Colorado, Arizona, and Nevada. The bladdery-inflated pods of *A. oophorus* are diagnostic.

Astragalus pattersonii A. Gray (for H. N. Patterson of Oquawka, Illinois, newspaper printer and plant collector) Patterson's milkvetch. Perennial, caulescent, 20–45 (50) cm tall, from a branching caudex. **STEMS** decumbent to ascending or erect. **LEAVES** 5–13 cm long; leaflets 7–15 or more, 6–38 mm long, 3–16 mm wide, elliptic to lanceolate, oblanceolate, or obovate, obtuse to acute, retuse, or mucronate, strigose to glabrous on both sides; stipules 3–8 mm long, all usually distinct. **INFL** a raceme, 6- to 24-flowered, the flowers declined-nodding at anthesis, the axis 2–15 cm long in fruit; bracts 2–8 mm long; pedicels 1–4.5 mm long; bracteoles 2; peduncle 3–18 cm long. **FLOWERS** 14–22 mm long, white, concolorous or the keel tip faintly purplish; calyx 8.8–14.2 mm long, the tube 6–8.8 mm long, cylindric, gibbous, pale tan or whitish, colored like the petals, thinly strigulose, the teeth 2.3–6.5 mm long, subulate. **PODS** erect, sessile, cylindric to ellipsoid or ovoid, 17–35 mm long, 6–10 mm thick, glabrous or puberulent, unilocular; ovules 22–38. $2n = 24$. [*Rydbergiella pattersonii* (A. Gray) Fedde; *Jonesiella pattersonii* (A. Gray) Rydb.]. Piñon-juniper and mixed

desert shrub communities, often on fine-textured, seleniferous substrates. COLO: Arc, LPl, Mon; NMEX: SJn; UTAH. 1260–2285 m (4130–7500'). Flowering: May–Jul. Colorado; Uinta Mountains, Utah; and Coconino County, Arizona. Plant used for ear and eye medicine, sore throats, and as an emetic by Navajos.

Astragalus praelongus E. Sheld. (very tall) Stinking milkvetch. Perennial, caulescent, 1–9 dm tall, from a branching superficial caudex. **PUBESCENCE** basifixed. **STEMS** erect or ascending, forming clumps. **LEAVES** 3–22 cm long; leaflets 7–33, 3–50 mm long, 2–24 mm wide, obovate, elliptic, oblong, lanceolate, or oblanceolate, obtuse or retuse to acute, sparingly strigose beneath, glabrous above; stipules 2.5–9 mm long, all distinct. **INFL** a raceme, 10- to 33-flowered, the flowers deflexed at anthesis, the axis 3–16 cm long in fruit; bracts 1–7 mm long; pedicels 1–7 mm long; bracteoles 2; peduncle 4–26 cm long. **FLOWERS** 15–24 mm long, ochroleucous, the keel often faintly purplish-tipped; calyx 5.8–14 mm long, the tube 4.4–7.5 mm long, cylindric, gibbous, glabrous, or thinly strigose, green or yellowish, usually differently colored than the petals, the teeth 0.3–6 mm long, subulate. **PODS** erect to declined, sessile, subsessile, or stipitate, inflated, ellipsoid, ovoid, obovoid, or subglobose, 18–42 mm long, 5–25 mm thick, usually straight, glabrous or puberulent, subunilocular, leathery-woody; ovules 40–75. $n = 12$. [*A. procerus* A. Gray, not Boiss. & Hausskn. 1872; *A. pattersonii* A. Gray var. *praelongus* (E. Sheld.) M. E. Jones; *Phacopsis praelongus* (E. Sheld.) Rydb.; *Rydbergiella praelonga* (E. Sheld.) Fedde & P. Syd.; *Jonesiella praelonga* (E. Sheld.) Rydb.]. Leaves used as a ceremonial emetic by Ramah Navajos.

1. Pods long-stipitate, the stipe 4–8 mm long. ..... ***var. lonchopus***
1' Pods sessile or short-stipitate, the stipe, when present, less than 3 mm long ..... (2)

2. Pods narrowly elliptic to oblong, 6–10 mm thick; plants of Rio Arriba and McKinley counties, New Mexico ..... ***var. ellisiae***
2' Pods broadly oblong to elliptic, 10–15 mm thick; plants of Apache County, Arizona, and San Juan County, New Mexico ..... ***var. praelongus***

var. *ellisiae* (Rydb.) Barneby (for Charlotte Cortland Ellis, nurse and plant collector) Ellis' milkvetch. [*Jonesiella ellisiae* Rydb.]. Clay soil, commonly on Mancos Shale, Moenkopi, and Chinle formations, but also on alluvial substrates containing selenium, in warm and salt desert shrub and piñon-juniper communities. NMEX: McK, RAr, SJn. 1945–2165 m (6380–7100'). Flowering: Apr–Jul. Relatively widespread from southern Utah, western Colorado, and in New Mexico and adjacent Texas. The Ellis' stinking milkvetch passes by degree to var. *praelongus* especially. Flowering specimens are difficult, if not impossible, to assign to a given variety. The type was collected in the Sandia Mountains, near Tijeras, Bernalillo County, New Mexico, on 30 Apr 1914, by Charlotte Cortland Ellis. Some specimens from adjacent Torrence County (*K. Heil 7585, 7626* SJC!) have very slender pods, tapering to the base (not truly stipitate) and a sulcate dorsal suture. Such specimens were noted briefly by Barneby (1964a: 588), who evidently failed to assign significant taxonomic value.

var. *lonchopus* Barneby (with long stipe) Longstipe milkvetch. Seleniferous fine-textured substrates in blackbrush, mixed desert shrub, and piñon-juniper communities. ARIZ: Apa, Nav; COLO: Mon; NMEX, McK, SJn; UTAH. 1160–2380 m (3800–7805'). Flowering: late Apr–Jul. A Colorado Plateau endemic. Canyons of the Colorado and San Juan rivers.

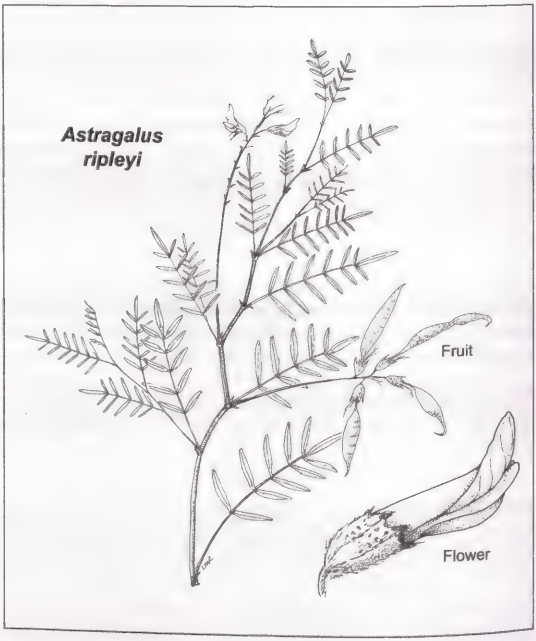
var. *praelongus* Clay and silt of the Mancos Shale, Moenkopi, and Chinle formations, and other seleniferous soils, in salt desert shrub and piñon-juniper communities. ARIZ: Apa; COLO: Mon; NMEX: McK, RAr, SJn; UTAH. 1630–2455 m (5350–8050'). Flowering: Apr–Jul. New Mexico, Arizona, southwest Colorado, southern Utah, and adjacent Nevada. The type variety of stinking milkvetch demonstrates great variation.

Astragalus preussii A. Gray **CP** (for Charles Preuss, artist with Captain Frémont) Preuss' milkvetch. Perennial or annual, caulescent, mostly 12–45 (50) cm tall, from a woody superficial caudex. **PUBESCENCE** basifixed; stems erect or ascending, forming clumps. **LEAVES** 3.5–13 cm long; leaflets 7–25, 6–28 mm long, 1–6 mm wide, obovate or obcordate to oblong, narrowly elliptic, lanceolate, or linear, emarginate to rounded, obtuse, or acute, glabrous; stipules 2–7 mm long, all distinct. **INFL** a raceme, 3- to 22-flowered, the flowers ascending, the axis 1–20 cm long in fruit; bracts 1.5–4 mm long; pedicels 1–5.5 mm long; bracteoles 2; peduncle 2–15 cm long. **FLOWERS** 14–24 mm long, pink-purple, bicolored, or white; calyx 6.4–12.3 mm long, the tube 5.1–9.7 mm long, cylindric, thinly strigose, purple, the teeth 1.3–2.6 mm long, subulate. **PODS** erect to ascending, stipitate or subsessile, the stipe 2–7 mm long, the body oblong-ellipsoid, inflated, 12–34 mm long, 6–13 mm thick, glabrous or puberulent, stiffly papery to leathery, unilocular; ovules 20–44. $2n = 24$. Clay and silt of the Mancos Shale, Moenkopi, and Chinle formations, and other seleniferous soils, in salt desert shrub and piñon-juniper communities. ARIZ: Apa; NMEX: McK, SJn; UTAH. 1790–2085 m (5840–6850').

Flowering: Mar–Jun. Northeast Arizona, northwest New Mexico, and southern Utah. Four Corners material belongs to **var. *latus*** M. E. Jones (broad, referring to the pod) Shale milkvetch. [*A. preussii* var. *sulcatus* M. E. Jones].

Astragalus proximus (Rydb.) Wooton & Standl. (referring to the close relationship with *A. flexuosus*) Aztec milkvetch. Slender, caulescent perennial, 1.5–4.5 dm tall, from a branching, buried caudex. **PUBESCENCE** thinly strigulose, basifixed. **STEMS** erect or ascending, subterranean for a space of 1–8 cm, often branched below. **LEAVES** 2–8 cm long, all shortly petioled; leaflets 7–11, 6–22 mm long, linear, linear-oblanceolate, or filiform to narrowly oblong, obtuse, strigulose; stipules 1.5–4.5 mm long, at least the lowermost connate-sheathing. **INFL** a raceme, loosely (7) 12- to 40-flowered, the flowers spreading at anthesis, the axis 4–17 cm long in fruit; pedicels 0.5–1.8 mm long; bracteoles 0; peduncle 3–11 cm long. **FLOWERS** 6.1–7 mm long, whitish, the banner and keel tip lilac-tinged, the banner recurved through 45°–50°; calyx 2.5–3.5 mm long, the tube 1.8–2.5 mm long, campanulate, the teeth 0.6–1.5 mm long, subulate or some deltoid. **PODS** pendulous, stipitate, the stipe (1) 1.2–2 mm long, the body linear-ellipsoid, 10–15 mm long, 2.3–3.2 mm thick, obcompressed, the valves glabrous, unilocular; ovules 6–10. $n = 11$. [*Homalobus proximus* Rydb.; *Pisophaca proxima* (Rydb.) Rydb.]. Sandy, often saline substrates derived from sandstone, among junipers or sagebrush. COLO: Arc, LPl; NMEX: McK, RAr, SJn; UTAH. 1650–2255 m (5410–7400′). Flowering: late Apr–Jul. Northwest New Mexico and adjacent Colorado. The Aztec milkvetch is a close match for the partially sympatric *A. wingatanus* in general aspect and flower and pod size. The pods are, however, glabrous, obcompressed, and definitely stipitate. In *A. wingatanus* the pods are strigulose, laterally compressed, and mainly sessile (or only short-stipitate). They form a juxtaposed species pair.

Astragalus ripleyi Barneby (for Harry Dwight Dillon Ripley) Ripley's milkvetch. Robust, caulescent perennial, 40–70 cm tall, from a branching subterranean caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** erect or ascending, buried for a space of 2–10 cm. **LEAVES** 4–9 (11) cm long; leaflets 13–17 (19), linear or linear-elliptic to subfiliform, obtuse to acutish or truncate, the terminal one nearly always continuous with the rachis; stipules 1–5 mm long, all distinct. **INFL** a raceme, loosely (5) 15–45-flowered, the flowers declined and secund at anthesis, the axis 2–16 cm long in fruit; bracts 1–2 mm long; pedicels 2.3–7 mm long; bracteoles 0; peduncle (3.5) 6–12 (15) cm long. **FLOWERS** 13–17 mm long, pale lemon-yellow, concolorous, the banner recurved through about 35°; calyx 5.5–7 mm long, the tube 5–6.6 mm long, cylindric, strigose, purplish or whitish, the teeth 0.5–1.1 mm long, triangular-subulate. **PODS** pendulous, stipitate, the stipe 8–15 mm long, the body linear-oblong to lanceolate or narrowly elliptic in outline, (14) 20–33 mm long, (3.5) 4–6 mm wide, strongly laterally flattened, straight or only slightly curved, strigulose, subdiaphanous at maturity, unilocular; ovules 11–17. Sagebrush, rabbitbrush, piñon-juniper, ponderosa pine, Douglas-fir, and aspen communities. COLO: Arc. 1980 m (6500′). Flowering: Jun–Jul. Known from one location about 20 miles south of Pagosa Springs. The terminal leaflet in most leaves is continuous with the rachis, and the leaflets are glabrous above. These features, along with the laterally compressed pods and elongate fruiting pedicels, easily distinguish Ripley's milkvetch from the disjunct *A. schmolliae*. The smaller, lemon-yellow flowers and pod differences easily differentiate Ripley's milkvetch from the coarser, larger-flowered *A. lonchocarpus*.



Astragalus robbinsii (Oakes) A. Gray (for James Watson Robbins) Robbins' milkvetch. Slender to robust caulescent perennial, 10–40 (60) cm long, from a superficial or barely subterranean caudex. **PUBESCENCE** basifixed. **STEMS** (1)

1.5–4 (6) dm long, usually ascending, subterranean for 0–2 cm. **LEAVES** 3–12 cm long; leaflets (7) 9–13 (15), (5) 7–25 (32) mm long, strigulose beneath with subappressed or narrowly ascending-incumbent hairs to 0.2–0.6 mm long, or glabrate throughout; stipules 1.5–6 mm long, at least some of the lower ones connate-sheathing. **INFL** a raceme, (5) 7–20 (33)-flowered, the axis (2) 3–18 (20) cm long in fruit; peduncle (3.5) 4.5–16 (23) cm long. **FLOWERS** 5.2–8 mm long, pink-purple or less commonly ochroleucous and tinged with purple, the banner recurved 50°–70°. **POD** stipe (1) 1.5–5 (6.5) mm long, the body ellipsoid, (1) 1.3–2.5 cm long, 3.5–5.5 mm thick, obtusely trigonous, the valves loosely strigulose-pilosulous, the septum 0.2–1 (1.5) mm wide; ovules (6) 7–10. Our material belongs to **var. *minor*** (Hook.) Barneby (small) Small elegant milkvetch. [*Phaca elegans* Hook. var. *minor* Hook.; *A. minor* (Hook.) M. E. Jones; *A. blakei* Eggl.; *A. robbinsii* var. *borealis* Eggl.; *Atelophragma blakei* (Eggl.) Rydb.; *A. robbinsii* var. *blakei* (Eggl.) Barneby ex Gleason; *A. macounii* Rydb.; *Atelophragma macounii* (Rydb.) Rydb.; *Atelophragma collieri* Rydb.; *A. collieri* (Rydb.) A. E. Porsild]. Stream banks, meadows, thickets, and moraines in humus or alluvial soils. COLO: SJn. 2895–3290 m (9500–10800'). Flowering: Jun–Aug. Disjunct from east-central (and disjunctly southeast) Alaska, south-central Yukon, and Northwest Territories, south to northern (Tetsa River Valley) and southern British Columbia, Alberta, eastern Washington, Montana, high mountains of central Idaho, northwest Wyoming, Utah (Summit County), and high mountains of central and southwest Colorado, and east to northern and central Vermont (Mount Mansfield; Willoughby Mountain; Pond Mountain, Wells, Rutland County), and St. John River, northern Maine, and in Cumberland County, Nova Scotia. The materials forming this variety are highly variable not only throughout but on an individual population basis. Variation involves great diversity in stature, in length of peduncle, fruiting raceme, and pods, and in number of flowers. The extremes serve to entice the taxonomist into recognition of subordinate taxa within this variety with its enormous geographical range. Such segregation, even though some of the populations are widely disjunct and more or less distinctive, appears to be unnecessary.

Astragalus sabulonum A. Gray (of coarse sands and gravels) Gravel milkvetch. Annual, winter-annual, or biennial, caulescent, 4–35 (42) cm tall or long, radiating from a root crown. **PUBESCENCE** basifixed, villous-hirsutulous. **STEMS** decumbent to ascending, rarely erect. **LEAVES** 1.5–7 cm long; leaflets (5) 9–15, 2–13 mm long, 1–5 mm wide, oblanceolate to oblong or obovate, retuse to truncate or obtuse, loosely villous on both surfaces or glabrate above; stipules 1–4 mm long, all distinct. **INFL** a raceme, 2–7-flowered, the flowers ascending-spreading at anthesis, the axis 0.3–2.5 cm long in fruit; bracts 1–2.5 mm long; pedicels 0.8–2 mm long; bracteoles 0; peduncle 0.5–4 cm long. **FLOWERS** 6.2–8 mm long, pink-purple or less commonly ochroleucous and tinged with purple; calyx 3.3–6.2 mm long, the tube 1.8–2.5 mm long, campanulate, hirsutulous, the teeth 1.8–3.5 mm long, subulate. **PODS** spreading-declined, sessile, obliquely ovoid, inflated, 9–17 (20) mm long, (4) 5–8 (11) mm thick, curved, thinly fleshy, green or purple-checked or -dotted, white-hirsutulous, unilocular; ovules 10–19. $2n = 24$. [*Phaca sabulonum* (A. Gray) Rydb.; *A. virgineus* E. Sheld.; *Phaca arenicola* Rydb.; *Phaca lerdoensis* Rydb.]. Warm desert shrub, mixed cool desert shrub, salt desert shrub, and lower piñon-juniper communities; often in sandy substrates. ARIZ: Apa, Nav; NMEX: McK, SJn; UTAH. 1095–1870 m (3600–6140'). Flowering: Feb–Jul. In the southeast counties of Utah (Emery County southward); northwest New Mexico; across northern Arizona; Clark, Esmeralda, Lincoln, Mineral, and Nye counties, Nevada; Riverside and Imperial counties, California; and Sonora. Though sometimes mistaken, because of the hirsutulous pod and occasional low growth, for *A. desperatus*, it is easily distinguished by being caulescent.

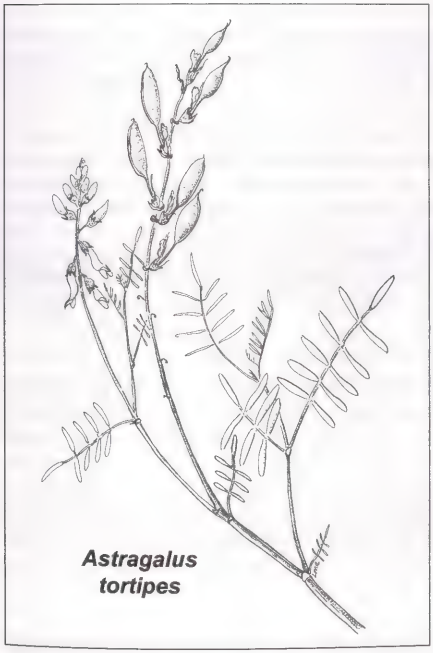
Astragalus schmolliae Ced. Porter (for Hazel Marguerite Schmoll, who botanized in southwest Colorado) Schmoll's milkvetch. Robust, caulescent perennial, 30–70 cm tall, from a branching, shallowly subterranean caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** erect or ascending, buried for a space of 2–10 cm. **LEAVES** 4–10 (11) cm long; leaflets (7) 11–21, linear or linear-oblong to -elliptic, obtuse to retuse, pubescent on both surfaces, all articulate; stipules 2–7 mm long, all distinct. **INFL** a raceme, loosely (7) 10- to 28-flowered, the flowers declined and secund at anthesis, the axis (2.5) 4.5–20 cm long in fruit; bracts 1.5–3 mm long; pedicels 1–2.5 mm long; bracteoles 0–2; peduncle 9–21 cm long. **FLOWERS** 14.5–18 mm long, ochroleucous, concolorous, the banner recurved through about 45°; calyx 6–7.5 mm long, the tube (5) 5.5–6 mm long, cylindric, strigose, the teeth 1–1.7 mm long, triangular-subulate. **PODS** pendulous, stipitate, the stipe 5–10 (12) mm long, the body linear-oblanceolate in outline, straight or evenly to hamately curved, (25) 30–40 mm long, 3.5–5 mm thick, dorsally compressed, triquetrous, strigulose, unilocular; ovules 18–20. [*A. platycarpus* (Rydb.) Barneby var. *montezumae* Barneby]. Piñon-juniper community, Cliff House Sandstone member of the Mesa Verde Group. COLO: Mon; on Chapin Mesa, Mesa Verde National Park. 1690–2145 m (5545–7045'). Flowering: May–Jun. A Four Corners endemic. Schmoll's milkvetch is locally common on Chapin Mesa in the near vicinity of Mesa Verde National Park headquarters and is easily seen when in full anthesis, growing among the low trees of the piñon-juniper forest.

Astragalus scopulorum Porter (of craggy rocks, symbolizing the Rocky Mountains) Rocky Mountain milkvetch. Moderate, caulescent perennial, 15–48 (65) cm tall, from a subterranean caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** decumbent to ascending, several to many, radiating from the caudex, buried for a space of 3–13 cm. **LEAVES** 1.5–8.5 cm long; leaflets (13) 15–29 (35), 2–19 mm long, 1–8 mm wide, oblong to elliptic or oblanceolate, some narrowly so, acute to obtuse or mucronate, thinly strigose to glabrous beneath, glabrous above, thinly ciliate; stipules 3–9 mm long, at least the lowermost ones connate-sheathing. **INFL** a raceme, 4–22-flowered, the flowers declined to nodding at anthesis, the axis 1–7 cm long in fruit; bracts 1.5–7 mm long; pedicels 1–4 mm long; bracteoles 0–2; peduncle 2–14 cm long. **FLOWERS** 18–24 mm long, ochroleucous, concolorous or the keel faintly purplish, the banner incurved through 80°–95°; calyx 9–11.5 (14) mm long, the tube 6.5–8.5 mm long, subcylindric, strigulose, the teeth 1.5–4 (6) mm long, subulate. **PODS** pendulous, stipitate, the stipe 4–9 mm long, the body oblong, straight or curved, 18–35 mm long, 3–6.5 mm wide, triquetrous, glabrous, bilocular, the septum 2–4 mm wide; ovules 18–25. $2n = 22$. [*Tragacantha scopulorum* (Porter) Kuntze; *Tium scopulorum* (Porter) Rydb.; *A. subcompressus* A. Gray; *A. rasus* E. Sheld.; *Tium stenolobum* Rydb.]. Mountain brush, sagebrush, ponderosa pine, piñon-juniper, and aspen–white fir communities. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1830–2525 m (6010–8290′). Flowering: May–Aug. Utah, Colorado, eastern Arizona, and New Mexico.

Astragalus sesquiflorus S. Watson (1–2-flowered) Sandstone milkvetch. Prostrate, caulescent perennial, forming mats or cushions 1–6 dm wide, radiating from a branching caudex, this more or less clothed with a thatch of old leaf bases. **PUBESCENCE** strigulose, malpighian, or merely subbasally attached. **STEMS** 5–28 (37) cm long or more, arising from a superficial root crown. **LEAVES** 1–4 (6) cm long; leaflets 7–13, 1.5–10 mm long, 0.6–2 mm wide, elliptic to obovate, acute to obtuse, strigose on both sides (commonly involute); stipules 1.5–4.5 mm long, all connate-sheathing. **INFL** a raceme, 1–4-flowered, the flowers ascending at anthesis, the axis very short in fruit; bracts 1.2–3 mm long; pedicels 0.7–4 mm long; bracteoles 0–2; peduncle 0.8–4.5 cm long, filiform. **FLOWERS** 6–8 mm long, pink-purple, the banner reflexed through about 80°; calyx 3.7–5.5 mm long, the tube 1.5–2.8 mm long, campanulate, strigulose, the teeth 1.9–3 mm long, subulate. **PODS** spreading-ascending, sessile or subsessile, the body obliquely oblong in outline, 8–10 mm long, 3–4 mm wide, trigonously compressed, strigulose; ovules 7–10. [*Tragacantha sesquiflora* (S. Watson) Kuntze; *Phaca sesquiflora* (S. Watson) Rydb.; *Batidophaca sesquiflora* (S. Watson) Rydb.; *A. sesquiflorus* var. *brevipes* Barneby]. Mixed desert shrub, piñon-juniper, and ponderosa pine or aspen to spruce-fir communities on sandstone or sandy substrates. ARIZ: Apa, Coc, Nav; UTAH. 1105–3140 m (3635–10310′). Flowering: May–Aug. South-central and southeast Utah, northern Arizona, and Montrose County, Colorado. The plant forms distinctive mats or powder-puff cushions on sand below the sandstone escarpments.

Astragalus tenellus Pursh (rather delicate) Pulse milkvetch. Perennial, caulescent, 10–70 (75) cm tall, from a branching, superficial caudex. **PUBESCENCE** basifixed. **STEMS** erect or ascending, or less commonly decumbent; forming clumps. **LEAVES** 2–9 cm long; leaflets 11–21, 3–24 mm long, 0.4–6 mm wide, narrowly oblong to elliptic, linear, oblanceolate, or obovate, acute to obtuse, mucronate, or emarginate, thinly strigose beneath, glabrous above; stipules 1.5–7 mm long, turning black in drying, at least some connate-sheathing. **INFL** a raceme, (1) 3–23-flowered, the flowers ascending at anthesis, the axis 0.5–11 cm long in fruit; bracts 0.5–2.7 mm long; pedicels 0.7–3.2 mm long; bracteoles 0–2; peduncle 0.2–4 cm long, often paired. **FLOWERS** 6–9 (11) mm long, white to ochroleucous, or less commonly pink-purple, the banner recurved through about 40°; calyx 2.6–5.2 mm long, the tube 2–2.7 mm long, campanulate, strigose, the teeth 0.7–2.5 mm long. **PODS** pendulous, stipitate, the stipe 0.6–5.5 mm long, the body elliptic to oblong in outline, straight or curved, 7–16 mm long, 2.5–4.5 mm wide, laterally flattened, glabrous or less commonly strigose, unilocular; ovules 3–9. $2n = 16, 24$. [*Ervum multiflorus* Pursh, technically superfluous; *Homalobus multiflorus* (Pursh) Nutt.; *A. multiflorus* (Pursh) A. Gray; *Tragacantha multiflora* (Pursh) Kuntze; *Homalobus tenellus* (Pursh) Britton; *Orobus dispar* Nutt.; *Physondra dispar* (Nutt.) Raf.; *Homalobus dispar* (Nutt.) Nutt.; *Phaca nigrescens* Hook.; *Homalobus nigrescens* (Hook.) Nutt. ex Torr. & A. Gray; *A. nigrescens* (Hook.) A. Gray; *Homalobus stipitatus* Rydb.; *Homalobus strigulosus* Rydb.; *A. tenellus* f. *strigulosus* (Rydb.) J. F. Macbr.; *A. tenellus* var. *strigulosus* (Rydb.) F. J. Herm.]. Prairies and plains, mountain brush, sagebrush, piñon-juniper, ponderosa pine, lodgepole pine, aspen-fir, and spruce-fir communities. COLO: Arc, Hin; NMEX: McK, RAr, SJn. 2285–2445 m (7500–8020′). Flowering: May–Aug. Southern Yukon, eastern to northern Manitoba, and south to Nevada, Utah, Nebraska, and Minnesota. Small, laterally compressed pods, peduncles often two per node, and stipules (and often the plants themselves) that blacken on drying are diagnostic for this species. Barneby (1964a) discusses the variation within the species at length, which mainly involves length of pod stipe, pubescence, and flower size and color. He cites five minor variants with at least some geographical and morphological integrity, each of which has received a formal name, mainly by Rydberg, as noted in the synonymy above. Perhaps some, possibly all, should receive formal recognition, but the problems of such recognition

are still those outlined by Barneby. Perhaps the most distinctive are those populations with pink-purple flowers that occur in Colorado. These plants were discussed as minor variants by Barneby (1964a), i.e., ". . . , but flowers purplish to bright purple; stipe of pod 1 cm long or less, the body pubescent with black or mixed black and white hairs (*Homalobus clementis*). Local on both sides of the Gunnison-Arkansas Divide, Gunnison and Chaffee Counties, Colorado, south to the Sangre de Cristo Range and the upper Rio Grande in Mineral County." These plants can be known as *A. tenellus* var. *clementis* (Rydb.) J. F. Macbr. These are the plants from Mineral County previously identified as *A. robbinsii* A. Gray var. *minor* (Hook.) Barneby (*K & M Heil 7939* SJNM), which does occur, however, within the San Juan River drainage, in the high mountains of southwestern Colorado.



Astragalus tortipes J. L. Anderson & J. M. Porter (twisted, referring to the pedicels) Sleeping Ute milkvetch. Tall, robust, caulescent perennial, 30–80 cm tall, arising from a shallowly subterranean caudex. **PUBESCENCE** strigulose, basifixed. **STEMS** few, erect or ascending, buried for a space of 0.5–2.2 cm. **LEAVES** (6) 8–14 (18) cm long; leaflets 7–15, 10–43 mm long, 1–4 mm wide, linear, acute, pubescent on both surfaces; stipules 3–12 mm long, all distinct, the subterranean ones white and chartaceous. **INFL** a raceme, loosely 10- to 25 (30)-flowered, the flowers declined at anthesis, the axis 7–12 cm long in fruit; bracts 1.5–2 mm long; pedicels 1–5 mm long, at first with normal orientation, ultimately twisted through 180°; bracteoles 1–2; peduncle 8–15 cm long. **FLOWERS** (12) 14–18 mm long, lemon-yellow, concolorous, the banner recurved through 80°–110°; calyx (4) 7–9 mm long, the tube 3.5–7 mm long, campanulate, strigose, the teeth (0.5) 1.2–2.5 mm long, lance-subulate. **PODS** inverted due to flexion of the pedicel, ascending to erect, stipitate, the stipe 12–16 (19) mm long, the body oblong-elliptic in outline, 22–30 mm long, 6–9 mm wide, only moderately laterally compressed, bicarinate, glabrous, unilocular; ovules 17–27. Mixed salt desert shrub communities, on Mancos Shale knolls and ridges with pedimental gravels. COLO: Mon. 1710–1750 m (5610–5740'). Flowering: May–Jun. This is a most unusual member of section *Lonchocarpi*; its affinities, name, and description were supplied to its nominal authors by Rupert Barneby. Its erect, stipitate pods are borne on stiff pedicels that are contorted through almost or quite 180°, thus presenting the ventral suture in a dorsal position. It grows intermixed with yet another rarity, *A. cronquistii*, which is abundant at this location, growing as a spreading-prostrate plant on the semi-barrens of the Mancos Shale Formation.

Astragalus wingatanus S. Watson (of Fort Wingate) Fort Wingate milkvetch. Perennial, caulescent, 15–45 (60) cm tall, from a subterranean caudex. **PUBESCENCE** basifixed. **STEMS** buried for 1–8 (16) cm, spreading-ascending, forming diffuse clumps. **LEAVES** 1.5–6.5 cm long; leaflets 7–15 (17), 3–18 mm long, 0.4–3.6 mm wide, linear to narrowly oblong, elliptic, or oblanceolate, acute, obtuse, or retuse, strigose to glabrous beneath, glabrous above, often ciliate; stipules 1.5–5 mm long, at least some connate-sheathing. **INFL** a raceme, very loosely 7- to 35-flowered, the flowers ascending at anthesis, the axis 3–8 cm long in fruit; bracts 0.5–2 mm long; pedicels 0.8–3 mm long; bracteoles 0–2; peduncle 2–14 cm long. **FLOWERS** 5.5–8 mm long, pink-purple, the wing tips white or pale; calyx 2.5–3.7 mm long, the tube 1.5–2.6 mm long, campanulate, strigose, the teeth 0.4–1.4 mm long, triangular-subulate. **PODS** deflexed, subsessile or short-stipitate, the stipe to 1.7 mm long, the body elliptic to oblong in outline, straight or slightly curved, 9–15 mm long, 3–4.5 mm wide, compressed, glabrous, unilocular; ovules 4–8. $n = 11$. [*Homalobus wingatanus* (S. Watson) Rydb.; *A. dodgeanus* M. E. Jones; *A. wingatanus* var. *dodgeanus* (M. E. Jones) M. E. Jones]. Piñon-juniper, mixed desert shrub, salt desert shrub, and less commonly in mountain brush communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1540–2225 m (5050–7300'). Flowering: May–Jul. Southeastern Utah and adjacent Colorado, southeast Arizona and northwest New Mexico. This species simulates *A. tenellus* (q.v.) in its small

flowers and laterally flattened pods. The buried caudex and elongating fruiting racemes are diagnostic for *A. wingatanus* and indicate relationships elsewhere (i.e., with taxa such as *A. flexuosus* var. *diehlii*). Its nearest ally in the near vicinity is *A. cliffordii* (q.v.), which differs in being a tall, clump-forming, rushlike plant with filiform peduncles and leaflets greatly reduced.

Astragalus wootonii E. Sheld. (for Elmer Ottis Wooton, New Mexico botanist) Wooton's milkvetch. Winter-annual or biennial (short-lived perennial), caulescent, (10) 15–50 cm tall, from a taproot and superficial root crown. **PUBESCENCE** basifixed, strigulose. **STEMS** commonly several or numerous, decumbent to incurved-ascending or almost prostrate. **LEAVES** (2) 4–10 (12) cm long; leaflets (7) 11–23, 5–20 mm long, narrowly oblanceolate, linear-oblong, or oblong-obovate, retuse-truncate or obtuse, often callous-mucronulate, folded or rarely flat, pubescent on both sides or glabrous above; stipules submembranous, (1.5) 2.5–7 (10) mm long, all distinct. **INFL** a raceme, 2- to 10 (15)-flowered, the flowers ascending to spreading or declined, the axis (0.5) 1–4 (5) cm long in fruit; bracts 1–3.2 mm long; pedicels 1–3.5 mm long; bracteoles nearly always 2; peduncle (0.5) 1.5–5.5 (7) cm long, shorter than the leaf. **FLOWERS** 4.6–7.5 mm long, whitish, sometimes tinged with pink or lavender, or pale to vivid reddish lilac, the banner recurved through about 50°; calyx 4.3–6.4 mm long, strigulose or villosulous, the tube 2.1–2.9 (3.2) mm long, campanulate or turbinate-campanulate, the teeth 2–3.5 mm long, lance-subulate. **PODS** spreading or declined, commonly humistrate, sessile on the conical receptacle and readily disjointing, broadly and subsymmetrically or somewhat obliquely ovoid, ovoid-ellipsoid, ellipsoid, or subglobose, bladdery-inflated, (10) 15–37 (43) mm long, (8) 12–20 mm in diameter, green or purplish-tinged, rarely lightly mottled, thinly strigulose, subvillosulous, or glabrate, becoming papery, stramineous, lustrous, unilocular; ovules (10) 13–21. $n = 11$. [*Phaca wootonii* (E. Sheld.) Rydb.; *A. wootonii* var. *typicus* Barneby; *A. playanus* M. E. Jones; *A. allochrous* A. Gray var. *playanus* (M. E. Jones) Isely; *Phaca tracyi* Rydb.; *A. tracyi* (Rydb.) Cory; *A. triflorus* sensu A. Gray, non *A. triflorus* (DC.) A. Gray]. Plains, hillsides, and valley floors, or along highways. COLO: Arc, LPl; NMEX: McK, RAr, SJn. 1870–2255 m (6145–7400'). Flowering: Mar–Jul. Sagebrush and piñon-juniper communities. From the upper Pecos across northern Arizona south of the Colorado River to the extreme eastern Mojave Desert in eastern San Bernardino County, California, south and southeast to northeast Sonora, Durango, Chihuahua, and Trans-Pecos Texas.

Astragalus zionis M. E. Jones (of Zion National Park) Zion milkvetch. Perennial, subacaulescent or short-caulescent, 3–23 cm tall, from a branching subterranean caudex, this sometimes clothed with a persistent thatch of leaf bases. **PUBESCENCE** basifixed. **STEMS** buried for 2–15 cm or more, 0–11 cm long, prostrate to ascending, the internodes often concealed by stipules. **LEAVES** mostly 2–15 cm long; leaflets 13–25, 2–16 mm long, 1–6 mm wide, elliptic or ovate, acute or less commonly obtuse, silvery villous on both sides; stipules 1.5–5.5 mm long, all distinct or some shortly connate-sheathing. **INFL** a raceme, 1- to 11-flowered, the flowers ascending at anthesis, the axis 0.3–6 cm long in fruit; bracts 2–5 mm long; pedicels 1–3 mm long; bracteoles 0–2; peduncle 0.5–15 cm long. **FLOWERS** 18–26 mm long, pink-purple or sometimes pale; calyx 8.3–18 mm long, the tube 6.5–12.7 mm long, cylindric, villous, the teeth 1.5–5.7 mm long, subulate. **PODS** ascending, sessile, obliquely ovoid-oblong in outline, 15–28 mm long, 5.5–9 mm wide, usually curved, dorsiventrally compressed, strigose or villosulous, brightly mottled, usually unilocular; ovules 24–30. $2n = 22$. [*Xylophacos zionis* (M. E. Jones) Rydb.]. On sandstone and in sandy and gravelly soils in blackbrush, sagebrush, ephedra, other mixed desert shrub (sometimes salt desert shrub), mountain brush, ponderosa pine, and riparian communities. ARIZ: Apa, Nav; NMEX: SJn; UTAH. 1345–3185 m (4420–10445'). Flowering: Mar–May. Southern Utah and adjacent Arizona. A Mojave-San Juan regional endemic.

Caesalpinia L. Rush-pea

(for Andrea Cesalpino, pioneer botanical systematist) Unarmed shrubs or perennial herbs, glandular-punctate in part. **LEAVES** alternate, odd-bipinnate, petiolate, the pinnae bearing several leaflets; stipules small, persistent. **INFL** a raceme, with several to many flowers; the axis of the raceme densely glandular. **FLOWER** calyx 5-lobed; corolla irregular; petals 5, conspicuous, the uppermost not enclosing the others in bud; stamens 10, long-exserted, brightly colored and showy, distinct; pistils sessile. **PODS** flattened, dehiscent. $x = 12$. One hundred species, mostly tropical.

1. Leaves with 2 or 3 pairs of pinnae; calyx lobes 6–9 mm long; petals 6–9 mm long ..... ***C. jamesii***
1' Leaves with 3–7 (9) pairs of pinnae; calyx lobes 8–10.5 mm long; petals 10–12 mm long ..... ***C. repens***

Caesalpinia jamesii (Torr. & A. Gray) Fisher (for Edwin James, first botanical collector of the central Rockies) James' rush-pea. Glandular-punctate herbaceous perennial from subterranean caudex and stout taproot. **STEMS** 0.5–3 (5) dm tall, erect or ascending, generally clustered, subterranean for 3–5 cm or more. **LEAVES** about 3–5 cm long, on petioles 1.5–2.5 cm long; stipules subulate, to 3 mm long, soon deciduous; pinnae 2 or 3 pairs, and with a terminal pinna, these with 5–8 (10) pairs of ovate- to elliptic-oblong leaflets 3.5- (7) mm long, obviously black-punctate and

puberulent or glabrate. **INFL** a raceme, shorter than or overtopping the leaves, arising opposite the leaves, with 5–15 spreading or declined flowers; pedicels 2–5 mm long. **FLOWER** petals 6–9 mm long, yellow, drying orange to orange-red, punctate, the banner spotted; calyx lobes 6–9 mm long; stamens surpassing the petals. **PODS** horizontal to declined and curved, finally dehiscent, the valves punctate, stellate-pubescent. [*Hoffmannseggia jamesii* Torr. & A. Gray]. Sand dune communities. ARIZ: Apa; NMEX: SJn. 1675–1980 m (5500–6500'). Flowering: Jun. Central and southern Texas to Arizona, north to southwest Nebraska, and eastern Colorado. Zunis gave infusions to sheep to make them prolific.

Caesalpinia repens Eastw. (creeping) Creeping rush-pea. Subacaulescent or shortly caulescent, 5–12.5 cm tall (aboveground), from a deeply subterranean caudex, the branches buried 3–15 cm, pale. **PUBESCENCE** basifixed. **LEAVES** 2.5–9.5 cm long; pinnae 3–7 (9); leaflets 4–14, 3–12 mm long, 1–6 mm wide, asymmetrically obovate-elliptic to oblong, crowded, entire, villosulous. **INFL** a raceme, 7- to 26-flowered, the flowers spreading at anthesis, the axis 3–8 cm long in fruit; bracts 3–7 mm long, caducous; bracteoles 0; pedicels 2–7 mm long; peduncle 1.2–6 cm long. **FLOWERS** opening flat or nearly so; petals yellow, 10–12 mm long, red-spotted near the base, the whole fading pink-orange; calyx 8–10.5 mm long, the tube 2–4.5 mm long, campanulate, retrorsely villosulous, the teeth 6–8.5 mm long, oblong-lanceolate, villosulous. **PODS** pendulous, oblong, 20–50 mm long, 10–20 mm wide, membranous, pilosulous. [*Hoffmannseggia repens* (Eastw.) Cockerell; *Moparia repens* (Eastw.) Britton & Rose]. Sandy deserts with ephedra, Indian ricegrass, and other arenophilous plants. UTAH. 1160–1680 m (3800–5510'). Flowering: early Apr–Jun. A Utah endemic.

Calliandra Benth. Stickpea, Fairy-duster

(beautiful stamens) Herbs (in ours), shrubs, or trees, unarmed. **LEAVES** bipinnate, with numeous leaflets. **INFL** borne in globose heads or capitate clusters. **FLOWER** calyx toothed or deeply cleft, 5-lobed; corolla small, obscured by the numerous, long-exserted, brightly colored staminal filaments. **PODS** straight, the margin thickened, elastically dehiscent. Two hundred species. Tropical America, Madagascar, India.

Calliandra humilis Benth. (low) Dwarf stickpea. Perennial herb, from a subterranean rootstalk and vertical caudex. **STEMS** solitary or clustered, asending, mainly 1–2 dm long. **PUBESCENCE** sparse or abundant, of flexuous hairs about 0.3–1 mm long. **LEAVES** 1.5–7 cm long, on petioles mainly 1–2.5 cm long; stipules 2–3 mm long; pinnae 1–5 (8) pairs; leaflets about 5–14 (20) pairs, imbricate, shortly oblong, oblique, the venation obscure. **INFL** axillary, sessile or in capitate, pedunculate clusters. **FLOWERS** (4) 6–8 (10), 1.8–2.5 cm in diameter, white to pinkish. **PODS** 3–5 cm long, 4–5 mm wide, oblong-oblanceolate, strongly margined, the beak apiculate. Slickrock with scattered, stunted ponderosa pine. NMEX: McK. 2285 m (7500'). Flowering: Jul–Aug. West Texas to Arizona. The lone specimen examined bears only 1–3 pairs of pinnae, each with 5–8 pairs of leaflets, and belongs to **var. *reticulata*** (A. Gray) L. D. Benson (network). [*C. reticulata* A. Gray]. Plant used as a "life medicine" by Navajos and as a powder (roots) for rashes by Zunis.

Cercis L. Redbud

(ancient Greek name for poplar or aspen) Small trees or shrubs. **LEAVES** alternate, simple, palmately veined, cordate-ovate or orbicular; stipules deciduous. **FLOWERS** clustered, appearing before the leaves from spurs on old branches or cauliflorous, pink, showy; calyx turbinate-campanulate, shallowly 5-lobed; corolla irregular, the keel larger than the banner; stamens 10, distinct; ovary subsessile. **PODS** short-stipitate, laterally flattened, the ventral suture somewhat winged, indehiscent or tardily dehiscent. $x = 7$. Six species in North America and one species in Europe.

Cercis occidentalis Torr. ex A. Gray (western) Western redbud. Plant commonly a shrub, mostly 1.5–3.5 m tall, rarely more. **LEAVES** cordate-reniform, cordate basally, rounded to emarginate apically, 2–7 cm long, commonly broader than long, glabrous or puberulent along vein axils beneath. **FLOWERS** appearing before the leaves, cauliflorous; pedicel 8–12 mm long; corolla pink to pink-purple, 12–15 mm long; keel petals 5.5–8 mm wide; calyx asymmetric, 3–4.5 mm long, 5.5–8 mm wide. **PODS** short-stipitate, 4–10 cm long, 13–20 mm wide, winged, the wings 1.5–2.5 mm wide, glabrous. Indigenous or rarely cultivated. In sandstone canyons and alcoves, often in hanging gardens. UTAH. 1125–1220 m (3700–4000'). Flowering: Mar–Apr. California, Nevada, and Arizona. Variation in *Cercis* has been summarized by Isely (1998). Our material was recognized by him as being distinctive as a population when compared to typical California specimens. Plants from Utah, Arizona, and Nevada clearly belong to **var. *orbiculata*** (Greene) Tidestr. (circular). [*C. orbiculata* Greene; *C. canadensis* L. var. *orbiculata* (Greene) Barneby]. The western redbud is placed within an expanded *C. canadensis* by Barneby but is maintained at varietal rank. The problem hinges on the distribution of typically eastern *canadensis* far to the west, in Texas especially. The two main taxonomic units are herein maintained as species rather than varieties. The type of *C. occidentalis* is either from south-central Texas (upper Guadalupe River, by

Lindheimer, s.n.), very close to the distribution of *C. canadensis*, which is regarded as *C. canadensis* var. *texensis* (S. Watson) M. Hopkins, or from California. If the former, it is far removed from the western materials. Thus, the nomenclatural question as to whether var. *orbiculata* should be maintained at specific or infraspecific rank remains unanswered. Barneby (in Cronquist et al. 1989) reports that the strong wood of this species was used by Indians in the Canyonlands region for bows.

Dalea L. Dalea

(for Samuel Dale, English physician and pharmacologist) Perennial herbs or subshrubs, unarmed, trailing or ascending to erect. **LEAVES** alternate; stipules linear to subulate; odd-pinnate with 3 or more leaflets, glandular-dotted. **INFL** in a dense spike; peduncle opposite the leaves. **FLOWER** calyx campanulate, 5- to 10-ribbed and 5-lobed; corolla papilionaceous, the banner petal attached near the rim of the floral cup, the outer 4 variously inserted or all near the rim of the staminal tube; stamens 5, monadelphous; petals white, yellowish, pink, or pink-purple to indigo. **PODS** 1- to 2-seeded, indehiscent, included in the calyx or slightly exceeding it. $x = 7$ or 8. Note: Included herein are the herbaceous species traditionally placed in *Petalostemon*, and excluded are those shrubby species now regarded as *Psorothamnus* (Wemple 1970). One hundred sixty species. Canada to Argentina, especially Mexico and the Andes in desert areas.

1. Plants annual ..... (2)
1' Plants perennial ..... (3)

2. Leaves 2–9.5 cm long, short-petiolate or subsessile, the main cauline ones with (7) 21–35 (49) leaflets (those of branchlets mainly only 5–21) ..... ***D. leporina***
2' Leaves 1–2.5 cm long, with petioles 5–15 mm long, often deciduous at anthesis; leaflets 5–9 ..... ***D. polygonoides***

3. Stems prostrate; spike slender, commonly less than 8 mm thick; leaflets 5–17 ..... (4)
3' Stems decumbent to ascending or erect; spike thicker, commonly 10 mm or more; leaflets 7 (9) or fewer ..... (5)

4. Leaflets (5) 7–9; bracts caducous; spike 8–11 mm thick (ignoring petals); calyx definitely glandular ..... ***D. scariosa***
4' Leaflets 5–15; bracts persistent; spike 7–8 mm thick (ignoring petals); calyx inconspicuously glandular ..... ***D. lanata***

5. Herbage pilose, pilosulous, or hirsute with lustrous hairs ..... ***D. flavescens***
5' Herbage glabrous ..... (6)

6. Petals pink to pink-purple; calyx densely silvery canescent, not long-ciliate ..... ***D. purpurea***
6' Petals white (fading cream); calyx with teeth ciliate ..... (7)

7. Calyx tube glabrous; flowers white, not especially compact in the spike ..... ***D. occidentalis***
7' Calyx tube definitely pilose, the teeth long plumose-hairy; flowers white to pale pink, definitely compact in the spike ..... ***D. cylindriceps***

Dalea cylindriceps Barneby (inflorescence is cylinder-like) Andean prairie-clover. Perennial, erect or ascending from a root crown and stout taproot, glabrous to the inflorescence. **STEMS** 2–7 dm tall, few to several from the root crown, simple or branched above. **LEAVES** 1–6 cm long, the petiole 3–7 (14) mm long; leaflets 7–9, linear-lanceolate to elliptic-oblong or -lanceolate, 1.2–2.5 cm long, 1–4 mm wide. **INFL** a spike on a peduncle 1–7 cm long, cylindric, 2.5–10 (12) cm long, 9–12 mm thick, very compact, pubescent; bracts caducous, but held by appressed calyces, pilose. **FLOWERS** nonpapilionaceous, the petals 4.7–6.2 mm long, white or less commonly pale pink, the epistemonous petals arising from the apex of the staminal column, soon withering, not concealing the stamens; the calyx 3.4–4.2 mm long, the tube 1.9–2.3 mm long, pilose, the lobes deltoid to lance-caudate; stamens typically 5. [*Petalostemon macrostachyus* Torr.; *D. macrostachya* Moric. 1833]. Dune sands and drainages with sand sagebrush and Indian ricegrass. NMEX: McK, RAr, San, SJn. 1645–2040 m (5400–6700'). Flowering: Jun–Sep. Southern Arizona and east to Texas. The Four Corners specimens represent a significant range extension for this handsome species, with its rather inconspicuous white to pale pink or purplish flowers and definitely plumose-hairy calyx teeth. It is easily distinguished from *D. purpurea* by the typically more numerous leaflets (7–9, not 3–7), and by the characteristics stated above.

Dalea flavescens (S. Watson) S. L. Welsh ex Barneby (yellowish) Kanab prairie-clover. **STEMS** 20–52 cm tall, from a superficial to subterranean caudex, glabrous to strigulose or pilose. **LEAVES** 1.5–4.7 cm long; stipules 1–4 mm long, lance-subulate to linear, persistent; leaflets 3–7, 5–20 mm long, 1–9 mm wide, folded or flat, oblong to oblanceolate or elliptic to linear, lustrous-strigulose or -pilose on both sides, glandular beneath; terminal leaflet petiolulate on a

continuation of the rachis or subsessile. **INFL** a spike, 1.5–9 (14) cm long, 10–18 mm wide (when pressed), the rachis spreading-hairy; bracts 4–8 mm long, lance-aristate to lance-subulate or lanceolate, villous to pilose and sometimes glandular; peduncle 1.5–20 cm long, glabrous to sparingly or densely pilose- or villous-hirsute. **FLOWERS** 6.2–11 mm long, the petals white, fading cream; calyx 4–7 mm long, the tube 10-ribbed, not translucent, the teeth 1.5–4 mm long; pistils 7.5–13 mm long, the style 6–9.5 mm long. **PODS** villous. [*Petalostemon flavescens* S. Watson; *Kuhnistera flavescens* (S. Watson) Kuntze]. Infusion of plant taken by Navajos when lightning strikes near a hogan.

1. Spikes rather lax, the longest 5–14 cm long; calyx teeth 2.7–4 mm long; pistils 11.5–13 mm long; styles 8.5–9.5 mm long; plants of central Glen Canyon ..... **var. *epica***
1′ Spikes dense, the longest seldom more than 5 cm long; calyx teeth 1.5–2.5 mm long; pistils 7.5–10.3 mm long; styles 6–8 mm long; plants widespread ..... **var. *flavescens***

var. *epica* (S. L. Welsh) S. L. Welsh & Chatterley (refers to the epic journey of the Bluff pioneers along the Hole-in-the-Rock trail) [*D. epica* S. L. Welsh]. Hole-in-the-Rock prairie-clover. Sandstone bedrock and sand in blackbrush and mixed desert shrub communities. UTAH. 1320–1410 m (4335–4635′). Flowering: Apr–Jun. Endemic to Utah. This phase of the species intergrades more or less completely with the typical materials and is possibly taxonomically inconsequential.

var. *flavescens* Grasslands, mixed desert shrub, blackbrush, and piñon-juniper communities, commonly in sandy soils. ARIZ: Nav; UTAH. 1220–1640 m (4000–5400′). A Navajo Basin endemic. Flowering: Apr–Jun.

Dalea lanata Spreng. (woolly) Woolly dalea. Perennial herbs from a woody root crown. **STEMS** prostrate, 15–60 cm long or more, from a subterranean to superficial caudex, pilosulous to glabrous. **LEAVES** 0.9–3 cm long; stipules 1–2 mm long, subulate, more or less persistent; leaflets 5–17, 1.5–10 mm long, 1–5.5 mm wide, obovate to cuneate, truncate to emarginate, commonly folded, pilosulous or glabrous. **INFL** a spike, 1.8–7.5 cm long, lax in middle to late anthesis and in fruit; bracts ovate-acuminate, pilosulous and with 1 or more large glands; peduncle 0.5–2.5 cm long. **FLOWERS** 6–7 mm long, the petals indigo to rose-pink; calyx 3.2–4.6 mm long, the tube 2.1–2.7 mm long, glabrous, the teeth 0.9–1.9 mm long, pilosulous dorsally and ciliate; pistils 5–6 mm long, the style 3.5–4.5 mm long. **PODS** villous to glabrous. $2n = 14$. [*Parosela lanata* (Spreng.) Britton]. Stabilized dunes and other sandy sites in salt desert shrub and blackbrush communities. ARIZ: Apa, Nav; NMEX: McK, SJn; UTAH. 1370–1910 m (4495–6260′). Flowering: Jun–Sep. Colorado and Kansas, south to Mexico. Four Corners material belongs to **var. *terminalis*** (M. E. Jones) Barneby (an end) [*D. terminalis* M. E. Jones]. This variety differs from var. *lanata* inter alia in the glabrous, shining, membranous calyx tube. Some plants from San Juan County, Utah (*B. F. Harrison 12194 et al.*, BRY!), are glabrous throughout but seem not to differ otherwise. Scraped roots eaten as candy by Hopis. Poultice used for centipede bites by Navajos.

Dalea leporina (Aiton) Bullock (spotted) Fox-tail prairie-clover. Slender, diminutive to rather robust annual, glabrous to the inflorescence. **STEMS** 1.5–12 (15) dm tall, simple or branched above. **LEAVES** 2–9.5 cm long, short-petiolate or subsessile, the main cauline ones with (8) 10–17 (24) pairs of leaflets (those of branchlets mainly only 4–10 pairs), these oblong-oblanceolate or obovate, emarginate or retuse, or less commonly obtuse, (2) 3–12 mm long, flat and relatively thin or loosely folded and thicker (in xeric habitats). **INFL** a spike, terminal to the main axis and all branches, the latter overtopping the former, the peduncles (1.5) 3–12 (15) cm long, the spike moderately dense, becoming cylindroid, 8–12 (15) mm thick (excluding petals and stamens); bracts caducous. **FLOWER** petals milky white to bluish purple or almost blue, in some races white, eglandular or the banner rarely gland-tipped, the epistemonous ones perched 1.2–2.8 mm below separation of the short filament tassel, readily deciduous; banner (3.4) 4.4–6 mm long; stamens 9 or 10, exserted. **PODS** 2.4–3 mm long, the style base lateral. [*Psoralea leporina* Aiton; *Dalea alopecuroides* Willd.]. Roadsides and other ruderal sites. COLO: Arc; NMEX: SJn. 1495–2135 m (4900–7000′). Flowering: Jul–Sep. Southern Wisconsin to North Dakota, south to Texas and Arizona.

Dalea occidentalis (Rydb.) Riley (western) Western prairie-clover. **STEMS** decumbent to erect, 4–9 dm tall, from a superficial caudex, glabrous. **LEAVES** 1.5–5.2 cm long; stipules 1–4.5 mm long, fragile, often coiled; leaflets 4–9, 5–27 mm long, 1–7 mm wide, oblanceolate to elliptic or oblong, truncate to emarginate, commonly folded, glabrous, glandular beneath. **INFL** a spike, 1–6.8 cm long, 8–12 mm thick, the rachis commonly glabrous; bracts lance-acuminate, caducous; peduncle 1.5–15 cm long, glabrous. **FLOWER** petals loosening with age; petals 6–7 mm, white; calyx strongly 10-ribbed, usually pubescent between the ribs, the tube 2.3–3 mm long, the lobes 1–1.3 mm long; pistils 9–11 mm long, the style 8–10 mm long. **PODS** glabrous or sparingly hairy apically. [*Kuhnistera occidentalis* A. Heller ex Britton & Kearney; *Petalostemon occidentalis* (A. Heller ex Britton & Kearney) Fernald; *Kuhnistera candida* (Willd.) Kuntze var. *occidentalis* Rydb.; *Petalostemon gracilis* Nutt. var. *oligophyllus* Torr.; *Kuhnistera oligophylla* (Torr.) A. Heller; *Petalostemon*

oligophyllum (Torr.) Rydb.; *Petalostemon candidus* (Willd.) Michx. var. *oligophyllus* (Torr.) F. J. Herm.; *Dalea oligophylla* (Torr.) Shinners; *D. candida* Willd. var. *oligophylla* (Torr.) Shinners]. Sandy drainages and crevices in rimrock in mixed desert shrub, blackbrush, piñon-juniper, and hanging garden communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, RAr, San, SJn; UTAH. 1495–2345 m (4900–7695'). Flowering: Jun–Sep. Alberta to Saskatchewan, south to Arizona, New Mexico, Texas, Mexico, and Iowa. I agree with Isely (1998) that the epithet *occidentalis* has priority at specific rank for this widespread and distinctive species, which, though similar to *D. candida* Willd., is essentially allopatric and differs in several features, "and can be distinguished at a glance" (Isely l.c.).

Dalea polygonoides A. Gray (many angles) Six weeks prairie-clover. Often diminutive, erect or ascending, glabrous or inconspicuously glandular, mainly 0.5–3 dm tall, simple or with spreading to ascending branches. **LEAVES** 1–2.5 cm long, with petioles 5–15 mm long, often deciduous at anthesis; leaflets 5–9, linear to oblong or oblanceolate, 5–15 mm long, 1.5–2.5 mm wide. **INFL** a spike, 1–2.5 cm long, 6–8 mm thick, initially ovoid, finally cylindrical, foliar bracts persistent, pilosulous. **FLOWERS** subpapilionaceous, about 4–6 mm long; corolla circa 4–5 mm, lavender to pale pink-purple, the epistemonous petals arising medially from the staminal column; calyx tube 2–2.5 mm long, slit above, thinly pilose or glabrate, the rib intervals each usually with a single large gland, sometimes 2, the lobes subulate; stamens about 7–9, sometimes some of them nonfunctional. Ground layer in ponderosa pine woodland. NMEX: McK. 2285 m (7500'). Flowering: Aug–Sep. Arizona, New Mexico, west Texas south to Mexico.

Dalea purpurea Vent. (purple) Violet prairie-clover. Perennial, erect or spreading-decumbent from the root crown, villosulous to glabrate, glandular. **STEMS** 2–8 dm tall, clump-forming, very leafy, simple or branched above. **LEAVES** with petioles 1.5–2.5 (3.5) cm long; leaflets typically 5 (3–7), linear-oblanceolate to filiform, 7–24 (28) mm long, folded, tubular or involute. **INFL** a spike, very dense; becoming oblong-cylindroid, mainly 7–12 (13) mm thick (ignoring petals), the axis becoming (1) 1.5–7 cm long; bracts deciduous with the fruiting calyx; peduncle (0) 1–9 (15) cm long, the first spike typically pedunculate, the lateral ones (if any) typically subsessile. **FLOWER** corolla 6–7 mm long, purple to lavender (rarely white); calyx tube 2–3.5 mm long, conspicuously subappressed- or matted-villosulous, with plainly antrorse hairs, eglandular, the lobes deltoid to subulate, subequal, shorter than the tube; epistemonous petals arising from apex of the staminal column; stamens 5. [*Petalostemon purpureus* (Vent.) Rydb.]. With grass. NMEX: McK, San. 2040–2150 m (6700–7050'). Flowering: Jul–Sep. Widespread from Montana east to Minnesota, and south to Texas, Louisiana, Mississippi, and Alabama.

Dalea scariosa S. Watson (thin, dry, membranous texture, not green) La Jolla prairie-clover. Perennial herbs from a woody root crown. **STEMS** prostrate to decumbent-assurgent, 30–60 (80) cm long or more, from a subterranean to superficial caudex, glabrous, glandular. **LEAVES** 1–3 cm long; stipules 1–2 mm long, subulate, more or less persistent; leaflets (5) 7–9, 3–10 mm long, 1–5.5 mm wide, obovate to cuneate, truncate to emarginate, commonly folded, glabrous. **INFL** a spike, 1.5–7.5 (10) cm long, lax in middle to late anthesis and in fruit; bracts caducous; peduncle 0.5–2.5 cm long. **FLOWERS** 9–10 mm long, the petals rose-pink; calyx with tube 3–4 mm long, glabrous, with 2 or more glands between the intervals, the teeth 0.9–1.9 mm long, ciliate; pistils 4–6 mm long, the style less than 3 mm long; stamens 5. **PODS** glabrous. [*Petalostemon scariosus* (S. Watson) Wemple]. Sandy habitats with juniper and among shrubs. NMEX: San. 1635 m (5365'). Flowering: Aug–Sep. (Sandoval Co.; *B. Hutchins 6676*. SJNM); endemic to north-central New Mexico.

Gleditsia L. Locust

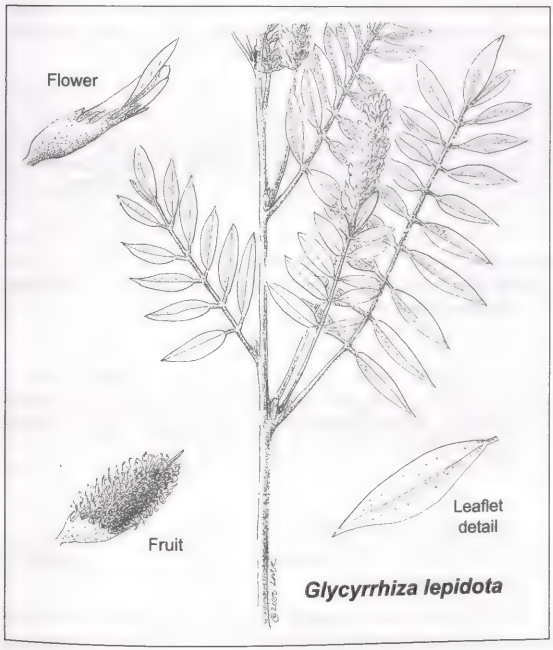
Trees, often armed with simple or branched, brown, stout thorns. **LEAVES** alternate, deciduous; stipules minute, caducous; pinnately once to twice compound (with both kinds of leaves often on the same branch, or some intermediate); with 3–5 pinnae, each with (8) 14–36 leaflets, or with 14–36 leaflets on once-pinnate ones. **INFL** spikelike axillary racemes. **FLOWERS** polygamous, almost regular; petals 3–5, very narrow, yellowish, the uppermost internal in bud; inconspicuous, in sepals equal or nearly so; stamens 3–10, distinct, the anthers in pistillate flowers abortive. **PODS** flattened, straplike, indehiscent. Fourteen species. Eastern North America, India, Japan to Philippines.

Gleditsia triacanthos L. (three thorns) Honey locust. Trees to 20 m tall or more; bark smooth. **LEAVES** compound; leaflets 12–35 mm long, the pinnae 3–5 (8) when bipinnate, the leaflets 14–36 on once pinnately compound leaves and on pinnae, 10–42 mm long, 3–14 mm wide, lanceolate to oblong, crenate, obtuse to cuspidate, glabrous above, puberulent along veins beneath. **INFL** a raceme, many-flowered, 3–7 cm long, short-pedunculate or subsessile. **FLOWER** petals 4–5 mm long, greenish; sepals separate. **PODS** sessile, oblong in outline, laterally flattened, 7–35 cm long, 15–30 mm wide, curved, indehiscent. **SEEDS** embedded in tissue. $2n = 28$. Cultivated shade tree, rarely escap-

ing. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, SJn; UTAH. 1220–2135 m (4000–7000'). Flowering: May–Jun. Native to the eastern United States. Honey locust is a popular, very hardy shade tree, represented by several cultivars, including thornless and yellow-leaved varieties. Collections from along the San Juan River, remote from any settlement, appear to be established.

Glycyrrhiza L. Licorice

(sweet root) Perennial, caulescent, from stout, sweet roots. **LEAVES** alternate, odd-pinnate, glandular-punctate; stipules subulate, distinct. **INFL** in axillary racemes, each subtended by a lanceolate, deciduous bract; bracteoles 0. **FLOWERS** papilionaceous; calyx 5-toothed; petals 5, white to cream, the keel shorter than the wings; stamens 10, diadelphous; ovary enclosed in the staminal sheath, the style glabrous. **PODS** sessile, elliptic to oblong in outline, burlike, armed with uncinate appendages, or smooth, indehiscent. **SEEDS** few. $x = 8$. Twenty species. Mostly Eurasia with few in Australia, North America, and South America.



Glycyrrhiza lepidota Pursh (covered with small scales) Licorice. Plants 4–12 dm tall, from a deep-seated root; stipules 2–7 mm long, subulate. **LEAVES** 8–19 cm long; leaflets 13–19, 8–53 mm long, 3–15 mm wide, lanceolate to oblong, acute and mucronate, glabrous above, glandular-dotted and puberulent beneath. **INFL** a raceme, 20- to 50-flowered, the flowers ascending at anthesis, the rachis 2.5–9 cm long in fruit; bracts 5–8 mm long, caducous; peduncles often paired, 3–8 cm long. **FLOWERS** 9.1–13 mm long, white to cream; calyx 4.8–6.9 mm long, the tube 2.5–4.9 mm long, campanulate to short-cylindric, stipitate-glandular, the teeth 1.5–3.6 mm long. **PODS** spreading, laterally compressed, oblong, 13–20 mm long, the body 5–7 mm wide, beset with hooked prickles, simulating cockleburs. $2n = 16$. Terraces, streamsides, seeps, and other semimoist sites in greasewood, mixed desert shrub, piñon-juniper, and cottonwood-willow communities. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1480–2265 m (4850–7425'). Flowering: May–Aug. Widespread in the United States, except for the southeast. Decoction of root used as an emetic by Navajos, and roots used as a breath freshener by Hopis.

Hedysarum L. Sweetvetch

(*hedys*, sweet, + *saron*, broom) Perennial herbs, caulescent, from a caudex and taproot. **LEAVES** alternate, odd-pinnate; stipules adnate to the petiole base, at least the lowermost connate-sheathing. **INFL** an axillary raceme, each subtended by a bract; bracteoles 2. **FLOWERS** papilionaceous; petals 5, red-purple to pink or pink-purple, the keel much longer than the wings, abruptly bow-shaped; calyx 5-toothed; stamens 10, diadelphous; ovary enclosed in the staminal sheath, the style glabrous. **LOMENTS** with 2–8 segments, prominently reticulate (Northstrom 1974; Northstrom and Welsh 1970; Rollins 1940; Welsh 1995a). One hundred species. North America, Eurasia, and Mediterranean.

1. Leaflets thick, the veins not apparent; fruit segments not winged; calyx lobes subequal, longer than the tube; plants of lower elevation; desert scrub to lower montane ..... ***H. boreale***

1'. Leaflets thin, the veins readily apparent; fruit segments winged; calyx lobes unequal, shorter than the tube; plants of higher elevation; upper montane ..... ***H. occidentale***

Hedysarum boreale Nutt. (northern) Northern sweetvetch. Perennial, caulescent, 17–70 cm tall, from branching, subterranean to superficial caudex. **PUBESCENCE** basifixed. **STEMS** decumbent to erect. **LEAVES** 3–12 cm long; stipules 2–10 mm long, at least some connate-sheathing; leaflets 5–15, 7–35 mm long, 2–19 mm wide, oblong to elliptic, lance-oblong, or ovate (rarely linear), strigose on both sides or glabrate to glabrous above. **INFL** a raceme, 5- to 45-flowered, the flowers ascending at anthesis, the axis 5–28.5 cm long in fruit; bracts 2–4 mm long; pedicels 0.8–4.5 mm long; bracteoles 2; peduncle 2.8–15 cm long. **FLOWERS** 10–19 mm long, red-purple to pink or pink-purple, less commonly white; calyx 4.5–8 mm long, the tube 2.5–3.5 mm long, campanulate, strigose, the teeth 2–6 mm long, subulate. **LOMENTS** stipitate, pendulous to spreading, with 2–8 segments, not winged, prominently reticulate. $2n = 16$. [*H. canescens* Nutt. ex Torr. & Gray, not L.; *H. cinerascens* Rydb.; *H. boreale* var. *cinerascens* (Rydb.) Rollins; *H. pabulare* A. Nelson; *H. mackenziei* Richardson var. *pabulare* (A. Nelson) Kearney & Peebles; *H. boreale* var. *pabulare* (A. Nelson) Dorn; *H. boreale* var. *obovatum* Rollins]. Mixed desert shrub, piñon-juniper, mountain brush, ponderosa pine, and aspen communities. ARIZ: Apa, Nav; COLO: Dol, LPl, Mon, SMg; NMEX: McK, San, SJn; UTAH. 1180–2845 m (3875–9335′). Flowering: May–Jul. Alberta, and east to Manitoba, and south to Nevada and Texas. Four Corners material belongs to **var. *boreale***. The use of leaf pubescence, or lack thereof, to segregate the var. *boreale* into further taxa is an exercise in frustration, leading to two essentially sympatric phases that might reflect ecology more than genetics. However, there are phases of the species with subtle differences that might be worthy of taxonomic consideration.

Hedysarum occidentale Greene (western) Western sweetvetch. Perennial, caulescent, 30–90 cm tall, from a branching, superficial caudex. **PUBESCENCE** basifixed. **STEMS** ascending to erect. **LEAVES** 8–20 cm long; stipules 10–17 mm long; leaflets 11–19, 9–37 mm long, 4–16 mm wide, ovate to lance-ovate or elliptic, apiculate to emarginate, strigose on both sides or glabrous above. **INFL** a raceme, 10- to 50-flowered, the flowers spreading to declined at anthesis, the axis 6–14 cm long in fruit; bracts 2–8 mm long; bracteoles 2; peduncle 3.7–15 cm long. **FLOWERS** 16–23 mm long, pink to red-purple; calyx 3.5–11 mm long, the tube 2.3–6 mm long, campanulate, glabrous to strigose, the teeth 0.5–2 mm long, triangular. **LOMENTS** stipitate, pendulous, with 1–5 segments, winged. [*H. lancifolium* Rydb.; *H. marginatum* Greene; *H. uintahense* A. Nelson]. Douglas-fir and spruce-fir communities. COLO: Arc, LPl, Min, Mon, SJn. 2955–3505 m (9700–11500′). Flowering: Jul–Aug. British Columbia to Washington, Idaho, Montana, Wyoming, Utah, and Colorado. Four Corners material belongs to **var. *occidentale***.

Lathyrus L. Sweetpea

(from the Greek *lathyros*, a sort of pulse) Annual or perennial herbs, clambering, trailing, or climbing. **LEAVES** alternate, even-pinnately compound, the rachis terminating in a bristle or prehensile tendril; stipules herbaceous, semihastate or semisagittate; leaflets 2–12, very variable. **INFL** an axillary raceme. **FLOWERS** papilionaceous; petals 5, white or cream to pink, purplish, or otherwise (in cultivated types), the wings not adnate to the keel, but fitted together in a groove; calyx 5-toothed, obliquely campanulate; stamens 10, diadelphous; style laterally compressed, bearded along the ventral (upper) edge. **PODS** oblong, several-seeded, the valves coiling upon dehiscence (Hitchcock 1952; Welsh 1965). One hundred fifty species. North-temperate; Europe, East Africa, and temperate South America.

1. Leaflets 2; stems winged; plants introduced ..... ***L. latifolius***
1′ Leaflets 4 or more; stems angled but not winged; plants indigenous ..... (2)

2. Keel conspicuously shorter than the wings; calyx glabrous or the teeth merely ciliate, the lower tooth usually longer than the tube; stipules large, foliaceous; petals pink-purple, rarely white ..... ***L. pauciflorus***
2′ Keel commonly subequal to the wings; calyx often hairy, the lower tooth shorter than the tube; stipules not foliaceous; flowers pink-purple, pale lavender, pinkish violet, cream, or white ..... (3)

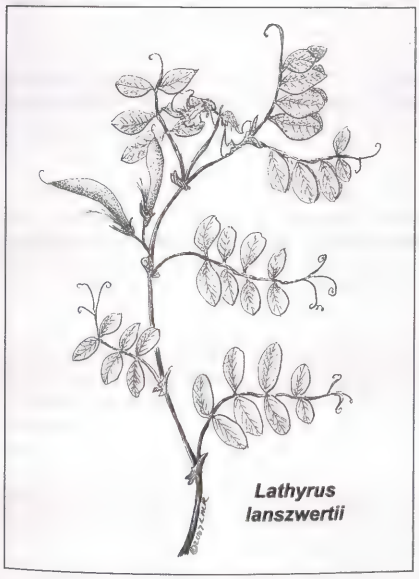
3. Flowers 8–15 (22) mm long; petals pale lavender tinged to pinkish violet, cream, or white, often polychrome in populations; plants common at middle elevations, especially in aspen, flowering in summer ..... ***L. lanszwertii***
3′ Flowers 15–30 mm long; petals bright pink to blue-purple; plants widespread at lower elevations, flowering mainly in springtime ..... (4)

4. Plants villous; calyx 5–8 mm long, the tube 3.5–5.5 mm long; pods not stipitate ..... ***L. brachycalyx***
4′ Plants glabrous or sparingly villous; calyx 8–12 mm long, the tube 5–7 mm long; pods stipitate, the stipe 4–6 mm long ..... ***L. eucosmus***

Lathyrus brachycalyx Rydb. (with a short calyx) Rydberg's sweetpea. Perennial, clambering herbs from a subterranean caudex. **STEMS** buried for a space of 1–15 cm or more, decumbent to erect, 10–50 cm long, the herbage villous or sometimes glabrous above (exceptionally throughout). **LEAVES** 2–9 cm long (excluding tendrils); stipules 6–15 mm

long, semisagittate; leaflets 6–12, 5–50 (70) mm long, 2–10 mm wide, linear to elliptic, oblong, lanceolate, or oblanceolate; tendrils simple or branched. **INFL** a raceme, 2- to 5-flowered, the flowers spreading at anthesis; peduncle 4–10 cm long. **FLOWERS** 15–25 mm long, pink to pink-purple (white); calyx tube 3.5–7 mm long, campanulate, the teeth 1.5–4 mm long, triangular to triangular-lanceolate. **PODS** 30–45 mm long, 5–8 mm wide. $2n = 14$. Sandy soils in piñon-juniper, mixed desert shrub, and riparian communities. ARIZ: Apa; COLO: LPl, Mon; NMEX: SJn; UTAH. 1250–2400 m (4100–7870'). Flowering: May–Jul. Southern and southeastern Utah, Colorado, and northwestern New Mexico. Four Corners material belongs to **var. *zionis*** (C. L. Hitchc.) S. L. Welsh (for Zion National Park) Zion sweetpea. [*L. zionis* C. L. Hitchc.]. Zion sweetpea forms extensive stands in sagebrush and piñon-juniper communities. It forms beautiful rounded clumps in full flower, often contrasting with the sandy habitats in which it grows.

Lathyrus eucosmus Butters & H. St. John (well-adorned) Seemly sweetpea. Plants 1.5–4 (6) dm tall. **LEAVES** 3–10 (13) cm long; stipules 8–20 mm long, semisagittate; leaflets (2–4) 6–10, mainly 3–6.5 cm long, 4–12 (16) mm wide, narrowly elliptic to lance-elliptic, coriaceous. **INFL** a raceme, 2- to 5-flowered; peduncle 3–12 cm long. **FLOWERS** 20–30 mm long; calyx 8–12 mm long, the tube 5–7 mm long, prominently veined, the teeth 2–5 mm long. **PODS** stipitate, the stipe 4–6 mm long, the body 3–4.5 cm long, 7–10 mm wide. $2n = 14$. [*L. brachycalyx* subsp. *eucosmus* (Butters & H. St. John) S. L. Welsh; *L. brachycalyx* var. *eucosmus* (Butters & H. St. John) S. L. Welsh]. Clay soils in washes in salt desert shrub communities. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1690–2245 m (5545–7360'). Flowering: Jun–Aug. Colorado, New Mexico, Arizona, and southeast Utah; Mexico. The much larger flowers are diagnostic for distinguishing this species from the previous one. Plant used by Navajos to remove placenta and for "deer infection," or swellings on horses.



Lathyrus lanszwertii Kellogg (for Dr. L. Lanszweert, a Belgian physician, early member of the California Academy of Sciences) Lanszwert's sweetpea. Plants clambering, decumbent to erect, 20–60 cm tall, the herbage glabrous to villous. **LEAVES** 2–14 cm long (excluding tendrils); stipules 7–20 mm long, semisagittate; leaflets 4–12, 7–75 mm long, 3–18 (26) mm wide, elliptic to lanceolate, oblanceolate, or oval; tendrils short and simple to more commonly branched and prehensile. **INFL** a raceme, 2- to 5-flowered, the flowers spreading at anthesis; peduncle 2–8.5 cm long. **FLOWERS** 12–22 mm long, pink-purple to white or cream and commonly suffused or veined with pink or purple; calyx tube 3.5–6 mm long, campanulate, the lower lateral teeth 1.8–4.2 mm long, triangular to lanceolate. **PODS** 30–60 mm long, 3–7 mm wide. $2n = 14, 28$. Pods dried and stored in winter by Apaches.

1. Tendrils commonly branched and/or coiled; leaflets often more than 6 ..... ***var. laetivirens***
1′ Tendrils reduced to a simple filiform stalk, rarely coiled; leaflets commonly 6 only ..... ***var. leucanthus***

var. *laetivirens* (Greene ex Rydb.) S. L. Welsh (richly + greenish white) Largeflower sweetpea. [*L. laetivirens* Greene ex Rydb.; *L. leucanthus* Rydb. var. *laetivirens* (Greene) C. L. Hitchc.]. Riparian, mountain brush, aspen, coniferous forest, and other montane communities. ARIZ: Apa; COLO: Arc, LPl; UTAH. 1840–3150 m (6040–10330'). Flowering: May–Jun. Northern Arizona; Utah; Lincoln County, Nevada; and western Colorado. Mostly the members of this variety are distinctive by their broader leaflets and larger flowers, but they are transitional in every way with var. *leucanthus*.

var. *leucanthus* (Rydb.) Dorn (white-flowered) Whiteflower sweetpea. [based on priorable autonym generated by *L. leucanthus* Rydb. var. *laetivirens* (Greene) C. L. Hitchc.; *L. leucanthus* Rydb.; *L. arizonicus* Britton; *L. lanszwertii* var. *arizonicus* (Britton) S. L. Welsh]. Mountain brush, ponderosa pine, aspen, and spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1830–3200 m (6010–10500'). Flowering: May–Jun. Grand Canyon Plateau of Arizona, Utah, Colorado, and New Mexico. This is the material previously regarded as either *L. arizonicus* or *L. lanszwertii* var. *arizonicus*. Occasional specimens have the tendrils produced into at least three prehensile branches.

Lathyrus latifolius L. (broad-leaved) Perennial sweetpea. Perennial, climbing or clambering vines, 8–20 dm tall, the stems broadly winged, glabrous. **LEAVES** 6–12 cm long (excluding tendrils), the rachis broadly winged; stipules 9–40 mm long, semihastate to semisagittate; leaflets 2, 35–80 (150) mm long, 5–23 (50) mm wide, lance-elliptic to oblong or ovate; tendrils branched, coiled. **INFL** a raceme, 5- to 15-flowered, the flowers spreading at anthesis; peduncle 7–15 cm long. **FLOWERS** 20–25 mm long, pink-purple, pink, or white; calyx tube 5.8–6.2 mm long, campanulate, the lower lateral teeth 3–6 mm long, lanceolate. **PODS** 6–8 (9.5) cm long, 7–10 mm wide, glabrous. $2n = 14$. Cultivated ornamental, persisting, escaping and now established, mainly along canal banks. COLO: Arc, LPl, Mon; NMEX: SJn. 1525–2150 m (5000–7045'). Flowering throughout the summer. Widely grown in the United States; introduced from Europe. Several species of *Lathyrus* have been shown to be toxic in experiments using laboratory animals. Included are *L. latifolius*, *L. odoratus* L., and *L. sylvestris* L., all introduced and grown as ornamentals.

Lathyrus pauciflorus Fernald (few-flowered) Utah sweetpea. Perennial, 2–10 dm tall or more, climbing vines, glabrous. **STEMS** merely angled. **LEAVES** 2–12.5 cm long (excluding tendrils); stipules 8–32 mm long, the larger ones, at least, foliose and toothed; leaflets 8–12, 14–50 mm long, 8–32 mm wide, ovate to elliptic; tendrils well developed, prehensile. **INFL** a raceme, 3- to 10-flowered, the flowers spreading at anthesis; peduncle 3.5–24 cm long. **FLOWERS** 13–27 mm long, pink to pink-purple, with keel usually pale or white; calyx tube 5–7.3 mm long, obliquely campanulate, more or less gibbous, the lower lateral teeth 2.5–7 mm long, often curved and spreading. **PODS** 4–7.5 cm long, 7–11 mm wide. $2n = 14$. Sagebrush, mountain brush, aspen, mixed conifer, and meadow communities. COLO: Arc, LPl, Mon. 2285–2440 m (7500–8000'). Flowering: May–Jul. Oregon, Idaho, Utah, Colorado, and California. Our material belongs to **var. *utahensis*** (M .E. Jones) Peck (of Utah). [*L. utahensis* M. E. Jones]. Apparent hybrids are known between this and varieties *laetivirens* and *lanszwertii* of *L. lanszwertii*.

Lotus L. Trefoil

(Greek *lotos*, a plant name of diverse application in antiquity) Plants annual or perennial herbs or suffrutescent, caulescent, from a taproot and caudex. **LEAVES** alternate, pinnately (or appearing palmately) compound; stipules foliaceous, scarious, or glandlike. **INFL** in axillary pedunculate umbels or solitary; bracts leaflike. **FLOWERS** papilionaceous; calyx 5-toothed; petals 5, yellow or white, sometimes suffused with red, the keel long-attenuate; stamens 10, diadelphous; ovary enclosed in the staminal sheath, the style glabrous. **PODS** flattened or subterete, straight, 1- to several-seeded, dehiscent. $x = 6, 7, 10$ (Ottley 1944). One hundred species. North-temperate.

Lotus wrightii (A. Gray) Greene (for Charles Wright, explorer of the southwestern United States) Wright's trefoil. Perennial, 12–60 cm tall. **STEMS** erect-ascending from a commonly superficial caudex. **LEAVES** petiolate (sometimes shortly so), palmate; stipules reduced to glands; leaflets 3–5, 2–22 mm long, 1–5 mm wide, spatulate to oblanceolate, oblong, linear, obtuse to acute. **INFL** commonly solitary, rarely 2; peduncle 0–2.6 cm long; bracts 1- to 5-foliolate. **FLOWERS** 14–18 mm long, yellow suffused with red; calyx 7.5–9.2 mm long, longer than or subequal to the tube. **PODS** narrowly oblong, 25–34 mm long, 2–2.6 mm wide, strigulose to villosulous, straight. [*Hosackia wrightii* A. Gray; *Anisolotus wrightii* (A. Gray) Rydb.]. Ponderosa pine woods. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1925–2725 m (6325–8940'). Flowering: Jun–Aug. Decoction of leaves used as a cathartic for "deer infections" and as a "life medicine" by Navajos. Used as a witchcraft medicine by Zunis.

Lupinus L. Lupine

(wolfish; the plants were once thought to rob the soil of nourishment) Plants annual or perennial herbs. **LEAVES** alternate, palmately compound; stipules slender, persistent. **INFL** a terminal raceme, perfect. **FLOWER** calyx bilabiate, the lips entire or toothed, commonly with bracteoles; petals usually blue or blue-purple, less commonly whitish, yellow, or reddish, the banner variously reflexed, glabrous or variously hairy dorsally, the wings mostly glabrous, the keel glabrous or ciliate on upper (less commonly lower) edges; stamens 10, monadelphous, with 5 long filaments alternating with 5 short ones. **PODS** laterally compressed, 2- to several-seeded. Two hundred species. Andes, Rockies, Mediterranean, Europe, tropical Africa highlands, and South America. Note: The genus is notoriously difficult because of lack of clear diagnostic features. Taxa tend to grade morphologically into each other, probably due to hybridization. The basic chromosome number is $x = 12$, but most of ours are polyploids, and numerous aneuploids are known. Wide-ranging perennial taxa tend to intergrade with all others they contact. Because of these problems, and the likelihood of cleistogamy in some taxa, it is not possible to assign all specimens to described entities. *Lupinus* is the most perplexing genus in the legumes. The following summary treatment is tentative. For a complete list of synonyms involved refer to Barneby (in Cronquist et al. 1989). Several of the species have been implicated in poisoning of livestock. Quinolizidine alkaloids and other kinds of alkaloids have been extracted from the plants. Sheep are the most affected, but horses,

cattle, and other animals have also been poisoned (Cox 1970; Dunn 1956, 1957, 1959, 1964; Hess 1969; Fleak and Dunn 1971).

1. Plants annual, the cotyledons commonly persistent ..... **Key 1**
1' Plants perennial, the cotyledons not present at flowering ..... **Key 2**

Key 1

Plants annual

1. Axis of the raceme elongate, mainly much over 2.5 cm long (except at early anthesis) ..... ***L. pusillus***
1' Axis of raceme contracted, mainly much less than 2.5 cm long (even in fruit) ..... (2)

2. Plants subacaulescent or acaulescent, the internodes seldom to 1 cm long; upper calyx lip 2 mm long or less, entire ..... ***L. brevicaulis***
2' Plants caulescent, with 1 or more elogated internodes, at least some more than 2 cm long; upper calyx lip 3–6 mm long, bilobed ..... ***L. kingii***

Key 2

Plants perennial

1. Leaflets glabrous above ..... (2)
1' Leaflets pubescent above ..... (3)

2. Leaves mainly basal, the petioles 8–13 cm long or more, coarsely hirsute; stems from a subterranean caudex (or if from a superficial caudex, the plants cultivated); plants indigenous to Grand and San Juan counties, Utah, and cultivated elsewhere ..... ***L. polyphyllus***
2' Leaves mainly well distributed along the stem, the petioles commonly less than 8 cm long, strigose or silvery hairy; stems from a caudex; plants of various distribution ..... ***L. argenteus***

3. Banner glabrous dorsally ..... (4)
3' Banner pubescent on the back, at least beneath upper lip of calyx ..... (6)

4. Flower 10–13.5 mm long; calyx saccate-gibbous or shortly spurred; leaves mainly basal ..... ***L. polyphyllus***
4' Flower 7–13 mm long; calyx not especially gibbous; leaves distributed along the stem, or all leaves basal ..... (5)

5. Plants acaulescent or short-caulescent; leaves essentially all basal ..... ***L. lepidus***
5' Plants caulescent; leaves distributed along the stem ..... ***L. argenteus***

6. Calyx with a gibbous-saccate spur at base of upper lip; wings or keel (or both) ciliate below the claws ..... ***L. caudatus***
6' Calyx at most gibbous at base of upper lip; wings and lower edge of keel glabrous ..... (7)

7. Leaves mainly basal; plants commonly less than 5 dm tall ..... ***L. polyphyllus***
7' Leaves mainly well distributed along the stems; plants often over 5 dm tall ..... (8)

8. Banner reflexed at or below the midpoint, strigose to thinly strigose near the tip or rarely hairy along the crest ..... ***L. sericeus***
8' Banner reflexed beyond the midpoint, strigose on the back beneath the calyx lobe or over much of the back ..... ***L. argenteus***

Lupinus argenteus Pursh (silvery) Silvery lupine. Plants perennial, 18–90 cm tall, from a superficial caudex, puberulent to strigose on stems and petioles. **LEAVES** mainly cauline; petioles 1.5–8 cm long; leaflets 6–9, 7–95 mm long, 2–22 mm wide, oblanceolate to spatulate or almost linear, flat or folded, strigulose to strigose on both surfaces or almost or quite glabrous above. **INFL** a raceme, 15- to 92-flowered, 5–24 cm long in anthesis, the axis 6–29 cm long in fruit; pedicels 1.5–6 mm long; peduncle 1.5–14.5 cm long. **FLOWERS** (5–7) 8.5–16 mm long, blue-purple, blue, white, or rarely other hues; calyx gibbous or rounded at base of upper lip; banner with a central yellow or white spot, pubescent or glabrous dorsally, reflexed above the midpoint, the wings and keel glabrous or variously sparingly ciliate; ovules 3–6. The silvery lupine is represented by several more or less distinctive but intergrading varieties. Furthermore, at least some of the phases grade into other taxa, especially into *L. caudatus*, but also into *L. sericeus*. Silvery lupine, along with those species, constitutes the most common and most widespread complex of the perennial lupines. Possibly all of

them are poisonous to livestock due to the presence of alkaloids. Ramah Navajos applied a poultice of crushed leaves to poison ivy blisters. The large proportion of the specimens encountered can be segregated by use of the following, admittedly arbitrary key.

1. Leaflets more or less evenly pubescent above, generally folded, the upper surface thus obscured; plants generally of middle and lower elevations ..... (2)
1' Leaflets glabrous above, or with hairs scattered or merely with a few near the margin, commonly flat and green, but sometimes folded; plants generally of middle and upper elevations ..... (3)

2. Stems with spreading or retrorse hairs; flower mainly 7–10 mm long; plants of Navajo County, Arizona ..... **var. *palmeri***
2' Stems with appressed or ascending hairs; flower size various; plants of various distribution ..... (4)

3. Flower 12–14 mm long; plants of sandy washes in southeastern Utah and northwestern New Mexico ..... **var. *moabensis***
3' Flower 8–12 mm long or more; plants widely distributed in the western United States. ..... **var. *argenteus***

4. Flower 5–7 (7.5) mm long; pedicels typically more than 2.5 mm long ..... **var. *parviflorus***
4' Flower typically larger or, if almost as small, the pedicels less than 2.5 mm long ..... (5)

5. Flower mainly 6–8 mm long, with pedicels less than 3.5 mm long ..... **var. *fulvomaculatus***
5' Flower mainly 8–11 mm long and with pedicels more than 3.5 mm long ..... (6)

6. Stems with the inflorescence solitary and terminal, rarely with 1 or 2 depauperate lateral racemes ..... **var. *rubricaulis***
6' Stems branched, each with a solitary and terminal raceme, each raceme maturing at about the same time ..... **var. *argenteus***

var. *argenteus* [*L. tenellus* Douglas ex G. Don; *L. argenteus* subsp. *argenteus* var. *tenellus* (Douglas) Dunn; *L. alpestris* A. Nelson, as to concept but not as to type; *L. lucidulus* Rydb.; *L. laxus* Rydb.; *L. macounii* Rydb.; *L. stenophyllus* Rydb.; *L. pulcher* Eastw.]. Shadscale, ephedra, grass, sagebrush, piñon-juniper, mountain brush, ponderosa pine, aspen, Douglas-fir, and less commonly spruce-fir communities ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1525–2590 m (5000–8495'). Flowering: mid-Apr–May. Alberta and Saskatchewan south to Oregon, California, Nevada, and the Dakotas. Those phases of the species with slightly gibbous calyx base and usually smallish, often compact flowers have been regarded as *L.* ×*alpestris*. They tend to tie the *argenteus* and *caudatus* complexes together, but as pointed out by Barneby (in Cronquist et al. 1989), they occupy "today a range greater than either of its two parents." Such materials are herein included within var. *argenteus* in a broad sense. However, they might be worthy of some taxonomic recognition. Choice of a name from the more than 80 names involved in the *argenteus-caudatus* complexes that matches these plants, which are not geographically correlated, would require examination of type material of all of those names, a task beyond the scope of this work. The huge number of names is indicative of the complexity of the group, and also of the lack of understanding of the various authors, especially Charles Piper Smith (who contributed about half of the names, mostly if not entirely inconsequential).

var. *fulvomaculatus* (Payson) Barneby (yellow spot) Yellow-spot lupine. [*L. fulvomaculatus* Payson; *L. parviflorus* Nutt. ex Hook. & Arn. var. *fulvomaculatus* (Payson) Harmon]. Mountain brush, aspen, spruce-fir, and subalpine meadow communities. COLO: SJn. About 2745 m (9000'). Flowering: mid-Apr–May. Southwest Montana, southern Idaho, Wyoming, southeast Utah, and Colorado. Flowers are typically lupine blue-purple, but occasional plants have white flowers.

var. *moabensis* S. L. Welsh (of Moab, Utah) Moab lupine. Blackbrush and mixed desert shrub communities. ARIZ: Apa; COLO: LPl; NMEX: SJn; UTAH. 1290–1950 m (4225–6400'). Flowering: mid-Apr–May. In Colorado (Mesa County) and New Mexico; a Navajo Basin endemic. This is the large-flowered, xeromorphic ecotype of lower elevations in the canyon country of the Four Corners. Large-flowered specimens occur elsewhere within var. *argenteus*, but not so consistently as for this variety.

var. *palmeri* (S. Watson) Barneby (for Edward Palmer, naturalist and explorer) Palmer's lupine. [*L. palmeri* S. Watson] Sagebrush and piñon-juniper communities. ARIZ: Nav. About 1980 m (6500'). Flowering: mid-Apr–May. Southwest Utah, Arizona, Nevada, and California.

var. *parviflorus* (Nutt.) C. L. Hitchc. (small-flowered) Small-flower lupine. [*L. parviflorus* Nutt. ex Hook. & Arn.; *L. argenteus* subsp. *parviflorus* (Nutt.) Phillips]. Aspen, lodgepole pine, and spruce-fir communities. NMEX: SJn; UTAH. 2285–3200 m

(7500–10500′). Flowering: mid-Apr–May. Montana and Idaho to Wyoming and South Dakota, and south to New Mexico. Small-flower lupine is matched in its flower size here and there throughout var. *argenteus*.

var. *rubricaulis* (Greene) S. L. Welsh (red stem) Subalpine lupine. [*L. rubricaulis* Greene; *L. caudatus* Kellogg var. *rubricaulis* (Greene) C. P. Sm.; *L. argenteus* subsp. *rubricaulis* (Greene) L. W. Hess & D. B. Dunn, 1970 Rhodora 72:111; *L. argenteus* var. *boreus* (C. P. Sm.) S. L. Welsh, at least as to concept; *L. alpestris* A. Nelson, as to type, but not as to concept; *L. maculatus* Rydb.]. Aspen, meadow, mixed conifer, riparian, and spruce-fir communities. COLO: Arc, Hin; UTAH. 2485–3390 m (8150–11120′). Flowering: mid-Apr–May. Idaho, Montana, and South Dakota, south to Nevada and Colorado (type from Crested Butte). It is with some reluctance that I synonymize *L. maculatus*.

Lupinus brevicaulis S. Watson (short stem) Shortstem lupine. Annual, 4–11 cm tall from a taproot; cotyledons sessile. **STEMS** 0–2 cm long, when developed at all usually obscured by the leaf bases. **LEAVES** in a basal tuft; petioles 0.8–6.5 cm long; leaflets 3–9, 5–18 mm long, 1.5–9 mm wide, oblanceolate, flat or folded, pilose beneath, glabrous above (except marginally in some). **INFL** a raceme, 4- to 12-flowered, 1–2.5 cm long in anthesis, the axis 1.5–3 cm long in fruit; peduncle 0.6–6.5 cm long. **FLOWERS** 5.2–7 mm long, blue-purple or white; pedicel 0.3–0.8 mm long; calyx tapering to the pedicel, the upper lip very short; banner with a central yellow spot, glabrous dorsally, reflexed near the midpoint. **PODS** 7–12 mm long, obliquely ovate in profile; ovules 2 or 3. Blackbrush, salt desert shrub, piñon-juniper, and sagebrush communities. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1660–2080 m (5445–6825′). Flowering: early May–Jul. Throughout Utah, and from Oregon to Colorado, south to Arizona and New Mexico. The plant was rubbed on boils as a liniment and used for sterility by Navajos.

Lupinus caudatus Kellogg (ending with a tail-like appendage) Spurred lupine. Perennial, 21–80 cm tall, from a woody caudex. **LEAVES** mainly cauline; petioles 1–12 cm long, commonly 2–8 cm long; leaflets 5–9, 10–45 (60) mm long, 2–14 cm wide, oblanceolate to elliptic or narrowly oblanceolate, pilose on both surfaces or glabrate above. **INFL** a raceme, 10- to 57-flowered, 3–16 cm long in anthesis, the axis 4.5–17 cm long in fruit; peduncle 1–6.5 cm long. **FLOWERS** 8–12.5 (13.5) mm long, blue-purple or less commonly white; pedicel 1–3 (5) mm long; calyx with a gibbous-saccate spur 0.2–1.5 (2) mm long at the base of the upper lip; banner pubescent dorsally, reflexed at or beyond the midpoint; wings commonly ciliate above and near the claws, the keel commonly ciliate above and near the claws; ovules 3–5. Two rather weak varieties are known from the San Juan River drainage. They are separable only arbitrarily but seem to represent at least trends within the variation. Leaves of this plant were used by Ramah Navajos as a ceremonial emetic and a lotion for poison ivy.

1. Leaflets bicolored, green to yellow-green above, dull green to grayish beneath; flowers mainly 10–12 mm long ..... **var. *argophyllus***

1′ Leaflets more uniformly colored, either green or gray on both surfaces or only somewhat bicolored..... **var. *utahensis***

var. *argophyllus* (A. Gray) S. L. Welsh (bright or shining leaf) Silverleaf lupine. [*L. decumbens* Torr. var. *argophyllus* A. Gray; *L. argenteus* Pursh var. *argophyllus* (A. Gray) S. Watson; *L. argophyllus* (A. Gray) Cockerell; *L. laxiflorus* Douglas ex Lindl. var. *argophyllus* (A. Gray) M. E. Jones; *L. caudatus* subsp. *argophyllus* (A. Gray) L. Phillips; *L. cutleri* Eastw.; *L. caudatus* var. *cutleri* (Eastw.) S. L. Welsh]. Piñon-juniper, mountain brush, ponderosa pine, and grassland communities. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1580–2445 m (5180–8020′). Flowering: late May–Jul. Montana, Idaho, Wyoming, Utah, and south to Arizona and New Mexico. Flowers of this variety are almost always at least 10–12 mm long, and the calyx definitely though shortly spurred. Specimens previously identified as var. *cutleri* do not differ in any major regard from those of var. *argophyllus*, whose range overlaps the area supposed to bear var. *cutleri*.

var. *utahensis* (S. Watson) S. L. Welsh (of Utah) Utah lupine. [*L. holosericeus* Nutt. var. *utahensis* S. Watson; *L. argenteus* Pursh var. *utahensis* (S. Watson) Barneby; *L. argentinus* Rydb.; *L. leucophyllus* Douglas ex Lindl. var. *lupinus* Rydb.]. Sagebrush, piñon-juniper, mountain brush, ponderosa pine, aspen, mixed conifer, and grassland communities. ARIZ: Apa; COLO: Dol, LPl, Mon, SMg; NMEX: McK, SJn; UTAH. 1480–2680 m (4850–8800′). Flowering: May–Jul. In Oregon, Idaho, and Wyoming, south to California, Nevada, Arizona, New Mexico, and Colorado.

Lupinus kingii S. Watson (for George King) King's lupine. [*L. sileri* S. Watson; *L. capitatus* Greene]. Annual, 6–28 cm tall, from a taproot; cotyledons sessile. **STEMS** with 1 or more apparent internodes more than 2 cm long. **LEAVES** mainly cauline; petioles 0.8–3.5 cm long; leaflets 5–7, 7–23 mm long, 2–6.5 mm wide, oblanceolate, flat or folded, long-pilose on both surfaces or glabrous medially above or overall. **INFL** a raceme, 5- to 12-flowered, 1–2.3 cm long at anthesis, the axis 1.8–3.7 cm long in fruit; peduncle 0–9.5 cm long. **FLOWERS** 7.8–9.2 mm long, blue-purple or less commonly pallid; calyx somewhat gibbous at base of upper lip; banner with a central yellow spot, glabrous dorsally, reflexed below

the midpoint; ovules usually 2. Sagebrush, piñon-juniper, mountain brush, ponderosa pine, and grass-forb-sagebrush communities. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1840–2375 m (6040–7800'). Flowering: Jun–Aug. Nevada, Utah, Arizona, Colorado, New Mexico. Hopis used the plant as an eye medicine. Navajos made poultices of crushed leaves for skin irritations. Also a Navajo "life medicine."

Lupinus lepidus Douglas ex Lindl. (charming or pleasant) Stemless lupine. Perennial, 2.5–40 cm tall, caespitose from a branching caudex, acaulescent or subacaulescent to short-caulescent. **LEAVES** mainly basal; petioles 1–10 cm long; leaflets 5–9, 3–40 mm long, 1.5–9 mm wide, oblanceolate to elliptic, flat or folded, mucronate, pilose on both surfaces, or less so above. **INFL** a raceme, 12- to 85-flowered, 1–23 cm long at anthesis, the axis 2–30 cm long in fruit; peduncle 0–3 cm long. **FLOWERS** 7–14 mm long, blue-purple or white; pedicel 1–4 mm long; calyx tapering to the petiole or only somewhat gibbous at base of upper lip; banner with a central yellow spot, glabrous dorsally, reflexed at or below the midpoint; ovules 2–4. $2n = 48$. Meadows, open deciduous woodland, mixed conifer, and sagebrush communities. ARIZ: Apa; COLO: Arc, Hin; NMEX: SJn. 2440–2775 m (8000–9100'). Flowering: Jun–Sep. Idaho and Montana, south to California, Nevada, Colorado, and New Mexico. Four Corners material belongs to **var. *utahensis*** (S. Watson) C. L. Hitchc. (of Utah) Watson's lupine. [*L. caespitosus* Nutt.; *L. lepidus* subsp. *caespitosus* (Nutt.) Detling; *L. aridus* Douglas ex Lindl. var. *utahensis* S. Watson; *L. watsonii* A. Heller; *L. caespitosus* var. *utahensis* (S. Watson) B. Cox].

Lupinus polyphyllus Lindl. (many leaves) Showy lupine, meadow lupine, blue pod. Plants perennial, 13–70 cm tall, from a subterranean to superficial caudex; pubescence of stems spreading-hirsute to hirsute-pilose or appressed-ascending. **LEAVES** mainly basal or basal and cauline; petioles of lowermost leaves 3.5–30 cm long; leaflets 8–13, 12–75 mm long, 1.2–7 mm wide, oblanceolate to obovate, plane or folded, pilose beneath, glabrous above or pilose on both sides. **INFL** a raceme, 13- to 68-flowered, 6–25 cm long in anthesis, 8–36 cm long in fruit; peduncle 3.5–13 cm long. **FLOWERS** 10–16 mm long, blue-purple or rarely white; pedicel 3–9 mm long; calyx gibbous or saccate-spurred at base of upper lip; banner with a central yellow or white spot, glabrous dorsally, reflexed near or above the midpoint; wings glabrous; keel sparingly ciliate near the apex; ovules 3–7.

1. Stems from a subterranean caudex; plants widespread throughout the Four Corners region ..... **var. *ammophilus***
1' Stems from a subterranean caudex; plants of Dolores, La Plata, and San Miguel counties, Colorado ..... (2)

2. Leaflets silky strigose on both surfaces; petioles of basal leaves only somewhat (if at all) longer than the cauline ones; plants of La Plata County, Colorado ..... **var. *humicola***
2' Leaflets glabrous above or essentially so; petioles of basal leaves markedly longer than the cauline ones; plants of Dolores, La Plata, and San Miguel counties ..... **var. *prunophilus***

var. *ammophilus* (Greene) Barneby (sand-loving) [*L. ammophilus* Greene]. Sand lupine. Sagebrush, piñon-juniper, mountain brush, ponderosa pine, and aspen–Douglas-fir forests, commonly in sandy soils. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: RAr, San, SJn; UTAH. 1735–2760 m (5700–9060'). Flowering: May–Aug. Southeast Utah; southwest Colorado; Apache County, Arizona; and northwest New Mexico. The long (2 mm plus) spreading hairs and petioles subequal to or longer than the stem proper easily characterize this plant within its area of growth.

var. *humicola* (A. Nelson) Barneby (ground-dweller) Meadow lupine. [*L. humicola* A. Nelson; *L. wyethii* S. Watson]. Wash bottoms and terraces or rimrock in piñon-juniper and riparian communities. COLO: LPl. 2500 m (8195'). Flowering: Jun–Aug. British Columbia and Alberta south to California, Nevada, and Colorado.

var. prunophilus (M. E. Jones) L. Phillips (plum-loving) Hairy bigleaf lupine. [*L. prunophilus* M. E. Jones; *L. wyethii* S. Watson var. *prunophilus* (M. E. Jones) C. P. Sm.; *L. arcticus* S. Watson var. *prunophilus* (M. E. Jones) C. P. Sm.; *L. tooelensis* C. P. Sm.]. Sagebrush, piñon-juniper, and mountain brush communities. COLO: Dol, LPl, SMg. 1830–2135 m (6000–7000'). Flowering: Jun–Aug. Washington to Nevada, east to Montana, Wyoming, Utah, and Colorado. Both varieties *ammophilus* and *prunophilus* are sufficiently beautiful as to be of horticultural significance. The flowers are large in both of them, and the basal cluster of long-petiolate leaves is attractive, even when the plants are not in flower.

Lupinus pusillus Pursh (dwarf) Dwarf lupine, rusty lupine. Annual, 3–24 cm tall, from a taproot; cotyledons sessile; pubescence of stems and petioles spreading long-hairy. **LEAVES** mainly cauline; petioles 1–9 cm long; leaflets 3–9 (14), 11–48 mm long, 2–10 mm wide, oblanceolate, flat or folded, long-pilose beneath, glabrous above. **INFL** a raceme, 4- to 38-flowered, 1–17 cm long in anthesis, the axis 4–21 cm long in fruit; peduncle 0.5–3.5 cm long. **FLOWERS** 8.5–12 mm long, blue or variously pink or white; pedicel 1–3.5 mm long; calyx tapering to the pedicel; banner with a

central yellow spot, glabrous dorsally, reflexed near the midpoint; ovules 2. **PODS** constricted between the seeds. Blackbrush, mixed desert shrub, piñon-juniper, and mountain brush communities; commonly in sand. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1220–1925 m (4000–6325'). Flowering: May–Jul. Washington to Alberta and Saskatchewan, south to Utah, Arizona, Colorado, New Mexico, and Kansas. Four Corners material belongs to **var. *pusillus***. This variety occurs mainly in the Colorado drainage system. Hopis used the plant as an ear and eye medicine, and the juice as holy water in the Po-wa-mu ceremony.

Lupinus sericeus Pursh (silky) Silky lupine. Perennial, 3–12 dm tall, from a branching caudex; pubescence of stems short-villous to pilose or strigose, sometimes spreading. **LEAVES** with petioles 1.2–9 cm long; leaflets 5–9, 0.7–7.8 cm long, 2–15 mm wide, oblanceolate, commonly flat (at least some), pilose to puberulent on both surfaces or glabrous to glabrate above. **INFL** a raceme, 14–70-flowered, 6–28 cm long in anthesis, the axis 8–37 cm long in fruit; peduncle 1.3–9 (12) cm long. **FLOWERS** 10–16 mm long, blue, blue-purple, pale, or white; pedicels 2–7 mm long; calyx more or less gibbous at the base of the upper lip; banner with yellow or brown eyespot, strigose along the dorsal crest or more widely; ovules 5–7. $2n = 48$. [*L. flexuosus* Lindley ex J. Agardh; *L. sericeus* var. *flexuosus* (Lindley) C. P. Smith]. Sagebrush, mountain brush, piñon-juniper, ponderosa pine, aspen, spruce-fir, and alpine meadow communities. COLO: Arc, Dol, LPl, Mon, SMg; NMEX: RAr; UTAH. 2135–2895 m (7000–9500'). Flowering: Jun–Aug. British Columbia east to Alberta, south to California, Nevada, Utah, Colorado, Arizona, and New Mexico. Four Corners material belongs to **var. *sericeus***.

Medicago L. Alfalfa, Black Medic

(Medea, source of alfalfa) Annual or perennial herbs, caulescent from a taproot or caudex. **LEAVES** alternate, pinnately trifoliolate, the leaflets serrate in the distal 1/2 or less; stipules herbaceous, often toothed. **INFL** in axillary, pedunculate racemes or heads; bracts subulate. **FLOWERS** papilionaceous, calyx 5-toothed; petals 5, yellow, white, blue, pink, lavender, or purple; stamens 10, diadelphous; ovary enfolded by the staminal sheath, the style subulate. **PODS** curved to spirally coiled, 1- to several-seeded, indehiscent, reticulate or spiny. Fifty-six species. Europe, Mediterranean, Ethiopia, and South Africa.

1. Flowers 2–3 mm long; inflorescence less than 10 mm long in anthesis; pods coiled through a single spiral, 1-seeded, unarmed; plants annual, prostrate to decumbent or rarely erect ..... ***M. lupulina***
1' Flowers 4–10 mm long; inflorescence longer than 10 mm (including flower length), or pods differing from above; plants various ..... (2)

2. Flowers yellow (sometimes tinged violet or violet throughout), mainly over 8 mm long; pods merely curved; plants uncommon ..... ***M. falcata***
2' Flowers blue, pink, lavender, purple, or white, mainly 8 mm long or shorter; pods spirally coiled; plants common ..... ***M. sativa***

Medicago falcata L. (curved like a sickle) Yellow alfalfa. Perennial (rarely functionally annual), 4–10 dm tall or more, the stems erect or ascending, strigulose; stipules 4–12 mm long, persistent, conspicuously veined. **LEAVES** short-petiolate, the leaflets linear, oblong, oblanceolate, or elliptic, 6–20 mm long, 1–6 (10) mm wide, few-toothed, tridentate, or merely apiculate apically, strigulose beneath. **INFL** a raceme, 6- to 20-flowered, mostly 10–20 mm long; peduncle subequal to the subtending leaves or longer. **FLOWERS** 6–10 mm long, yellow, sometimes suffused with violet; calyx campanulate, the tube 1–2 mm long, the teeth 1.5–3 mm long, lance-subulate. **PODS** 6–10 mm long, merely curved, unarmed, several-seeded. $2n = 16, 32$. Sparingly cultivated forage plant, escaping and persisting. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: SJn. 1675–2145 m (5500–7045'). Flowering: Jun–Aug. Introduced from the Old World. This plant forms hybrids with *M. sativa* and is sometimes considered a phase of that species. It seldom grows in pure stands; usually it occurs mixed with *M. sativa* and is impressive where grown along interstate highways in the Four Corners region. Mature fruiting pods are diagnostic for the entity.

Medicago lupulina L. (hop plant) Black medic, hop clover. Annual, the stems prostrate to decumbent or sometimes erect, 10–50 cm long or more. **LEAVES** short-petiolate; stipules entire or nearly so, 3–6 mm long, persistent; the leaflets cuneate to obcordate, 4–17 mm long, 2–15 mm wide, toothed in the apical 1/3 (rarely more), pubescent to glabrous. **INFL** a raceme, compactly 6- to 25-flowered, less than 25 mm long in fruit; peduncle mostly equaling or surpassing the subtending leaves. **FLOWERS** 2–3 mm long, yellow; calyx campanulate, about 1 mm long. **PODS** spiral through about 1 coil, unarmed, 1-seeded. $2n = 16, 28, 32$. Introduced weedy species of lawns, fields, roadsides, other open sites, and in native vegetation. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1065–3200 m (3500–10500'). Flowering: May–Oct. Introduced from Europe.

Medicago sativa L. (cultivated) Alfalfa, lucerne. Perennial, or functionally annual, the stems 4–12 dm long or more, ascending to erect, finally sprawling, strigulose. **LEAVES** short-petiolate; stipules entire or toothed, 4–12 mm long, persistent; the leaflets elliptic to oblanceolate, 8–40 mm long, 2–15 mm wide, apically few-toothed, pubescent. **INFL** a raceme, 6- to 25-flowered, 10–35 mm long or more; peduncle often surpassing the subtending leaves. **FLOWERS** 6–8 (10) mm long, blue, lavender, pink, purple, or white; calyx campanulate to short-cylindric, the tube 1.5–2.5 mm long, the lance-subulate teeth 2–4 mm long. **PODS** spirally coiled, unarmed, several-seeded. $2n = 16, 32, 64$. Introduced forage plant, escaping and persisting, now almost or quite cosmopolitan. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1690–2945 m (5545–9670′). Flowering: May–Oct. Introduced from Europe. This Old World introduction is possibly the most important forage species grown in the Four Corners, as it is in much of the American West.

Melilotus Mill. Sweet Clover

(*mel*, honey, + *lotus*, a plant name of many applications) Plants annual or biennial herbs, caulescent, from a stout taproot. **LEAVES** alternate, pinnately trifoliolate, the leaflets dentate-serrate in the distal 1/2 or more; stipules herbaceous, distinct, subulate, entire or hastately lobed. **INFL** borne in axillary, pedunculate racemes; bracts subulate. **FLOWERS** papilionaceous; petals 5, white or yellow, the keel obtuse; calyx 5-toothed; stamens 10, diadelphous; ovary enfolded by the staminal sheath, the style subulate. **PODS** straight, ovoid, reticulately veined or cross-ribbed, unarmed, glabrous, 1- to 2-seeded, indehiscent. $x = 8$. The generic name *Melilotus* is considered to be feminine, despite its ending; hence, the specific epithets must agree with that gender. Twenty species. Temperate and subtropical; Europe, North Africa, and Ethiopia.

1. Flowers white; pods reticulately veined ..... ***M. albus***
1′ Flowers yellow; pods cross-ribbed ..... ***M. officinalis***

Melilotus albus Medik. (white) White sweet clover. Annual or biennial, the stems commonly 5–15 dm tall or more, erect, strigulose. **LEAVES** short-petiolate; stipules entire or hastately lobed, mostly 5–10 mm long, persistent; the leaflets obovate to elliptic or oblanceolate, 8–35 mm long, 1–15 mm wide, pubescent or glabrous. **INFL** a raceme, 38- to 115-flowered, 1.8–14.5 cm long or more; peduncle commonly surpassing the subtending leaves. **FLOWERS** 4–5.5 mm long, white; calyx campanulate, the tube 1.2–1.8 mm long, the teeth 1–1.5 mm long, acuminate. **PODS** 2.5–6 mm long, reticulately veined, 1- to 2-seeded. $2n = 16, 24$. Introduced forage plant, now widely established. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1225–2365 m (4025–7755′). Flowering: Jun–Sep. Introduced from Europe. White sweet clover is an excellent source of honey for domestic bees. This species and yellow sweet clover both contain the substance coumarin and are responsible for a hemorrhagic disease and subsequent death in livestock. The substance or one of its isomers, commercially known as coumadin or warfarin, is utilized in medicine as a blood thinner following stroke and other human ailments. It is also the basis for a common rat and mouse poison, inducing fatal hemorrhagic disease in those animals as well.

Melilotus officinalis (L.) Lam. (used in medicine) Yellow sweet clover. Annual, winter-annual, or biennial, the stems 5–15 dm tall or more, erect, strigulose. **LEAVES** shortly petiolate; stipules entire or with 1–3 basal teeth, 3–10 mm long, persistent; the leaflets cuneate to elliptic or oblanceolate, 8–38 mm long, 3–16 mm wide, pubescent or glabrous. **INFL** a raceme, 20- to 65-flowered, 1.8–11 (14) cm long; peduncle shorter to longer than the subtending leaves. **FLOWERS** 4.5–6 (7) mm long, yellow, fading cream; calyx campanulate, the tube 1–1.8 mm long, the teeth 1–1.5 mm long, acuminate. **PODS** 3–5 mm long, cross-ribbed, 1- or 2-seeded. $2n = 16$. [*Trifolium melilotus-officinalis* L.]. Common ruderal weed of almost cosmopolitan distribution in fields, along roadsides, and other open sites, often in native plant communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1065–2455 m (3500–8050′). Flowering: May–Jul. Introduced from Europe, and widely grown and established in North America. Drought-resistant strains of yellow sweet clover are commonly used in reclamation plantings. It is genetically incompatible with the closely similar *M. alba*. Ramah Navajos used a cold infusion for chills.

Onobrychis Mill. Sainfoin

(*onos*, donkey, + *bruchein*, to bray) Perennial herbs, caulescent, from a caudex and taproot. **LEAVES** alternate, odd-pinnate; stipules adnate to the petiole base, the lowermost amplexicaul but not connate. **INFL** in an axillary raceme, each subtended by a bract; bracteoles 2. **FLOWERS** papilionaceous; petals 5, red-purple to lavender or pink, the keel much longer than the wings, abruptly bow-shaped; calyx 5-toothed; stamens 10, essentially diadelphous; ovary enclosed in the staminal sheath, the style glabrous. **FRUIT** a loment reduced to 1 segment, this armed with prickles. One hundred thirty species. Eurasia and Ethiopia.

Onobrychis viciifolia Scop. (vetch-leaved) Sainfoin, holy clover. Perennial, caulescent, 20–45 cm tall, from a branching, superficial caudex. **STEMS** ascending to erect. **LEAVES** 3–12 mm long; stipules 3–12 mm long, all more or less amplexicaul; leaflets 11–21 (27), 8–25 mm long, 2–7 mm wide, oblong to elliptic or oblanceolate, pilose mainly along veins beneath, glabrous above. **INFL** a raceme, 14- to 39 (50)-flowered, the flowers ascending-spreading at anthesis, the axis 4–14 cm long in fruit; bracts 2.5–4.5 mm long; pedicels 0.2–1.5 mm long; bracteoles 1; peduncle 8–19 cm long. **FLOWERS** 10–13 mm long, red-purple, lavender, or pink; calyx 5.5–6.5 mm long, the tube 2.3–3 mm long, campanulate, the teeth 2.2–4 mm long, subulate. **LOMENTS** sessile, ascending, armed with prickles. $2n = 28$. [*Hedysarum onobrychis* L.; *O. onobrychis* Rydb.; *O. sativa* Lam.]. Introduced forage and reclamation plant, escaping and persisting, roadsides, canal banks, and reclamation areas. COLO: Dol, LPl, Mon, SMg. 1855–2365 m (6095–7760'). Flowering: Jul–Aug. Native to Europe. The genus is closely allied to *Hedysarum* and is equally attractive.

Oxytropis DC. Locoweed

(Greek *oxys*, sharp, + *tropis*, keel) Perennial, caulescent or acaulescent herbs, from a taproot and caudex. **LEAVES** alternate or basal, odd-pinnate; stipules adnate to the petiole base, often connate-sheathing. **INFL** scapose or an axillary raceme, each subtended by a single bract; bracteoles 0 (rarely 2). **FLOWERS** papilionaceous; petals 5, pink, pink-purple, or white, the keel shorter than the wings, the keel tip produced into a porrect beak; calyx 5-toothed; stamens 10, diadelphous; ovary enfolded in the staminal sheath, the style glabrous. **PODS** sessile or stipitate, straight, erect, ascending, or spreading-declined, 1- or 2-loculed, or partially 2-loculed by intrusion of the ventral (upper) suture, dehiscent apically or throughout. $x = 8$ (Barneby 1952; Ralphs, Welsh, and Gardner 2002; Welsh 1991, 1995b, 2001). Three hundred species. Mostly north-temperate.

1. Plants caulescent, with 1 or more internodes apparent, or sometimes acaulescent; pods stipitate, pendulous ..... ***O. deflexa***
1' Plants acaulescent, the internodes not apparent; pods sessile, steeply ascending ..... (2)

2. Pubescence of malpighian hairs; corollas typically some shade of pink-purple ..... ***O. lambertii***
2' Pubescence of basifixed hairs; corollas typically white ..... ***O. sericea***

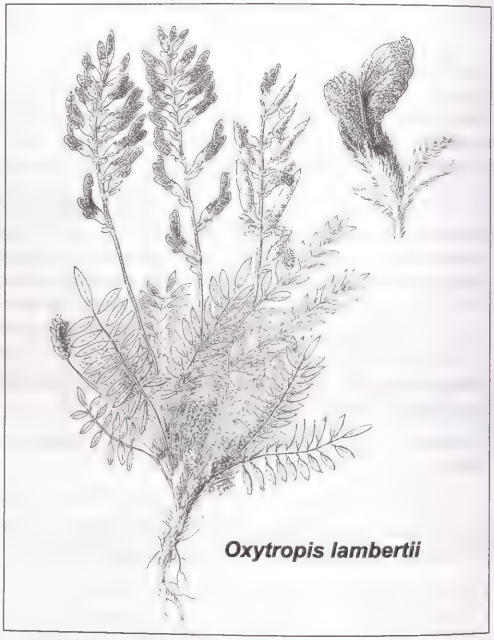
Oxytropis deflexa (Pall.) DC. (turned away) Stemmed oxytrope. Perennial, caulescent to subacaulescent, (5) 7–48 cm tall. **PUBESCENCE** basifixed, villous-pilose. **STEMS** few to several from a caudex, with usually 1–7 apparent internodes (sometimes none), flexuous, sometimes acaulescent, more or less villous with spreading or retrorse hairs. **LEAVES** 2–22 cm long; stipules 7–20 mm long, subherbaceous, sometimes connate opposite the petiole, slightly adnate to the petiole, the free blades caudate-acuminate; leaflets (9) 15–41, 3–25 mm long, 1–8 (11) mm wide, not fasciculate, lance-oblong to lanceolate, pilose on both surfaces or glabrous above, quite sessile. **INFL** a raceme, 3- to 30-flowered or more, the flowers ascending to declined at anthesis, the axis 3.5–10 cm long in fruit; bracts pilose; peduncle 3.5–32 (36) cm long, villous-pilose. **FLOWERS** 5–10.5 (12) mm long, whitish, lilac, or blue purple; calyx 3–8 mm long, the tube 2–3.5 (4.5) mm long, campanulate, the teeth 1.5–5 mm long, lance-subulate. **PODS** spreading-declined, subsessile to shortly stipitate, the body oblong to ellipsoid, 8–18 mm long, 3–4.5 mm wide, subunilocular, pilosulous. $2n = 16$. [*Astragalus deflexus* Pall.; *Aragallus deflexus* (Pall.) A. Heller; *Astragalus retroflexus* Pall.] (Boivin 1962).

1. Flowers pink-purple, pink, or less commonly whitish, 2–15 (20) per raceme; racemes hemispheric (or subcapitate) to shortly subcylindrical, 14–20 mm broad in flower (when pressed), not much elongating in fruit (1–10 cm long); herbage variously pubescent; plants often of woods or thickets ..... **var. *pulcherrima***
1' Flowers whitish, pinkish, bluish, or less commonly pink-purple, 10–30 or more per raceme; racemes subcylindrical, 10–13 (14) mm broad in flower (when pressed), much elongating in fruit (to 18 cm long); herbage usually conspicuously long-villous; plants commonly of open sites ..... **var. *sericea***

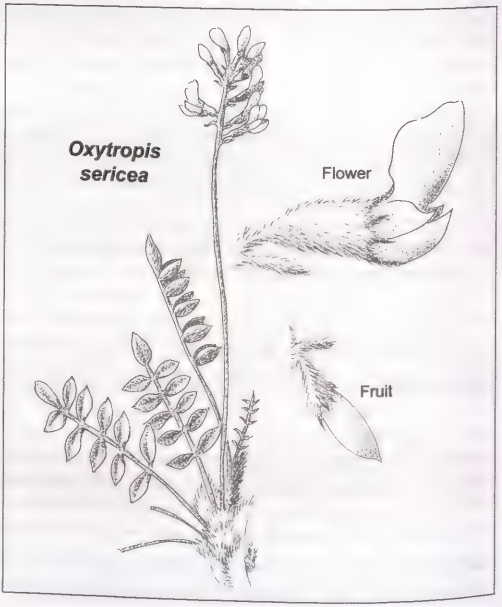
var. *pulcherrima* S. L. Welsh & A. Huber (beautiful or handsome) Beautiful oxytrope. Caulescent or subacaulescent to acaulescent. **INFL** a raceme, rather densely 10- to 20-flowered, 20–27 mm wide when pressed, typically 1.5–6 cm long in fruit. **FLOWERS** bright pink-purple or purple. Alpine tundra, spruce-fir, and aspen communities, on gravels and in meadows COLO: LPl, SJn. 3260–3810 m (10700–12500'). Flowering in summer. Northeast Utah and southwest Colorado. Large-flowered materials from the Uinta Mountains of Utah and from the Rockies of southwestern Colorado have long been identified as *O. deflexa* var. *deflexa*. Examination of critical material, including types from Siberia, has demonstrated that these American materials are distinct from all Siberian phases of the species.

var. *sericea* Torr. & A. Gray **CP** (of silk) Silky oxytrope. [*O. retrorsa* var. *sericea* (Torr. & A. Gray) Fernald; *O. deflexa* subsp. *foliolosa* (Hook.) Cody; *O. retrorsa* Fernald; *O. deflexa* subsp. *retrorsa* (Fernald) Á. Löve & D. Löve; *O. deflexa* var. *culminis*

Jeps.; *O. deflexa* var. *parviflora* B. Boivin]. Typically caulescent, rarely acaulescent. **INFL** a raceme, usually 10–25-flowered, normally much elongated in fruit. **FLOWERS** typically dirty white or variously suffused with purple. $n = 8$ (*Spellenberg 4002*, NMC). Spruce-fir, other conifer, aspen, willow, alder, and meadow communities. COLO: LPl, Min, SJn. 2600–3585 m (8535–11760'). Flowering in summer. Alaska, Yukon, Northwest Territories, British Columbia, Alberta, Saskatchewan, Manitoba; Washington, California, Idaho, Montana, Colorado, New Mexico, Oregon, Utah, and Wyoming.



Oxytropis lambertii Pursh (for Aylmer Bourke Lambert) Lambert's locoweed, purple locoweed. Caespitose, acaulescent, (10) 14–50 cm tall. **PUBESCENCE** malpighian, strigose. **LEAVES** 3–24 cm long; stipules pilose; leaflets 7–13, 7–45 mm long, 2–8 mm wide, lanceolate to oblong or linear; scapes 4–28 (45) cm long, strigose. **INFL** a raceme, 8- to 40-flowered, the flowers ascending at anthesis, the axis 3–23 cm long in fruit; bracts strigose. **FLOWERS** 17–25 mm long, pink-purple; calyx 6.5–10 mm long, the cylindric tube 4.5–7.5 mm long, the teeth 1.5–4.5 mm long, subulate. **PODS** sessile or shortly stipitate, erect or ascending at maturity, cylindroid to lance-acuminate in outline, the body 15–27 mm long, 2.5–6 mm thick, bilocular, strigose to strigulose. $n = 16$. Mixed desert shrub, piñon-juniper, sagebrush, and grass communities. ARIZ: Apa, Nav; COLO: SMg; NMEX: McK, RAr, SJn; UTAH. 1675–2285 m (5500–7500'). Flowering: May–Jul. The species ranges from Saskatchewan and Manitoba southward. Our material belongs to the southern montane and steppe **var. *bigelovii*** A. Gray (for John Milton Bigelow, botanist and surgeon). [*Aragallus bigelovii* (A. Gray) Greene; *Astragalus lambertii* Pursh (Spreng.) var. *bigelovii* (A. Gray) Tidestr.; *O. lambertii* subsp. *bigelovii* (A. Gray) W. A. Weber]. This species, like its near congener *O. sericea*, produces locoism in livestock, due to the presence of indolizidine alkaloids in at least some populations.

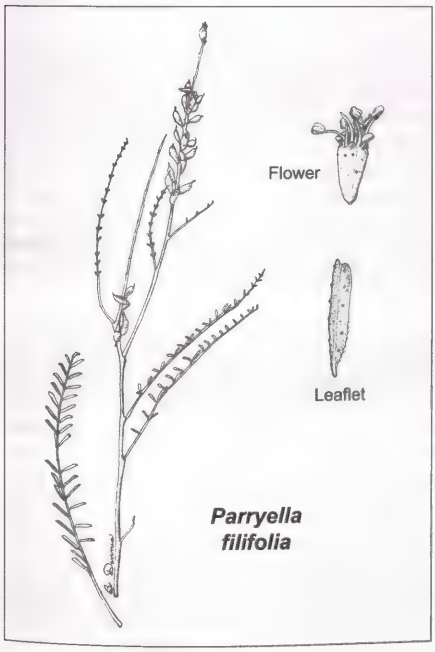


Oxytropis sericea Nutt. (of silk) Silky or white locoweed. Caespitose, acaulescent, 13–32 cm tall. **PUBESCENCE** basifixed, silky pilose. **LEAVES** 3.5–21 cm long; stipules pilose to subtomentose; leaflets 9–23, 4–32 (40) mm long, 1.5–10 mm wide, lanceolate to oblong, elliptic, or ovate, pilose; scapes 7–26 cm long, pilose. **INFL** a raceme, 6- to 27-flowered, the flowers ascending to spreading, the axis 1.5–12 cm long in fruit; bracts pilose. **FLOWERS** 15–26 mm long, white or tinged with purple; calyx 8–12 mm long, the tube cylindric, the teeth triangular to subulate. **PODS** erect, sessile, the body subcylindric to ovoid-oblong, 10–25 mm long, 4–7.5 mm thick, bilocular or nearly so, strigose or pilosulous. [*O. lambertii* Pursh var. *sericea* (Nutt.) A. Gray; *Spiesia lambertii* (Pursh) Kuntze var. *sericea* (Nutt.) Rydb.;

Aragallus sericeus (Nutt.) Greene; *Aragallus lambertii* (Pursh) Greene var. *sericeus* (Nutt.) A. Nelson; *Aragallus majusculus* Greene]. Sagebrush, piñon-juniper, and grassland (rarely mixed desert shrub) communities. NMEX: McK, RAr. 2135 m (7000'). Flowering: May–Aug. Yukon south to Nevada, New Mexico, and Oklahoma. Our material belongs to **var. *sericea***. The white locoweed contains indolizidine alkaloids associated with so-called locoism in livestock. Another syndrome in cattle, brisket disease, is also symptomatic of poisoning due to this plant. Livestock should not be grazed where the plant is common, or the animals must be closely monitored and removed from the range to other feeding stations free of the plants, should symptoms appear.

Parryella Torr. & A. Gray Dunebroom

(named for Charles Christopher Parry) Unarmed shrubs. **LEAVES** alternate, pinnate, with numerous leaflets, glandular-dotted; stipules subulate, caducous; peduncles opposite the leaves. **INFL** in a loose, spicate raceme or panicle. **FLOWER** calyx turbinate-campanulate, 10-ribbed near the base, 5-lobed; petals lacking; stamens 10, the filaments distinct, inserted on the hypanthium. **PODS** 1-seeded (2-ovuled), indehiscent, obliquely ovoid, glandular-dotted, exserted from the calyx. (Rydberg 1919a.) One species. Southwest United States and Mexico.



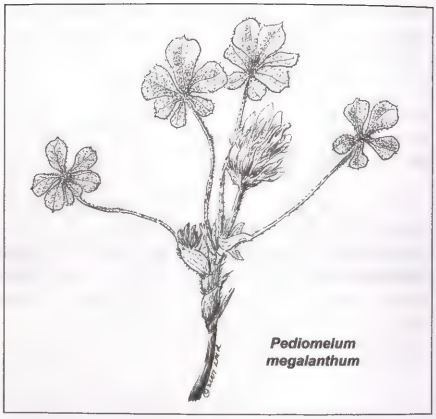
Parryella filifolia Torr. & A. Gray ex A. Gray (referring to the threadlike leaves) Narrow-leaf dunebroom. Shrubs to 15 dm tall or more, often partially buried in sand, the branchlets strigose and with mammiform, glandular protuberances. **LEAVES** 3.5–13 cm long; stipules 1–2 mm long, chestnut-brown, fragile; leaflets 8–40, 1–21 mm long, linear (rarely oblong), all involute, strigose to glabrate and glandular on the visible surface. **INFL** a raceme, 4–10 cm long, the main ones often branched near the base, forming panicles, 35- to 90-flowered, the axis not much elongating in fruit; bracts reduced to gland-tipped vestiges; peduncle 0–1 cm long. **FLOWERS** 5–6.5 mm long in anthesis, calyx 2.5–3.1 mm long, 10-ribbed near the base, the tube opaque, the teeth 0.2–0.5 mm long, ciliate; stamens long-exserted. **PODS** short-stipitate, the body 5–6.5 mm long, 2.5–3 mm wide, the pilose style base persistent, glabrous, glandular-punctate. $n = 10$. Stabilized dune sands with sand sagebrush, purple sage, blackbrush, Indian ricegrass, and four-wing saltbush, or less commonly in sandstone pockets or talus with skunkbrush, singleleaf ash, cliff rose, and rabbitbrush. ARIZ: Apa; COLO: Mon; NMEX: McK, SJn. 1625–1900 m (5330–6235'). Flowering: Jun–Sep. Grand and San Juan counties, Utah; Montezuma County, Colorado; northeast Arizona; and northwest New Mexico. This plant shows promise for use in reclamation of sandy sites. Hopis used the beans for toothaches, the plant for basketry and kachina masks, and the roots for stable gear.

Pediomelum Rydb. Breadroot

(Greek *pedion*, plain, + *melon*, apple) Perennial herbs, unarmed, from deep-seated, tuberous roots. **LEAVES** alternate; stipules triangular to subulate; blade palmately 3- to 7-foliolate, glandular-dotted. **INFL** borne in an axillary raceme or spikelike raceme. **FLOWER** petals blue to purple, lavender, or white; calyx subcylindric, gibbous at the base on the upper side, 5-lobed, the lowest lobe the longest; stamens 10, diadelphous (rarely all connate). **PODS** 1-seeded, irregularly dehiscent, usually included within the calyx. Note: The name is from the Greek words for prairie and apple, a literal translation of the French "pomme de prairie," a reference to the edible, tuberous roots of most species. The species have been traditionally assigned within an expanded *Psoralea* L., a genus now restricted to South African plants (see also *Psoralidium*) (Rydberg 1919b; Ockendon 1965). Fifty species. Mostly North America.

Pediomelum megalanthum (Wooton & Standl.) Rydb. (referring to the large flower) Large-flowered breadroot. Subacaulescent to caulescent, 4–25 cm tall, from slender, subterranean caudex branches arising from deep-seated

tuberous roots. **STEMS** with 0–5 elongated internodes, incurved-strigose or with a few (rarely most) hairs spreading-ascending. **LEAVES** mainly 5 (8)-foliolate; stipules scarious, 2–15 mm long; petioles 1.2–9.5 cm long, pubescent like the stems or more commonly spreading-hairy; leaflets 9–34 mm long, 4–23 mm wide, cuneate-obovate to subrhombic, gray-green, strigulose, and punctate beneath, yellow-green, punctate, and strigose overall above. **INFL** a raceme, mainly 6- to 24-flowered, 2–5 cm long; pedicels 1.5–5 mm long; bracts commonly bidentate, lance-ovate, 3–12 mm long; peduncle 1.4–5 cm long. **FLOWERS** 12.5–21 mm long, the banner, wings, and keel commonly purple or suffused with purple; calyx 12.5–18.5 mm long, the tube 5.5–8 (9) mm long, only somewhat broader than the lateral ones. **PODS** included in the calyx. [*Psoralea megalantha* Wooton & Standl.]. Mixed desert shrub, piñon-juniper woodland, and blackbrush communities. ARIZ: Apa; NMEX: SJn; UTAH. 1750–2160 m (5740–7085′). Flowering: Apr–Jun. Four Corners material belongs to **var. *megalanthum***. Eastern Utah and adjacent Colorado to northwest New Mexico and northeast Arizona.



Phaseolus L. Bean

(Greek for an edible bean) Annual or perennial herbs, from a taproot. **LEAVES** alternate; stipules herbaceous, distinct; pinnately trifoliolate. **INFL** axillary or in an axillary raceme, each subtended by a bract; bracteoles 2, attached at base of calyx. **FLOWER** papilionaceous; petals 5, pink to purplish or white; calyx 5-toothed; stamens 10, diadelphous; ovary few- to several-ovuled, the style twisted or coiled in the keel, bearded toward the apex, the stigma oblique. **PODS** linear to oblong, laterally flattened to subterete, the valves coiling upon dehiscence. Fifty species. Tropics and the deserts of America.

Phaseolus angustissimus A. Gray (referring to the narrow leaves) Perennial, decumbent or clambering. **STEMS** 1.5–5 (10) dm long, glabrous, generally clustered and often branched. **LEAVES** mainly 2–6 cm long or more; stipules 2–3 mm long, often reflexed; leaflets 3, deltoid to oblong-lanceolate or linear-lanceolate, often asymmetric and lobed at the base. **INFL** 2–20 cm long, with flower clusters in the upper bracteate axils. **FLOWER** petals 6–10 mm long, lavender to pink; calyx 2–3 mm long. **PODS** oblong-falcate, 1.5–2 cm long, 6–7 mm wide, the beak filiform, about 2 mm long; seeds rugose-warty. [*P. dilatatus* Wooton & Standl.]. Mixed desert shrublands with ephedra, *Gutierrezia*, Bigelow sagebrush, shadscale, and galleta. ARIZ: Apa; NMEX: McK. 1600–1915 m (5245–6285′). Flowering: Jun–Sep. West Texas and west across New Mexico and Arizona.

Psoralidium Rydb. Scurfpea

(diminutive of *Psoralea*) Perennial, unarmed herbs, from rhizomes. **LEAVES** alternate; stipules triangular to subulate; pedately 3-foliolate, glandular-dotted. **INFL** an axillary, pedunculate, and interrupted spikelike raceme. **FLOWER** petals bluish or purplish to lavender, or less commonly white; calyx campanulate, the tube short, 5-lobed, the lower-most lobe typically longer than the others; corolla papilionaceous; stamens 10, diadelphous. **PODS** 1-seeded, indehiscent, usually not included in the calyx (Rydberg 1919c).

1. Peduncle 15–40 cm long or more; leaves few, mostly deciduous by anthesis, the leaflets sharply acuminate; plants of southeast Utah ..... ***P. junceum***
1′ Peduncle mainly shorter than 15 cm; leaves numerous, persisting through the season, the leaflets obtuse to rounded or cuspidate; distribution various ..... (2)

2. Plants commonly 4–10 dm tall, at least some leaves 4- to 5-foliolate; flowers mainly indigo ..... ***P. tenuiflorum***
2′ Plants often less than 4 dm tall, all leaves commonly 3-foliolate; flowers white to purple ..... ***P. lanceolatum***

Psoralidium junceum (Eastw.) Rydb. (rushlike) Rush scurfpea. Caulescent, 4.8–9 dm tall, from a rhizome. **STEMS** with 5 or more elongated internodes, strigose. **LEAVES** commonly 3-foliolate; stipules acuminate, strigose; often deciduous by anthesis; petiole 1.4–7 cm long, pubescent like the stems; leaflets 3, 19–44 mm long, 3–7 mm wide,

oblanceolate to elliptic, acuminate apically, strigose and glandular on both surfaces, greenish; peduncle (8) 11–48 cm long. **INFL** a raceme, 7- to 20-flowered, 5–11 cm long; bracts lance-acuminate, glabrous dorsally, 1.5–2.5 mm long, deciduous. **FLOWERS** 4.2–5.8 mm long, the petals indigo; calyx 2.7–3.4 mm long, the tube 1.3–2.5 mm long, campanulate, not especially gibbous, the lower tooth 0.7–1.4 mm long, longer than the others. **PODS** 1-seeded, densely silky villous. [*Psoralea juncea* Eastw.]. Stabilized dunes and other sandy sites, often growing with *Amsonia tomentosa*, Indian ricegrass, resinbush, purple sage, sand sagebrush, and blackbrush, and less commonly with juniper. UTAH. 1145–1710 m (3760–5610'). Flowering: Apr–Jun. Southeast Utah; Coconino County, Arizona. A Glen Canyon–San Juan regional endemic.

Psoralidium lanceolatum (Pursh) Rydb. (lance-shaped) Dune scurfpea. Caulescent, 1.5–6.8 dm tall, from a rhizome, clump-forming, the stems with 5 or more elongated internodes, glabrous or strigose. **LEAVES** persistent at flowering; stipules lance-attenuate, 3–16 mm long; petiole 0.8–3 cm long, strigose to glabrate; leaflets 3, 14–50 mm long, 0.5–9 mm wide, oblanceolate below, becoming linear upward, obtuse to acute or cuspidate, sparingly strigose on both sides or glabrous above, yellow-green. **INFL** a raceme, 5- to 41-flowered, 1.2–17 cm long; bracts ovate to elliptic or lance-olate, glabrous dorsally, 1.3–2.8 mm long, persistent; peduncles 3.3–24 cm long. **FLOWERS** 4.8–6.3 mm long, blue, white, or bicolored; calyx 1.6–2.8 mm long, the tube 1.3–2 mm long, campanulate, not especially gibbous, the lower tooth 0.2–0.8 mm long, not much larger than the others. **PODS** 1-seeded, conspicuously glandular. $2n = 22$. [*Psoralea lanceolata* Pursh; *P. elliptica* Pursh; *Lotodes ellipticum* (Pursh) Kuntze; *Psoralea laxiflora* Nutt., not (Pursh) Poir.; *Psoralea micrantha* A. Gray ex Torr.; *Psoralidium micranthum* (A. Gray) Rydb.]. Trends in morphological variation are apparent among Utah specimens; in their extremes they are readily recognized, but whether they represent taxa is open to question. Navajos used the plant as a poultice for itches and sores, for stomachache, venereal disease, menstrual pain, and for protection against witchcraft. Zunis ate fresh flowers for stomachaches.

1. Racemes compact to moderately lax, 1.2–5.5 cm long at anthesis, the flower nodes seldom widely spaced or mainly with more than 3 flowers per node; blue and white flowers variably abundant; plants with a widespread distribution ..... **var. *lanceolatum***

1′ Racemes lax, 2.5–17 cm long at anthesis, the flower nodes widely separated, often with 2 or 3 flowers per node; blue flower color predominating; plants of southeastern Utah and Rio Arriba County, New Mexico **var. *stenophyllum***

var. *lanceolatum* Plains scurfpea. Sand dunes and other sandy sites. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1100–2130 m (3610–6995'). Flowering: May–Jul. Washington and Saskatchewan, south to California, Arizona, New Mexico, and Oklahoma.

var. *stenophyllum* (Rydb.) S. L. Welsh (narrow-leaved) Slenderleaf scurfpea [*Psoralea stenophylla* Rydb.; *Psoralidium stenophyllum* (Rydb.) Rydb.; *Psoralea lanceolata* Pursh var. *stenophylla* (Rydb.) Toft & S. L. Welsh]. Sandy sites. ARIZ: Apa; NMEX: RAr; UTAH. 1150–2125 m (3775–7000'). Flowering: May–Jul. Southeast Utah, northeast Arizona, and northwest New Mexico.

Psoralidium tenuiflorum (Pursh) Rydb. (slender-flowered) Prairie scurfpea. Caulescent, 4–10 dm tall or more, forming large clumps. **STEMS** with 8 or more elongated internodes, strigose. **LEAVES** with scarious stipules 2–13 mm long, strigose; 3- to 5-foliolate; persistent at flowering; petioles 0.1–2.2 cm long, strigose to strigulose; leaflets 6–40 mm long, 2–16 mm wide, oblanceolate throughout, mainly rounded to a cuspidate apex, gray-green and strigose beneath, yellow-green and glabrous or pubescent only along the veins above. **INFL** a raceme, mainly 7- to 21-flowered, 1–5.9 cm long; bracts ovate-acuminate, glabrous dorsally, 1.5–2.5 mm long, persistent; peduncle 0.5–7 cm long or lacking, sometimes bracteate or some flowers axillary. **FLOWERS** 4.5–6 cm long, the petals indigo; calyx 2.5–3.2 mm long, the tube 1.5–2 mm long, campanulate, not gibbous, the lower tooth 0.8–1.7 mm long, noticeably larger than the others. **PODS** 1-seeded, glabrous, conspicuously glandular. [*Psoralea tenuiflora* Pursh; *Psoralea floribunda* Nutt. ex Torr. & A. Gray; *Psoralidium obtusiloba* Torr. & A. Gray; *Psoralidium bigelovii* Rydb.; *Psoralea bigelovii* (Rydb.) Tidestr.; *Psoralea tenuiflora* var. *bigelovii* (Rydb.) J. F. Macbr.]. Piñon-juniper, sagebrush, mountain brush, and ponderosa pine communities. ARIZ: Apa; COLO: Arc, LPl; NMEX: McK, RAr. 1895–2510 m (6215–8230'). Flowering: Apr–Sep. North Dakota and Montana, south to Arizona, New Mexico, Texas, and Mexico. The segregation of varieties from among our materials seems unwarranted. Our material represents the edge of the range for this species more common on the prairies and plains of the Great Plains. Navajos smoked the leaves for influenza and the Night Chant. Zunis made a poultice for body purification.

Psorothamnus Rydb. Dalea

(scurfy shrub) Shrubs, typically armed. **LEAVES** alternate; stipules subulate or vestigial; odd-pinnate, with 5 or more leaflets, glandular-dotted. **INFL** in a lax raceme; peduncle opposite the leaves. **FLOWERS** papilionaceous; petals mainly indigo; calyx campanulate, 10-ribbed, 5-lobed; the petals all inserted on the hypanthium; stamens 9 or 10, monadelphous. **PODS** 1- to 2-seeded, indehiscent, exserted from the calyx. $x = 10$. Note: Traditional treatments have placed the species of *Psorothamnus* within an expanded *Dalea* (Rydberg 1919d).

1. Leaves unifoliolate (often deciduous by anthesis), oblanceolate to linear ..... ***P. scoparius***
1' Leaves plurifoliolate (usually present) ..... (2)

2. Branchlets densely reflexed-puberulent, bearing conspicuous yellow to red-orange resinous glands ... ***P. thompsoniae***
2' Branchlets merely appressed-strigose, lacking glands or only obscurely glandular ..... ***P. fremontii***

Psorothamnus fremonti (Torr.) Barneby (for John Charles Frémont, explorer, general, naturalist) Frémont's dalea. Armed shrubs, 5–15 dm tall or more; branchlets strigose, sparingly if at all glandular. **LEAVES** 1.8–6.5 cm long; stipules 0.3–14 mm long, fragile; leaflets (1) 3–9, 3–14 mm long, 0.8–6 mm wide, glandular beneath, strigose on both sides, linear to oblong or elliptic, obtuse to rounded, the uppermost often confluent with the rachis. **INFL** a raceme, 8- to 41-flowered, 3.5–14.3 cm long, the rachis strigose to strigulose; bracts 0.8–1.8 mm long, lanceolate, glabrous or else foliose and with 1–4 leaflets; peduncle 0–2.2 cm long, or some flowers axillary. **FLOWERS** 8.5–12 mm long, indigo, rarely white; calyx 4.5–6.5 mm long, the tube 2.5–3.3 mm long, obscurely if at all 10-ribbed, appressed-strigose to glabrate, the teeth 1.8–3.2 mm long, strigose, the upper markedly wider than the others. Blackbrush, mixed desert shrub, and (less commonly) piñon-juniper communities. ARIZ: Nav; UTAH. 1110–1490 m (3640–4890'). Flowering: Apr–Jun. Southern Utah, Arizona, Nevada, and California. The plants are strikingly beautiful, contrasting indigo flowers with grayish foliage. Much of the material, if not all, from along Lake Powell shows the influence of *P. arborescens* (Torr. ex A. Gray) Barneby (i.e., very elongate, lance-linear calyx teeth) and might be best assigned to that species. Decoction of root or plant top taken as an antihemorrhagic.

Psorothamnus scoparius (A. Gray) Rydb. (broomlike) Broom dalea. Unarmed shrubs, mainly to about 1 m tall or more; branchlets rather copiously glandular. **LEAVES** 5–20 mm long, soon deciduous; stipules very small or lacking; unifoliolate (rarely some trifoliolate), petiolate to subsessile, the blades linear-oblanceolate to oblong. **INFL** a spike, subcapitate, 6–15-flowered, 8–12 mm wide; pedicels very short; peduncle 0.5–3.5 cm long. **FLOWER** petals 6–9 mm long, blue to violet; calyx 3.5–4.5 mm long, pilosulous, the lobes unequal, shorter than the tube. **PODS** about 4 mm long, somewhat exserted from the calyx. [*Dalea scoparia* A. Gray]. Growing with four-wing saltbush, sand sagebrush, and other psammophytes. ARIZ: Nav; NMEX: San, SJn. 1455 m (4800'). Flowering: Aug–Sep.

Psorothamnus thompsoniae (Vail) S. L. Welsh & N. D. Atwood (for Ellen P. Thompson, sister of Major John Powell) Thompson's indigo-bush or dalea. Armed shrubs, 2.5–8 dm tall or more; branchlets velvety with retrorse, short hairs, conspicuously glandular with yellow to orange-red, mammiform, resinous glands. **LEAVES** 0.7–5 cm long; stipules vestigial or to 0.8 mm long; leaflets 7–17, 1–10 mm long, 0.6–4 mm wide, linear to oblong, oval, or obcordate, glandular and strigose to glabrate beneath, strigose above, the uppermost jointed to the rachis. **INFL** a raceme, mainly 8- to 25-flowered, 2–9 cm long, the rachis retrorsely hairy; bracts 0.5–1.5 mm long, lanceolate, glabrous or hairy, soon deciduous; peduncle 0.4–1.8 cm long, rarely obsolete and some flowers axillary. **FLOWERS** 7.8–10.8 mm long, indigo or purple-pink; calyx 3.7–5 mm long, the tube 2.1–3.2 mm long, conspicuously 10-ribbed, glabrous or villous, ovate to oval, obtuse or only the lowermost acute. **PODS** glandular-dotted. $n = 10$. [*Parosela thompsoniae* Vail]. Two more or less distinctive and easily recognizable varieties are known.

1. Calyx tube glabrous; leaflets oblong to oval or obcordate; plants of San Juan County and elsewhere ..... **var. *thompsoniae***
1' Calyx tube villous; leaflets linear to narrowly elliptic or oblong; plants of San Juan County ..... **var. *whitingii***

var. *thompsoniae* [*Parosela thompsoniae* Vail; *Dalea thompsoniae* (Vail) L. O. Williams] Blackbrush, shadscale, piñon-juniper, ephedra, galleta, sand sagebrush, resinbush, and *Ephedra* communities, in sand and among boulders. UTAH. 1135–1675 m (3730–5500'). Flowering: May–Aug. Southeastern Utah. The plants grow well on sand, even dunes, but also occur in fine-textured saline soils and talus.

var. *whitingii* (Kearney & Peebles) Barneby (for Alfred F. Whiting, botanist, anthropologist, and ethnobotanist) [*Dalea whitingii* Kearney & Peebles]. Whiting's indigo-bush. Mixed desert shrub community. UTAH. 1410–1520 m (4620–5030').

Flowering: May–Aug. Monument Valley and west to Navajo Mountain, south of the San Juan River, Utah (San Juan County); Wupatki National Monument, Coconino County, Arizona. Navajo Basin endemic.

Robinia L. Locust

(for Jean and his son Vespasien Robin, 17th-century herbalists and gardeners) Shrubs or trees, often armed. **LEAVES** alternate; stipules setaceous and caducous or persistent as spines; odd-pinnate, the leaflets petiolulate and stipulate. **INFL** an axillary raceme. **FLOWER** corolla white, pinkish, or pink, very showy, often aromatic; papilionaceous; calyx campanulate to turbinate, the 5 teeth triangular to triangular-acuminate; stamens 10, diadelphous; ovary subsessile or sessile. **PODS** oblong, straight, laterally flattened, tardily dehiscent. $x = 10, 11$ (Isely and Peabody 1984). Four to five species found in North America.

1. Uppermost pair of calyx teeth free for about 2/3 of their length; branchlets and often the peduncle hispid ..... ***R. neomexicana***
1' Uppermost pair of calyx teeth connate almost to the apex, forming an emarginate lip; branchlets and peduncle lacking hispid processes ..... ***R. pseudoacacia***

Robinia neomexicana A. Gray (of New Mexico) New Mexico locust. Small trees or shrubs, mainly 1–8 m tall; branchlets villosulous, rarely glandular. **LEAVES** 8–20 (28) cm long; stipules 3–10 mm long or more, often spiny; leaflets 9–19, 12–40 mm long, 7–20 mm wide, lance-oblong to oblong, obtuse, cuspidate, sparingly pubescent above and below, finally glabrate on one or both sides; petioles villosulous near the base. **INFL** a raceme, 3- to 14-flowered, 3–8 cm long; peduncle 1–4 cm long, glandular-pubescent to hispid throughout. **FLOWERS** 16–24 mm long, calyx campanulate, the tube 5 mm long, the teeth 3–5 mm long, triangular-acuminate; corolla pale pink or bright pink-purple. **PODS** 40–80 mm long, glandular-pubescent to hispid or glabrous. [*R. neomexicana* var. *luxurians* Dieck; *R. luxurians* (Dieck) Rydb.; *R. breviloba* Rydb.; *R. subvelutina* Rydb.]. Mesic, often shaded talus slopes and river terraces in cottonwood, sagebrush, and piñon-juniper communities. ARIZ: Nav; COLO: Arc, LPl, Mon; NMEX: SJn. 1610–2070 m (5280–6800'). Flowering: Jun. Nevada, Arizona, New Mexico, Texas, and Mexico. Used by Hopis to purify the stomach. Apaches ate the raw pods as food and made high quality bows from the wood.

Robinia pseudoacacia L. (false acacia) Black locust, false acacia. Trees to 25 m tall or more and to 1.5 m in diameter; branchlets puberulent to villosulous, lacking glands. **LEAVES** (6) 8.5–26 cm long; stipules minute or represented by spines; leaflets (5) 11–25, 11–60 mm long, 6–30 (38) mm wide, lance-oblong to oblong, obtuse to retuse or cuspidate, puberulent to glabrate on both sides; petioles villosulous to pilose near the base. **INFL** a raceme, 11- to 27-flowered, 4–13 cm long; peduncle 1.4–4.3 cm long, puberulent to villosulous. **FLOWERS** 12–20 (23) mm long; calyx broadly campanulate to turbinate, the tube 3.5–5.5 mm long, the teeth 1.5–2 mm long, the upper pair connate, the sinus shallow; corolla white (fading cream), or pale pink. **PODS** 4–12 cm long, glabrous. $2n = 22$. Cultivated ornamental, street, and shade trees, long persisting, escaping, and established along fencerows and stream bottoms. ARIZ: Nav; COLO: Dol; NMEX: McK, SJn; UTAH. 1350–2100 m (4425–6895'). Flowering: Jun. Indigenous in the summer deciduous forest of the eastern United States. This is a handsome shade tree with very hard wood, which has been grown in the Four Corners region since earliest pioneer times. The fragrant flowers yield nectar for excellent honey, and the wood has been used for fence posts. The seeds have been implicated as poisonous to livestock. The herbage evidently contains phytotoxins.

Sophora L. Sophora

(Arabic *sofera*, a plant with yellow flowers) Perennial herbs, unarmed. **LEAVES** alternate; stipules obsolete or herbaceous; odd-pinnately compound. **INFL** in a terminal raceme. **FLOWERS** perfect, papilionaceous; calyx 5-toothed; petals all distinct; stamens 10, distinct or essentially so; ovary stipitate. **PODS** spreading to pendulous, subterete, constricted between the seeds, indehiscent or tardily so. $x = 9$. Fifty-two species. Mostly tropical and north-temperate.

1. Flower white to cream; leaflets less than 5 times longer than broad, gray-green ..... ***S. nuttalliana***
1' Flower blue-purple to blue; leaflets more than 5 times longer than broad, silvery hairy ..... ***S. stenophylla***

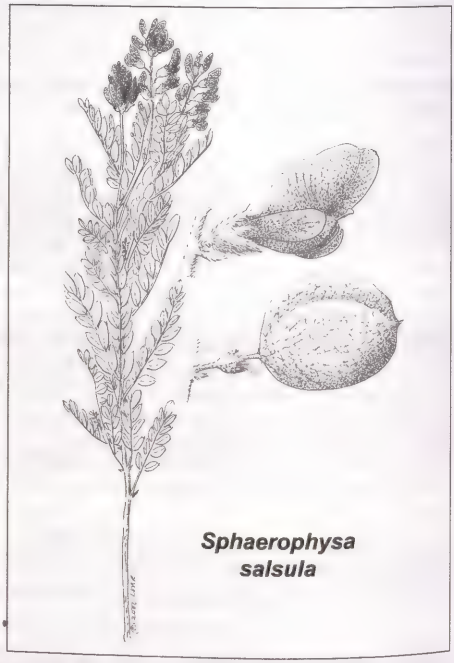
Sophora nuttalliana B. L. Turner (for Thomas Nuttall, English-American naturalist and botanist) Silky sophora, white sophora. Perennial, caulescent, 12–27 (30) cm tall, from a rhizome. **PUBESCENCE** essentially basifixed. **STEMS** ascending to erect. **LEAVES** 2.5–6 (7) cm long; stipules 1.5–4 mm long, distinct, caducous; leaflets 13–23, 2–11 mm long, 0.8–6 mm wide, oblong-obovate to obovate, rounded to retuse, often folded, strigose beneath, glabrous above. **INFL** a raceme, mainly 8- to 52-flowered, 3–9 cm long at anthesis, the axis 3–13 cm long in fruit; bracts 3–7 mm long; pedicels 2–4 mm long; bracteoles 1; peduncle 0.8–3 cm long. **FLOWERS** 14–19 mm long, white to cream (fading

cream); calyx 8–10.5 mm long, gibbous, the tube 6.4–8.5 mm long, obliquely short-cylindric, the teeth 2–2.5 mm long, triangular. **PODS** erect-ascending, stipitate, the stipe 6–12 mm long, the body 12–40 mm long, 3–4.5 mm thick, constricted tightly between the usually 1–3 seeds, strigose. [*S. sericea* Nutt., not Duham.]. River bottoms and roadsides in various plant communities. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn. 1760–2310 m (5780–7580'). Flowering: May–Jun. Wyoming and South Dakota, south to Arizona, Colorado, New Mexico, and Texas. The terminal inflorescences immediately distinguish this from an *Astragalus*, with which it is occasionally confused. Used by Navajos as sheep forage.

Sophora stenophylla A. Gray **CP** (narrow-leaved) Silvery sophora. Perennial, caulescent, 13–41 cm tall (aboveground), from deeply seated rhizomes. **PUBESCENCE** basifixed. **STEMS** ascending to erect. **LEAVES** with stipules 3–12 mm long, distinct, caducous, or obsolete; 1.7–5.6 mm wide, linear to narrowly oblong, acute to attenuate, silvery pilosulous, the pubescence fading yellowish in time. **INFL** a raceme, mainly 12- to 39-flowered, 5–17 cm long in anthesis, 6–23.5 cm long in fruit; bracts 3–7 mm long; pedicels 1–8 mm long; bracteoles 0; peduncle 1.7–5 cm long. **FLOWERS** 15–27 mm long, blue-purple to blue; calyx 6.5–10.8 mm long, gibbous, the tube 4.8–7.2 mm long, obliquely short-cylindric, the teeth 1.7–3.6 mm long, ovate-triangular. **PODS** spreading-declined, stipitate, the stipe 8–16 mm long, the body 15–60 mm long, 6–8 mm wide, strongly constricted between the usually 1–5 seeds, strigose. Sand dunes and other sandy sites, in sand sagebrush, eriogonum-ephedra, blackbrush, piñon-juniper, and ponderosa pine (less commonly salt desert shrub) communities. ARIZ: Apa, Nav; NMEX: McK, SJn; UTAH. 1370–1910 m (4500–6260'). Flowering: Apr–May. Southeast Utah, northwest New Mexico, and northeast Arizona. This is a strikingly beautiful plant with silvery foliage and large, blue, scented flowers.

Sphaerophysa DC. Swainsonpea

Perennial, caulescent, from rhizomes. **LEAVES** alternate, odd-pinnate; stipules adnate to the petiole base, all distinct. **INFL** borne in an axillary raceme, each subtended by a single bract; bracteoles 1. **FLOWERS** papilionaceous; petals 5, dull red, drying lavender to brown; calyx 5-toothed; stamens 10, diadelphous; ovary enfolded by the staminal sheath; style glabrous except for a tuft of hair below the stigma. **PODS** stipitate, bladdery-inflated, subunilocular. Two species. Eastern Mediterranean to central Asia.



Sphaerophysa salsula (Pall.) DC. (refers to the alkaline habitat in which it grows) Alkali swainsonpea. Perennial, caulescent, 4–7 dm tall, from a deeply placed rhizome. **PUBESCENCE** basifixed. **LEAVES** 3–10 cm long; stipules 1–4 mm long, all distinct; leaflets 15–25, 3–18 mm long, 1–7 mm wide, oblong-obovate to elliptic, retuse to obtuse and apiculate, strigose beneath, glabrous above. **INFL** a raceme, 5- to 17-flowered, the flowers ascending in anthesis, finally nodding, the axis 2.5–9 cm long in fruit; bracts 1–2 mm long; pedicels 2.5–8 mm long; bracteoles 2; peduncle 2.5–9 cm long. **FLOWERS** 12–14 mm long, dull red, fading lavender to brown; calyx 5–6 mm long, the tube 3.8–4.6 mm long, campanulate, the teeth 1.2–2 mm long, triangular. **PODS** ascending to declined, stipitate, the stipe 4–7 mm long, the body bladdery-inflated, ovoid, 13–24 mm long, 9–20 mm wide (when pressed), unilocular, strigulose. [*Phaca salsula* Pall.; *Swainsonia salsula* Taubert]. Introduced weedy species along the San Juan River. NMEX: SJn (B-Square Ranch). 1615 m (5300'). Flowering: May–Jun. Widespread in the western United States; adventive from Asia. The species is locally common in Wyoming, Colorado, New Mexico, and Arizona, and less so, evidently, in Idaho and Nevada. This plant resembles an *Astragalus* species and has been mistaken twice as belonging to previously undescribed and unnamed indigenous species (*A. violaceus* H. St. John; *A. iochrous* Barneby). Generic concepts involving this genus are unresolved, and it seems likely that the plants will ultimately be placed in some earlier-named genus.

Thermopsis R. Br. False Lupine

(Greek *thermos*, lupine, + *opsi*, resemblance) Perennial herbs, caulescent, from rhizomes. **LEAVES** alternate, palmately trifoliolate; stipules foliaceous. **INFL** in a terminal raceme; bracts herbaceous, persistent. **FLOWERS** papilionaceous; calyx 5-toothed; petals 5, yellow or suffused with purple, the keel rounded; stamens 10, distinct; ovary stipitate, the style glabrous. **PODS** narrowly oblong, flattened, many-seeded. $x = 9$.

1. Pod straight, not especially lomentlike, erect or ascending; plants mostly 20–70 cm tall or more ..... ***T. montana***
1′ Pod curved, lomentlike, spreading to recurved; plants mostly 14–40 cm tall ..... ***T. rhombifolia***

Thermopsis montana Nutt. (of Montana) Golden pea, yellow pea. Caulescent, 2–7.5 (10) dm tall, the stems erect, pilosulous to glabrate. **LEAVES** with stipules foliar, lanceolate to ovate, 13–60 mm long, 3–30 mm wide; petioles 0.8–3.7 cm long; leaflets 3, 21–92 mm long, 5–36 mm wide, elliptic to lanceolate or oblanceolate, acute to rounded, pilosulous beneath, glabrous to glabrate above. **INFL** a raceme, mainly 2- to 23-flowered, 6–25 cm long in anthesis, the axis 9–28 cm long in fruit; peduncle 2.2–13 cm long; bracts 5–11 mm long. **FLOWERS** 20–26 (29) mm long, yellow; calyx 10.2–12.3 mm long, the tube 7–8.3 mm long, obliquely campanulate, the teeth 3.1–4 mm long, ovate-triangular. **PODS** erect or ascending, stipitate, the stipe 2.5–6 mm long, the body 40–54 mm long, 5–7 mm wide, pilose, stramineous or turning black. $2n = 18$. Moist sites along streams, in meadows, around seeps and springs. COLO: Arc, Dol, Hin, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 2410–2745 m (7910–9000′). Flowering: May–Jun. British Columbia south to Montana, California, Arizona, Colorado, New Mexico, and Utah. When included within an expanded *T. rhombifolia*, our material is perhaps best regarded as *T. rhombifolia* var. *montana* (Nutt.) Isely (Isely 1978). Ramah Navajos used the plant as a fumigant for headaches, sore eyes, and for sickness caused by hunting. The plant was also used as a lotion for protection from witches.

Thermopsis rhombifolia (Nutt. ex Pursh) Richardson (diamond-shaped leaves) Goldenbanner. Caulescent, 15–40 cm tall, the stems erect, glabrate. **LEAVES** with stipules foliose, ovate to lanceolate, 6–30 mm long, 2–22 mm wide; petioles 0.3–2.5 cm long; leaflets 3, 15–47 mm long, 7–25 mm wide, obovate to oblanceolate, obtuse to rounded, glabrous on both sides. **INFL** a raceme, mainly 4- to 30-flowered, 2–10 cm long in anthesis, the axis 2–12 cm long in fruit; peduncle 0.5–5.8 cm long; bracts simple to foliose. **FLOWERS** 18–22 mm long; calyx 7.5–10 mm long, the tube 4.5–6 mm long, the teeth 3–4 mm long, triangular-ovate. **PODS** divaricate, finally recurved, lomentlike, stipitate, the stipe 1.5–4 mm long, the body 25–70 mm long, 5–7 mm wide, pilose to glabrate. $2n = 18$. [*Cytisus rhombifolius* Nutt. ex Pursh]. Sandy and clay soils, mainly where moist, in mixed desert shrub and piñon-juniper communities. NMEX: McK, RAr, SJn. 1510–1810 m (4950–5940′). Flowering: May–Jun. Alberta and Saskatchewan, south to Colorado, New Mexico, and Nebraska.

Trifolium L. Clover

(three-parted leaves) Perennial or short-lived perennial or annual, caulescent or acaulescent, from taproot and caudex, rhizome, or stolon. **LEAVES** alternate; stipules membranous to foliaceous, often connate; palmately to pinnately 3-foliolate, or rarely 4- to 7-foliolate, commonly serrate throughout, rarely entire. **INFL** borne in a terminal or axillary, pedunculate to sessile, subcapitate head or raceme. **FLOWERS** papilionaceous; petals 5, pink, white, or red-purple, withering and persistent, finally investing the pod; calyx 5-toothed; stamens 10, diadelphous. **PODS** usually shorter than the calyx, indehiscent, 1- to several-seeded (Gillett 1965, 1969, 1971, 1972; Hermann 1953; McDermott 1910; Martin 1946).

1. Plants acaulescent or subacaulescent, mainly 1.5–10 cm tall ..... (2)
1′ Plants caulescent, with 1 or more elongated internodes (see also *T. parryi*), mainly 10–60 cm tall ..... (8)

2. Head 1- to 4-flowered, essentially sessile, the flower 15–23 mm long; plants of high elevations ..... ***T. nanum***
2′ Head several-flowered, sessile or pedunculate, the flower either shorter or the head pedunculate; plants of various distribution ..... (3)

3. Plants densely pulvinate-caespitose, matted, known from Navajo Mountain. ..... ***T. andinum***
3′ Plants typically not densely pulvinate-caespitose, or if so then of other distribution ..... (4)

4. Leaflets toothed; calyces villosulous to pilosulous; flower less than 9 mm long; plants of moderate elevation, broadly distributed ..... ***T. gymnocarpon***
4′ Leaflets entire or, if toothed, the calyces glabrous; flower more than 9 mm long; plants of high elevations ..... (5)

5. Leaflets entire ..... (6)
5′ Leaflets toothed ..... (7)

6. Calyces and herbage strigose, less commonly glabrous; banner rounded to acute ..... ***T. dasyphyllum***
6′ Calyces and herbage villous-pilose; banner attenuate ..... ***T. attenuatum***

7. Head subtended by a conspicuous involucre, the bracts often connate at least at the base and over 3 mm long ..... ***T. parryi***
7′ Head not subtended by an involucre, the bracts if present not at all connate ..... ***T. brandegeei***

8. Plants stoloniferous, prostrate and rooting at the nodes; flowers white; calyx not bladdery-inflated; introduced, widespread ..... ***T. repens***
8′ Plants not stoloniferous (except in some *T. fragiferum*), usually erect or ascending, not or seldom rooting at the nodes; flower mainly pink to red-purple, though sometimes white ..... (9)

9. Calyx soon bladdery-inflated and enclosing the corolla; plants introduced ..... ***T. fragiferum***
9′ Calyx not accrescent or only slightly so, never enclosing the corolla; plants various ..... (10)

10. Head sessile or nearly so, commonly immediately subtended by a trifoliolate bract; plants cultivated, escaping, and persisting ..... ***T. pratense***
10′ Head with well-developed peduncle, not immediately subtended by foliose bracts; plants indigenous or cultivated ..... (11)

11. Head subtended by a spinose-toothed involucre ..... ***T. wormskjoldii***
11′ Head lacking an involucre ..... (12)

12. Flower mainly 7–9 mm long; head axillary, from the uppermost nodes; plants cultivated, escaping and persisting ..... ***T. hybridum***
12′ Flower 10–16 mm long; head terminal, solitary; plants indigenous ..... ***T. longipes***

Trifolium andinum Nutt. (of the Andes Mountains) Andean clover. Apparently acaulescent (in reality short-caulescent, the stem with usually 2 few-flowered heads, each subtended by a bracteate leaf), densely pulvinate-caespitose, mat-forming, 0.3–5 cm tall, from woody caudex branches and a thick taproot, the stems obscured by imbricated stipules and persistent leaf bases; petioles 0–2.3 cm long. **LEAVES** with scarious stipules yellowish, glabrous except toward the tip, 3–9 mm long; leaflets 3, 2–12.5 mm long, 1.2–5 mm wide, oblanceolate to obovate, toothed in the apical 1/3, strigose to strigulose on both sides, commonly folded, abruptly acuminate. **INFL** a head, closely subtended by reduced leaflike bracts, these with or without a trifoliolate bract, sessile or appearing pedunculate by elongation of internodes on floriferous branches, the internodes glabrous. **FLOWERS** 7–15, in 2 closely associated heads, the banner violet-purple, the keel and wings ochroleucous, 9–12 mm long, on a pedicel 0.5–1 mm long, these glabrous to strigose; calyx 5–7 (8.5) mm long, the tube 2.2–3.6 (4) mm long, sparingly pilose to glabrous, the teeth 2–3.8 (4.5) mm long, lance-subulate, pilose. **PODS** 4–5 mm long, 2.3–2.7 mm wide. Ponderosa pine, Rocky Mountain juniper, and Douglas-fir–aspen communities. UTAH. 2800–3330 m (9195–10930′) Flowering: May–Jun. Navajo and Abajo mountains. Wyoming, Nevada, and Arizona.

Trifolium attenuatum Greene (weak or meager) Rocky Mountain clover. Acaulescent, densely caespitose, mat-forming or tufted, 8–26 cm tall, from a caudex and thick taproot, the stems obscured by imbricated stipules and marcescent leaf bases; petioles 1.5–10 cm long. **LEAVES** with scarious stipules, glabrous, strongly veined, 5–17 mm long; leaflets 3, 11–45 (60) mm long, 1–7 mm wide, narrowly lanceolate to lance-linear, entire, villous-pilose on both sides (sometimes

sparingly so), commonly flat, attenuate or less commonly merely acute, sharply apiculate. **INFL** a head, 20–30 mm wide, terminal, on a peduncle 5–18 (23) cm long, these pilose, the head closely subtended by an inconspicuous involucre of ovate or ovate-attenuate, mainly diminutive scales, distinct almost or quite to the base. **FLOWERS** 12–29, erect, the banner violet or whitish, the keel and wings lavender-purple, 12–15 mm long, the banner attenuate apically; pedicel 0.5–1.5 mm long, finally deflexed; calyx 6.5–7.2 mm long, the tube 2.2–2.5 mm long, villous-pilose, the teeth 3.3–4.7 mm long, linear-subulate, villous-pilose. **PODS** 4–6 mm long. Alpine meadows and rock stripes or spruce-fir communities. COLO: Arc, Con, Hin, LPl, Min, RGr. 3050–3805 m (10000–12485′). Flowering: Jun–Aug. Southern Colorado and northern New Mexico. *Trifolium attenuatum* has been distinguished from *T. dasyphyllum* on the basis of shorter pedicels and flowers that ultimately are reflexed in late anthesis. Neither of these features is diagnostic when applied to most herbarium specimens from the San Juan drainage. However, the pubescence of the herbage, except for the stipules, is villous-pilose, not strigose, and the leaflets are lance-linear and long-attenuate, and evidently the pedicels do reflex at maturity. The type came from "near Pagosa Peak, southern Colorado, 6 Aug. 1899, C. F. Baker, No. 443." Greene (1900) noted that the "silky hairiness," attenuate banner apex, and pedicels that deflex in age are evidently significant and diagnostic, but the latter is difficult to discern except when plants are taken at the close of the flowering season. Other supposed differences noted by Greene, i.e., the more numerous flowers per head in *T. dasyphyllum*, were evidently based only on the solitary plant available to him. Longest leaflets certainly surpass in length those of *A. dasyphyllum*, a feature indicated by Greene.

Trifolium brandegeei S. Watson **CP** (for Townshend Stith Brandegee, botanist) Brandegee's clover. Acaulescent and caespitose, mainly 6–15 cm tall, the leaves and peduncles lax and ascending, the herbage glabrous or sparingly long-hairy. **LEAVES** with petioles elongate, much surpassing the leaflets in length; typically 3 leaflets, mainly 7–30 mm long and 5–15 mm wide, oval, obovate, or elliptic-oblong, entire to sharply denticulate, glabrous or glabrate. **INFL** a head; the involucre very small or lacking; peduncle surpassing the leaves. **FLOWERS** declined, calyx 6–10 mm long, glabrous or with scattered long hairs, green or purple, the teeth lanceolate or ovate-lanceolate, attenuate apically, as long as or longer than the tube; corolla 13–20 mm long, purple. **PODS** 2- to 7-seeded. High mountains in alpine plant communities and with krummholz. COLO: Arc, Con, LPl, Min, Mon, RGr, SJn. 3050–3740 m (10000–12275′). Flowering: Jun–Aug. Southwest Colorado and central New Mexico.

Trifolium dasyphyllum Torr. & A. Gray (hairy leaves) Thickleaf clover. Acaulescent, loosely mat-forming, 2–14 cm tall, from a caudex and thick taproot, the stems obscured by imbricated stipules and leaf bases; petioles 0.3–4 cm long. **LEAVES** with 3 leaflets, 3–28 mm long, 1–5 mm wide, oblanceolate, entire, strigose beneath, strigose to glabrate above, flat or folded, sharply apiculate; stipules scarious, glabrous or strigose, 5–17 mm long. **INFL** a head, closely subtended by a long-lobed involucre (the linear-subulate lobes distinct almost to the base, or rarely all reduced to triangular or ovate-apiculate scales), (3) 11–18 (30) mm wide, terminal, sessile or on a peduncle 0.5–10 (15–23) cm long, these strigose. **FLOWERS** 6–16, erect, the banner violet to ochroleucous, the keel and wings purple, or all purple or rarely white, 11–13 mm long; pedicel 0.5–1.5 mm long; calyx 5.7–9.1 mm long, the tube 2.5–2.9 mm long, strigose to glabrate, the teeth 1.9–6.4 mm long, subulate, strigose to glabrate. **PODS** 4–6 mm long. Alpine meadows and rock stripes. COLO: Arc, Hin, LPl, Min, Mon, SJn. 3350–3900 m (11000–12800′). Flowering: Jun–Sep. Montana, Wyoming, Colorado, and New Mexico. *Trifolium attenuatum* has been distinguished from *T. dasyphyllum* on the basis of shorter pedicels and flowers that ultimately are reflexed in late anthesis.

Trifolium fragiferum L. (strawberry-bearing) Strawberry clover. Caulescent, 5–30 cm long, rhizomatous and sometimes stoloniferous, decumbent to ascending. **LEAVES** with petioles 0.5–13 cm long, obovate, toothed from near the base, truncate to retuse and apiculate, flat, glabrous to glabrate on both sides; stipules scarious, 8–20 mm long. **INFL** a head, involucrate, many-flowered, subglobose, 10–22 mm wide, on a peduncle 2–17 cm long, these glabrous. **FLOWERS** 4–6 mm long, purplish, finally included within the accrescent calyx; calyx finally bladdery-inflated, pilose, reticulately veined around translucent lacunae. $2n = 16$. Meadows, roadsides, and other disturbed sites. NMEX: SJn. 1645 m (5400′). Flowering: Jul–Aug. Utah, Colorado, and New Mexico; native to Europe. Strawberry clover was evidently introduced as a forage and honey plant but is found most commonly as a weedy species in at least mildly saline sites.

Trifolium gymnocarpon Nutt. (naked fruit) Nuttall's clover, dwarf clover. Acaulescent to short-caulescent, 4–16 cm tall, from a caudex and taproot, the stems mainly obscured by imbricated stipules and leaf bases. **LEAVES** with stipules scarious to herbaceous, 6–23 mm long; petioles 1–9 cm long; leaflets 3–5, 6–23 mm long, 2–10 mm wide, elliptic to oblong, ovate, or obovate, toothed from near the base, pilosulous beneath, glabrous to pilosulous above, flat or folded, rounded to acute and apiculate. **INFL** a head, without an involucre, hemispheric, commonly 12–18 mm wide,

terminal and axillary, on a peduncle 1–6.5 cm long, these strigulose, erect to bent apically. **FLOWERS** 6–15, the lower ones reflexed in age, the petals pink to lavender or purple, 8.5–11 mm long; pedicel 0.5–1 mm long; calyx 4.4–7 mm long, the tube 2.2–3.3 mm long, strigose, the teeth 1.8–3.7 mm long, subulate, strigose. **PODS** 4–8 mm long, 3–4.5 mm wide. [*T. subcaulescens* A. Gray; *T. gymnocarpon* var. *subcaulescens* (A. Gray) A. Nelson; *T. plummerae* S. Watson; *T. gymnocarpon* f. *plummerae* (S. Watson) McDermott; *T. gymnocarpon* var. *plummerae* (S. Watson) J. S. Martin; *T. gymnocarpon* subsp. *plummerae* (S. Watson) J. M. Gillett; *T. nemorale* Greene]. Mixed desert shrub, sagebrush, piñon-juniper, mountain brush, ponderosa pine, Douglas-fir, and spruce-fir communities. ARIZ: Apa; COLO: Arc, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1865–2440 m (6120–8000'). Flowering: Apr–Jun. Oregon, California, Idaho, Nevada, Wyoming, Colorado, New Mexico, and Arizona. Nuttall's clover is common in the sagebrush communities of the region, where it is often overlooked, due in part to its low stature and to the varicolored or mottled leaves that blend with the background. Attempts at recognition of infraspecific taxa appear to be futile.

Trifolium hybridum L. (hybrid) Alsike clover. Caulescent, 15–70 cm tall, erect or ascending (rarely decumbent), from a caudex and taproot. **LEAVES** with petioles 0–16 cm long; stipules herbaceous, 5–25 mm long; leaflets 3, 5–38 mm long, 3–28 mm wide, oval to lance-elliptic, ovate, or obovate, flat, toothed from near the base, glabrous on both sides, obtuse to retuse and apiculate. **INFL** a head, without an involucre, 12–25 mm wide, terminal and axillary on peduncles 1.5–13 cm long, these glabrous or glabrate, erect. **FLOWERS** many, the lower reflexed in age, the calyx 2.7–4 mm long, the tube 1.2–1.6 mm long, glabrous, scarious, the teeth 1–2.5 mm long, subulate, glabrous; petals white to pink or reddish, fading red-brown, 5–9 mm long. **PODS** 1- to 3-seeded. $2n$ = 16, 32. Cultivated, short-lived forage plant, escaping and persisting. COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: SJn. 1485–3225 m (4870–10590'). Flowering: Jun–Sep. Established throughout much of the temperate world; introduced from Europe. Ingestion of alsike clover has resulted in production of photosensitization in horses, and also in hogs, sheep, and cattle.

Trifolium longipes Nutt. (long-stalked) Rydberg's clover, summer clover. Caulescent (rarely acaulescent), 5–31 (37) cm tall, erect or ascending from a branching caudex and stout to slender taproot, or rhizomatous. **LEAVES** with petioles 1.2–10 cm long; stipules foliaceous, strongly veined, 8–40 mm long; leaflets 3, 5–47 (57) mm long, 3–18 mm wide, narrowly oblong to elliptic, oblanceolate, or obovate, flat, toothed from near the base, pilosulous beneath, glabrous above, acute to obtuse and apiculate. **INFL** an erect head, without an involucre, 17–31 mm long, 15–33 mm wide (when pressed), terminal on peduncles 0.5–17 cm long, these strigulose. **FLOWERS** many, finally reflexed, calyx 4.5–7.8 mm long, the tube 1.6–2.5 mm long, scarious, pilose distally, the teeth 2.9–5.8 mm long, pilose, subulate; the petals whitish to pink or purple; 11–13 mm long. **PODS** 1- to 4-seeded. $2n$ = 16, 24, 32, 48.

1. Plants rhizomatous, the roots slender, not much enlarged; leaflets of main leaves commonly more than 5 times longer than broad; plants of Arizona and Colorado. ..... **var. *reflexum***
1' Plants from a caudex and tuberous root; leaflets less than 4 times longer than broad; roots tuberous-thickened; plants more widespread..... **var. *rusbyi***

var. *reflexum* A. Nelson (reflexed) Wind River clover, Rydberg's clover. [*T. longipes* subsp. *reflexum* (A. Nelson) J. M. Gillett; *T. rydbergii* Greene; *T. oreganum* Howell var. *rydbergii* (Greene) McDermott]. Meadows, stream banks, woods, and willow communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon; UTAH. 1900–2645 m (6235–8680'). Flowering: Apr–Jun. Wyoming (type from Wind River Mountains, Fremont County), Colorado, Arizona, New Mexico, and Utah.

var. *rusbyi* (Greene) Harr. (for Henry Hurd Rusby, botanist, physician, explorer) Rusby's clover. [*T. rusbyi* Greene; *T. longipes* var. *pygmaeum* A. Gray; *T. longipes* subsp. *pygmaeum* (A. Gray) J. M. Gillett; *T. longipes* var. *brachypus* S. Watson; *T. brachypus* (S. Watson) Blank.; *T. confusum* Rydb.]. Alpine and subalpine meadows, open woods, stream banks, and grasslands with *Geum*, *Pedicularis*, *Smelowskia*, and *Saxifraga*, often in aspen-spruce-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon, SJn; NMEX: RAr, SJn; UTAH. 1840–2895 m (6040–9500'). Flowering: Apr–Jun. Southern Utah, southwest Colorado, northwest New Mexico, and northern Arizona.

Trifolium nanum Torr. **CP** (dwarf) Dwarf clover, tundra clover. Acaulescent, pulvinate-caespitose, 2–4 cm tall, from a caudex and taproot, the stems obscured by imbricated stipules and leaf bases. **LEAVES** with petioles 0.3–2 mm long; stipules scarious to herbaceous; leaflets 3, 3–11 mm long, 1–5 mm wide, oblanceolate to obovate, toothed to entire, glabrous or with some hairs on the lower surface, folded or flat, acute to mucronate. **INFL** a head, 1- to 4-flowered, with an involucre of distinct to connate bracts, terminal, sessile or on peduncles 0.3–4 cm long, these glabrate to glabrous. **FLOWERS** 15–23 mm long; pedicel 1–2 mm long; calyx 5–7 mm long, the tube 3.5–4 mm long, scarious, glabrous, the teeth 2.2–2.8 mm long, triangular-subulate, glabrous; pale purplish (fading dark violet), erect. **PODS** 1-

to 4-seeded. $2n = 16$. Alpine meadows and scree. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3550–3870 m (11655–12690'). Flowering: Jun–Aug. Montana, Wyoming, Colorado, and New Mexico.

Trifolium parryi A. Gray (for Charles C. Parry, British-American botanist and explorer) Parry's clover. Acaulescent or short-caulescent and with 1 elongate internode, 4–25 cm tall, from a caudex and taproot. **LEAVES** with petioles 0.6–13 cm long; stipules scarious to herbaceous, 6–18 mm long; leaflets 3, 5–43 mm long, 1.5–13 (16) mm wide, oblanceolate or obovate to elliptic or oblong, flat, toothed from near the base, glabrous on both sides, acute to obtuse and apiculate. **INFL** a head, 5- to 20-flowered, subtended by distinct involucral bracts, terminal on peduncles 1.8–22 cm long, these glabrous or sparingly hairy near the apex. **FLOWERS** 12–17 mm long, erect; pedicel 0–1 mm long; calyx 4–7.1 mm long, the tube 2–3.9 mm long, scarious, glabrous, the teeth 2–3.2 mm long, lance-subulate; the petals pale to dark pink-purple (fading dark violet). **PODS** 1- to 4-seeded. $2n = 16, 32$. Alpine meadows, openings in spruce and other coniferous woods, and on talus slopes. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn. 3350–4025 m (11000–13200'). Flowering: Jul–Aug. Montana, Wyoming, Colorado, and New Mexico. Materials from Mineral County, Colorado, have been assigned to **subsp. *salictorum*** (Greene ex Rydb.) J. M. Gillett (1965 Brittonia 17:132), which is characterized by "thicker, fleshier and more obtuse leaves, more elongate flower heads, thicker peduncles and larger stipules than those of subsp. *parryi*."

Trifolium pratense L. (in meadows) Red clover. Caulescent, short-lived perennial, 18–60 cm tall or more, from a taproot, erect or ascending. **LEAVES** with petioles 0.8–19 cm long; stipules scarious to subherbaceous, 11–24 mm long; leaflets 3, 11–54 mm long, 8–28 mm wide, elliptic to lanceolate, ovate, or obovate, flat, toothed from near the base (the teeth inconspicuous), long-pilose beneath, glabrous above, obtuse to retuse. **INFL** a head, closely subtended by 1 or more foliose bracts, these often 3-foliolate, sessile, or on spreading-hairy peduncles to 3 cm long, many-flowered, 22–36 mm long, 20–34 mm wide, axillary, erect. **FLOWERS** 13–20 mm long, calyx 7.5–9.7 mm long, the tube 3.2–4.1 mm long, strigose, scarious, the teeth 4.3–5.6 mm long, subulate, pilose; corolla deep red. **PODS** 2-seeded. $2n = 14, 28, 48$. Cultivated forage plant, escaping and at least locally established. COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn. 1720–2715 m (5640–8910'). Flowering: Jun–Sep. Probably universal; native to Europe. This important agronomic crop plant is a common component of seed mixtures for pasture and hay lands. It is of importance as a forb in meadows cut for wild hay and is commonly found established along roadsides. Bees utilize its nectar to produce fine quality honey. Poisoning of livestock has been reported for this plant, possibly due to the presence of cyanogenetic glycosides. According to Barneby (in Cronquist et al. 1989:214–215), most if not all of our plants have coarse, hollow stems and belong to what has been collectively called **var. *sativum*** Schreb. (von Schreber 1804).

Trifolium repens L. (creeping) White clover. Caulescent, 8–35 cm tall, the stems stoloniferous, creeping and rooting at the nodes, the petioles and peduncles often arising at right angles to the stem axis, radiating from a root crown. **LEAVES** with petioles 1.8–24 cm long; stipules scarious, 3–10 mm long; leaflets 3, 5–22 (38) mm long, 4–18 (30) mm wide, obcordate or obovate to oval or elliptic, flat, toothed from near the base, glabrous on both sides, truncate to emarginate. **INFL** a head, without an involucre, many-flowered, 10–32 mm long, 15–30 mm wide, axillary, on a peduncle 6–33 cm long, these glabrous or sparingly pilose, erect. **FLOWERS** 5–9 (10) mm long, pedicels 1–6.4 mm long; calyx 3.2–5.4 mm long, the tube 2.2–2.7 mm long, scarious, glabrous, the teeth 1–2.7 mm long, subulate, glabrous; white or pinkish, fading brown, the lower reflexed in age. **PODS** 1- to 3-seeded. $2n = 16, 22, 30, 32$. Commonly grown valuable forage and pasture plant now established both in weedy open sites and in native plant communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1645–3445 m (5400–11305'). Flowering: Apr–Oct. Probably universal; native to Europe. White clover has also been implicated in animal poisoning.

Trifolium wormskioldii Lehm. (for Morton Wormskjold, explorer and botanist) Wormskjold's clover, cow clover. Perennial, caulescent, 12–35 cm tall or more, rhizomatous. **STEMS** ascending to erect. **LEAVES** with petioles 1.2–4 cm long; stipules herbaceous, 8–15 mm long, many-toothed; leaflets 3, 6–30 mm long, 3–14 mm wide, oblanceolate to elliptic or obovate, flat, toothed from near the base, glabrous throughout. **INFL** a head, subtended by an involucre, 20–30 mm wide, many-flowered, axillary, erect. **FLOWERS** 10–18 mm long, calyx 7–9 mm long, the tube 2.9–3.7 mm long, glabrous, the teeth 4.1–5.3 mm long, subulate, glabrous; corolla reddish to purple. **PODS** 1- to 4-seeded. $2n = 16, 32$. [*T. involucratum* Ortega; *T. fimbriatum* Lindl.; *T. involucratum* var. *fimbriatum* (Lindl.) McDermott; *T. willdenovii* Spreng. var. *fimbriatum* (Lindl.) Ewan]. Meadows and streamsides. ARIZ: Apa. 2135–2745 m (7000–9000'). Flowering: May–Sep. British Columbia and Idaho, south to California, Colorado, New Mexico, and Mexico. Specimens from southwestern Colorado have been assigned to both **var. *wormskioldii*** and to **var. *arizonicum*** (Greene) Barneby, 1989

Intermountain Fl. 3B: 228. [*T. arizonicum* Greene, 1895 Erythea 3:18]. The former has flowers mainly 9–13 mm long, the latter 7–9 mm long. The relatively small number of herbarium specimens from the San Juan drainage in herbaria precludes much in the way of analysis of varietal status. Paiutes ate the leaves uncooked as greens.

Vicia L. Vetch

(English vetch) Annual or perennial herbs, clambering, trailing, or climbing. **LEAVES** alternate, even-pinnately compound, the rachis terminating in a usually prehensile tendril; stipules herbaceous, entire to semisagittate; leaflets 4–12 or more, very variable. **INFL** solitary, axillary, or an axillary raceme. **FLOWERS** papilionaceous; calyx 5-toothed, obliquely campanulate to short-cylindric; petals 5, pink to white, the wings adnate to the keel; stamens 10, diadelphous; style filiform, bearded around the circumference below the stigma. **PODS** oblong, 2- to several-seeded, the valves coiling upon dehiscence (Hermann 1960).

1. Flowers 15 or more in dense, secund racemes; introduced plants of cultivated lands and other sites .... ***V. villosa***
1′ Flowers 10 or fewer, in secund racemes or otherwise; introduced or indigenous plants ..... (2)

2. Flowers 5–8 mm long; plants very slender ..... ***V. ludoviciana***
2′ Flowers 12–25 mm long or more; plants not very slender, indigenous and widespread ..... ***V. americana***

Vicia americana Muhl. ex Willd. (of America) American vetch. Perennial, 1.2–12.7 dm tall, the stems glabrous or pubescent. **LEAVES** (excluding tendrils) 2–3 cm long; stipules 3–10 mm long, semisagittate, deeply toothed in the lower portion; leaflets 8–16, 3–44 mm long, 1–19 mm wide, linear, elliptic, oblong, ovate, lanceolate, oblanceolate, or obovate, glabrous to pubescent, acute to truncate, rounded, or retuse and apiculate, less commonly toothed apically; tendrils branched or simple. **INFL** a raceme, 3- to 7 (10)-flowered, the flowers spreading at anthesis; peduncles 1.8–6.7 cm long. **FLOWERS** 13–22 (25) mm long; calyx 6.2–8.4 mm long, the tube 4.8–6.5 mm long, the lowermost tooth 0.7–1.9 (2.5) mm long, triangular; corolla pink to pink-purple. **PODS** stipitate, the stipe 2.5–4.5 mm long, the body 23–35 mm long, 6–8 mm wide, glabrous. $2n = 14$. [*V. oregana* Nutt.; *V. americana* var. *oregana* (Nutt.) A. Nelson; *V. americana* subsp. *oregana* (Nutt.) Abrams; *V. truncata* Nutt.; *V. americana* var. *truncata* (Nutt.) Brewer]. Sagebrush, piñon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 2285–3200 m (7500–10500′). Flowering: May–Aug. British Columbia east to Ontario, Kansas, Missouri, Virginia, and south to Mexico. Infusion of the plant was used by Navajos as an eye wash. The plant is a "life medicine."

Vicia ludoviciana Nutt. ex Torr. & A. Gray (of Louisiana) Louisiana vetch. Annual or winter-annual, 3–8.5 dm tall, the stems glabrous or puberulent. **LEAVES** (excluding tendrils) 1.8–5.5 cm long; stipules semihastate to linear-oblong, 1–4 mm long; leaflets 6–10, 7–28 mm long, 0.6–4 mm wide, linear to oblong or oblanceolate, pilosulous to glabrous, obtuse to acute and mucronate; tendrils branched and prehensile. **INFL** a raceme, 1 (2)-flowered, the flowers ascending to spreading at anthesis; peduncles 0.4–4.8 cm long. **FLOWERS** 6.3–7.4 mm long; calyx 2.2–3.3 mm long, the campanulate tube 1.4–1.9 mm long, the lowermost tooth 0.8–1.4 mm long, lance-subulate; corolla lavender. **PODS** stipitate, the stipe 0.8–1.4 mm long, the body 16–28 mm long, 5–6.2 mm wide, glabrous. $2n = 14$. [*V. exigua* Nutt.; *V. thurberi* S. Watson]. Blackbrush, mixed desert shrub, and piñon-juniper communities. ARIZ: Apa; COLO: LPl, Mon; NMEX: SJn; UTAH. 1665–1910 m (5465–6265′). Flowering: Apr–May. Oregon, California, Nevada, Utah, Arizona, New Mexico, Colorado, and Texas.

Vicia villosa Roth (hairy) Hairy vetch. Annual or biennial, 5–20 dm tall, the stems spreading-hairy. **LEAVES** (excluding tendrils) 2.3–8 cm long; stipules toothed or entire, 5–15 mm long; leaflets 10–18, 8–30 mm long, 1–6 mm wide, linear to oblong or narrowly lanceolate, long-pilose or hirsute on both sides, acute to obtuse and apiculate. **INFL** a raceme, mainly 15- to 25-flowered, the flowers declined at anthesis; peduncles 1.8–7.5 cm long. **FLOWERS** 15–17 mm long; calyx 7–7.8 mm long, the gibbous tube 3.8–4.7 mm long, the teeth 3.1–4.3 mm long, subulate, pilose; corolla pink-purple or reddish violet. **PODS** 20–30 mm long, 7–10 mm wide, glabrous. $2n = 14$. Weedy introduction in cultivated lands and other disturbed sites, often along fencerows. COLO: LPl, Mon. 1975–2110 m (6475–6930′). Flowering: Jun–Jul. Adventive from Europe. Four Corners material belongs to **var. *villosa***. This plant, long grown for forage in agricultural areas, is often conspicuous along fencerows in populated areas.

FAGACEAE Dumort. BEECH, OAK FAMILY

Rodney Myatt

Woody shrubs or trees, evergreen or deciduous, monoecious. **LEAVES** alternate; petiolate; stipules small, deciduous; blade simple, entire, toothed, or lobed. **INFL** with staminate catkins or short, pistillate branches; male catkins pendulous or somewhat erect spikes; female branches with 1–few flowers, involucre cup-shaped or lobed and burlike. **FLOWERS** with staminate calyx lobes 4–6, small; petals 0; stamens 4–12; pistillate calyx 6-lobed; petals 0; style branches 2–3, ovary inferior. **FRUIT** a nut subtended by a scaly involucral cup (acorn) or 1–3 nuts subtended by a spiny, burlike involucral cup. Seven genera and about 900 species worldwide, especially in the Northern Hemisphere. Only *Quercus* occurs naturally in our area. Fruits of most members (*Quercus*, *Fagus*, *Castanea*, *Lithocarpus*, etc.) important as food source for wildlife and indigenous peoples. Trees important as habitat for forest animals. Bark used as cork (*Quercus suber*) or as tannin source (*Lithocarpus* spp.).

Quercus L. Oak

(ancient Latin name for oak) Woody shrubs to trees, evergreen or deciduous, sometimes clonal, with stems rooting at ground; monoecious; often with dense pubescence on young twigs, petioles, leaf blades, and involucral cups, usually more glabrous with age; hairs both single and stellate, with 2–10+ rays; some species with sparse, golden, glandular hairs on leaves and acorn cup. **LEAVES** alternate, deciduous, thin to sclerophyllous, entire to lobed or toothed; lobes rounded, acute, or mucronate; teeth acute, mucronate, or spinose; stipules linear to linear-spatulate. **INFL** catkins; staminate catkins pendulous, with many flowers, occurring early in season, often before leaves are fully developed, and located in axils toward ends of young branches; pistillate catkins short, erect, 2–4 flowers, in axils toward base of young stems. **FLOWERS** with staminate calyx lobes 4–6, ciliate-fringed; pistil with 3 stigmas, short, recurved in flower; ovary subtended by scaly involucral cup, scales with thickened bases. **FRUIT** an acorn with the enlarged involucral cup covering 1/4 to 1/2 of the nut. All of the naturally occurring species in our region are members of the subgenus *Quercus* (*Lepidobalanus*, white oaks), which lack aristate bristles on leaf lobes, have thickened cup scale bases, smooth (nontomentose) inner wall of pericarp, short, thickened styles, and fruits maturing in one year. Species of this subgenus, including ours, hybridize readily and form populations of introgressed individuals and local hybrid swarms, making identification often problematic. Approximately 600 species worldwide, especially in temperate regions of the Northern Hemisphere. An important food source for wildlife and Native Americans. In some regions important as a source of hardwood lumber and firewood.

1. Leaves deciduous, thin, deeply lobed, lobe sinuses generally more than halfway to midrib of leaf; mostly small to medium-size trees or not sclerophyllous, occasionally shrubs ..... ***Q. gambelii***
1′ Leaves deciduous or evergreen, but sclerophyllous, entire, toothed, or shallowly lobed; lobe sinuses less than halfway to midrib; shrubs or small trees, may be clonal or not ..... (2)

2. Plants semievergreen, mainly 10–30 dm tall or more, or if deciduous, then typically hairy above and densely so beneath; forming clones within and adjacent to stands of *Q. gambelii*, and occurring as scattered individuals where *Q. gambelii*, *Q. turbinella*, or *Q. welshii* coexist; acorns typically less than 5 mm long and less than 10 mm wide, if formed at all ..... ***Q. pauciloba*** and ***Q. eastwoodiae*** (hybrids)
2′ Plants not as above ..... (3)

3. Leaves evergreen, entire (only occasionally with teeth), grayish, with light gray pubescence on petioles and twigs, mostly small trees ..... ***Q. grisea***
3′ Leaves evergreen or deciduous, lobed or toothed, not particularly grayish or with dense gray pubescence ..... (4)

4. Leaves deciduous, lobed or shallow, with rounded to acute teeth ..... (5)
4′ Leaves evergreen, toothed, with spinose tips on teeth; shrubs, but not clonal; plants usually of more upland, desert chaparral, or woodland habitats ..... (6)

5. Leaf lobes mostly acute, mucronate, or apiculate; young leaves densely hairy; plants low shrubs, branch bases at ground usually buried; plants of sandy, low desert habitats in western portion of the Four Corners ..... ***Q. welshii***
5′ Leaf lobes mostly rounded to acute; young leaves not so densely hairy; plants shrubs to small trees; some may be semievergreen; plants of more upland, woodland-sagebrush habitats in eastern part of the Four Corners ..... ***Q. ×undulata***

6. Leaf spines 1–2.5 mm; young leaves with dense stellate pubescence, rays 8–10+, more or less appressed; golden hairs present on leaves; common ..... ***Q. turbinella***

6' Leaf spines 3–5 mm; young leaves sparsely pubescent, stellate hairs with fewer rays; golden hairs lacking; rare, Mesa Verde National Park, Colorado ..... ***Q. ajoensis***

Quercus ajoensis C. H. Mull. (from Spanish word for garlic, the origin of name for Ajo Mountains, Arizona) Shrubs to small trees. **LEAVES** evergreen, orbicular to elliptic, toothed, with elongate spines on teeth; slightly pubescent to glabrous, lacking golden hairs. **ACORN** cups very shallow. Growing on shallow, red sand, on gentle, south-facing slope, with piñon-juniper. COLO: Mon. 2135 m (7000') Flowering: May: There is some question as to whether this population is distinct from *Q. turbinella*. One specimen examined was definitely *Q. ajoensis*; others may be hybrids with *Q. turbinella*. The species occurs in southwest Arizona (type locality is Ajo Mountains, Pima County) and into Mexico, but hybrids with *Q. turbinella* occur in mountains to the north and east in Arizona, and apparently in the Sacramento Mountains, New Mexico. Found in Mesa Verde National Park, Wetherill Mesa (Muller 1954).

Quercus gambelii Nutt. (for William Gambel, naturalist, ornithologist, and botanist) Gambel's oak. Trees to upright shrubs, mostly 2–5 m. **STEMS** single to multiple from ground, sometimes clonal as shrubs. **LEAVES** deciduous, deeply lobed; lobes 3–4 per side, often divided toward tip, rounded to acute at tip, nonaristate; blade 5–12+ cm long, elliptic to obelliptic in outline; base tapered; petiole 0.5–1.5 cm; young leaves with stellate pubescence on both surfaces, especially dense near base and petiole, upper surface glabrous with age; stellate hairs with 2–6 rays, upright; no golden, glandular hairs. **ACORNS** with involucral cup 1–2 cm diameter; covering about 1/3 nut; nut up to 2 cm long. Widespread and variable, occurring in piñon-juniper and upland scrub communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. Flowering: May–Jun. Hybridizes with each of the other species in the region in which it comes in contact. Much of the variation in each species may be the result of past and present introgression of characters from *Q. gambelii.* Some populations or individuals of hybrids are recognized with binomials (cf. *Q.* ×*eastwoodiae* Rydb., *Q.* ×*pauciloba* Rydb., *Q.* ×*undulata* Torr.). Particularly tall, more arborescent trees which occur occasionally in protected, well-watered sites may be recognized as var. *bonina* S. L. Welsh. Based on plants from the type locality (Goodhope Bay, Utah), these plants have larger acorns and grow much faster under similar conditions than var. *gambelii*. Decoction of the root used for postpartum pain, as a cathartic, and as a "life medicine." Acorns were a staple, ground into a meal or eaten whole by Apaches, Acoma, most Puebloans, and Navajos. The red leaf galls were used as dyes and the wood used for baby cradles, tools, ceremonial objects, and shade house construction by Navajos. The bark was also used to tan hides (Tucker 1961).

Quercus grisea Liebm. (gray) Gray oak. Small trees, occasional shrubs; petiole and young twigs with light grayish pubescence. **LEAVES** evergreen, mostly entire, ovate to ovate-elliptic, upper side often grayish green; base rounded to truncate. Hybrids with *Q. gambelii* (*Q.* ×*undulata*) occur in the south and southeastern part of the region. Sagebrush and montane communities. COLO: Arc, Mon. Flowering: May. Occurs mostly in the southern part of Arizona and New Mexico, and into Texas, possibly getting into the montane sagebrush habitats of the southern and eastern parts of the region in Sandoval County, New Mexico. Arizona, New Mexico, Texas, and south to Mexico. The raw fruit was used by Apaches and Navajos as food. Ramah Navajos used the wood to protect new or ceremonial hogans from lightning, ghosts, and witches (Tucker 1961, 1971).

Quercus turbinella Greene (almost top-shaped, referring to the acorns) Shrub live oak. Shrubs, crown spreading, multiple stems, but not clonal. **LEAVES** evergreen, sclerophyllous, elliptic to round-elliptic; petiole 0.5–1 cm; blade 2–4 cm, often slightly grayish green on upper surface, dull green below; base rounded to truncate; blade toothed to shallow, acutely lobed; lobes or teeth spinose-tipped, spines 0.5–1.2 mm; young leaves with dense pubescence, more dense on lower surface, upper usually nearly glabrous with age; stellate hairs with 8–10 rays, more or less appressed to leaf surface; some golden, glandular hairs usually present; veins somewhat raised, lighter in color, evident. Sandy to rocky soils, upland desert scrub, sagebrush, rabbitbrush communities, bordering piñon-juniper. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, SJn; UTAH. Flowering: May. Arizona, California, and Nevada, east to Colorado, Utah, New Mexico, and south to Mexico.

Quercus welshii R. A. Denham (for Stanley L. Welsh, Utah botanist) Welsh's oak. Shrubs, with multiple erect stems, usually bases buried by sediment. They appear not to be clonal. **LEAVES** deciduous; blade 4–6 cm, occasionally shorter, elliptic, shallow lobes; upper side slightly darker green than lower; lobes acute, may be mucronate, not spine-tipped; young leaves densely pubescent on both surfaces, petiole, and young stems; stellate hairs variable, 4–10 rays, usually upright; no golden, glandular hairs. Plants of lowland, sandy habitats, mostly in the western part of the region. The multiple-base habit often traps sand into dunelike formations. ARIZ: Apa, Nav; NMEX: SJn; UTAH. 1300–1800 m

(4000–5300′). Flowering: May. Utah, Arizona, New Mexico, Oklahoma, and Texas. There is some question as to whether these plants represent a distinct species or a variety *of Q. havardii* (var. *tuckeri*). Our plants differ from the more eastern *Q. havardii* Rydb. (eastern New Mexico, Texas, Oklahoma) in having somewhat deeper, more acute, often mucronate lobes, characters apparently influenced by introgression with *Q. gambelii* and possibly *Q. turbinella*. [*Quercus havardii* Rydb. var. *tuckeri* S. L. Welsh] (Tucker 1970).

Quercus* ×*eastwoodiae Rydb. (for Alice Eastwood, western botanist) Eastwood's oak. Hybrid (*Quercus gambelii* × *Quercus havardii*). Shrubs, clonal. **LEAVES** deciduous, generally lobed halfway to midrib; lobes acute to mucronate or short-spinose; pubescence dense on leaf surface, petioles, and young twigs; rays upright, variable in number. Sandy to rocky soils in alluvial sites, sandy canyon bottoms, more or less riparian habitats in western part of the region. ARIZ: Nav; UTAH. Arizona and Utah. Flowering: Apr–May (Tucker 1970).

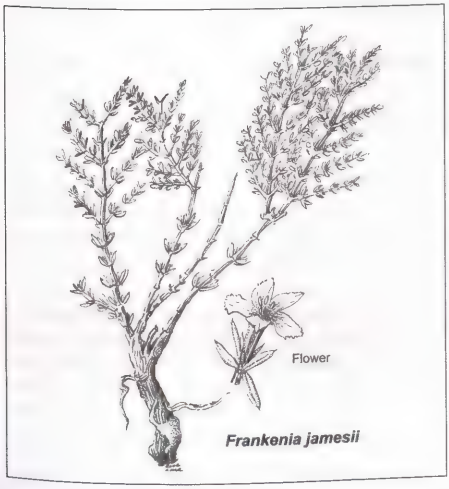
Quercus* ×*pauciloba Rydb. (small-lobed) Hybrid (*Quercus gambelii* × *Quercus turbinella*). Shrubs. **LEAVES** deciduous, shallow to moderately lobed, although lobe sinuses usually 1/2 or less to leaf midrib; lobes acute, mucronate, or short-spinose; pubescence variable, usually not very dense; some stellate hairs with 6–8 rays, upright, some with 8–10 rays, appressed. Most of the specimens examined for the area have characteristics closer to *Q. gambelii* and are closer to *Q. gambelii* populations than *Q. turbinella*. Occurring in upland scrub and piñon-juniper communities, along canyon draws and rocky slopes. ARIZ: Apa, Nav; NMEX: McK, SJn; UTAH. 1200–2000 m (3500–6000′). Flowering: Apr–May. Colorado, Utah, Nevada, Arizona, and New Mexico (Tucker 1961).

Quercus* ×*undulata Torr. (wavy) Wavy-leaved oak. Hybrid (*Quercus gambelii* × *Quercus grisea*). Mostly shrubs to small trees. **LEAVES** shallowly lobed, elliptic to narrowly elliptic, 3–5 cm, a few leaves persistent more than 1 year; leaves often grayish above; lobes acute to rounded, sometimes mucronate; pubescence on leaf base, petiole, and young twigs often grayish silvery. Occurs in upland sagebrush, piñon-juniper communities in eastern part of region. NMEX: McK, RAr, San. Flowering: May. Colorado, Utah, Arizona, and New Mexico (Tucker 1961, 1971).

FRANKENIACEAE Desv. ALKALI HEATH FAMILY

Linda Mary Reeves

Salt-tolerant herbs. **LEAVES** generally opposite, sessile, small, heathlike, often decussate, simple, entire, often with inrolled margins. **INFL** a terminal or axillary cyme, occasionally solitary. **FLOWERS** actinomorphic, perfect, rarely unisexual and monoecious or dioecious; calyx tubular, lobes 4–7; petals free, 4–7, sometimes with a long claw, often with a scale at the base; stamens usually 6, occasionally 24, in 2 whorls, occasionally united at ovary base; ovary superior, with 2–4 united carpels, with a single locule and parietal placentation; style simple; stigma 2- or 3-lobed. **FRUIT** a capsule with persistent calyx. $2n = 20, 30$. About four genera (*Anthobryum*, *Frankenia*, *Hypericopsis*, *Niederleinia*) and 90 species from warm-temperate and subtropical regions, primarily the Mediterranean region, Australia, southern South America, the southwestern U.S., and Mexico. Some ornamental use, especially the St. Helena shrub seaheaths. *Frankenia ericifolia* is used as a fish poison.



Frankenia L. Alkali Heath, Seaheath, Wispweed (for Johannes Franckenius, 17th-century Swedish botanist) Subshrubs, usually salt-tolerant, often pubescent. **LEAVES** small, often congested on small lateral branches, pubescent, often salt-encrusted. **FLOWERS** perfect, subtended by a pair of bracts and a pair of bracteoles, often each pair united by a stipular sheath; calyx ribbed, 5-lobed, margin ciliate, persistent; petals 4–6, pink, white, or purplish; stamens 4–6 in 2 whorls, the outer shorter than the inner, filaments often fused at bases; ovary 3-carpellate, placentation basal or parietal. About 80 species of seaside, gypsum, or saline habitats (50 species in Australia). Primarily Mediterranean, Australian, warm-temperate, and arid subtropical distribution.

Frankenia jamesii Torr. ex A. Gray (for Edwin P. James, 1797–1861, an American naturalist and botanical explorer

in the Rocky Mountains) James' seaheath. Small shrub with woody base to 30 cm tall. **STEMS** jointed; puberulent. **LEAVES** decussate, appearing whorled; linear to elliptic, somewhat terete, aculeate; somewhat clasping; hispid; margins strongly revolute, often tightly coiled, appearing to be fascicled; base margins ciliate; 3–5 mm long, about 1 mm wide. **INFL** cymose or solitary. **FLOWERS** sessile; calyx tube ribbed, 4–5 mm long, lobes toothlike, 5; petals 5, clawed, about twice as long as calyx tube, white, apex margin somewhat denticulate; stamens 6, 3 long and 3 short; style with 3 branches. **FRUIT** a linear, angled capsule about 5 mm long. Primarily in desert scrub, usually associated with gypsum deposits. Possibly an obligate gypsophile. COLO: Mon; NMEX: SJn, McK. 1500–2000 m (5000–6500'). Flowering: May–Jun. Fruit: Jun–Jul. West Texas and Mexico to New Mexico and Colorado.

FUMARIACEAE Marquis FUMITORY FAMILY

Lynn M. Moore

Winter-annual, biennial, or perennial herbs with watery juice. **LEAVES** alternate or basal, divided or compound; without stipules. **INFL** a raceme or panicle; pedunculate; with bracts. **FLOWERS** irregular; perfect; sepals 2, small and bractlike, peltate, not enclosing the bud, persistent or caducous; petals 4, unequal, outer 2 petals connate, upper petal forming a spurlike saccate base, inner 2 petals coherent, forming a hood over the stigma and anthers; pistil 1; superior; carpels 2; locule 1; style 1; stigma capitate or lobed, wet; stamens 6, diadelphous in 2 bundles of 3, filaments connate at base, the middle anther 2-locular, the lateral anthers 1-locular. **FRUIT** a valvate, dehiscent or indehiscent capsule. **SEEDS** 1 to many. $x = 8$. Four genera and 23 species in North America (19 genera and 450 species worldwide). Temperate, often montane regions of North America, Eurasia, Africa, and Australia. Most botanists, especially those from Europe, treat the Fumariaceae as a subfamily of the Papaveraceae. Intermediate genera do exist, i.e., *Hypecoum* and *Pteridophyllum* (characterized by weakly irregular flowers and four distinct stamens), and cladistic analysis also supports the treatment of the Fumariaceae within the Papaveraceae. Nevertheless, our flora shows distinct morphological differences in the two families and will be treated here as separate to facilitate ease of use in the field (Arber 1931; Judd, Sanders, and Donoghue 1994; Thorne 1974; Zomlefer 1989). One genus in our flora.

Corydalis DC. Corydalis, Fumewort

(Greek *korudallis*, from *korudos*, crested lark, from the shape of the flowers) Plants erect to prostrate herbs. **LEAVES** basal or cauline; compound; 2–4 times pinnate or pinnate-pinnatifid. **INFL** a raceme or panicle. **FLOWER** sepals 2, small and bractlike, peltate; not enclosing the bud, persistent or caducous; petals 4, unequal, outer 2 petals connate, upper petal forming a saccate spur, inner 2 petals coherent, forming a hood over the stigma and anthers. **FRUIT** a dehiscent capsule. **SEEDS** few to many; small; elaisome present (oil-bearing appendage). About 100–300 species in temperate North America, Eurasia, Australia, and Africa.

1. Petals pale to bright yellow; winter-annual or biennial; plants less than 50 cm tall ..... ***C. aurea***
1' Petals white, inner petals red to purple-tipped; perennial; plants tall, up to 2 m ..... ***C. caseana***

Corydalis aurea Willd. (with gold) Plants winter-annual or biennial; glaucous; less than 50 cm tall; more or less branched caudex. **STEMS** 10–50; prostrate-ascending; 2–3.5 dm long. **LEAVES** bipinnate; leaflets pinnatifid. **FLOWER** petals pale to bright yellow. **FRUIT** linear capsules, often torulose.

1. Raceme not longer than leaves, slender or weak; spur less than 1/2 the length of the rest of the corolla from the pedicel; capsules pendent or spreading at maturity ..... **subsp. *aurea***
1' Raceme longer than leaves, stout or robust; spur about equal the length of the rest of the corolla from the pedicel; capsules erect at maturity, stout ..... **subsp. *occidentalis***

subsp. *aurea* Scrambled eggs, golden corydalis, goldensmoke, mountain corydalis, Tazhii yilchin á ts'ísígíí (little turkeylike odor) **INFL** a raceme, not longer than leaves; slender or weak. **FLOWERS** with upper petal spur less than 1/2 the length of the rest of the corolla from the pedicel. **FRUIT** with capsules pendent or spreading at maturity; slender; 18–24 mm long. **SEEDS** smooth, without marginal ring. $2n = 16$. [*Capnoides aureum* (Willd.) Kuntze; *Corydalis washingtoniana* Fedde]. Hillsides, roadsides, and dry washes in montane, ponderosa pine, sagebrush, and piñon-juniper woodland communities. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1980–3275 m (6500–10750'). Flowering: May–Aug. Native across the United States (absent from the Southeast) and Canada. Kayenta and Ramah Navajo drug plant used as an antidiarrheal, dermatological aid, disinfectant, and gynecological aid. Plant

sprinkled on livestock for snakebites. Used for sheep feed. Cold infusion used to soak watermelon seeds to increase production.

subsp. *occidentalis* (Engelm. ex A. Gray) G. B. Ownbey (of the west) Curvepod fumewort, curvepod, corydalis. **INFL** a raceme longer than leaves; stout or robust. **FLOWERS** with upper petal spur about equal the length of the rest of the corolla from the pedicel. **FRUIT** capsules erect at maturity; stout; 12–20 mm long. **SEEDS** smooth; with narrow marginal ring. [*Corydalis aurea* Willd. var. *occidentalis* Engelm. ex A. Gray; *C. curvisiliqua* (A. Gray) Engelm. ex A. Gray subsp. *occidentalis* (Engelm. ex A. Gray) W. A. Weber; *C. montana* Engelm. ex A. Gray; *Capnoides montanum* (Engelm. ex A. Gray) Britton]. Hillsides, sandy terraces, and disturbed sites in desert scrub, sagebrush, mountain shrub, piñon-juniper woodland, ponderosa pine, and mixed conifer communities. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon; NMEX: McK, RAr, SJn; UTAH. 1310–2530 m (4300–8300'). Flowering: Apr–Jul. Native in the United States west of the Mississippi River. Ramah Navajo drug plant used as a rheumatic remedy. Cold infusion taken for stomachache, for sore throat, and as lotion for backache. Compound decoction of plant used for menstrual difficulties, and injuries. Used for sheep feed. Cold infusion used to soak watermelon seeds to increase production.

Corydalis caseana A. Gray **CP** (for Eliphalet Lewis Case, 1843–1925) Brandegee's fumewort, Sierra fumewort, Sierran fumewort, Sierra corydalis, fitweed, cimmarona. Plants perennial; glaucous; up to 2 m tall; large, fleshy roots. **STEMS** 1–several; 10–15 dm long. **LEAVES** 2–4 times pinnate; large, 20–30 cm long. **INFL** a raceme or panicle; 50 or more flowers; bracts linear to linear-elliptic, 10–12 mm long, becoming reduced distally. **FLOWER** petals white, inner petals red to purple-tipped. **FRUIT** capsule ellipsoid; reflexed; 10–15 mm long. **SEEDS** with numerous minute protuberances. [*Corydalis brandegeei* S. Watson]. Wet aspen and spruce-fir forests in the San Juan Mountains. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn. 2650–3569 m (8700–11800'). Flowering: Jun–Aug. Our material belongs to **subsp. *brandegei*** (S. Watson) G. B. Ownbey (named for Townshend Brandegee, 1843–1925, and Mary Katharine (Layne) Brandegee, pioneer western botanists). Our subspecies is endemic to southern Colorado and adjacent New Mexico. Palatable to both sheep and cattle, although highly toxic to livestock. Significant losses have occurred to both cattle and sheep. Often located along streams of conservation interest.

GENTIANACEAE Juss. GENTIAN FAMILY

John R. Spence

Annual, biennial, or perennial herbs (ours), caespitose to erect, from either a weakly to well-developed taproot, from rhizomes or stolons, or sometimes from fibrous rootlets. **STEMS** branched or not, round to angled, erect, ascending, or decumbent, sometimes winged. **LEAVES** opposite, whorled or sometimes alternate, sessile or rarely petiolate, stipules lacking; blade simple, entire, basal rosettes often present, bases often sheathing-connate, sometimes white-margined and wavy-margined. **INFL** solitary or a simple to complex, thyrsoid cyme. **FLOWERS** actinomorphic, hypogynous, perfect, often showy, 4- to 5-merous; sepals persistent, united, cleft or shallowly lobed, sometimes lobes reduced to absent, inner membranaceous rim often present; petals united, tubular, funnelform, campanulate, rotate, or salverform, plicae sometimes present between lobes, fringed coronae sometimes present on inner surface of lobes below tip, 1 or 2 nectaries present at base of corolla tube or on ovary base; stamens versatile or rarely basifixed, epipetalous, inserted or exserted, alternate with the corolla lobes, sometimes connate, anthers longitudinally dehiscent, sometimes becoming spirally twisted after anthesis, free or rarely connate; ovary of 2 carpels, sessile or stipitate, with 1 or 2 locules each, style obsolete to capitate to filiform, stigmas 2, entire or 2-lobed, often persistent. **FRUIT** a 2-valved septicidal capsule. **SEEDS** typically numerous, small, smooth, reticulate, striate, or pitted, sometimes winged. A family of 85 or more genera and about 1650 species, distributed worldwide, especially common in moist, cool-temperate sites in the Northern Hemisphere, and mountains in the subtropics and tropics. *Lomatogonium* is included in the key and is likely to occur in subalpine-alpine areas of the San Juan Mountains. Many members of the family in the subtropics and tropics are woody shrubs or small trees, lianas, or even root-parasites, but temperate genera are primarily herbaceous. The spectacular Arctic-alpine and Sino-Himalayan perennial gentians are widely cultivated as ornamentals, and many of our local species are among the most attractive wildflowers in the West. Gentians contain unusual bitter substances, such as mangiferin and swertianolin, known as xanthone glycosides, which are reported to have medicinal properties. Many species have been used in traditional herbal remedies. Generic limits, especially in *Gentiana*, *Gentianella*, and *Swertia*, are controversial. While *Gentianella* has been split into several segregate genera, most authors still treat *Gentiana* as one large genus (Ho and Liu 1990; Struwe and Albert 2002). However, including tiny annuals such as *Chondrophylla fremontii* in the same genus as the type, the European *G. lutea*, a meter-tall, coarse,

perennial forb with petals that are mostly separate and yellow or red, is inexplicable. The sections of *Gentiana* are strongly marked and morphologically distinctive; thus this treatment follows W. A. Weber and R. C. Wittmann (2001) in taking a relatively narrow view, as they are easily separated in the study area.

1. Corolla rotate, with 1 or 2 fringed glands on the upper surface of each petal lobe; leaves opposite or in whorls, basal rosette typically present ....(2)
1' Corolla tubular, salverform, or campanulate, obvious glands lacking on upper surface of lobes at base although fringed corona sometimes present near base of lobe; leaves opposite, basal rosette present or absent ....(4)

2. Plants slender annuals from a weakly developed taproot; basal leaves few or absent; stigmas decurrent along carpel sutures; flowers white or light blue; subalpine bog plants ....*Lomatogonium*
2' Plants biennials or perennials from a well-developed taproot; basal leaves numerous and well developed; stigmas terminal; flowers white or greenish; habitats and elevations various....(3)

3. Flowers 5-merous, glands 2 per petal lobe; stem leaves opposite or subopposite; style distinctly short and thickened; high elevations in moist to wet sites ....***Swertia***
3' Flowers predominantly 4-merous, glands 1–2 per petal lobe; stem leaves opposite or whorled; style long and slender-filamentous; low to mid-elevations in upland sites....***Frasera***

4. Corolla salverform, pink to rose; anthers becoming spirally twisted after anthesis; in low-elevation wet sites ....***Zeltnera***
4' Corolla funnelform-tubular to long-campanulate, blue to white; anthers not spirally twisted after anthesis; primarily montane plants in a variety of habitats ....(5)

5. Plants perennial; corolla usually longer than 2.5 cm, corolla lobes with conspicuous plicae between them, lobe margins never fringed ....(6)
5' Plants annual or biennial; lobes with or without plicae, corolla typically shorter than 2.5 cm, if longer or if plants perennial, then corolla lobe margins distinctly fringed ....(7)

6. Flowers white or yellow-white; basal rosette present; low-growing (less than 0.2 m); alpine plants ....***Gentianodes***
6' Flowers blue to blue-purple; basal rosette lacking; taller (0.3–1 m); montane to subalpine plants....***Pneumonanthe***

7. Corolla lobes with plicae, lacking fringed corona below apex; leaves connate into a tubular sheathing base, white-margined; low-growing, often prostrate plants....***Chondrophylla***
7' Corolla lobes lacking plicae, sometimes with 1–2 distinct fringed coronas below tips on inside; leaves not connate or tubular-sheathing at base, not white-margined; plants mostly erect ....(8)

8. Corolla large, often longer than 2.5 cm, dark blue, corolla lobe margins distinctly fringed, fringed corona lacking ....***Gentianopsis***
8' Corolla shorter than 2.5 cm, pale blue to white, corolla lobes not fringed, fringed corona present just below corolla lobe tips on inside ....(9)

9. Fringed coronae 2 per petal lobe; flowers on long naked peduncles, solitary, longer than subtending internodes; calyx gibbous at base ....***Comastoma***
9' Fringed corona 1; flowers on short peduncles, shorter than subtending internodes, often clustered; calyx lobes not gibbous at base ....***Gentianella***

Chondrophylla A. Nelson Moss Gentian

(Latin *chondro*, cartilage, + *phyllum*, leaf, referring to the white-margined leaves) Caespitose, annual or biennial herbs from slender taproot. **STEMS** 1 or several, erect, curved, or prostrate, somewhat angled, simple or branched. **LEAVES** in basal rosettes, stem leaves opposite, sessile, sometimes recurved, connate-sheathing at base, with narrow to wide whitish margins, sometimes obscurely so. **INFL** of terminal solitary flowers (ours). **FLOWERS** predominantly 4-merous, sessile or short-pedicellate; calyx tubular, lobes equal, not gibbous at base, with an intracalycine membrane present, sometimes not continuous; corolla tubular-salverform, blue, purple, green, or white, with symmetrical plicae between lobes, lobes more or less entire, small nectary glands at base on pistil, alternate with filaments, lobes lacking fimbriate scales; stamens free, inserted; pistil on short stipe, elongating in fruit; stigmas 2, sessile, persistent. **FRUIT** an obovate or cylindric capsule, the valves recurved when split open. **SEEDS** small, numerous, ovoid to ellipsoid, finely reticulate or smooth, lacking wings. A large genus of 175 species, distributed almost worldwide in montane habitats, with large

concentrations in China and adjacent regions, New Guinea, and reaching Australia and South America. The corollas of some *Chondrophylla* species are temperature- and touch-sensitive, closing when touched or when clouds cover the sun. Species are among the few annuals in Arctic-alpine habitats. The life strategies of our species are not well known but are probably mostly biennial.

1. Capsule obovoid, mostly less than 3 times as long as wide, with the valves deeply split and gaping widely when mature, shortly exserted from corolla on stout stipe; corolla pale blue or white ..... ***C. fremontii***
1' Capsule cylindric, more than 4 times longer than wide, with valves only parted halfway down tube or less when mature, exserted or not from corolla on a slender stipe; corolla typically deep blue ..... (2)

2. Flowering stems erect; flowers erect; capsule not fully exserted from corolla; plants mostly less than 5 cm tall; corolla distinctly temperature- and touch-sensitive ..... ***C. prostrata***
2' Flowering stems arcuate; flowers nodding, not erect; capsule fully exserted from corolla on long stipe; plants typically greater than 5 cm tall; corolla not especially sensitive ..... ***C. nutans***

Chondrophylla fremontii (Torr.) A. Nelson (for J. C. Frémont, explorer and naturalist) Caespitose, annual or biennial herbs from slender taproot. **STEMS** 1 or several, ascending-erect to erect, not arcuate, 2–10 cm. **LEAVES**: cauline leaves lanceolate to elliptic, erect, with wide white margins. **FLOWERS** not obviously touch- or temperature-sensitive; calyx 4–8 mm, lobes 2–4 mm, linear to lanceolate, scarious-margined, midrib distinct; corolla white to pale blue, sometimes with greenish or purplish spots, tube 6–10 mm, lobes 2–4 mm, plicae small, 0.1–0.3 mm, mostly entire. **FRUIT** a short, obovate or elliptic capsule, about 2–3 times as long as wide, 2–6 mm, the valves deeply split nearly to fruit base, and strongly recurved on dehiscence, forming an open cup, partially included or barely exserted past corolla on short, stout stipe. [*Gentiana aquatica* L.]. Uncommon in meadows and wetlands in montane and subalpine forests and alpine tundra communities. COLO: LPl, Min, RGr, SJn. 2440–3655 m (8000–12000'). Flowering: Jun–Jul. Fruit: Aug. Alaska and Yukon south through the Rocky Mountains; west to Nevada and California.

Chondrophylla nutans (Bunge) W. A. Weber (nodding, for the nodding flowers) Caespitose, biennial herbs from slender taproot. **STEMS** 1 or several, ascending or curved, arcuate to somewhat nodding, 4–12 cm. **LEAVES** ovate to obovate, somewhat recurved, with green to narrow white margins. **FLOWERS** not obviously touch- or temperature-sensitive; calyx 6–12 mm, lobes 4–6 mm, broadly lanceolate to triangular, not scarious-margined, midrib not distinct; corolla dark blue, tube 8–20 mm, lobes 2–4 mm, plicae large, 0.5–2 mm, split into 2–3 segments. **FRUIT** an elongate, elliptic to fusiform capsule, more than 4 times as long as wide, the valves split about halfway or less to fruit base, somewhat recurved on dehiscence but not forming an obvious cup, on a slender dark brown or blackish stipe, 1–3 cm long, long-exserted well past corolla. Rare in meadows and slopes in alpine tundra. COLO: LPl, Mon. 3700–4150 m (12000–13700'). Flowering: Jun–Aug. Fruit: Aug–Sep. Colorado; Siberia.

Chondrophylla prostrata (Haenke) J. P. Anderson (for the prostrate stems) Caespitose, biennial herbs from slender taproot. **STEMS** 1 or several, ascending, decumbent, or prostrate, somewhat angled, simple or branched, 1–5 cm. **LEAVES** ovate to obovate, recurved, with narrow white to sometimes mostly green margins. **FLOWERS** distinctly touch- or temperature-sensitive; calyx 6–12 mm, lobes 4–6 mm, broadly lanceolate to triangular, not scarious-margined, midrib not distinct; corolla dark blue, tube 8–20 mm, lobes 2–4 mm, plicae large, 0.5–2 mm, split into 2 or 3 segments. **FRUIT** an elongate, elliptic to fusiform capsule, more than 4 times as long as wide, the valves split about halfway or less to fruit base, somewhat recurved on dehiscence but not forming an obvious cup, on a slender, tan to dark brown stipe less than 1 cm long, partially included or barely exserted past corolla. Fairly common in meadows and slopes in subalpine meadows and alpine tundra. COLO: Hin, LPl, RGr, SJn. 3500–4200 m (11500–14000'). Flowering: Jun–Jul. Fruit: Aug–Sep. Alaska south to Alberta, to Colorado and California.

Comastoma Toyok. Lapland Gentian

(Latin *coma*, mane, + *stoma*, opening, for the fringed scales partially occluding the corolla opening) Caespitose to erect annual (ours), biennial, or perennial herbs from fibrous rootlets, taproots, or rhizomes. **STEMS** 1 or several, erect, angled, simple or branched from near the base. **LEAVES** in basal rosettes, stem leaves few, sessile, not connate at base, lacking white margins. **INFL** of terminal solitary flowers (ours). **FLOWERS** predominantly 4-merous, long-pedicellate; sepals united in short tube, unequal, with 2 somewhat larger lobes, lobes gibbous at base, lacking intracalycine membrane; corolla tubular-campanulate, blue or white, lacking plicae between lobes, lobes entire, small nectary glands at base of lobes, alternate with filaments, each lobe with 2 fimbriate scales at base; stamens free, inserted; pistil sessile, stigmas 2, sessile, persistent. **FRUIT** an elliptic, fusiform to ovoid capsule. **SEEDS** small, numerous, smooth, lacking

wings. A small genus of 15 species, circumboreal in montane regions, with a concentration in China and adjacent regions. Although included within *Gentianella* by most past authors, recent work has shown that *Comastoma* is more closely related to *Lomatogonium*.

Comastoma tenellum (Rottb.) Toyok. (*tenellus*, delicate, for its small, slender stature) Lapland gentian. Annual herbs from weakly developed, fibrous taproot. **STEMS** 1 to several, simple or branched, curved-ascending, 4–15 cm high. **LEAVES** glabrous, mostly basal, 4–15 mm long, oblanceolate, cauline leaves smaller, 4–10 mm, lanceolate to elliptic, somewhat clasping at base. **INFL** of solitary, terminal or axillary flowers. **FLOWER** pedicel 3–70 mm long; calyx 4–10 mm, the lobes lanceolate to narrowly triangular, parted nearly to base, distinctly gibbous at base; corolla white, sometimes blue-tinged, 5–15 mm long, lobes 2–6 mm long. **FRUIT** a fusiform capsule, 9–16 mm long. [*Gentianella tenella* (Rottb.) Börner]. Rare in damp alpine meadows. COLO: Hin, LPl, Min, RGr, SJn. 3650–4120 m (12000–13500'). Flowering: Jul–Aug. Fruit: Aug–Sep. Alaska to Greenland, south to California, Nevada, Arizona, New Mexico; Eurasia.

Frasera Walter Elk Gentian, Monument Plant, Tc'il peezet–'ool–itsh–íkíih

(for John Fraser, 18th-century surveyor and botanist) Erect biennial or perennial herbs from a well-developed taproot. **STEMS** 1 or several, round, erect, smooth, simple or branched. **LEAVES**: a basal rosette present or absent, cauline leaves opposite or whorled, entire, somewhat thickened, glabrous to puberulent, sometimes white-margined. **INFL** a cyme or loose to dense thyrse or rarely flowers solitary. **FLOWERS** 4- or rarely 5-merous; calyx deeply cleft with linear to lanceolate lobes, lacking intracalycine membrane; corolla rotate or campanulate, white or yellowish white to green, sometimes with blue or purple streaks, lacking plicae between lobes, each lobe with 1 or 2 foveate nectary glands, sometimes with surrounding corona or fringe of hairs or scales, lobes entire; stamens free or connate at base, exserted; pistil sessile, style slender, filiform, with 2-parted stigma. **FRUIT** an ovoid to elliptic capsule. **SEEDS** relatively few, 5–25 per carpel, somewhat flattened, sometimes narrowly winged along margin. A small genus of 15 species, native and endemic to North America, mostly found in the West, in dry to moist upland habitats. The *Four Corners Flora* follows Struwe and Albert (2002) in segregating *Frasera* from *Swertia*, based on molecular and morphological data. All species of *Frasera* studied are biennial (rosettes sometimes live for several years before bolting) and monocarpic, while *Swertia perennis* is a polycarpic, long-lived perennial. Species are widely used as medicinal plants in the Four Corners region.

1. Petal glands 2; leaves whorled, basal ones large, 20–50 cm long, not white-margined, cauline leaves not connate at base ..... ***F. speciosa***
1' Petal glands 1; leaves opposite to whorled, basal leaves less than 20 cm, typically white-margined, cauline leaves connate-sheathing at base ..... (2)

2. Glands narrow, 2-forked (lobed) at apex; stem leaves in whorls of 4 ..... ***F. albomarginata***
2' Glands broad, with 2 parallel lobes at base; stem leaves in opposite pairs ..... ***F. utahensis***

Frasera albomarginata S. Watson (white-margined, for the leaves) White-margined frasera. Biennial herbs. **STEMS** 1 or several, mostly unbranched, 2–6 dm high, not glaucous. **LEAVES** glabrous to finely puberulent, in whorls of 4, white-margined, plane or undulate, weakly connate-sheathing, basal leaves 3–10 cm, oblanceolate, with a rounded tip, cauline leaves few, abruptly reduced in size. **INFL** a wide panicle of pedunculate cymes, typically 7–25 cm broad. **FLOWER** calyx 2–6 mm, the lobes lanceolate to narrowly ovate; corolla white, sometimes greenish-tinged or with green dots, lobes 6–10 mm long, glands 1 at base of lobe, split above into 2 lobes, fringed with short whitish hairs, crown scales lacking. **FRUIT** an elliptic capsule, 11–17 mm long. [*Swertia albomarginata* Kuntze]. Common in open sandy to clay soils in sagebrush and piñon-juniper woodlands. ARIZ: Apa; COLO: Mon; NMEX: SJn; UTAH. 1670–2200 m (5500–7200'). Flowering: May–Jun. Fruit: Jul–Aug. California and Nevada east to Arizona, New Mexico, and Colorado.

Frasera speciosa Douglas ex Griseb. (showy, in reference to the large size of the plant) Elkweed, p–ih il tjaa'íh. Biennial or short-lived perennial (but monocarpic) herbs. **STEMS** mostly 1, simple, 5–20 dm high, yellowish to somewhat glaucous green. **LEAVES** glabrous or puberulent, in whorls, not white-margined, mostly plane, not or only weakly connate-sheathing, basal leaves 20–50 cm, 4–9 mm wide, spatulate to oblanceolate, with an acute to rounded tip, cauline leaves numerous, 3–6 in whorls, gradually reduced in size. **INFL** a dense, narrow, compact, leafy thyrse of cymes, lower ones pedunculate, upper ones sessile, verticillate. **FLOWER** calyx 9–25 mm, the lobes narrowly lanceolate, not scarious-margined; corolla pale green, with purple blotches, lobes 9–20 mm long, with deeply split corona scales alternating with nectary, nectary glands 2, elliptic, not split, lobes fringed around margins. **FRUIT** an oblong capsule, 18–25 mm long. [*Swertia radiata* (Kellogg) Kuntze]. Common in open to shaded meadows, clearings, and wood-

lands in piñon-juniper, sagebrush, mountain brush, montane and subalpine conifer forests, aspen, and alpine tundra; rarely in lower-elevation springs and hanging gardens. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1800–3700 m (5900–12000'). Flowering: May–Jul. Fruit: June–Aug. Elkweed, and probably other species of *Frasera*, have a long tradition of use by indigenous tribes. The roots and leaves were used as a general-purpose tonic, while the leaves were mixed with tobacco and smoked to achieve calmness and to clear the mind. Washington to South Dakota, south to California, Nevada, Colorado, Arizona, New Mexico, and Texas; Mexico.

Frasera utahensis M. E. Jones. (of Utah) Utah frasera. Biennial herbs. **STEMS** 1 or several, simple or sometimes branched from base, 5–10 dm high, glaucous. **LEAVES** glabrous, opposite, white-margined, arched, plane or undulate, connate-sheathing, basal leaves 6–12 cm long, lanceolate, with acuminate tips, cauline leaves few, abruptly reduced in size, not always connate. **INFL** a wide, triangular panicle of thyrsoid or racemiform branches of pedunculate cymes, 12–30 cm broad. **FLOWER** calyx 3–6 mm, the lobes lanceolate to narrowly ovate, scarious-margined; corolla white to green, spotted with darker green, lobes 6–10 mm long, glands 1 at base of lobe, broad, rounded, with 2 basal tubes, strongly fimbriate around margins with hairs, crown scales lacking. **FRUIT** an elliptic capsule, 9–16 mm long. [*Swertia utahensis* (M. E. Jones) H. St. John, not *Swertia paniculata* Wall. (*F. paniculata* Torr.)]. Common on sandy to silty or clay soils and slickrock in open shrublands and piñon-juniper woodlands, rarely in lower-elevation springs and hanging gardens. ARIZ: Apa, Nav; NMEX: SJn; UTAH. 1370–2040 m (4500–6700'). Flowering: May–Jul. Fruit: June–Aug. Utah, Arizona, and New Mexico.

Gentianella Moench Little Gentian, Felwort

(diminutive of *Gentiana*) Erect, annual or biennial herbs from a well-developed taproot. **STEMS** 1 or several, erect, angled or sometimes winged, simple or branched. **LEAVES** in basal rosette, stem leaves opposite, sessile, not connate-sheathing, lacking white margins. **INFL** terminal or axillary cymes, or flowers solitary. **FLOWERS** 4 (5)-merous; sepals united in short tube to almost free, lacking intracalycine membrane, lobes equal to often strongly unequal in 2 series; corolla tubular, funnelform-tubular, campanulate, or salverform, blue, pink, white, yellow, or purple, each lobe with 1 (ours) small nectary gland at base alternate with filaments, each lobe with 1 fimbriate scale present on inside, lobes entire; stamens free, inserted; stigmas 2, sessile, persistent. **FRUIT** an ovoid capsule. **SEEDS** small, numerous, smooth, lacking wings. A large genus of about 150–200 species, widespread in the Northern Hemisphere, south in the mountains of Central and South America. The genus is apparently polyphyletic (Struwe and Albert 2002), but our species are related to the type of the genus, characterized by one nectary gland per petal, and thus are likely to remain in *Gentianella* sensu stricto.

1. Calyx lobes subequal, 1–2 slightly longer than others, united at base into a short tube, lobes 4–12 mm long; corolla lobes 3–5 mm long, fimbriae separate to base ..... ***G. acuta***
1' Calyx lobes unequal, 2 outer lobes much larger, foliaceous, 7–20 mm long, covering inner lobes; corolla lobes 4–8 mm long, fimbriae united at base in a scalelike sheet ..... ***G. heterosepala***

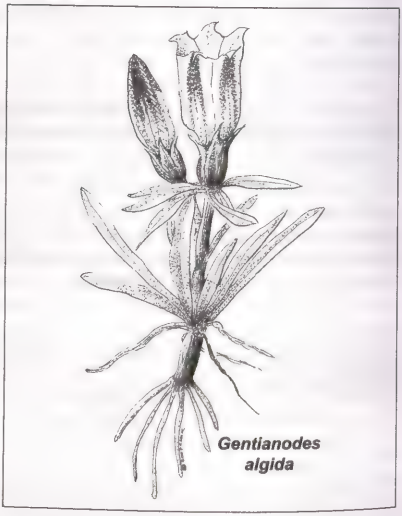
Gentianella acuta (Michx.) Hultén (acute or narrowed, in reference to the lanceolate, acute calyx lobes) Felwort. Erect, annual or biennial herbs. **STEMS** simple or sometimes branched, 1–3 (4) dm, branches stiffly erect. **LEAVES** 1–6 cm, basal leaves oblanceolate to elliptic, withering early, cauline leaves sessile, lanceolate to ovate. **INFL** several terminal or axillary cymes each of several flowers, on short pedicels 0.5–3 cm. **FLOWERS** 4 (5)-merous; calyx 4–12 mm, the tube short, 2–5 mm, the lobes unequal, 2 slightly longer, 2–8 mm, narrowly lanceolate; corolla tubular-campanulate, tube short, 2–5 mm, the lobes unequal, 2 slightly longer, 2–8 mm, narrowly lanceolate; corolla tubular-campanulate, 8–17 mm, purplish blue to pale blue, corolla lobes 3–5 mm, fimbriae free, not united in a scale at base, rarely absent in late-flowering plants; anthers 0.5–0.9 mm. **FRUIT** a fusiform capsule, 10–20 mm, slightly exserted, dehiscent at tips. [*G. amarella* (L.) Börner subsp. *acuta* (Michx.) J. M. Gillett]. Fairly common in moist to wet meadows in montane to low alpine areas. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, SJn; UTAH. 2500–4000 m (8000–13000'). Flowering: Jul–Aug. Fruit: Aug–Sep. Circumboreal. Alaska to the Atlantic; California, Arizona, New Mexico, and North Dakota.

Gentianella heterosepala (Engelm.) Holub (different sepals, for the distinctly unequal calyx lobes) Felwort. Erect, annual or biennial herbs. **STEMS** usually simple, sometimes branched, 1–5 dm, branching open and somewhat ascending. **LEAVES** 2–6 cm, basal leaves spatulate to obovate, soon withering, cauline leaves sessile from a somewhat cordate base, oblanceolate to elliptic. **INFL** 1 or more few-flowered cymes or flowers sometimes solitary, lower ones at least long-pedicellate, 2–8 cm. **FLOWERS** 4 (5)-merous; calyx 6–20 mm, lobes strongly unequal, with 2 large outer foliaceous ovate lobes, 7–20 mm, enclosing smaller inner lanceolate lobes, 5–10 mm, free almost to base, tube

usually absent; corolla tubular-campanulate, 10–25 mm, blue, white, pink, or occasionally yellow, tube 6–16 mm, lobes 4–8 mm, fimbriae bases united into a scale; anthers 0.7–1.6 mm. **FRUIT** a fusiform capsule, 12–18 mm, slightly exserted, dehiscent at tips. [*G. amarella* (L.) Börner subsp. *heterosepala* (Engelm.) J. M. Gillett]. Fairly common in moist to wet meadows in montane to subalpine areas. ARIZ: Apa; COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr, SJn; UTAH. 2500–3500 m (8000–11500'). Flowering: Jun–Jul. Fruit: Jul–Aug. Arizona, Colorado, and New Mexico.

Gentianodes Á. Löve & D. Löve Arctic Gentian

(Latin for Gentius, a king of Illyria, who according to Pliny was the first to discover the medicinal properties of gentians) Caespitose perennial herbs from a well-developed taproot, sometimes with short rhizomes. **STEMS** 1 or several, short, erect or ascending, strongly angled, simple or branched from near the base. **LEAVES** in well-developed basal rosettes, cauline leaves few, sessile, connate-sheathing at base, lacking white margins. **INFL** of terminal flowers, typically 1 but sometimes 2 or 3 in a cluster. **FLOWERS** predominantly 5-merous, sessile, tubular-funnelform; sepals united in long tube, lobes equal, not gibbous at base, with an intracalycine membrane; corolla tubular-campanulate, white or rarely yellow, often with purple-green blotches, symmetrical plicae present between lobes, small nectary glands at base of pistil, alternate with filaments, lobes lacking fimbriate scales, entire; stamens free, inserted; pistil stipitate, style short, stigmas 2, persistent. **FRUIT** an elliptic to oblong capsule. **SEEDS** large, 1–2 mm, with irregular winged margins. A genus of about 100 species, circumpolar in Arctic-alpine regions, with a major concentration in China and the Himalayas, and only one species reaching North America.



Gentianodes algida

Gentianodes algida (Pall.) Á Löve & D. Löve. (cold, for the tundra habitat) **STEMS** 1 or several, 5–20 cm, ascending to erect, simple. **LEAVES**: basal leaves 4–10 cm, long-lanceolate or linear, cauline leaves 2–6 cm, lanceolate to oblanceolate, in 2–3 pairs below flower bracts. **INFL** typically 1-flowered, sometimes 2–3 present. **FLOWER** calyx tube 9–18 mm, the lobes often of unequal lengths, 6–12 mm; corolla funnelform, tube 30–50 mm, white or pale yellow with green to purple blotches inside, lobes short, 2–6 mm. **FRUIT** a capsule, elliptic-fusiform, short-stipitate, not strongly exserted beyond corolla. [*Gentiana algida* Pall.]. Common in alpine tundra and adjacent subalpine meadows and rocky slopes. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3300–4200 m (11000–13500'). Flowering: Jul–Aug. Fruit: Aug–Sep. Alaska and Yukon south to New Mexico.

Gentianopsis Ma Fringed Gentian

(Latin for resemblance to *Gentiana*) Erect annual, biennial, or perennial herbs, from a slender taproot or rhizomes. **STEMS** 1 or several, erect, angled, simple or branched from near the base or higher. **LEAVES** in weakly developed basal rosettes, cauline leaves opposite, sessile, somewhat connate-sheathing at base, lacking white margins. **INFL** of terminal solitary flowers, sometimes with axillary flowers below. **FLOWERS** predominantly 4-merous, short- to long-pedicellate; sepals united in long tube, lobes equal or unequal, with 2 larger and 2 smaller lobes, not gibbous at base, with a discontinuous triangular intracalycine membrane often present; corolla tubular-campanulate or funnelform, blue, lacking plicae between lobes, lobes strongly fringed and with tips erose or dentate, small nectary glands at base alternate with filaments, lacking fimbriate scales; stamens free, inserted; pistil stipitate, stipe sometimes elongating in fruit, stigmas 2, sessile, persistent. **FRUIT** a slender, fusiform to elliptic capsule. **SEEDS** small, numerous, angular, papillate, lacking wings. A small, circumboreal genus of 25 species, segregated from *Gentianella*.

1. Perennials; flowers sessile or on short pedicels in axes of 2 leafy bracts; corolla lobes oblong.....***G. barbellata***
1' Annuals; flowers on long pedicels, bracts lacking; corolla lobes obovate.....***G. thermalis***

Gentianopsis barbellata (Engelm.) H. H. Iltis (for the short, stiff fimbriae of the petals) Erect perennials arising from rhizomes. **STEMS** 5–15 cm, simple or branched above. **LEAVES** in well-developed basal rosettes, 2–8 cm, strongly connate-sheathing at base, stem leaves few, 1–4 cm. **INFL** of terminal solitary flowers. **FLOWERS** sessile or sometimes

short-pedicellate, subtended by 2 bractlike leaves; calyx tube 10–25 mm, lobes 5–12 mm, equal, with an interrupted intracalycine membrane with 1–6 short processes; corolla broadly funnelform, 20–40 mm, lobes 12–24 mm, oblong, fringed in lower 1/2 or to near tip, tips somewhat rounded to acute, erose or dentate; anthers 1.5–2.5 mm. Uncommon in damp mountain and subalpine meadows, rocky slopes, and forest clearings, extending into low alpine tundra. COLO: LPl, RGr, SJn. 3000–3960 m (9800–13000'). Flowering: June–Aug. Fruit: Aug–Sep. Wyoming south to Colorado, Arizona, and New Mexico.

Gentianopsis thermalis (Kuntze) H. H. Iltis (referring to warm springs; the species was first collected around hot springs in Yellowstone National Park) Erect annuals from a slender taproot. **STEMS** 2–6 dm, simple or branched above. **LEAVES** in weakly developed basal rosettes, stem leaves numerous, only weakly or not connate-sheathing at base, 2–7 cm long, oblanceolate, becoming smaller and elliptic above. **INFL** of terminal solitary flowers. **FLOWERS** on a long pedicel, 3–10 cm; calyx tube 12–40 mm, lobes 8–25 mm, unequal, in 2 series, lacking an intracalycine membrane; corolla broadly funnelform, 20–80 mm, lobes 10–20 mm, obovate, fringed in lower 1/2, tips rounded and erose or dentate; anthers 2–4 mm. [*G. detonsa* (Rottb.) Ma]. Common in damp mountain and subalpine meadows, rocky slopes, riparian zones, and forest clearings, extending into low alpine tundra. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 2700–3650 m (8900–12000'). Flowering: June–Aug. Fruit: Aug–Sep. The flowers of *G. thermalis* are among the largest of any native species in the Four Corners region. Some populations have white- or pink-flowered individuals. Circumboreal. Alaska to Newfoundland, south to Mexico.

Pneumonanthe Gled. Bottle Gentian

(Latin *pneumon*, lung, + *anthos*, flower, for the inflated bottlelike flowers) Erect perennial herbs from a well-developed taproot, short, erect, rhizomatous corms sometimes present. **STEMS** 1 or several, erect, angled, simple or branched from near the base. **LEAVES** lacking basal rosettes, cauline leaves numerous, opposite, sessile, connate-sheathing at base, lacking white margins. **INFL** of terminal and lateral bracteate cymes. **FLOWERS** predominantly 5-merous, sessile or pedicellate; calyx tubular, entire or split on 1 side to base, lobes equal or unequal, not gibbous at base, with an intracalycine membrane; corolla funnelform to campanulate, blue or blue-purple, lobes lacking fimbriate scales, entire, with asymmetrical plicae between lobes; small nectary glands at base of pistil, alternate with filaments; stamens free or anthers connate, inserted; pistil sessile or stipitate; style short, slender, stigmas 2, persistent. **FRUIT** an elliptic to ovoid capsule. **SEEDS** small, numerous, reticulate, winged or wingless. A circumtemperate genus of about 40 species, with the majority of the species in North America, extending south into the mountains of Mexico and Guatemala.

1. Flowers arising from below the stem in leaf axils as well as the apex; floral bracts narrowly lanceolate, not scarious or boat-shaped; upper stem leaves lanceolate ..... ***P. affinis***
1' Flowers mostly terminal; floral bracts large, broadly ovate, somewhat scarious, boat-shaped; upper stem leaves below the flowers ovate ..... ***P. parryi***

Pneumonanthe affinis (Griseb.) Greene (affinity, in reference to its close relationship to several other species of the genus) Rocky Mountain bottle gentian. Erect to ascending, perennial herbs. **STEMS** 1 or several, 1–7 dm high, puberulent throughout. **LEAVES** few to crowded, elliptic to lanceolate, smaller near base and becoming narrower near tip, 2–4 cm long, 0.7–2 cm wide, margins puberulent, midribs often puberulent. **INFL** of terminal and lateral bracteate cymes, 1–5 per node, lateral flowers usually present; bracts lanceolate, slightly scarious-margined, green, not boat-shaped, shorter than the flowers. **FLOWERS** sessile to short- or long-pedicellate; calyx tube 5–10 mm, often split on 1 side to near base, scarious-margined between lobes, calyx lobes variable, lanceolate to narrowly elliptic, 1–3 mm, equal to strongly subequal; corolla funnelform to campanulate, strongly plicate, often narrower at mouth than in middle, blue or blue-purple, 15–40 mm, with asymmetrical plicae between lobes, tips split 2 (3–5) times, lobes 3–10 mm; anthers free, 1.5–3 mm, inserted; pistil stipitate. **FRUIT** an elliptic to ovoid capsule, 12–30 mm. [*Gentiana affinis* Griseb.]. Uncommon in dry to damp, montane to subalpine meadows and grasslands, forest clearings, and grassy slopes, rarely extending to lower elevations at springs and hanging gardens. ARIZ: Nav; COLO: Arc, LPl, SJn; NMEX: SJn; UTAH. 1800–3200 m (6000–10500'). Flowering: Jun–Jul. Fruit: Jul–Sep. There is some confusion regarding the

taxonomy of this and related species. *Pneumonanthe oregana* (Engelm. ex A. Gray) Greene occurs in the Northwest and is replaced by *P. affinis* in the Rocky Mountains and adjacent plains south to Utah and Colorado. *Pneumonanthe bigelovii* (A. Gray) Greene is found in southern Colorado, New Mexico, and Arizona. In Arizona and New Mexico a fourth species is found, *P. rusbyi* (Greene ex Kusn.) Greene. Material in the Four Corners region is interpreted as *P. affinis*, but some collections in the eastern part of the region approach *P. bigelovii*. Plants recently collected in Navajo County, Arizona, on the Navajo Nation approach the southern *P. rusbyi*. More work is needed to sort out this group. British Columbia to Montana, south to California and New Mexico.

1. Corolla broadly funnelform to campanulate, widest at mouth, deep blue-purple; bracts shorter than the corolla; calyx tube typically split down 1 side; Colorado and Utah northward ..... ***P. affinis***
1' Corolla funnelform to fusiform, narrowed above, dull to pale blue or sometimes white; bracts variable, exceeding the corolla or shorter; calyx split down 1 side or not split; New Mexico, Arizona, or southeastern Colorado .....(2)

2. Corolla fusiform, closed at maturity; bracts shorter than the corolla; calyx tube often split on 1 side; New Mexico and Arizona..... *P. rusbyi*
2' Corolla funnelform, open at maturity; bracts exceeding the corolla; calyx tube mostly entire; southeastern Colorado, eastern New Mexico, and southern Arizona..... *P. bigelovii*

Pneumonanthe parryi (Engelm.) Greene (for C. C. Parry) Parry's bottle gentian. Erect to ascending, perennial herbs. **STEMS** 1 or several, 1–5 dm, sparsely puberulent. **LEAVES** somewhat crowded, numerous, broadly elliptic to ovate, smaller near base and becoming larger above, numerous, 2–4 cm long, 1–2.5 cm wide, margins somewhat puberulent, midribs glabrous to puberulent. **INFL** of terminal, dense, bracteate cymes, with (1) 2–6 flowers; bracts large, slightly shorter than flowers, boat-shaped, reddish, with scarious margins. **FLOWERS** sessile or short-pedicellate; calyx tube 10–25 mm, usually united but sometimes split on 1 side, scarious-margined between lobes, calyx lobes elliptic, mostly equal to subequal, 3–11 mm; corolla broadly funnelform to campanulate, widest at mouth, blue or blue-purple, 20–50 mm, strongly plicate, with asymmetrical plicae between lobes, tips split 2–5 times, lobes 3–15 mm; anthers free, 3–5 mm, inserted; pistil stipitate. **FRUIT** an elliptic to ovoid capsule, 15–45 mm. [*Gentiana parryi* Engelm.]. Fairly common in damp to wet, montane to subalpine meadows and grasslands, forest clearings, and alpine tundra communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 2300–4100 m (7500–13500'). Flowering: Jul–Aug. Fruit: Aug–Sep. Wyoming and Colorado, south to Arizona and New Mexico.

Swertia L. Star Gentian, Felwort

(for Emmanuel Sweerts, Dutch engraver and gardener) Erect to ascending perennial herbs arising from a rhizome. **STEMS** 1 or several, round, smooth, erect to decumbent, simple. **LEAVES** at base alternate, somewhat crowded, cauline leaves subopposite or alternate, entire, somewhat thickened, glabrous, not connate at base, not white-margined. **INFL** a cyme or loose to dense thyrsoid panicle. **FLOWERS** 5-merous; calyx deeply cleft with lanceolate lobes, lacking intracalycine membrane; corolla rotate, deeply cleft with oblong lobes, blue, purple, or rarely white, each lobe with 2 small, foveate, fringed nectary glands at base, lacking plicae between lobes, lobes erose-dentate or entire, but not fringed; stamens free, exserted; pistil sessile, style short or lacking, stigmas 2. **FRUIT** an ovoid capsule. **SEEDS** large, flattened, winged around margin. A large genus of perhaps 140 species, distributed in Eurasia, Africa, and Madagascar, with only one species reaching North America. *Swertia* is polyphyletic as currently circumscribed according to von Hagen and Kadereit (2002). Thus it may be best to restrict the use of the generic name to the type section, of which the type species is *S. perennis*. The elk gentians are not closely related to *Swertia* and are segregated as *Frasera* following Struwe and Albert (2002).

Swertia perennis L. (perennial) Felwort. Erect perennial herbs arising from a short rhizome. **STEMS** typically 1, simple, usually not branched, 2–6 dm. **LEAVES** forming basal rosette, long-petiolate, 4–20 cm long, petiole often as long as the blade, oblanceolate to obovate, cauline leaves few, small, 2–6 cm, lanceolate or narrowly oblanceolate, sessile. **INFL** a few-flowered cyme. **FLOWERS** mostly 5-merous; calyx tube short or nearly absent, lobes lanceolate, 4–8 mm; corolla bluish purple, tube short, lobes 7–15 mm, oblong to elliptic, often erose at tips, each lobe with 2 small, round glands near base, with sparse, long fimbriae. **FRUIT** an ovoid to elliptic capsule, 8–12 mm. Fairly common in wet meadows, marshes, clearings in subalpine forests, stream banks, and bogs. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 2600–4000 m (8600–13000'). Flowering: July. Fruit: Aug. Alaska to California; Eurasia.

Zeltnera G. Mans. American Centaury

(for botanist L. Zeltner, specialist of *Centaurium*) Erect, annual to biennial herbs from a taproot. **STEMS** 1 or several, erect, angled, often winged, simple or branched from near the base. **LEAVES** with or without basal rosettes, stem

leaves opposite, somewhat sheathing, not connate at base, lacking white margins. **INFL** a terminal cyme or spike. **FLOWERS** predominantly 5-merous, sessile to pedicellate; calyx deeply cleft into equal linear lobes, sometimes scarious-margined, lobes not gibbous at base, lacking intracalycine membrane; corolla rotate or salverform, pink, rose, or rarely white, corolla tube slender, lacking plicae between lobes, lobes entire, small nectary glands at base alternate with filaments, lacking fimbriate scales; stamens free, exserted; pistil sessile, style simple or 2-lobed, persistent. **FRUIT** a cylindrical-fusiform capsule. **SEEDS** small, numerous, reticulate, lacking wings. A genus of about 25 species, endemic to western and southern North America, Mexico, and Guatemala. The North American species have traditionally been placed in the primarily Eurasian *Centaurium*, but Mansion and Struwe (2004) have shown the genus to be polyphyletic. The North American species are segregated as *Zeltnera* and appear to be most closely related to the Mediterranean genera *Schenkia* and *Exaculum*, and to North American *Sabatia*.

1. Corolla tube 10–20 mm, lobes 7–13 mm, exserted well past the calyx lobes ..... ***Z. calycosa***
1' Corolla tube 6–12 mm, lobes 3–5 mm, barely exserted past the calyx lobes ..... ***Z. exaltata***

Zeltnera calycosa (Buckley) G. Mans. **CP** (calyx) Buckley's centaury. Annual to rarely biennial herbs. **STEMS** 5–60 cm. **LEAVES**: basal rosette present, well developed, leaves lanceolate to ovate or often oblanceolate, 2–6 cm long. **FLOWER** calyx 8–14 mm, lobes not scarious-margined; corolla well-exserted past calyx, tube yellowish, 10–20 mm, lobes light pink or white, ovate to obovate, 7–13 mm, anthers 1.5–3.5 mm. **FRUIT** a cylindrical capsule, 8–15 mm. [*Centaurium calycosum* (Buckley) Fernald]. Common in low to mid-elevation wet meadows, riparian zones, springs, and seeps. ARIZ: Apa, Nav; COLO: Mon; NMEX: SJn; UTAH. 1100–1850 m (3600–6000'). Flowering: May–Jul. Fruit: Jul–Sep. California to Texas; Mexico.

Zeltnera exaltata (Griseb.) G. Mans. (very tall) Great Basin centaury. Annual herbs. **STEMS** 2–30 cm, highly variable in height in same population. **LEAVES**: basal rosette usually lacking, occasionally weakly developed in larger plants, leaves linear to lanceolate, 1–3 cm long. **FLOWER** calyx 6–10 mm, lobes often scarious-margined; corolla barely exserted past calyx, tube yellowish, 6–12 mm, lobes pink to rose or rarely white, strap-shaped, 3–5 mm; anthers 0.5–1.5 mm. **FRUIT** a cylindrical capsule, 6–10 mm. [*Centaurium exaltatum* (Griseb.) W. Wight ex Piper]. Uncommon in low-elevation wet meadows, riparian zones, springs, and seeps. COLO: Mon; NMEX: SJn. 1100–1700 m (3600–5600') Flowering: Jun–Aug. Fruit: Jul–Sep. British Columbia to Idaho and Colorado; Baja California.

GERANIACEAE Juss. GERANIUM FAMILY

Lynn M. Moore

(Greek, a crane, for the long fruit beak) Annual or perennial herbs. **LEAVES** opposite or alternate, stipulate, simple or compound. **INFL** axillary, cymose, sometimes appearing umbellate. **FLOWERS** mostly regular, perfect; sepals 5, distinct; petals 5, distinct; pistil 1, ovary superior, usually 5-loculed, 1–2 ovules per locule, axile placentation, style 1 with 5 stigmatic lobes; stamens 5 or 10, the filaments usually united at the base. **FRUIT** a dry schizocarp, 1 seed per locule, the mericarps separating from the base and coiling at maturity. $x = 7–14$. Eleven to 14 genera, 700–775 species. Widely distributed in temperate to subtropical regions, relatively rare in tropical regions, where it is mostly restricted to higher elevations. *Pelargonium* species are widely cultivated as house plants.

1. Leaves pinnate-pinnatifid or tripartite; stamens 5 ..... ***Erodium***
1' Leaves cordate-palmatifid, 5 (7) segments; stamens usually 10 ..... ***Geranium***

Erodium L'Hér. ex Aiton Storksbill, Filaree

(Greek *erodios*, a heron, referring to the long beaks of the fruit) Plants winter-annual or short-lived perennial. **LEAVES** opposite, pinnate-pinnatifid or tripartite, petiolate, stipulate. **INFL** a few-flowered umbel on axillary peduncles. **FLOWERS** with persistent sepals, usually awn-tipped; petals deciduous; fertile stamens 5, alternate with 5 reduced scalelike staminodia, filaments distinct and broadest at the base. **FRUIT** a schizocarp with an elongated style column, styles bearded inside; each mericarp spindle-shaped, becoming free from the tip of the central style column, then spirally coiling, mericarp remaining intact. **SEEDS** smooth. In *Erodium* the beaks of the fruit form a corkscrewlike tail that tightens when dry and loosens when moist. This action drives the sharp, pointed beaks into the soil, thus planting the fruit. This is similar to the seeds of *Stipa* and *Cercocarpus*. Approximately 12 species (20 taxa) in North America. Worldwide about 75 species widespread in temperate and semitropical regions.

1. Leaves pinnate; petals 3–6 (7) mm long ..... ***E. cicutarium***
1' Leaves tripartite; petals 6–12 mm long ..... ***E. texanum***

Erodium cicutarium (L.) L'Hér. ex Aiton (for hemlock, which it is said to resemble) Storksbill, filaree, redstem filaree, redstem storksbill, alfilaree, alfilaria, heronsbill, bee food, menstruation medicine, tis'nádáá (Navajo). Plants glandular, villous, strigose. **STEMS** few to several, erect or decumbent at first, becoming prostrate. **LEAVES** basal and cauline, pinnate, 3–14 cm long, 4–8 opposite pairs of pinnatifid lateral leaflets, leaflets 6–13 mm long, stipules lanceolate, acute, fimbriate. **INFL** 2–5 (10)-flowered umbel, glandular-pubescent; pedicels 5–18 (22) mm long, spreading to reflexed at base, recurved at the tip. **FLOWERS** with sepals 2.8–6.4 mm long, lanceolate to ovate, awn mucronate, 0.1–0.4 (1) mm long; petals 5, 3–6 (7) mm long, ciliate at the base, rose-lavender; receptacle and style 2.5–4.5 cm long; style pilose-strigulose; mericarps 4–5.5 mm long, hirsute-ascending; filaments broad at the base, anthers mainly 0.8 mm long. **FRUIT** a schizocarp with a persistent elongated style column; mericarps separating from the tip of the central axis, spirally coiling, bearded, hairs strigose. $2n$ = 20, 36, 38, 40, 42. [*Geranium cicutarium* L.]. Piñon-juniper, sagebrush, desert scrub, montane, and spruce-fir communities; frequently disturbed and often dry places, roadsides, farmland, and rangelands. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1125–2600 m (3700–8500'). Flowering: Apr–Aug. Considered a noxious weed; native of Europe or Asia; introduced by the Spanish in the 16th century into Mexico, then colonized and naturalized north into Arizona, New Mexico, and throughout the U.S. Occasionally grown for forage, it is a serious competitor of early-planted spring crops, facilitated by its ability to emerge and thrive under cool to moderate temperatures. Plants were used medicinally by the Jemez and Zuni. The Navajo used it to treat excessive menstruation and bobcat or mountain lion bites. The Navajo also used it on prayer sticks and as a medicine in many ceremonies.

Erodium texanum A. Gray (of Texas) Texas storksbill, desert heronsbill, desert storksbill, large-flowered storksbill, bull filaree, Texas filaree, Texas fillarie, tufted filaree. Plants eglandular, canescent-strigulose, hairs retrorse on lower stems and petioles, ascending on the leaves, upper stem, and inflorescence. **STEMS** few to several, decumbent to prostrate, reddish. **LEAVES** basal and cauline, 1–3.3 cm long, 0.8–3 cm wide, ovate and tripartite, lobes rounded, crenate, cordate at the base, middle segment sometimes pinnately lobed, veins often reddish, stipules lanceolate to deltate. **INFL** (1) 2–4-flowered umbel, pedicels 6–18 mm long, spreading and abruptly recurved at the tip. **FLOWERS** with sepals 5–11 mm long, lanceolate, broadly oblanceolate to ovate, 5 reddish nerves, margins hyaline and glabrous, awn 0.2–0.8 mm long; petals 5, 6–12 mm long, obovate, broadly rounded, purplish red; receptacle and style 4.5–7 cm long, style pilose-strigulose; mericarps 7–9 mm long, hirsute-ascending from a pustulose base, anthers mainly 1.1–1.2 mm long. **FRUIT** a schizocarp with a persistent elongated style column; mericarps separating from the tip of the central axis, spirally coiling, bearded, hairs pilose-ascending. $2n$ = 20. Gravelly or rocky soils in desert scrub communities along the San Juan arm of Lake Powell. UTAH. 1125 m (3700'). Flowering: Feb–Apr. Native to the southwestern United States from California to Texas and Oklahoma, east to Missouri and South Carolina, south to Mexico.

Geranium L. Cranesbill, Geranium

(modern Latin from Greek *geranion*, *geranos*, crane, alluding to the long beak of the fruits) Plants annual or (ours) perennial herbs. **LEAVES** alternate or opposite, cordate-palmatifid, 5 (7) segments, petiolate, stipulate. **INFL** a 2-flowered dichasial cyme. **FLOWERS** with sepals imbricate, persistent, mucronate or awn-tipped; petals deciduous; style column usually beaked; stigmas (5) free; styles nearly glabrous inside; stamens 10, usually all anther-bearing, occasionally 5 fertile and 5 sterile, filaments often unequal, with the inner whorl the longest. **FRUIT** a schizocarp, mericarps separating at maturity below and recurving, remaining attached to the upper column; seeds forcibly expelled. **SEEDS** smooth, reticulate-alveolate, or pitted. Dichotomous keys for this genus are tentative at best. This genus has considerable variability, and diagnostic characters in the past have been based upon pubescence type and its position on the plant (Aedo 2001). A genus of about 300 species of temperate and tropical mountain regions from around the world.

1. Petals white, occasionally light pink to lavender in bud, pilose on bottom adaxial surface for 1/2 or more the length ..... (2)

1' Petals pink to purple, pilose on bottom adaxial surface for 1/4 to 1/2 the length ..... (3)

2. Petals 14–20 mm long, with dark purple veins; stems and pedicels hirsute with red- or purple-tipped glandular hairs ..... ***G. richardsonii***

2' Petals 5–10 mm long; stems and pedicels hirsute with yellowish or whitish-tipped glandular hairs ..... ***G. lentum***

3. Leaves 6–12 (15) cm wide; petals 14–22 mm long, pilose on bottom adaxial surface for only 1/4 the length ..... ***G. viscosissimum***

3' Leaves 1.5–7 (7.5) cm wide; petals (8) 10–15 (17) mm long, pilose on bottom adaxial surface for 1/4 to 1/2 the length ..... ***G. caespitosum***

Geranium caespitosum E. James ex Torr. (caespitose or tufted) Perennial herb from a branched caudex with thick marcescent leaf bases. Plants erect to ascending, sometimes sprawling; usually few stems per caudex base. **LEAVES** palmately lobed, 3–5 segments, each 3–5 (7)-lobed, each ultimate segment obovate or rhombic, 1.5–7 (7.5) cm wide. **FLOWERS** with sepals 8–11 mm long, mucronate tip (0.5) 1–2 mm long; scarious margins; petals pink to purple, (8) 10–15 (17) mm long, pilose at bottom for 1/4 to 1/2 the length; gynoecium 10–13 mm long; mature stylar column 22–31 (40) mm long; beak 2.5–5.5 mm long; stamens 10 (15), the inner whorl sometimes longer. **FRUIT** 22–31 (40) mm long. **SEEDS** reticulate-pitted, dark brown. $n = 26$. Northern Tiwa and western Keres pueblos used this as a treatment for sore throats, rashes, and abrasions along with other plants with high tannin content. The Navajo also used this for overexertion and as a life medicine, and the blossoming plants were dipped in salt water to bring rain. The Jemez used the split fiber to sew moccasins. The *G. caespitosum* complex has been subject to controversial interpretation for over 100 years. Most botanists believe that there is one species. Over the years different varieties have been recognized based upon the glandular versus nonglandular pubescence type. Cronquist, Holmgren, and Holmgren (1997) give a detailed discussion of the taxonomic problems of this species complex; a conservative view is taken here.

1. Stems, petioles, or pedicels nonglandular (sometimes with a few short glandular hairs among the longer nonglandular hairs) ..... **subsp. *atropurpureum***
1′ Stems, petioles, or pedicels with glandular-tipped hairs ..... **var. *caespitosum***

subsp. *atropurpureum* (A. Heller) W. A. Weber (dark purple) Western purple cranesbill, magenta geranium. **STEMS** reddish-tinged, mostly retrorse to spreading nonglandular hairs, occasionally short-hirsute, whitish- to yellowish-tipped glandular hairs present within the longer nonglandular hairs. **INFL** pedicels mostly with retrorse nonglandular hairs, sometimes with a few short yellowish- or whitish-tipped glandular hairs among the longer nonglandular hairs. [*G. atropurpureum* A. Heller; *G. marginale* Rydb. ex Hanks & Small; *G. toquimense* N. H. & A. H. Holmgren]. Coniferous forest, including piñon-juniper, ponderosa pine, spruce-fir, aspen, oak, and montane tall shrub communities. Occasionally along riparian corridors and wetlands. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 2100–2900 m (6800–9500′). Flowering: Jun–Aug (Sep). Native to the western United States from Wyoming south to Mexico, west to Nevada, and east to the panhandle of Texas.

var. *caespitosum* Pineywoods geranium, purple cluster geranium, tufted geranium. Perennial herb from a branched caudex with thick marcescent leaf bases. Plants erect, sometimes sprawling, usually few stems per caudex base. **STEMS** with pilose-spreading to retrorse nonglandular hairs and glandular yellowish- or whitish-tipped hairs. **INFL** with pilose pedicels, spreading nonglandular hairs and yellowish- or whitish-tipped glandular hairs. [*G. caespitosum* subsp. *caespitosum*; *G. fremontii* Torr. ex A. Gray; *G. parryi* (Engelm. ex A. Gray) Heller]. Coniferous forest from ponderosa pine to spruce-fir; montane tall shrub and meadow communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 2000–3000 m (6500–10000′). Flowering: Jun–Aug (Sep). Native to the western United States from Wyoming south to Mexico, west to Nevada, and east to the panhandle of Texas. This variety is less common in the Four Corners region then subsp. *atropurpureum*.

Geranium lentum Wooton & Standl. (pliable) Mogollon geranium, white geranium. Perennial herb from a branched or unbranched woody caudex with wiry marcescent leaf bases. Plants erect, usually few stems per caudex base. **STEMS** with pilose-spreading to retrorse nonglandular and glandular yellowish- or whitish-tipped hairs. **LEAVES** palmately lobed, 5 (7) trifid lobes, ultimate segment obovate or rhombic, sometimes shallowly lobed, 2.5–5 (7) cm wide. **INFL** with densely hirsute pedicels, spreading to retrorse nonglandular hairs and short- to long-hirsute, yellowish- or whitish-tipped glandular hairs. **FLOWER** sepals 6–8 mm long, tip mucronate, 0.5–1 mm long, margins scarious; petals white with cream to light pinkish veins, 5–10 mm long, pilose at bottom for 1/2 to 3/4 the length; gynoecium 7–8 mm long; mature stylar column 22–27 mm long; beak 1–2 (3.5) mm long. **FRUIT** 22–27 mm long. **SEEDS** reticulate. Sandstone canyons; coniferous forests, black sagebrush, aspen, and Gambel's oak communities. ARIZ: Apa. 2225 m (7300′). Flowering: Jun–Sep. Native to the southwestern United States from Arizona to New Mexico and south to Mexico. Navajo applied a poultice of moist leaves and roots to injuries; a decoction of the plant was taken for internal injury and was used as a life medicine.

Geranium richardsonii Fisch. & Trautv. (honors Sir John Richardson, 1787–1865, Scottish naturalist) Richardson's geranium. Perennial herb from a branched or unbranched woody caudex; frequently rhizomatous; covered with marcescent leaf bases. Plants erect, usually solitary. **STEMS** with pilose-spreading to retrorse nonglandular and glandular purple- or red-tipped hairs, lower stems sometimes nearly glabrous. **LEAVES** palmately lobed, 3–5 (7) trifid

lobes, these divisions pinnately coarsely toothed, the teeth acute, (4) 6–12 (15) cm wide. **INFL** with dense to sparsely hirsute pedicels, spreading nonglandular hairs and glandular, usually purple- or red-tipped hairs. **FLOWER** sepals 7–8 mm long, tip mucronate, 1–3 mm long, margins scarious; petals usually white, sometimes pink or lavender in bud, with light pink to dark purple veins, 14–20 mm long, pilose at bottom for 1/2 or more the length; gynoecium 8–9 mm long; mature stylar column 19–28 (35) mm long; beak 1–3.5 (4) mm long. **FRUIT** 19–28 (35) mm long. **SEEDS** reticulate-alveolate, dark brown. $2n = 52, 56$. [*G. gracilentum* Greene]. Coniferous forests and mixed coniferous forests from piñon-juniper to subalpine; meadows and tall shrub communities; riparian corridors and alpine. ARIZ: Apa; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 2400–4200 m (7800–13800'). Flowering: Jun–Aug. Native to western North America from the Northwest Territories south to California, Arizona, and New Mexico, east throughout the Rocky Mountains to the Black Hills. Occasionally the purple-tipped glandular hairs are undeveloped in small early growth. Northern Tiwa and western Keres pueblos used this plant as a treatment for sore throats, rashes, and abrasions along with other plants with high tannin content. The Navajo used it as a "life medicine," and the Cheyenne used it for nosebleeds.

Geranium richardsonii

Geranium viscosissimum Fisch. & C. A. Mey. (sticky, alluding to the densely glandular pubescence throughout the stems and petioles) Sticky purple geranium, sticky geranium. Perennial herb from an elongate, thick, sometimes branched caudex, often short-rhizomatous; plants erect, usually solitary. **STEMS** with pilose-spreading to retrorse nonglandular and glandular yellowish- or whitish-tipped hairs. **LEAVES** palmately lobed, 5 (7) segments, each 9 (13)-lobed, these divisions pinnately coarsely toothed, the teeth acute, 6–12 (15) cm wide. **INFL** with pubescent pedicels, mostly yellowish- or whitish-tipped glandular hairs and retrorse to spreading nonglandular hairs. **FLOWERS** with sepals 8–11 mm long, tip mucronate, 1–2 mm long, margins scarious; petals usually white, sometimes pink or lavender in bud, with light pink to dark purple veins, 14–20 mm long, pilose at bottom for 1/2 or more the length; gynoecium 11–13 mm long; mature stylar column 28–41 mm long; beak 4–6 (7) mm long. **FRUIT** 19–28 (35) mm long. **SEEDS** reticulate. $2n = 52$. [*G. nervosum* Rydb.; *G. viscosissimum* var. *nervosum* (Rydb.) C. L. Hitchc.; *G. viscosissimum* subsp. *nervosum* (Rydb.) W. A. Weber]. Roadsides, mountain shrub, montane aspen, and spruce-fir communities. COLO: Arc, Dol; Hin, LPl, Min, Mon, RGr, SJn; UTAH. 1600–3200 m (5200–10500'). Flowering: Jun–Aug. Native to northwestern North America from British Columbia south to northern California, east across the mountains to Colorado and the Black Hills. This species is uncommon in the San Juan River drainage. Our material belongs to **var. *incisum*** (Torr. & A. Gray) N. H. Holmgren (deeply cut). It has been reported from New Mexico, but no specimens of *G. viscosissimum* in New Mexico have been verified. It is reported to occur along the Piedra River in Archuleta County, Colorado, and unverifed specimens do exist from other locations in the San Juan Mountains. It is easily confused with *G. caespitosum*. *Geranium viscosissimum* differs in having larger leaves, fruit, and erect, often solitary stems as well as no reddish tinge as in *G. caespitosum* subsp. *atropurpureum*. It was used by the Blackfoot as a cold remedy, gynecological aid, and treatment for sore eyes. It was also thought to work as a love charm or love potion.

GROSSULARIACEAE DC. CURRANT or GOOSEBERRY FAMILY

Roy Taylor

(Latin *grossularia*, gooseberry) Shrubs (ours). **STEMS** spiny. **LEAVES** mostly alternate, rarely opposite, stipules absent or present; simple and sometimes deeply cleft. **INFL** a raceme or panicle, or of solitary flowers in the upper axils. **FLOWERS** perfect, rarely unisexual, regular or nearly so, epigynous with a saucer-shaped to tubular hypanthium; sepals 3–9, sometimes larger than the petals; petals 3–9, alternate with the sepals; stamens as many as and alternate

with the petals; nectary disc often present internal to the stamens; gynoecium of 2 or 3 (7) carpels united to form a compound, superior to partly or wholly inferior ovary; ovules numerous. **FRUIT** a berry. **SEEDS** numerous. $x = 8, 9, 11, 12, 17, 30$. About 340 species of cosmopolitan distribution (Cronquist, Holmgren, and Holmgren 1997a).

Ribes L. Gooseberry or Currant

(Syrian *ribas*, derived from the Persian word for the genus *Ribes*) Shrubs with or without bristles and spines. **LEAVES** alternate; stipules none or adnate to the petiole; palmately lobed, crenate or dentate. **INFL** a raceme or rarely solitary; pedicels subtended by bracts, usually with 2 bractlets about midlength. **FLOWERS** perfect; hypanthium mostly corolla-like; sepals 5, mostly petaloid; petals (4) 5, often smaller than the sepals; stamens (4) 5 (6); ovary inferior, 1-loculed; styles 2, united or distinct. **FRUIT** a berry, crowned by the withered flowers. **SEEDS** several to many. The genus *Ribes* includes both currants and gooseberries. Currants have jointed and disarticulating pedicels, several flowers per raceme, and stipitate-glandular or glabrous berries. The currants in our area are without spines or bristles except for *R. lacustre* and *R. montigenum*. Gooseberries have nonjointed, persistent pedicels, 3–23 flowers per raceme, and no stipitate-glandular hairs on the berries. The gooseberries of the Four Corners region all have nodal spines.

1. Plants armed with nodal spines, often with internodal bristles ..... (2)
1′ Plants unarmed ..... (5)

2. Hypanthium tubular to narrowly campanulate, 1–6 mm long; racemes 1–5-flowered; pedicel not jointed just below flower ..... (3)
2′ Hypanthium shallowly cupped to saucer-shaped, 0.5–1.5 mm long; racemes 3–23-flowered; pedicel jointed just below flower at maturity ..... (4)

3. Stamens about equal to petals; berry glabrous, pubescent or glandular-pubescent, not spiny; anthers 0.7–1.6 mm long, not apiculate; style glabrous, connate nearly full length, short-bifid at apex ..... ***R.. leptanthum***
3′ Stamens exceeding petals; berry with long, stout spines; anthers longer than 1.6 mm, apiculate ..... ***R. inerme***

4. Leaves densely glandular or glandular-pubescent; racemes 3–11-flowered; pedicels 1–5 mm long; berry bright red ..... ***R. montigenum***
4′ Leaves glabrous or sparsely pubescent; racemes 5–23-flowered; pedicels 2.5–7 mm long; berry black or dark purple ..... ***R. lacustre***

5. Hypanthium saucer-shaped to shallowly cup-shaped or turbinate, 0.6–3.5 mm long ..... (6)
5′ Hypanthium tubular-campanulate to cylindric, 4–13 mm long ..... (8)

6. Ovary, berry glabrous ..... ***R. inerme***
6′ Ovary, berry with stipitate-glandular hairs ..... (7)

7. Racemes loosely flowered, floriferous nearly to base; peduncle absent or to 1.5 mm long; plants with weak decumbent stems; floral bracts 1–3.5 mm long, less than 1/2 as long as pedicels ..... ***R. laxiflorum***
7′ Racemes densely flowered, obviously pedunculate, at least 2 cm long; plants erect; floral bracts conspicuous, 2.8–7 mm long, more than 1/2 as long as pedicels ..... ***R. wolfii***

8. Flowers bright yellow, sometimes aging orange or pink to red-purple, nearly always glabrous; berry glabrous; anther without a cuplike gland at tip ..... ***R. aureum***
8′ Flowers white to pinkish white or greenish white, to yellow, pubescent; berry glabrous to glandular-pubescent; anther tipped by small, cup-shaped gland ..... (9)

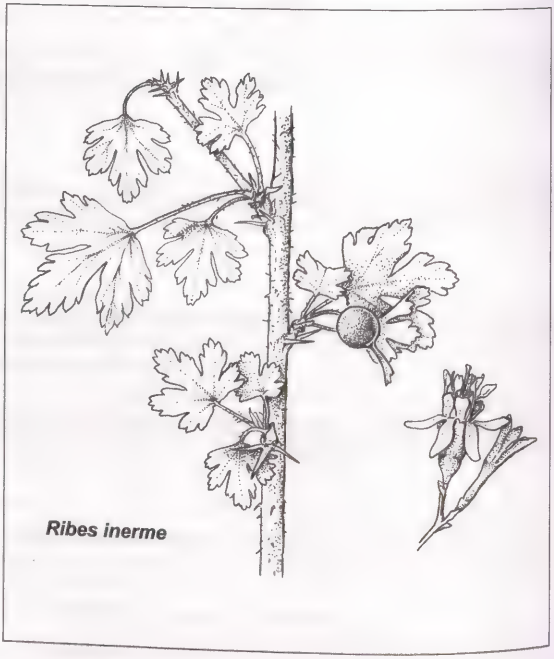
9. Hypanthium narrowly tubular, 1.5–4 mm wide, 6–9.5 mm long, at least twice as long as the sepals; sepals 1.5–3.5 mm long, usually remaining recurved after anthesis; pedicels 0.4–3.4 mm long; leaf blades 0.5–5 cm wide ..... ***R. cereum***
9′ Hypanthium broad, usually campanulate, 3.5–7.5 mm wide, 4.5–7 mm long, about the same length as the sepals; sepals 3.5–7 mm long; pedicels 3–17 mm long; leaf blades 2–10.5 cm wide ..... ***R. viscosissimum***

Ribes aureum Pursh (golden) Golden currant, Lewis' currant. Shrubs, 1–3 m tall, unarmed; branchlets glabrous. **LEAVES** with petioles 0.5–2.5 (3) cm long; blades (1) 1.6–4.7 cm long, 1–6.7 cm wide, orbicular, reniform, obovate, cuneate to truncate basally, strongly 3-lobed, the lobes entire or crenate to lobed, glabrous. **INFL** a raceme with (3) 6–9 flowers; bracts 3–12 mm long, entire; pedicels to 3 mm long. **FLOWER** hypanthium cyclindric, yellow, or often reddish in age, corolla-like; sepals mostly 4–6 mm long, yellow, spreading; petals about 2 mm long, yellow, cream, or reddish; stamens subequal to the petals, the anthers longer than the filaments; styles united to near the apex. **FRUIT**

8–12 mm long, black, red, orange, or translucent-golden, glabrous. Riparian, palustrine, and hanging garden habitats; along irrigation canals; greasewood-shadscale, sagebrush, piñon-juniper, serviceberry-hawthorn, ponderosa pine, and Douglas-fir communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: RAr, SJn; UTAH. 1485–2165 m (4870–7100'). Flowering: Apr–Sep. Washington to Saskatchewan, south to California and New Mexico.

Ribes cereum Douglas (waxen) Wax or squaw currant. Shrubs, (0.2) 0.5–1.5 (2) m tall, unarmed; branchlets pilose-villous and stipitate-glandular. **LEAVES** with petioles 0.4–2.2 (2.9) cm long; blades 0.5–2.5 (3.4) cm long, 0.7–3 (4.4) cm wide, orbicular, reniform, rarely ovate, cordate or truncate basally, with 3–7 shallow lobes, the lobes crenate or dentate, puberulent and stipitate-glandular, or glabrous except on margins and along veins beneath. **INFL** a raceme with 2 or 3 flowers, the axis very short; bracts 2–5 mm long, ciliate, fringed, or lacerate, glandular. **FLOWER** hypanthium 4–11 mm long, pinkish, pilose, sometimes also stipitate-glandular; sepals about 2 mm long, spreading, whitish or pinkish; petals about 1 mm long, whitish; staminal filaments subequal to the anthers; styles united to near the apex; ovaries stipitate-glandular. **FRUIT** 6–8 mm long, reddish, sparingly stipitate-glandular, rarely glabrate. Alcoves and riparian sites; mountain brush, sagebrush, piñon-juniper, ponderosa pine, aspen, spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1910–3595 m (6260–11800'). Flowering: Apr–Jul. British Columbia to Montana, south to California and New Mexico. The Hopi and Navajo used the berries for food. The Kayenta Navajo used it as an Evilway, Nightway, and Mountaintopway emetic. Also used as a poultice applied to sores and to purify a child who has seen a forbidden sand painting. The Ramah Navajo used the stems to make arrow shafts; the green plant indicated time for plowing and the leafy plant indicated time to plant maize.

Ribes inerme Rydb. (not spiny) Whitestem gooseberry, wine gooseberry. Shrubs 7.5–20 dm tall, branchlets often whitish, glabrous, armed at the nodes with 1 (3) spines, or the spines lacking; internodal bristles mostly lacking or few and sparse. **LEAVES** with petioles (0.3) 0.5–4.5 cm long, sometimes with 1 to few pilose, gland-tipped hairs; blades (0.8) 1.5–9 cm long, orbicular or nearly so, cordate to truncate with 3–5 main lobes, these again lobed and crenate-dentate toothed, the major sinuses cut 1/3–2/3 to the base, glabrous, glabrate with hairs mostly along the veins, or occasionally moderately dense-strigose, not glandular, paler beneath than above. **INFL** a 1–4-flowered raceme, the axis to about 12 cm long; bracts 1–2 mm long, greenish, glabrous or glandular-ciliolate and puberulent; pedicels 2–5 mm long. **FLOWER** hypanthium 2–3.5 mm long, cylindric to narrowly campanulate, greenish or greenish cream, sometimes purplish-tinged, densely pilose to villous-woolly inside; sepals about 3 mm long, colored as the hypanthium; petals about 1–1.5 mm long, obovate to narrowly fan-shaped, white; stamens (1.5) 2–2.5 times longer than the petals, 2.4 (5) mm long; styles subequal to or slightly longer than the stamens, cleft 1/2–2/3 to the base, rather densely pilose on the lower 1/2 or more. **FRUIT** 7–10 mm long, reddish or reddish purple, succulent, more or less edible. [*Grossularia inermis* (Rydb.) Coville & Britton]. Piñon-juniper, mountain brush, aspen, willow, Douglas-fir, spruce-fir communites; often in mountain meadows. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn, SMg; NMEX: RAr; UTAH. 1985–3290 m (6520–10800'). Flowering: May–Jun. British Columbia to California, Montana to New Mexico. The berries eaten during the winter by the Navajo.



Ribes inerme

Ribes lacustre (Pers.) Poir. (growing by lakes or ponds) Swamp black gooseberry. Shrubs, 7.5–15 dm tall, branchlets armed with internodal prickles and nodal spines, puberulent, eglandular. **LEAVES** with petioles 0.35 cm long, glabrous or with scattered stipitate-glandular hairs; blades (0.6) 1.5–5.6 cm long, (1) 2–8 cm wide, orbicular in outline, cordate at the base, usually 5-lobed, the lobes again lobed and doubly crenate-dentate, glabrous or sparingly hairy along the veins. **INFL** a raceme, rather loosely 5- to 15-flowered, the axis to 4.5 cm long in fruit, stipitate-glandular with reddish or purplish glands, puberulent; bracts 2–3 mm long, ciliate-glandular; pedicels 3–8 mm long. **FLOWER** hypanthium less than 1 mm long, saucer-shaped, yellow-green, pinkish, or reddish; sepals 2.5–3 mm long, yellow-green, pinkish, or reddish; petals shorter than the sepals, pinkish; stamens subequal to the petals; styles parted to the base. **FRUIT** 6–8 mm long, dark purple, coarsely stipitate-glandular. [*R. oxyacanthoides* L. var. *lacustre* Pers.]. Moist sites, often in conifer and aspen woods. COLO: Arc, Hin, LPl, Min, Mon, SJn; UTAH. 2300–2620 m (7545–8600'). Flowering: May–Jul. Alaska to Newfoundland, south to California, Colorado, South Dakota, and Michigan.

Ribes laxiflorum Pursh (loose flowers) Western or trailing black currant. Shrubs to about 0.7 m tall, the stems sprawling or ascending, unarmed; branchlets and some older branches puberulent. **LEAVES** with petioles (0.5) 2–4.5 cm long, puberulent, sometimes short stipitate-glandular near the blade; blades (1) 2–5 cm long, 1.5–6.5 cm wide, orbicular or nearly so, cordate, with 3–5 primary lobes, these again lobed and crenate-dentate toothed, the major sinuses cut about 1/3–1/2 to the base, glabrate or with some puberulent and stipitate-glandular hairs, especially toward the base on veins beneath, slightly paler beneath with translucent, crystalline, sessile glands. **INFL** a 5–10-flowered raceme, stipitate-glandular and puberulent, the axis 24 cm long; bracts 1–2 mm long, linear or narrowly triangular, greenish; pedicels 4–10 mm long, jointed just below the ovary, some usually persisting at least until fruit is nearly mature. **FLOWER** hypanthium less than 1 mm long; sepals 2–3 mm long, pinkish or purplish; petals about 1 mm long, 1–1.3 mm wide, broadly fan-shaped with concave margins; stamens subequal to the petals; styles cleft 1/3–2/3 their length. **FRUIT** to about 1 cm long, blackish, stipitate-glandular, the glands and stalks mostly purplish. [*R. coloradense* Coville]. Moist sites; aspen and spruce-fir communities. COLO: Arc, Hin, LPl, Min, Mon, SJn. 2530–3290 m (8300–10800'). Flowering: May–Aug. Alaska to Washington and along the coast to southwest California, east to Alberta and northern Idaho.

Ribes leptanthum A. Gray (thin flowers) Trumpet gooseberry. Shrubs, 0.5–2 m tall; branchlets armed at the nodes with 1–3 spines, usually lacking internodal bristles, puberulent. **LEAVES** with petioles 0.2–1.2 cm long; blades 0.5–1.6 cm long, 0.7–2 cm wide, orbicular, cordate basally, mostly 5-lobed, the main lobes again shallowly lobed or toothed, glabrous or less commonly puberulent and rarely glandular. **INFL** a 1–3-flowered raceme, the axis very short; bracts glabrous except glandular-ciliate or -toothed; pedicels about 1 mm long. **FLOWER** hypanthium 4–5.5 mm long, whitish, pilose or short-villous; sepals 4–6 mm long, whitish; petals 2.5–3 mm long, whitish; stamens subequal to the petals; anthers shorter than the filaments; styles glabrous, apically notched. **FRUIT** mostly 6–10 mm long, blackish, glabrous. [*Grossularia leptantha* (A. Gray) Coville & Britton]. Piñon-juniper, mountain brush, ponderosa pine, aspen, spruce-fir, and mountain meadow communities. ARIZ: Apa; Nav; COLO: Mon; NMEX: SJn; UTAH. 2040–2785 m (6700–9135'). Flowering: May–Jun. Colorado, Utah, New Mexico, and Arizona. The Isleta and Jemez Indians eat the fresh berries.

Ribes montigenum McClatchie (mountain-born) Red prickly currant, gooseberry currant. Shrubs, 0.5–2 m tall; branchlets armed at the nodes with 1–3 spines, usually lacking internodal bristles, puberulent. **LEAVES** with petioles 0.2–1.2 cm long; leaf blades 0.5–1.6 cm long, 0.7–2 cm wide, orbicular, cordate basally, mostly 5-lobed, the main lobes again shallowly lobed or toothed, glabrous or less commonly puberulent and rarely glandular. **INFL** a 1–3-flowered raceme, the axis very short; bracts glabrous except glandular- or ciliate-toothed; pedicels about 1 mm long. **FLOWER** hypanthium 4–5.5 mm long, whitish; sepals mostly 2.5–4 mm long, yellowish green, pink, red, or orange; petals 2.5–3 mm long, whitish; stamens subequal to the petals; anthers shorter than the filaments; styles glabrous, apically notched. **FRUIT** about 6–10 mm long, blackish, glabrous. [*R. lacustre* (Pers.) Poir. var. *molle* A. Gray; *R. molle* (A. Gray) Howell]. *R. lacustre* var. *lentum* M. E. Jones]. Douglas-fir, spruce-fir, aspen; often in talus and scree slopes. ARIZ: Apa; COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2865–3445 m (9400–11305'). Flowering: May–Jul. British Columbia to southern California, east to Montana, and south to New Mexico.

Ribes viscosissimum Pursh (sticky) Sticky currant. Aromatic shrubs, mostly 1–2 m tall, unarmed; branchlets pilose-hirsute and stipitate-glandular. **LEAVES** with petioles 0.6–7 cm long; blades 0.9–6.6 cm long, 1.3–10 cm wide, orbicular, rarely ovate, cordate basally, 3–7-lobed, the main lobes crenate or dentate and sometimes again lobed, glandular-hairy and often pilose or hirsute. **INFL** a 4–12-flowered raceme, the axis 5–30 mm long, glandular; bracts 5–8.5 mm long, entire to toothed, glandular; pedicels 3–17 mm long. **FLOWER** hypanthium 5–9 mm long, whitish or pale green,

stipitate-glandular and pilose-hirsute; sepals 3–5.5 mm long, white or yellow-green, or occasionally pinkish; petals 2–3 mm long, whitish; stamens subequal to the petals; filaments longer than the anthers; styles glabrous or nearly so. **FRUIT** 10–13 mm long, black, rather dry, stipitate-glandular. Moist canyon bottoms and slopes in aspen, fir, Douglas-fir, lodgepole pine, and spruce-fir communities. ARIZ: Coc, Nav. 1835–1950 m (6020–6400'). Flowering: May–Jun. British Columbia, south to California, east to Montana and Arizona.

Ribes wolfii Rothr. (for John Wolf, 1820–1897, botanist and naturalist) Rothrock's currant. Shrubs, 0.5–3 m tall, unarmed; branchlets glabrous or puberulent. **LEAVES** with petioles 0.7–4.5 cm long, glabrous or puberulent; blades 1.2–5.7 cm long, 1.2–8 cm wide, orbicular, cordate basally, 3 (5)-lobed, the main lobes again lobed and variously 1–2-crenate or -dentate, glabrous except for sessile, clear, crystalline glands. **INFL** an 8–16-flowered raceme, glandular, the axis about 1–4 cm long; bracts 3–6 mm long, mostly entire; pedicels 1–5 (7) mm long. **FLOWER** hypanthium 0.7–1.5 mm long, green, bowl-shaped, glabrous or puberulent; sepals 2–3 mm long, whitish; petals about 1–1.5 mm long, white; styles free or united below the middle. **FRUIT** 6–10 mm long, blackish, not very fleshy, stipitate-glandular. [*R. mogollonicum* Greene]. Aspen, Douglas-fir, and spruce-fir communities, usually in shade. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: SJn; UTAH. 1830–3500 m (6005–11480'). Flowering: May–Jul. Colorado, Arizona, New Mexico, north to Washington and Idaho.

HALORAGACEAE R. Br. WATER-MILFOIL FAMILY

C. Barre Hellquist

Rhizomatous, submersed and emergent herbs. **LEAVES** simple, opposite, alternate, or whorled. **INFL** submersed or emergent in leaf or bract axils. **FLOWERS** perfect or imperfect, polypetalous or apetalous; sepals usually developed; petals small or lacking; stamens twice the number of sepals; ovary 1–4-celled; ovules 1 per cell; styles 1–4. **FRUIT** indehiscent, nutlike (Aiken 1981; Crow and Hellquist 1983; Mason 1957; Orchard 1981). Seven genera, about 160 species worldwide.

Myriophyllum L. Water-milfoil

(Greek *myrios*, many, + *phyllon*, leaf) Perennial, aquatic herbs. **LEAVES** whorled or opposite, submersed leaves capillary, emergent; leaves bractlike. **INFL** sessile, in axils of leaves or bracts, the uppermost staminate; the upper flowers often in an emersed terminal spike. **FLOWERS** perfect or imperfect; calyx 4-merous; petals 4 or none; stamens 4–8; ovaries inferior, 4-celled; ovule single in each cell; stigmas 4, recurved. **FRUIT** hard, nutlike, 4-locular, splitting into 4 mericarps. Forty species. *Myriophyllum spicatum* L. is to be looked for in our range.

1. Bracts of emersed leaves entire, shorter than flowers or fruit ..... ***M. sibiricum***
1' Bracts of emersed leaves pectinate, longer than flowers and fruit ..... ***M. verticillatum***

Myriophyllum sibiricum Kom. (of Siberia) Shortspike water-milfoil. **STEMS** simple or branching, purple to brownish purple, turning white upon drying. **LEAVES** in whorls of 3 or 4, about 1 cm or more apart, with midstem whorls up to 3 cm apart, simple pinnate with 11 or fewer segments on each side of the rachis, lower leaves often shorter than those toward stem tip. **INFL** a spike, flowers in verticils, lower pistillate, upper staminate; in axils of tiny bracts, shorter than flowers. **FLOWER** petals oblong-ovate, about 2.5 mm long; anthers 8. **FRUIT** subglobose, 2–3 mm long, mericarps rounded on back, smooth or rugulose. [*M. exalbescens* Fernald; *M. magdalenense* Fernald; *M. spicatum* L. var. *exalbescens* (Fernald) Jeps.]. Lakes, ponds, slow-flowing streams, and ditches. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Mon, SJn; NMEX: McK, RAr, SJn. 2200–3275 m (7300–10775'). Flowering: Jun–Aug. Fruit: Jul–Aug. Alaska east to Newfoundland, south to California, Arizona, New Mexico, Kansas, Minnesota, Illinois, West Virginia, Maryland, and Connecticut. It has been used as a medicine for poor circulation and as an emetic.

Myriophyllum verticillatum L. (whorled) Northern water-milfoil, whorl-leaf water-milfoil. **STEMS** simple, in the late season producing clavate winter buds. **LEAVES** in whorls of 4 or 5; submersed leaves 0.8–4.5 cm long, with 9–13 opposite or alternate pairs of capillary flaccid divisions; divisions to 28 mm long; emergent leaves and bracts smaller, coarser, or pectinate-pinnate. **INFL** a spike, flowers in whorls or groups of 4–6, lower pistillate, upper staminate; bracteoles palmately 7-lobed, 0.5 mm long. **FLOWER** petals are rudiments in pistillate flowers, spoon-shaped, obtuse, 2.5 mm long; anthers 4 or 8. **FRUIT** subglobose, 2–2.5 mm long, deeply 4-furrowed, mericarps rounded on back, smooth or slightly tuberculate. Lakes and ponds. COLO: Arc, LPl. 2650 m (8700'). Flowering and fruiting unknown.

British Columbia east to Saskatchewan and Newfoundland, south to California, Utah, Colorado, Texas, Michigan, Indiana, Maryland, and Delaware. The plant has been used as a stimulant by eastern Native American tribes.

HYDRANGEACEAE Dumort. HYDRANGEA FAMILY

Roy Taylor

(Greek for water jar, in reference to the cup-shaped fruit) Shrubs (ours). **LEAVES** opposite or alternate, simple, sometimes lobed. **INFL** corymbiform to paniculiform. **FLOWERS** perfect, regular, marginal ones often sterile and irregular, hypogynous or 1/2 to fully epigynous, with a short or prolonged hypanthium; sepals 4 or 5; petals 4 or 5; stamens (1) 2 to several times as many as the petals, sometimes up to 70; nectary disc usually present on top of the ovary; gynoecium of (2) 3–5 (12) carpels united to form a compound, 1/2 to fully inferior, rarely superior ovary; ovules (1) several or numerous. **FRUIT** a capsule (ours). **SEEDS** straight, linear, embryo embedded in the fleshy endosperm. $x = 13-18+$. About 17 genera and 170 species widespread in temperate and subtropical parts of the Northern Hemisphere (Cronquist, Holmgren, and Holmgren 1997a).

1. Stamens 8, the filaments flat, broad; leaves up to 3 cm long, not prominently nerved; flower petals mostly 10–20 mm long, 5.5–12 mm wide ..... ***Fendlera***
1′ Stamens more than 20, the filaments terete, subulate; leaves 1–1.5 cm long, 3-nerved beneath; flower petals 5–17 mm long, 3.5–12 mm wide ..... ***Philadelphus***

Fendlera Engelm. & A. Gray Fendlerbush

(for Augustus Fendler, 1813–1883, a German-born botanical explorer) Shrubs. **LEAVES** opposite, nearly sessile, deciduous. **FLOWERS** perfect, showy; hypanthium calyxlike; sepals 4; petals 4; stamens 8, filaments flattened, lobed at the apex; ovary inferior at the base, 4-loculed; styles 4. **FRUIT** a capsule, over 1/2 superior. **SEEDS** few in each locule. Two or three species in the southwestern United States (Welsh et al. 2003).

Fendlera rupicola Engelm. & A. Gray **CP** (living near rocks) Cliff fendlerbush. Many-branched shrub to 2 m tall, the bark striate, reddish to straw-colored on the younger twigs, grayish on the older. **LEAVES** opposite, often forming a tight fascicle, blade lanceolate to linear-elliptic and often revolute, 1–4 cm long, 2–7 mm wide, sparingly strigose on both sides, the midrib prominent, grooved above, ridged beneath, nearly sessile leaves without stipules, short-petiolate, deciduous. **FLOWER** hypanthium 2–3 mm long; perfect, showy, solitary or 2–3 together at the ends of short branches or spurs; sepals 3–5 mm long, to 8 mm in fruit, persistent, strigose beneath, tomentose-villous above; petals 13–20 mm long, constricted to a narrow claw, the blade to 11 mm wide, white; staminal filaments about 6–8 mm long, to 2 mm wide at the base, 2-lobed apically, the lobes 2–3 mm long, the anthers shorter or longer than the lobes; styles 4, appearing as 2 at anthesis, glabrous or with multicellular hairs. **FRUIT** a capsule 8–15 mm long. Often on dry, rocky, gravelly slopes; blackbrush, desert scrub, and piñon-juniper woodland communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1495–2560 m (4900–8400′). Flowering: Apr–Jul. Utah, Colorado, and New Mexico to Arizona and Texas. Navajo uses include: an infusion of inner bark for swallowed ants; the notched stick rubbed with a smooth stick instead of beating a drum in the Mountain Chant Ceremony; used by the Home God in the Mountain Chant Ceremony; wood used to make arrow shafts; used to kill hair lice; used to make weaving forks, planting sticks, and knitting needles. The Kayenta Navajo used the plant as a cathartic and for Plumeway, Nightway, Male Shootingway, and Windway ceremonies; boiled with juniper berries, piñon buds, and cornmeal, and used in mush-eating ceremonies.

Philadelphus L. Mock Orange

(from the Greek *philos*, love, + *adelphos*, brother; said to be named for Ptolemy Philadelphus, king of Egypt, 283–247 B.C.) Shrubs. **LEAVES** opposite, subsessile or on short petioles. **INFL** in few-flowered cymes at the ends of leafy branches. **FLOWER** hypanthium calyxlike; perfect; sepals 4 (5); petals 4 (5), white or nearly white; stamens many. **FRUIT** a loculicidal capsule, mostly 20–60; ovary at least 2/3 inferior, with 3–5 locules; styles 3–5, distinct or united. **SEEDS** numerous (Welsh et al. 2003).

Philadelphus microphyllus A. Gray (small-leaved) Littleleaf mock orange. Shrubs 8–20 dm tall. **STEM** branchlets appressed, pubescent. **LEAVES** with petioles about 1–3 mm long, blades 10–40 mm long, 4–15 mm wide; elliptic or ovate to lanceolate, base cuneate, tip acute, margins entire, slightly revolute, sparingly to moderately strigose-sericeous. **FLOWER** hypanthium hemispheric, about 2–4 mm long; pubescent; sepals 3–6 mm long, ovate, acuminate,

tips often reflexed, densely white-tomentose beneath and on margins, strigose to glabrate on outer surface; petals 5–17 mm long, oblanceolate, entire to erose, white; stamens many, filaments 2–5.8 mm long, somewhat united at base, white with anthers yellowish; ovary complete, inferior at anthesis, styles 4. **FRUIT** a capsule 4–10 mm long, ovoid, woody, 4-valved. **SEEDS** 1–3.5 mm long. Rocky cliffs, sandy soils, talus, and hanging gardens; piñon-juniper woodlands, mountain brush, ponderosa pine, aspen, and spruce-fir communities. [*P. occidentalis* A. Nelson; *P. microphyllus* var. *occidentalis* (A. Nelson) Dorn; *P. microphyllus* subsp. *stramineus* f. *zionensis* C. L. Hitchc.]. ARIZ: Apa, Coc, Nav; COLO: Dol, LPl, Mon; NMEX: McK, SJn; UTAH. 1605–2805 m (5270–9200′). Flowering: May–Jul. Fruit: Sep. Wyoming and Utah to Texas. The fruits were formerly eaten for food by the Isleta.

HYDROCHARITACEAE Juss. TAPEGRASS or FROG-BIT FAMILY

(including **NAJADACEAE** Juss. BUSHY PONDWEED, NAIAD, or WATER-NYMPH FAMILY)

C. Barre Hellquist

Annual or perennial, aquatic, submersed herb; caulescent, with or without evident stem; submersed and floating leaves or submersed leaves, in fresh, brackish, and marine waters. **STEMS** rhizomatous, creeping or rooting at proximal nodes, leafy. **LEAVES** basal, alternate, opposite, or whorled; sessile or petiolate, margin entire, spinulose to serrate. **INFL** axillary, terminal, or scapose, 1-flowered or cymose, subtended by spathe or as involucres. **FLOWERS** unisexual, staminate and pistillate on same or different plants, epigynous, free; mostly 6-parted or with perianth absent; stamens (0–) 2–many. **FRUIT** berrylike or achenelike. **SEEDS** 1–many, fusiform, ellipsoid, ovoid, spheric, or straight (Cook and Urmi-König 1985; St. John 1962). Eighteen genera, about 116 species worldwide.

1. Leaves usually 3, in whorls along stem; blades linear, lacking basal sheaths ..... ***Elodea***
1′ Leaves subopposite, appearing whorled; blades with distinct basal sheaths ..... ***Najas***

Elodea Michx. Waterweed

(Greek *helodes*, marshy) Perennial, freshwater herbs. **STEMS** rooted in substrate, branched or unbranched. **LEAVES** submersed and floating, cauline, whorled 3 (–7) at each node, or leaves opposite at base of stems; sessile, blades linear to linear-lanceolate; apex acute, midrib lacking lacunae on either side, margins with fine serrations. **INFL** solitary, sessile. **FLOWERS** unisexual, staminate and pistillate on separate plants, rarely bisexual, usually raised to the surface of the water by elongate floral tube base. **FRUIT** ovoid to lance-ellipsoid, smooth. **SEEDS** cylindric to fusiform. Five species in North America, South America, Europe, introduced into Australia.

1. Staminate pedicel remaining until after anthesis; midstem leaves in whorls of 3 with numerous groups of 2, spreading; pistillate spathe 9–67 mm; seeds 2.8–3 mm ..... ***E. bifoliata***
1′ Staminate pedicel detached before or during anthesis; midstem leaves in whorls of 3, 2 on the lowest portion of stem, recurved; pistillate spathe 8.3–17.5 mm; seeds 4.5–5.7 mm or longer ..... ***E. canadensis***

Elodea bifoliata H. St. John **CP** (two-leaved) **LEAVES** with many in 2s, especially on lower stem; linear to narrowly elliptic, 4.7–24.8 × (0.8–) 1.8–4.3 mm. **INFL** with a staminate spathe, 10.2–42 mm; peduncles abscissing after anthesis; pistillate spathe 9–67 mm. **FLOWERS** imperfect; pedicel remaining briefly after anthesis; stamens 7–9, pollen in monads; styles 2.3–3 mm. **SEEDS** 2.8–3 mm. [*E. longivaginata* H. St. John]. Lakes, ponds, reservoirs, and streams. COLO: Hin, LPl; NMEX: SJn. 1700–2750 m (5625–9075′). Flowering and fruiting: unknown. Widely scattered. British Columbia, east to Minnesota, south to California, Utah, Colorado, and Kansas. *Elodea bifoliata* appears to be the more common species throughout the southwestern United States.

Elodea canadensis Michx. (Canadian) **LEAVES** mostly in 3s, spreading or recurved, linear, oblong to ovate, 5–13 × 2–5 mm. **INFL** with staminate spathe 8.2–13.5 mm, peduncle abscissing just before or during anthesis; pistillate spathe 8.3–17.7 mm. **FLOWERS** imperfect; pedicel detaching before anthesis; stamens 7–9 (–18), pollen in tetrads; styles 2.6–4 mm. **SEEDS** 4–5.7 mm or longer. $2n = 24$ (Great Britain). Lakes, ponds, and streams, often alkaline. COLO: Arc. 2050–2750 m (6850–9075′). Flowering and fruiting: unknown. British Columbia and Alberta east across Canada to Quebec, south to California, Utah, Colorado, Arkansas, Alabama, and Virginia; Europe; Asia; Australia. Has been used as a strong emetic by eastern American tribes.

Najas L. Bushy Pondweed, Naiad, Water-nymph

(Greek *naias*, a water nymph) Aquatic submersed annuals. **STEMS** slender, highly branched, rooting at proximal nodes, some with prickles on internodes. **LEAVES** with sheaths variously shaped, margins serrate or dentate; blades linear, 1-veined; margins serrate to minutely serrulate with 50–100 teeth per side; apex acute to acuminate. **INFL** involucres mostly present in staminate flowers, rare in pistillate flowers. **FLOWERS** unisexual; staminate flower subtended by membranous involucre, pistillate flower sessile. **FRUIT** closely enveloping seed. **SEEDS** fusiform to obovoid, areola usually arranged into longitudinal rows. $x = 6$ (Haynes 1979; Lowden 1986). Forty species. *Najas guadalupensis* (Spreng.) Magnus is to be looked for in our study area.

Najas marina L. (of the sea) Spiny naiad. **STEMS** branched, internodes with prickles. **LEAVES** stiff with age; sheaths 2–4.4 mm wide; apex acute; blade 0.4–4.5 mm wide; margins with 8–13 coarse serrations per side. **INFL** with 1 flower per axil; staminate and pistillate on separate plants. **FLOWERS**: staminate 1.7–3 mm wide; pistillate 2.5–5.7 mm wide; styles 1.2–1.7 mm. **SEEDS** 2.2–4.5 mm long, areoles of testa irregularly arranged, not in distinct rows. $2n = 12$ (Europe). [*N. gracilis* Morong]. Lakes and ponds, in brackish water or water of high calcium or sulfur content. NMEX: SJn (Morgan Lake). 1615 m (5450'). Flowering: Jul–Aug. Fruit: Jul–Aug. Widely scattered. California and Nevada east to Minnesota and New York, south to Arizona, Texas, Alabama, and Florida.

HYDROPHYLLACEAE R. Br. WATERLEAF FAMILY

N. Duane Atwood and Stanley L. Welsh

Perennial, biennial, or annual herbs, or shrubs. **LEAVES** simple or pinnatifid. **INFL** commonly in cymes, these mostly scorpioid. **FLOWERS** perfect, regular, 5-merous; calyx lobes 5, similar or dissimilar, sometimes accrescent in fruit; corolla lobes 5; stamens 5, exserted or included; pistil 1–2-carpellate, the ovary superior, 1-loculed or more or less completely 2-loculed; styles 2, or if 1 then 2-cleft. **FRUIT** a longitudinally dehiscent capsule. **SEEDS** 1 to many. $x = 5–13+$.

1. Inflorescence capitate or almost so; stamens long-exserted; plants of mountain brush communities and upward ..... ***Hydrophyllum***
1′ Inflorescence definitely scorpioid, thyrsoid, or axillary, or the flowers sometimes solitary; stamens included or exserted ..... (2)

2. Ovary unilocular; plants annual with diffusely branched, angled stems. ..... ***Ellisia***
2′ Ovary more or less bilocular; plants annual to biennial or perennial, stems not angled ..... (3)

3. Stamens unequally inserted on the corolla tube; flowers axillary or solitary in small, dense, leafy clusters; plants low, branching annuals. ..... ***Nama***
3′ Stamens equally inserted on the corolla tube; flowers mostly in cymes; plants low to tall, annual, biennial, or perennial ..... ***Phacelia***

Ellisia L. Ellisia

(named for John Ellis, English botanist) Annual. **STEMS** simple to diffusely branched and angled. **LEAVES** pinnately divided, the lower opposite, the upper alternate. **FLOWERS** solitary in the upper leaf axils and retrosely hirsute; corolla white to blue, campanulate; calyx divided nearly to the base, enlarging in fruit; stamens included; style divided at the apex less than 1/2 its length. **FRUIT** unilocular, ovules on fleshy placentae attached at the top and bottom of the cell. **SEEDS** usually 4, regularly reticulated.

Ellisia nyctelea L. (night) Aunt Lucy. Annual, 1–4 dm tall. **STEMS** simple or diffusely branched, angled, retrorsely hirsute, 10–40 cm tall. **LEAVES** 2–8 cm long, divisions pinnately divided, 7–13, oblong, acute or obtuse, hispidulous. **FLOWER** calyx lobes 3–5 mm long, lanceolate or ovate-lanceolate; stamens included. **FRUIT** hispid. **SEEDS** 2–3 mm in diameter, globose, dark brown. [*Macrocalyx nyctelea* (L.) Kuntze; *Ellisia nyctelea* var. *coloradensis* Brand]. Valleys and mountains, shaded places. 1220–2745 m (4000–9000'). COLO: Mon. Flowering: May–June. Atlantic states west to Saskatchewan, south to New Mexico.

Hydrophyllum L. Waterleaf

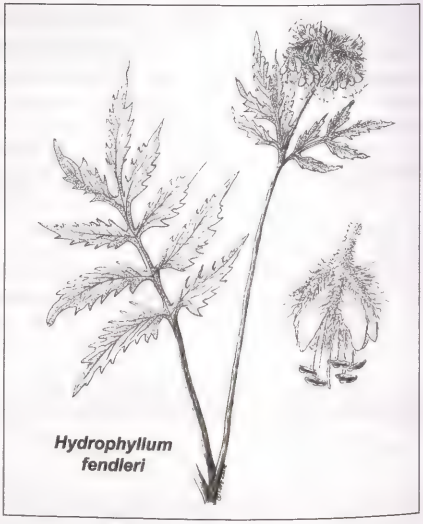
(Greek *hydro*, water, + *phyllon*, leaf) Perennial herbs. **STEMS** erect, succulent, from horizontal rhizomes, these bearing fleshy, fibrous to tuberous roots. **LEAVES** pinnately compound, mostly basal, oblong or oval in outline, petioles

slightly dilated and clasping at the base, ciliate. **INFL** composed of 1 to several globose or lax cymes, short-pubescent or strigose and hispid. **FLOWERS** campanulate, purplish to blue, white, or violet; calyx divided nearly to the base, the lobes linear, oblong, or lanceolate; stamens 5, exserted; style 1, exserted 5–10 mm, cleft 1–2 mm; stigma capitate; ovules attached to the front of the 2 large parietal placentae. **SEEDS** 1–3, brown, subglobose, reticulate.

1. Flowers in dense capitate clusters; peduncles shorter than the petioles of the subtending leaves; anthers short-oblong, 0.6–1 mm long ..... ***H. capitatum***
1′ Flowers in open clusters; peduncles longer than the petioles of the subtending leaves; anthers linear to oblong, 1–2 mm long ..... ***H. fendleri***

Hydrophyllum capitatum Douglas ex Benth. (for the headlike flower clusters) Capitate waterleaf. Plants 1–5 dm high, from short rhizomes, these bearing a fascicle of tuberous roots. **STEMS** short. **LEAVES** pinnately compound, ovate to oval in outline, strigose, the blades 2.5–10 cm long, 2–13 cm wide, the primary divisions 5–7, obovate to oblong or lanceolate, the lobes and divisions acute, obtuse, or mucronate. **INFL** of 1 to several globose cymes, the peduncles 1–5 cm long, shorter than the subtending leaves, mostly recurved in fruit. **FLOWER** pedicel 2–5 mm long; sepals obtuse or abruptly acute, 3–4 mm long, 1.5 mm broad or less, ciliate and strigose; petals 5–9 mm long, purplish or white; stamens exserted 5 mm; style exserted 5–10 mm. **SEEDS** normally 2, light brown, 2–3 mm in diameter. $2n = 18$. [*H. capitatum* var. *pumilum* Geyer ex Hook.] Mountain brush, aspen, sagebrush, and mixed conifer communities. COLO: Hin; UTAH. 1340–2745 m (4400–9000′). Flowering: Jun–Jul. Washington to Wyoming, south to Utah and Colorado. Our plants belong to **var. *capitatum.***

Hydrophyllum fendleri (A. Gray) A. Heller (for Augustus Fendler, first resident botanist in New Mexico) Fendler's waterleaf. Perennial, 2–9 dm tall from short rhizomes, these bearing fibrous roots. **STEMS** erect, retrorse-hispid. **LEAVES** pinnately compound, ovate or oval in outline, strigose, the blade 6–30 cm long, with 9–13 primary divisions, these ovate to lanceolate, acuminate, coarsely serrate or incised. **INFL** of 1 to several lax cymes, peduncles 3–17 cm long, often branched, mostly longer than the subtending leaves (at least in fruit). **FLOWER** pedicel 2–7 mm long; sepals linear to lanceolate (in fruit), 4–6 mm long , 1–2 mm broad, ciliate and strigose, often hispid dorsally; petals 6–10 mm long, white to violet; stamens exserted 4–6 mm; style exserted 5–7 mm. **SEEDS** 1–3, light brown, 2.5–3 mm in diameter. $2n = 18$. [*H. occidentale* (S. Watson) A. Gray var. *fendleri* A. Gray; *H. albifrons* A. Heller var. *fendleri* (A. Gray) Brand]. Piñon pine, mountain mahogany, oak, ponderosa pine, and spruce communities. COLO: Arc, Hin, LPl, Min, Mon; UTAH. 2500–2970 m (8200–10157′). Flowering: Jun–Jul. British Columbia to Oregon, south to Colorado and southeastern Utah.



Nama L. Nama

(Greek, spring) Low, branching annuals. **LEAVES** alternate, entire, hirsutulous to hispid, retrorse to erect. **INFL** of terminal nonscorpioid cymes. **FLOWER** sepals subequal, linear to lanceolate; petals purple or lavender, deciduous, tubular to funnelform; stamens included, borne unequally on the corolla tube; style included, divided to the base or 2-lobed at the apex. **FRUIT** a capsule falsely bilocular by intrusion of the placentae; ovules numerous. **SEEDS** numerous, brown, mostly reticulate.

1. Styles solitary, 2-lobed at the apex; corolla tubular, 3–5 mm long ..... ***N. densum***
1′ Styles 2, distinct to the base; corolla tubular-campanulate to funnelform-campanulate, 5–16 mm long, or if smaller, stem hairs retrorse (4–7 mm long in *N. retrorsum*) ..... (2)

2. Shorter stem pubescence retrorse ..... ***N. retrorsum***
2′ Shorter stem pubescence spreading to erect ..... (3)

3. Corolla relatively showy, purple, 9–15 mm long, funnelform-campanulate, plants relatively coarsely hairy with long and short hairs ..... ***N. hispidum***

3' Corolla smaller, about 5 mm long, tubular-campanulate, pale lavender, finely glandular and not coarsely hairy ..... ***N. dichotomum***

Nama densum Lemmon (compact) Compact nama. Annual. **STEMS** dichotomously branched, branches mostly prostrate, spreading-hirsute, 1–10 cm across. **LEAVES** oblanceolate, 0.4–3 cm long, 1–5 mm wide, entire. **FLOWERS** sessile and solitary in the upper leaf axils; calyx lobes linear, 3.8–7 mm long, 1–3 mm wide; corolla funnelform, white to lavender, 3–7.2 mm long, the tube long, the lobes short; style 0.5–2 mm long, 2-lobed at the apex. **FRUIT** 2–3.5 mm long. **SEEDS** 15, 0.5–0.9 mm long, dark brown to blackish, pitted and reticulate. $2n = 14, 28$. [*Conanthus densus* Lemmon ex A. Heller]. Sandy soils or often loose gravel in juniper, sagebrush, and desert shrub communities. ARIZ: Apa; UTAH. 1430–1865 m (4699–6112'). Flowering: May–Aug. Central Washington to eastern California, east through southeastern Oregon and the western part of the Snake River Plains through Nevada to Elko and Nye counties, and disjunct in southwestern Wyoming and eastern Utah.

Nama dichotomum (Ruiz & Pav.) Choisy (having divisions in pairs, referring to the stems) Wishbone fiddleleaf. Annual. **STEMS** erect or ascending, sparsely leafy, often dichotomously branched, glandular and setose, 5–27 cm long. **LEAVES** alternate, linear to narrowly oblanceolate or spatulate, petiolate, 1–3 cm long, 2–5 mm wide. **FLOWERS** pale lavender, with prominent dark guidelines, tubular-campanulate, 3.3–4.5 mm long, borne singly or in pairs in the upper branches, some subtended by a very long leaf or bract, sessile or the lower sometimes with a pedicel to 5 mm long; calyx lobes linear to narrowly spatulate, 5–10 mm long; stamen bases dilated into free-margined scales shorter than the free filament. **FRUIT** oblong, 3.5–4.5 mm long, 1.8–2.3 mm wide, short-pubescent. **SEEDS** 56–62, brown, 0.7 mm long, 0.4 mm wide, oblong, prominently large-pitted. Limestone gravels to sandy soils in piñon-juniper to ponderosa, fir, aspen communities. ARIZ: Apa; COLO: Arc; NMEX: McK, SJn. 1220–2989 m (4000–9800'). Flowering: Aug–Sep. Colorado, New Mexico, Arizona; Mexico and South America.

Nama hispidum A. Gray (referring to the stems' coarse, rigid, erect hairs) Hairy nama. Leafy, branched annuals, 1–3 dm tall. **STEMS** more or less spreading, hispid. **LEAVES** 1–7 cm long, 2–6 mm wide, entire, revolute, finely glandular and with somewhat appressed, nonglandular hairs, oblanceolate to spatulate. **INFL** solitary to several in terminal cymes. **FLOWER** sepals linear to lanceolate, 5–8 mm long; petals purple, broadly funnelform, 8–14 mm long, 7–8 mm wide; style 2–5 mm long, cleft to the base. **SEEDS** numerous, 0.5 mm long, yellowish brown, reticulate. $2n = 14$. Sandy soils. ARIZ: Apa; NMEX: McK, RAr, SJn; UTAH. 1130–1220 m (3700–4000'). Flowering: May–Jun. Western Texas and northern Mexico to southeastern California, north to Kane County, Utah. Our plants belong to what has been referred to as **var.** ***spathulatum*** C. L. Hitchc. Plant used by Navajos as a lotion for spider bites.

Nama retrorsum J. T. Howell (refers to the backward-pointing hairs on the stem) Howell's nama. Leafy, freely branched, erect annuals, pubescent throughout, 1–3 dm tall. **STEMS** erect, fastigiate, hirsute, the shorter stem hairs retrorse. **LEAVES** linear to linear-oblong, sessile, 1–5 cm long, 2–5 mm wide, entire. **FLOWERS** sessile or nearly so and solitary in the upper leaf axils; sepals linear, 5–6 mm long, with narrow, hispid lobes; corolla purple, funnelform, 4–7 mm long, the lobes 1–2 mm; styles 2, distinct to the base. **FRUIT** 3–4 mm long. **SEEDS** numerous, narrowly ellipsoid, shallowly and obscurely pitted, 0.6–0.8 mm long. Sand dunes and other sandy soils in desert shrub–grass communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: RAr, San, SJn; UTAH. 1060–2135 m (3500–7000'). Flowering: Apr–Aug. Grand County, Utah, south to Coconino and Navajo counties, Arizona.

Phacelia Juss. Phacelia

Herbaceous annuals, biennials, or perennials, mostly pubescent and with glandular hairs. **LEAVES** mostly alternate, the lower sometimes opposite, entire to pinnately compound. **INFL** in variously disposed scorpioid cymes, or apparently in lax racemes. **FLOWERS** few to numerous; calyx divided to the base; corolla tubular to broadly campanulate, blue, purplish, violet, or white, mostly deciduous, a few species with a tardily deciduous corolla; stamens included or exserted, equally inserted at the base of the corolla tube, with a pair of scales attached to the base of the corolla and filaments; style included or exserted, bifid, mostly pubescent. **FRUIT** a capsule, unilocular (or nearly bilocular by the intrusion of the placentae). **SEEDS** 1 to numerous, variously roughened, boat-shaped, terete or flattened.

1. Stamens included in the corolla ..... (2)

1' Stamens exserted from the corolla more than 2 mm ..... (5)

2. Ovules and seeds about 40 ..... ***P. indecora***
2' Ovules and seeds 1–20 ..... (3)

3. Leaves deeply pinnatifid; flowers white ..... ***P. ivesiana***
3' Leaves entire or undulate; flowers lavender to purple ..... (4)

4. Leaves oblong to elliptic; style and branches 1.5 mm long; filaments glabrous; flowers in dense sessile clusters; plants of Apache County, Arizona, and McKinley County, New Mexico ..... ***P. cephalotes***
4' Leaves broadly ovate to orbicular; style including branches 1.5–4 mm long; filaments sparsely hairy; flowers in racemes, these 1–4 cm long; plants more broadly distributed ..... ***P. demissa***

5. Seeds excavated on the ventral surface on 1 or both sides of a prominent ridge ..... (6)
5' Seeds not excavated ventrally ..... (13)

6. Corolla lobes pubescent and erose-fimbriate or erose-denticulate; leaves strongly dissected ..... ***P. neomexicana***
6' Corolla lobes not both pubescent and erose; leaves less dissected, only the lower or none of the sinuses reaching the midrib ..... (7)

7. Corolla small, 4 mm long or less, white, blue, or lavender; seeds rather shallowly excavated on both sides of the ventral centrally placed ridge ..... ***P. alba***
7' Corolla more than 4 mm long, variously colored or rarely white ..... (8)

8. Leaves glabrous or nearly so, except sometimes with hairs on the petiole ..... ***P. splendens***
8' Leaves distinctly hairy or glandular ..... (9)

9. Plants endemic to the high mountains of Colorado in Archuleta, Mineral, Hinsdale, and Rio Grande counties ..... ***P. bakeri***
9' Plants of lower elevations in the San Juan River drainage ..... (10)

10. Mature seeds black, 2.5–2.8 mm long, 1–1.2 mm wide; plants restricted to the Moenkopi Formation in San Juan County, Utah ..... ***P. constancei***
10' Mature seeds reddish or brown and large in size; plants of sandy or sandy-gravelly sites and more widely distributed ..... (11)

11. Corolla rotate to funnelform, the tube white; dorsal surface of mature seeds reddish and smooth; plants restricted to Grand and San Juan counties, Utah ..... ***P. howelliana***
11' Corolla tubular-campanulate to campanulate, the tube lavender to bluish; dorsal surface of mature seeds brown or dark brown to black and with transverse ridges or corrugated; plants widespread ..... (12)

12. Corolla lavender; seeds lacking ventral corrugations; plants of sand dunes and other sandy sites ..... ***P. integrifolia***
12' Corolla blue or purple; seeds corrugated ventrally ..... ***P. crenulata***

13. Leaves entire or with 1–4 pairs of lobes; stems strigose to hispid, not silvery ..... ***P. heterophylla***
13' Leaves pinnatifid, the segments also cleft or entire; stem pubescence silky ..... ***P. sericea***

Phacelia alba Rydb. (refers to white flowers) White-flowered phacelia. Annual, 0.5–7 dm tall. **STEMS** simple to branched, erect or ascending, leafy, hirsute to setose and stipitate-glandular. **LEAVES** pinnatifid to subpinnatifid, 2–10 cm long, 2–8 cm wide, short-hairy and somewhat glandular, the lowermost long-petiolate, the upper sessile or subsessile. **INFL** of dense, terminal, compound scorpioid cymes, the lower ones often simple, densely glandular and puberulent to hirsute, the cymes 1–2 cm long in flower, to 8 cm long in fruit. **FLOWERS** subsessile, or the pedicel to 1 mm long; sepals linear to oblanceolate, 3.5–4 mm long; petals white to lavender or pale blue, tubular-campanulate; stamens exserted 2–4 mm; style exserted 2–4 mm, divided to below the middle. **FRUIT** ovoid to subglobose, 3–3.3 mm long, glandular-puberulent. **SEEDS** 1–2 (4), light to dark brown when mature, 2.4–3 mm long, uniformly alveolate and cymbiform, the ventral surface shallowly excavated on both sides of the ridge, lacking corrugations, the margins thick and entire. |*P. neomexicana* Thurb. ex Torr. var. *alba* (Rydb.) Brandl. Sagebrush, piñon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities. ARIZ: Apa; NMEX: McK, RAr, San, SJn. 1370–2930 m (4520–9600'). Flowering: late May–Sep. Wyoming, Colorado, Utah, New Mexico, Arizona, and Chihuahua, Mexico.

Phacelia bakeri (Brand) J. F. Macbr. (for C. F. Baker, entomologist and botanist) Baker's phacelia. Annual or biennial, 0.5–4.8 dm tall. **STEMS** with dense, black, multicellular, stipitate glands, pilose-hirsute. **LEAVES** pinnately divided,

irregularly crenate-dentate, 2–8 cm long, 0.5–3 cm wide, reduced above. **INFL** of compound terminal and lateral scorpioid cymes. **FLOWER** sepals oblanceolate to narrowly spatulate, pubescent, 4.5–5 mm long; petals campanulate, violet to dark blue, 7–8 mm long, 5–7 mm wide, pubescent on the lobes; stamens exserted 5–9 mm, anthers greenish, filaments bluish; style exserted 5–9 mm, pubescent below. **FRUIT** oblong to oval, 3.5–4 mm long, 3–3.2 mm wide, setose and glandular. **SEEDS** elliptic, brown, 2.7–3 mm long, 1.3–1.6 mm wide, pitted ventrally, the margins thin, the ridge tapering to the margins and lacking excavations, pitted dorsally and flattish, with a shallow central groove. [*P. crenulata* Torr. ex S. Watson var. *bakeri* Brand]. Talus slopes and gravelly soils of open tundra, grassy alpine slopes in sagebrush-grass, spruce, fir, pine, and aspen communities. COLO: Arc, Hin, LPl, Min, RGr. 2150–3722 (7045–12204'). Flowering: Jul–Sep. Colorado endemic.

Phacelia cephalotes A. Gray (refers to the flower head) Chinle phacelia. Annual, 0.5–1.3 dm tall. **STEMS** low, almost prostrate, glandular-villous. **LEAVES** entire, oblong, ovate to elliptic, petiolate, hirsutulous, and glandular, the lower petioles longer than the blade, 0.5–1.8 cm long. **INFL** of compact, sessile or subsessile, scorpioid cymes, these terminal on the branches of the stems. **FLOWER** sepals oblanceolate, 3–4 mm long in flower, to 8 mm long in fruit; petals lavender, inconspicuous, 3–5 mm long, the tube yellowish; stamens and style included. **FRUIT** ovate, 3–4 mm long, shorter than the calyx. **SEEDS** when mature, 8–12, oblong, angular, the angles denticulate, pitted, 1–1.5 mm long. $n = 11$. Salt desert shrub and juniper communities primarily on the Chinle Formation. ARIZ: Apa; NMEX: McK; UTAH. 1060–1525 m (3500–5000'). Flowering: May–Jun. Washington, Kane, and San Juan counties, Utah, east to McKinley County, New Mexico.

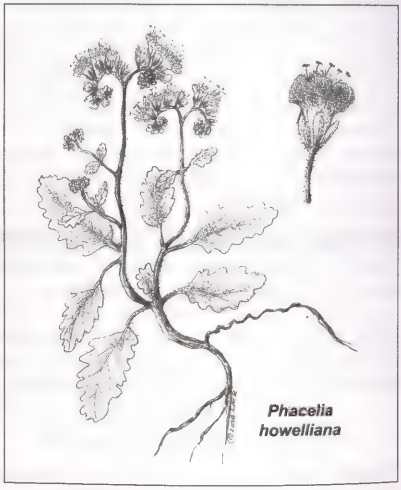
Phacelia constancei N. D. Atwood (for Lincoln Constance, a California botanist) Constance's phacelia. Erect biennial herb, 1.5–4.3 dm tall. **STEMS** coarse, 1–several, reddish, hirsutulous to hirsute, and finely glandular. **LEAVES** basal and cauline, linear-lanceolate, revolute, crenate to dentate, the lower short-petiolate or sessile and larger than the upper, the upper sessile. **INFL** of terminal cymes. **FLOWER** sepals elliptic to oblanceolate, 3–4 mm long; petals pale lavender to white, (4) 5–6 mm long, tubular-campanulate; stamens and style exserted 3–4 mm. **SEEDS** 4, black, 2.5–2.8 mm long, 1–1.2 mm wide, elliptic, the margins corrugated, the ventral surface finely pitted, excavated and divided by a prominent ridge, this corrugated along one side, the dorsal surface finely pitted. $n = 11$. Salt desert shrub and juniper communities. COLO: Mon; UTAH. 1250–2013 m (4100–6600'). Flowering: Jun–Sep. Southeastern Utah, northern Arizona, and southwestern Colorado.

Phacelia crenulata Torr. ex S. Watson (having small, rounded teeth) Corrugate phacelia. Annual, 0.3–8.3 dm tall. **STEMS** simple or more commonly branched, stipitate-glandular with short or long trichomes, and usually with some nonglandular hairs intermixed. **LEAVES** oblong-elliptic, subentire to deeply lobed, the lower lobes sometimes almost distinct, the lower leaves the largest, petiolate, the upper mostly reduced and finally sessile. **INFL** scorpioid, terminal on the stems and branches. **FLOWER** sepals elliptic to oblanceolate, 3–10 mm long; petals blue, violet to purple, campanulate, 4–7 mm long; stamens exserted 3–11 mm; style exserted, bifid 1/2 its length, glandular-pubescent below. **FRUIT** globose to subglobose, 2.6–4.1 mm long, 2.8–3.2 mm wide, puberulent to glandular. **SEEDS** 4, elliptic to oblong, 2.8–4 mm long, 1.3–3.2 mm wide, pitted, the ventral surface corrugated on the margins and one side of the ridge. $2n = 22$. Desert shrub of saltbush, blackbrush, budsage, *Ephedra*, *Yucca*, *Hilaria*, *Poliomintha*, and piñon-juniper communities on rocky, sandy, gravelly, silty clay. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, SJn; UTAH. 1148–1922 (3742–6292'). Flowering: late Mar–Jun. Eastern Nevada, east through much of Utah to western Colorado, south to northern Arizona and northwestern New Mexico. Our plants belong to **var. *corrugata*** (A. Nelson) Brand. Plant used for horse injuries by Hopis.

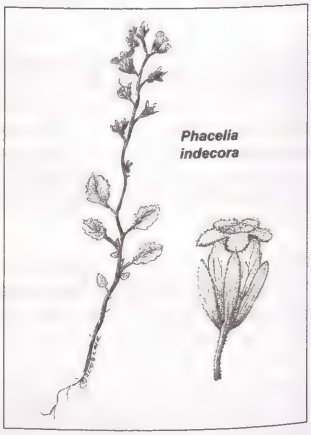
Phacelia demissa A. Gray (refers to lowly) Brittle phacelia. Annual, branched from the base, mostly broader than high, 0.3–2 dm tall. **STEMS** brittle and succulent when fresh, densely glandular-villous, usually reddish. **LEAVES** mostly cauline, broadly ovate to orbicular, 1–2.6 cm long, entire to undulate, the lower ones long-petiolate, the upper short-petiolate. **INFL** of terminal or axillary, sessile, scorpioid cymes. **FLOWER** sepals oblong to oblanceolate, 5–7 mm long in fruit; petals lavender to purple with a yellow tube, easily deciduous, 3.5–9 mm long, tubular-campanulate when fully open, sessile to short-pedicellate; stamens included; style included, hairy, shortly bifid. **FRUIT** oblong, 2.5–4 mm long, finely pubescent; ovules 4–20. **SEEDS** ovate to elliptic, 1.1–1.5 mm long, brown to reddish, pitted-reticulate. $2n = 24$. Salt desert shrub, saltcedar, cottonwood, rabbitbrush, and piñon-juniper commuities on Chinle, Dakota, Mancos Shale, Morrison, and Tropic Shale formations. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, SJn. 1300–2196 m (4266–7200'). Flowering: May to Jun. Eastern, central, and southern Utah, southwest Colorado, northern Arizona, and northwest New Mexico. Our plants belong to **var. *demissa***.

Phacelia heterophylla Pursh (having leaves of more than one form) Varileaf phacelia. Biennial or perennial, 2–6 dm tall. **STEMS** simple, sometimes branched, erect, stout, strigose to hispid, not silvery but sometimes also glandular. **LEAVES** basal and cauline, the lower petiolate, entire or with 1–4 pairs of lobes. **INFL** somewhat virgate, typically branched, densely pilose to spreading-hispid. **FLOWER** sepals lanceolate to oblong, 3–6 mm long, unequal; petals dirty white to purplish, campanulate, 4–7 mm long. **FRUIT** ovoid, 2–3 mm long, pubescent. **SEEDS** 1 or 2, 2–2.5 mm long, brown. $n = 11$. Sagebrush, mountain brush, aspen, and spruce-fir commuities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: RAr, San, SJn: UTAH. 1370–3340 m (4497–10855'). Flowering: Jun–Sep. Rocky Mountains of Montana, west to Oregon and Washington, east and south to Wyoming, Utah, western Colorado, New Mexico, Arizona to Mexico. Our plants belong to **var. *heterophylla***. Used for greens by Navajos.

Phacelia howelliana N. D. Atwood (for J. T. Howell, botanist) Howell's phacelia. Annual, 0.9–2.3 dm tall. **STEMS** mostly branched and leafy at the base, glandular and hirsute. **LEAVES** oblong to oval, 2–6 cm long, 1–2.5 mm wide, irregularly crenate to lobed, strigose and slightly glandular, the petiole to 5 cm long. **INFL** of branched scorpioid cymes. **FLOWER** pedicels to 2 mm long; sepals linear to narrowly oblanceolate, 3.5–4.5 mm long, 1–1.2 mm wide, glandular and hirsute; petals 5–6 mm long, 6–7 mm wide, rotate to funnelform, the lobes pale violet to blue, the tube white; stamens and style exserted 3–4 mm, the style shorter than the stamens, bifid 3/4 its length, the lower 1/4 pubescent. **FRUIT** oblong to subglobose, glandular and hirsutulous, especially near the apex. **SEEDS** 4, brown, 3.2–4 mm long, 1.4–1.8 mm wide, elliptic, the margins corrugated, involute to flattened, the ventral surface pitted, excavated and divided by a prominent ridge, this sometimes curved to one side and barely corrugated, the dorsal surface reddish brown, smooth and surrounded by a lighter margin. Salt and warm desert shrub and piñon-juniper communities. ARIZ: Apa, Nav; UTAH. 1125–1525 m (3688–5000'). Flowering: late Apr–Jun. Endemic to Utah in Emery, Garfield, Grand, and San Juan counties; adjacent Navajo and Apache counties, Arizona.



Phacelia indecora J. T. Howell (without elegance) Bluff phacelia. Annual, 3–14 cm tall. **STEMS** erect to spreading, branched, glandular. **LEAVES** elliptic to oblong, 4–26 mm long, hirsutulous and glandular. **FLOWER** sepals oblanceolate, 3–5 mm long,; petals narrowly campanulate, pale blue, 3–4 mm long, the lobes pubescent, the tube pale yellow and streaked with blue lines. **FRUIT** elliptic, 3–4 mm long. **SEEDS** about 40. Mainly associated with hanging garden communities. UTAH. 1370 m (4488'). Flowering: May–mid-Jun. Endemic to San Juan County, Utah.



Phacelia integrifolia Torr. (with entire leaves) Torrey's phacelia. Annual or winter-annual, 1–6 dm tall. **STEMS** simple or somewhat branched, densely stipitate-glandular and spreading-hirsute. **LEAVES** simple, crenate to somewhat cleft, oblong to ovate or lanceolate, strigose, finely glandular and with spreading, setose hairs, the lower leaves largest, petiolate, the upper smaller, short-petiolate to sessile. **INFL** terminal, elongate. **FLOWER** sepals oblanceolate to elliptic, 3–4.5 mm long in flower, 4.4–6.5 mm long in fruit; petals lavender to bluish, 5–6.5 mm long and broad, tubular-campanulate; stamens and style exserted 5–6 mm, the style bifid 2/3–3/4 its length, puberulent below. **FRUIT** ovoid to globose, 3.2–5.3 mm long, pubescent. **SEEDS** when mature, 4, oblong to elliptic, dark brown to black, 3.1–4.5 mm long, 1.7–2.2 mm wide, the transverse ridges on the dorsal surface quite distinct, the ventral surface lacking corrugations, the ridge often curved to one side. $2n = 22$. Sandy soil, sometimes on sand dunes

in blackbrush and other warm desert shrub, shrub-grass communities. ARIZ: Apa, Nav; COLO. Mon; NMEX: McK, RAr, San, SJn; UTAH. 1190–1710 m (3900–5606'). Flowering: late Mar–Jun. Kane and San Juan counties, Utah, south through central and eastern Arizona, across New Mexico to Trans-Pecos Texas and Mexico, northern Texas, Oklahoma, and southern Kansas.

Phacelia ivesiana Torr. **CP** (for J. C. Ives) Newberry's phacelia. Annual, 0.4–2.7 dm tall, hirsutulous and mostly finely glandular (rarely dark or black). **STEMS** prostrate or ascending, branched. **LEAVES** pinnately divided or lobed, oblong to lanceolate, 1–5 cm long, basal and cauline. **INFL** of laxly flowered, scorpioid cymes. **FLOWER** sepals oblong to oblanceolate, 2–4 mm long in flower, elongating to 7 mm in fruit; petals white, inconspicuous, 2–4 mm long, the tube yellowish; stamens included, the filaments glabrous; style included, divided 1/4 its length, glabrous. **FRUIT** oblong, 3–4.5 mm long, pubescent, especially apically. **SEEDS** 8–15, brown, 1–1.5 mm long, corrugated transversely and alveolate. $n = 22$. Sandy, sandy-clay, silty gravelly soils and occasional on limestone gravels in warm desert shrub, cool desert shrub, sagebrush, rabbitbrush, ephedra, snakeweed, mahogany, and piñon-juniper communities. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1220–2166 m (4000–7100'). Flowering: late Mar–Jul. Sonoran Desert of southeastern California, east through Nevada, Arizona, Utah, Colorado to Wyoming and the Snake River Plains of Idaho.

Phacelia neomexicana Thurb. ex Torr. (for New Mexico) New Mexico phacelia. Annual, 0.8–6.8 dm tall. **STEMS** erect to sparsely branched, setose, hispid and with small stipitate-glandular hairs, often reddish, leafy. **LEAVES** pinnate, the secondary pinnae irregularly incised, 3–8.5 cm long, 1–4.5 cm wide, strigose and stipitate-glandular, petiolate, the petiole 1.5 cm long or less. **INFL** congested, terminal on the main stem and lateral branches (sometimes arising from the axils of the uppermost branches with 1–3 cymes, the cymes up to 1 dm long in fruit. **FLOWERS** short-pedicellate (0.5 mm long); sepals linear to narrowly oblanceolate, 2–3 mm long in flower, to 4 mm in fruit, hispid and densely glandular; petals campanulate, blue, about 4 mm long, 3–3.5 mm wide, the lobes pubescent and erose; stamens and style exserted, the stamens exceeding the corolla 1–2 mm, the filaments bluish, anthers yellow, style exserted 1 mm, bifid 3/4 its length, glandular on the lower 1/4. **FRUIT** oval to elliptic, 4.5–4.7 mm long, 3 mm wide, setose and densely glandular, the raphe oblanceolate. **SEEDS** 4, oblong, brown, 3.2–3.3 mm long, 1.1–1.5 mm wide, alveolate, ventral surface excavated on both sides of the ridge. $n = 11$. Pine and oak woods in canyons and on mountain slopes in rocky to sandy soils. ARIZ: Apa; NMEX: McK, San. 2074–2745 m (6800–9000'). Flowering: late Jul–mid Oct. Eastern Arizona in Apache County, southeastern New Mexico, north through the mountains of central New Mexico, and possibly southern Colorado. Zunis powdered the root and used for rashes.

Phacelia sericea (Graham) A. Gray **CP** (for the silky hairs on the stem) Silky phacelia. Stout perennial, 1–5 dm tall. **STEMS** 1 to several, the pubescence silky, hairs appressed to spreading, or loosely woolly. **LEAVES** pinnatifid, the segments also cleft or entire, the lower well developed, cauline well developed but reduced upward. **INFL** a dense terminal thyrse, usually elongate, the cymes many, compact, short. **FLOWER** sepals linear, pubescent; petals dark purple or blue, persistent, campanulate, 5–7 mm long and as broad, pubescent inside and out; stamens and style long-exserted, the filaments hairy at the base, the style 6–13 mm long, bifid 1/2 its length. **FRUIT** ovoid, 4–6.5 mm long, pubescent. **SEEDS** 8–20, oblong, 1–2 mm long, brown to black, reticulate and grooved longitudinally. $2n = 22$. Open sagebrush slopes, aspen and spruce-fir wooded areas, commonly in rocky soils at middle and upper elevations. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2285–3540 m (7491–11606'). Flowering: Jun–Aug. Southeastern Utah, Colorado, central Nevada, north through the mountains of Wyoming, Montana, central and northeastern Idaho to Washington; British Columbia and Alberta, Canada. Our plants belong to **var. *sericea***.

Phacelia splendens Eastw. (brilliant) Eastwood's phacelia. Annual, 0.5–2.7 dm tall. **STEMS** erect, simple or branched, leafy, puberulent and stipitate-glandular. **LEAVES** pinnatifid, 2–7.5 cm long, 0.7–4 cm wide, petiolate, blade essentially glabrous. **INFL** terminal on the main stem and branches, cymes compact. **FLOWER** pedicels short; sepals linear to narrowly oblanceolate, 2.5–3 mm long in flower, 4–4.4 mm long, 0.6–1 mm wide in fruit, hirsute and scattered glandular-hairy; petals campanulate, blue, 4–8 mm long and as broad, glabrous to sparsely pubescent; stamens and style exserted 7–11 mm, filaments blue, anthers yellow, style bifid about 2/3 its length, puberulent and glandular below. **FRUIT** subglobose, 4–4.5 mm long, 3–3.5 mm wide. **SEEDS** 4, finely pitted, ventral surface excavated on both sides of the ridge, ridge corrugated on one side, margins ± revolute. $n = 11$. Mancos Shale Formation. COLO: Mon; NMEX: SJn. 1373–1830 m (4500–6000'). Flowering: late Apr–Jun. Southwestern Colorado, northwestern New Mexico, and southeastern Utah.

IRIDACEAE Juss. IRIS FAMILY

William Jennings

Perennial (ours) or annual herbs herbs from rhizomes, bulbs, or corms. **LEAVES** mostly basal, long and narrow, 2-ranked. **INFL** a raceme or panicle, subtended by 2 spathelike bracts. **FLOWERS** perfect, regular (ours) or irregular, showy, 6 petaloid segments (tepals) in 2 whorls, similar or distinct and dissimilar; stamens 3, usually partly adnate to the outer petaloid segments; style usually 3-branched, branches often flattened, opposite the stamens and outer petaloid segments; ovary inferior with 3 locules. **FRUIT** loculicidally dehiscent capsule. **SEEDS** many, membranous, usually with fleshy endosperm, sometimes arillate. About 60 genera and 1500 species, pantropical, pantemperate. Widely grown as ornamentals (*Iris*, *Crocus*, *Gladiolus*).

1. Style branches large, petal-like; flowers large, over 3 cm wide; sepals and petals dissimilar ..... ***Iris***
1' Style branches small, not petaloid; flowers small, less than 3 cm wide; sepals and petals alike ..... ***Sisyrinchium***

Iris L. Iris, Flag, Fleur-de-lis, Gladden

(Greek *iris*, rainbow) Perennial, rhizomatous or bulbous. **STEMS** erect, simple or branched. **LEAVES** mostly basal, linear to swordlike; flat (ours), terete, or quadrangular. **INFL** spike, raceme, or panicle bearing 1 to several flowers from paired spathelike bracts. **FLOWERS** showy, brightly colored, petaloid perianth parts differentiated into 2 whorls of 3 each, and united below into a tube; the outer whorl spreading, recurved, or reflexed; the inner whorl erect or arching; stamens 3, alternating with the inner whorl and next to the style branch; style divided into 3 petaloid branches, arched over the outer perianth whorl. **FRUIT** a loculicidal capsule. **SEEDS** numerous, in 2 rows in each locule. A genus of the north-temperate zone; about 150 species. There are numerous cultivated species and hybrids of iris, and sometimes these escape or persist, usually where iris rhizomes have been dumped by gardeners culling their beds. The most commonly seen are *I. germanica* (the common large-flowered and many-colored garden iris) and *I. pseudacorus* (a yellow-flowered species of wet habitats). The iris flower should be familiar to nearly everyone, and our one species of native iris looks like a smaller, blue-flowered version of the large, cultivated garden iris.

Iris missouriensis Nutt. (of Missouri, meaning the river, the type specimen being taken "toward the sources of the Missouri") Western iris, wild iris, blue flag. Rhizomatous perennials. **STEMS** 20–60 cm tall, barely surpassing the leaves. **LEAVES** linear, flat, erect. **FLOWERS** typical of the genus; light blue, occasionally white. **FRUIT** capsule 3–5 cm long, short-cylindrical, 6-ridged. Wetlands such as marshes, moist meadows, stream banks, and pond shores, often in places that dry up as the season progresses. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1525–3050 m (5000–10000'). Flowering: May–Jul. Practically ubiquitous in the United States west of the Great Plains. Used as a ceremonial emetic by Ramah Navajo. Chewed root poultice applied to newborns by Zunis to increase strength.

Sisyrinchium L. Blue-eyed Grass

(Greek *sys*, pig, + *rynchos*, snout, alluding to swine grubbing the roots for food) Perennial (ours) or annual herbs, often caespitose, rhizomatous or not. **STEMS** scapelike or branched, compressed and 2-winged. **LEAVES** basal or basal and cauline, alternate, flat, ensiform, glabrous. **INFL** a terminal cluster from a 2-bracted spathe, bracts approximately equal, or somewhat or greatly unequal. **FLOWERS** actinomorphic, tepals 6, all alike, widely spreading to reflexed, bluish violet to light blue (ours), white, lavender to pink, magenta, purple, or yellow; not fragrant; stamens symmetrically arranged, filaments distinct, connate basally or into tube, tapering to apex; anthers parallel, surrounding but not appressed to style branches; styles 3, erect, connate basally; filiform, extending between stamens and usually beyond anthers. **FRUIT** a capsule, more or less globose. **SEEDS** many, seed coat black, granular to rugulose (Henderson 1976; Cholewa and Henderson 1984). Native to the New World, about 80 species.

Mature flowers and spathes provide the best identification material, but identification is best accomplished on fresh material, as the flowers press poorly. Multiple specimens from the same population are recommended, due to variability of the species. White-flowered plants of a normally blue-flowered species are occasionally found, leading to reports of *S. campestre* E. P. Bicknell far beyond its normal range.

1. Spathe bracts subequal, the inner bract typically 12–20 mm, the outer bract typically 13–24 mm; stems branched, with a leaflike bract subtending 2 or more pedunculate spathes ..... ***S. demissum***
1' Spathe bracts unequal, the inner bract typically 13–35 mm, the outer bract typically 20–75 mm, the ratio of the length of the outer bract to the inner bract 1.2 to 2.8; stems simple (unbranched) ..... (2)

2. Outer-to-inner bract ratio 1.2 to 1.8; outer bract tapered evenly to an acute apex; outer whorl of perianth parts (sepals) with length-to-width ratio of 2.2 to 3.0 (shorter and broader than the following species), apex usually rounded ..... ***S. idahoense***

2' Outer-to-inner bract ratio 1.8 to 2.8; outer bract often widening above the apex of the inner bract before tapering to an acuminate apex; inner bract gibbous-based (bulging out); outer whorl of perianth parts (sepals) with a length-to-width ratio of 2.9 to 4.5 (longer and narrower than the preceding species) ..... ***S. montanum***

Sisyrinchium demissum Greene (lowly or humble) Perennial herb, caespitose, to 50 cm tall, often somewhat glaucous. **STEMS** branched, with 1 or 2 nodes. **LEAVES** 1.5–5 mm wide, glabrous, basal, about 1/2 the height of the whole plant. **INFL** borne singly on branched stems; spathes green, wider than supporting branch, glabrous, tapering evenly to apex. **FLOWER** tepals deep bluish violet, bases yellowish, outer tepals 6–15 mm, apex rounded to acute or occasionally emarginate, aristate; filaments connate for most of length. **FRUIT** a capsule, tan when mature, 4–8 mm, pedicel erect to ascending. **SEEDS** 1–2 mm, globose to obconic, granular. Moist areas such as wet meadows, springs, seeps, and stream banks. ARIZ: Apa; COLO: Arc, LPl; NMEX: McK, SJn. 1400–2775 m (4620–9100'). Flowering: Jun–Jul. *Sisyrinchium demissum* is a southwestern species of Arizona, New Mexico, and western Texas, reaching its northern limits in the Four Corners region. It also occurs in Colorado's San Luis Valley.

Sisyrinchium idahoense E. P. Bicknell (of Idaho) Perennial herb, caespitose, to 45 cm tall, not glaucous. **STEMS** simple, winged, glabrous. **LEAVES** glabrous. **INFL** borne singly on an unbranched stem; spathes glabrous, tapering evenly to the apex, outer bract typically 13–16 mm longer than the inner. **FLOWER** tepals light to deep bluish violet, occasionally purple, bases yellowish, outer tepals 8–13 mm, apex rounded, truncate, or emarginate, aristate; filaments connate for most of length, bluish violet. **FRUIT** capsule beige, light or dark brown when mature, 3–6 mm, pedicel erect to ascending. **SEEDS** 1–3 mm, globose to obconic, usually granular. [*S. occidentale* E. P. Bicknell]. In moist montane areas such as wet meadows, springs, seeps, and stream banks. NMEX: RAr. 2250 m (7380'). Flowering: late Jun–Jul. Our material belongs to **var.** ***occidentale*** (E. P. Bicknell) Douglass M. Hend. (of the West) and is found in the Rocky Mountains, reaching its southern limits at the northern edges of the San Juan drainage. Typical var. *idahoense* occurs in the Pacific Northwest, mainly Oregon and Washington

Sisyrinchium montanum Greene **CP** (of the mountains) Perennial herb, caespitose, to 50 cm tall; not glaucous. **STEMS** simple, winged, glabrous. **LEAVES** glabrous. **INFL** borne singly on an unbranched stem; spathes glabrous, outer bract 12–46 mm longer than the inner bract; outer bract often constricted near the apex (bract gradually tapers, then narrows noticeably, then widens again before tapering to apex); inner bract with gibbous base (bulges out noticeably). **FLOWER** tepals dark bluish violet; bases yellowish; outer tepals 9–14.5 mm; apex emarginate to retuse, aristate; filaments connate for nearly entire length. **FRUIT** capsule tan to dark brown, globose, 4–7 mm, pedicel erect to spreading. **SEEDS** globose to obconic, 1–1.5 mm, rugulose. In moist montane areas such as wet meadows, springs, seeps, and stream banks. COLO: Arc, Hin, LPl, San Juan. 2040–2855 m (6700–9365'). Flowering: late May–early Jul. *Sisyrinchium montanum* is transcontinental in distribution, across Canada and the northern tier of states in the United States, extending south in the Rockies to southern Colorado and northern New Mexico; it does not occur in Utah or Arizona. The species reaches its southern limits at the northern edge of the San Juan drainage. Our material is **var.** ***montanum***. Variety *crebrum* Fernald occurs in the northeast United States and Canada.

JUGLANDACEAE DC. ex Perleb WALNUT FAMILY

Linda Mary Reeves

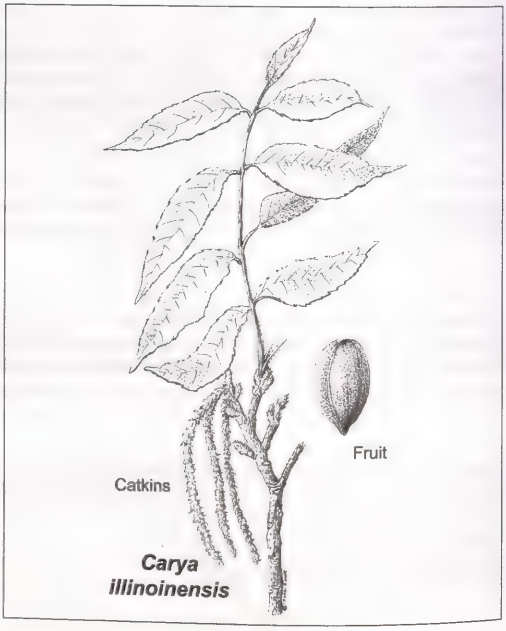
A small family of monoecious, rarely dioecious, aromatic trees and shrubs. **LEAVES** pinnately compound, primarily alternately, rarely oppositely; deciduous or evergreen. **INFL** with staminate pendulous catkins and pistillate flowers clustered or in solitary erect spikes or androgynous panicles. **FLOWERS** imperfect, wind-pollinated; staminate calyx 2–5-lobed; stamens 3–40; pistillate flowers bracteate; sepals 0–4; petals 0, stamens 3–105, sessile; pistil 1; ovary inferior, 2–4-carpelled, generally 2; ovule 1; style short, 1; stigmatic branches 2–4. **FRUIT** a drupe or winged nut with a fibrous husk derived from the involucre and calyx. **SEEDS** solitary, 2-lobed, with large, fleshy, oily cotyledons. x = 16. About 7 genera with about 60 species. North-temperate zone but also subtropical areas of southeast Asia and the Andes. The best known genera include the walnuts and butternuts (*Juglans*), and the hickories and pecans (*Carya*). Both produce fine-grained timber and valuable edible seeds with much ellagic acid (Laferriére 1993; Correll and Johnston 1979b).

1. Staminate and pistillate flowers usually without sepals; husk of fruit valvular; endocarp smooth or with reticulate markings.....*Carya*
1′ Staminate and pistillate flowers with 4 small sepals; fruit with weakly dehiscent husk and irregularly furrowed endocarp.....*Juglans*

Carya Nutt. Hickory, Pecan

(Greek, a nut) Trees with durable, hard wood and scaly buds, twigs reddish, with prominent light-colored lenticels. **LEAVES** petiolate; blade odd-pinnately compound; often glandular; leaflets 5–25, margin serrate to entire. **INFL** with staminate catkins usually in fascicles of 3 in the bud scale axils; pistillate flowers 2–10 in a cluster or short spike on a peduncle terminating the seasonal shoot above the leaves. **FLOWERS** (staminate) with 3–8 stamens, adnate to the bract and 2 bracteoles; filaments short or none, free; pistillate with a bract and 3 bracteoles sepal-like in flower, calyx absent; stigmas sessile, 2, often divided, stigmatic disc at base, papillose, persistent. **FRUIT** a drupe with a 4-valved husk, stony endocarp smooth (in ours) or reticulated. About 15 species in eastern North America and eastern Asia. Tasty seeds often eaten as food and cultivated widely in the Southwest, West, and Southeast; wood used for durable purposes and fine furniture.

Carya illinoinensis (Wangenh.) K. Koch (of Illinois) Pecan, nogal morado, nuez encarcelada. Large tree to 50 m high (ours shorter), occasionally developing a massive trunk; thick bark light brown to reddish, often deeply furrowed. Overwintering buds flattened and tomentose. **LEAVES** to 50 cm long (often shorter in ours), petiolate; leaflets 5–15, petiolulate, oblong-lanceolate to lanceolate, laterals falcate, apex acuminate, base often asymmetric, cuneate to rounded, margin serrate to doubly serrate, to 20 cm long and 7.5 cm wide (often smaller in both measurements); yellow-green; glabrous or pilose above; paler and glabrous to pubescent below. **FRUIT** in spikes or clusters of 3–11, cylindric or ellipsoid; apex acute or apiculate; base rounded. **SEEDS** oily, furrowed and edible. [*C. oliviformis* (Michx.) Nutt.; *C. pecan* (Marshall) Engl. & Graebn.; *Hicoria pecan* (Marshall) Britton; *Juglans illinoinensis* Wangenh.]. Scattered, naturalized or escaped specimens from homesteads and cultivation. Known in our area only from Canyon del Muerto, Arizona; escaped from Navajo orchards. ARIZ: Apa. 1900–1950 m (6200–6350′). Flowering: May–Jun. Fruit: Aug. Texas north to Iowa and Illinois, east to Ohio, Maryland, south to Florida. Widely cultivated for food and wood; seeds and wood gathered by many tribes.



Juglans L. Walnut, Nogal, Butternut

(classical Latin for walnut) Primarily large trees with furrowed, scaly bark and hard, fine-grained wood. Occasionally large shrubs. **LEAVES** oddly pinnately compound, with largest leaflets at midrib; leaflet margins serrate or entire, gland-dotted. **INFL** greenish, with staminate catkins sessile, axillary, pendulous on old wood; pistillate flowers solitary or in clusters, terminal on new leafy growth. **FLOWERS** subtended with 2–6 bracts; sepals 4, occasionally reduced to minute teeth; inner surfaces of stigmatic branches often deeply fringed. **FRUIT** a drupe with fibrous indehiscent exocarp and mesocarp; stony, furrowed endocarp. About 20 species in both the Eastern and Western Hemispheres. Other naturalized *Juglans* species, especially *J. nigra* L., which is probably escaped, should be searched for in riparian areas and around abandoned homesteads.

Juglans major (Torr.) A. Heller (greater) Arizona walnut, nogal, nogal silvestre, ha'atltse'dii. Tree to about 15 m with trunk to 120 cm diameter; however, often less than 8 m tall in our area and often with several trunks and shrublike.

Juglans major

Bark deeply furrowed and/or ridged; twigs reddish to dark brown, puberulent when young, gray with age. **LEAVES** 15–43 cm long; short-petiolate; leaflets 5–13 (occasionally more or less), lanceolate to falcate-lanceolate, apex acuminate, to 10 cm long, margin dentate-serrate, puberulent when young. **FRUIT** globose to oval, to 30 mm diameter; exocarp and mesocarp light brown, thin, glandular-pubescent; endocarp hard, furrowed. **SEEDS** small, edible. [*J. elaeopyren* Dode; *J. microcarpa* Berland. var. *major* (Torr.) L. D. Benson; *J. rupestris* Engelm. ex Torr. var *major* Torr.] Scattered in streams, washes, and canyons. Known in our area only from Canyon de Chelly and Navajo National Monument, Arizona. ARIZ: Apa, Nav. 1700–2100 m (5700–6800'). Flowering: Apr–May. Fruit: July–Aug. From the Edwards Plateau in Texas, Oklahoma through Utah and southwestern New Mexico, Arizona and south to Guerrero, Mexico. Our specimens probably naturalized from transplants in Navajo orchards. The wood has been used for durable fence posts. The seeds were eaten as winter food by many tribes. A major Navajo dye plant; the fruits are boiled for a golden brown dye, and the young twigs are used for a light brown or reddish dye.

JUNCACEAE Juss. RUSH FAMILY

David W. Jamieson

Annuals or mostly perennials, caespitose or rhizomatous grasslike herbs. **CULMS** terete or flattened, leafless or leafy. **LEAVES** with sheathing bases; sheaths open or closed, often supporting membranous to cartilaginous auricles at the transition to the blade. Blades reduced to bristles, or well developed and terete, or laterally or adaxially-abaxially flattened. **INFL** congested heads or open panicles. **FLOWERS** small, the tepals arranged in 2 series of 3 similar greenish to brown or purplish brown segments; stamens 3 or 6. **FRUIT** a 3-carpellate ovary that matures into a 1- or 3-loculed capsule. **SEEDS** 3 or many (Flora of North America Editorial Committee 2000; Hermann 1975; Cronquist et al. 1977; Hurd, Goodrich, and Shaw 1994; Weber and Wittmann 2001).

1. Leaves glabrous, sheaths open; ovary incompletely to completely 3-loculed; seeds numerous.....***Juncus***
1' Leaves and sheaths usually with hairy margins, sheaths closed; ovary 1-loculed; seeds 3 .....***Luzula***

Juncus L. Rush

(Latin, to join or bind, from use of the stems) Annual or mostly perennial grasslike herbs. **CULMS** caespitose, or arising individually or in clusters from slender to stout rhizomes, terete to sometimes flattened, leafless to leafy. **LEAVES** basal, alternate or 2-ranked; sheaths open basally, the upper margins often scarious and prolonged into membranous or cartilaginous auricles; blades absent, or present as a short bristle or with a well-developed blade, flattened, equitant, inrolled, channeled, or terete, and when so, often hollow or pith-filled and weakly to strongly septate-nodulose. **INFL** terminal or apparently lateral, essentially cymose, flowers arranged rarely singly, or in mostly few- to many-flowered clusters in open, paniculate or corymblike arrangements or in congested, many-flowered heads; subtended by a leaflike bract that is divergent or extends beyond the flowers as a continuation of the culm. **FLOWERS** small, sessile or pedicellate, pedicels and or flowers subtended by single scarious bracts, or the flowers subtended by a pair of variously shaped, scarious bracts called prophylls; perianth regular and hypogynous, in 2 series of 3 small and similar, variously scarious, chartaceous or tawny to green tepals; stamens 3 or 6, anthers shorter or longer than the filaments; ovary 3-carpelled, style single, often persistent in fruit and bearing 3 long stigma lobes. **CAPSULES** loculicidal, often variously shaped, apiculate or triquetrous, 1, or usually 3-loculed. **SEEDS** tiny and numerous, usually less than 1 mm, with one or both ends protruding as parenchymatous tails. About 350 species, Arctic and north-temperate regions.

1. Flowers prophyllate (each subtended by 2 hyaline-scarious bracts) ..... (2)
1' Flowers not prophyllate ..... (9)

2. Plants annual ..... ***J. bufonius***
2' Plants perennial, densely caespitose or rhizomatous ..... (3)

3. Plants densely caespitose ..... (4)
3' Plants rhizomatous ..... (8)

4. Leaf sheaths bladeless or bristle-tipped. ..... ***J. drummondii***
4' Lower leaf sheaths bladeless or bristle-tipped, but upper leaves clearly bladed ..... (5)

5. Inflorescence lateral, the inflorescence bract extending beyond the inflorescence like a continuation of the stem (sometimes shorter in *J. hallii*); seeds tailed ..... (6)
5' Inflorescence apparently terminal, the inflorescence bract more or less divergent from beneath the inflorescence; seeds not tailed ..... (7)

6. Capsules acute ..... ***J. parryi***
6' Capsules retuse ..... ***J. hallii***

7. Capsules obtuse to blunt, incompletely 3-loculed; auricles short, rounded, and cartilaginous ..... ***J. dudleyi***
7' Capsules clearly retuse, completely 3-loculed; auricles membranous ..... ***J. confusus***

8. Tepals acuminate; leaves reduced to bladeless sheaths, which may be bristle-tipped ..... ***J. arcticus***
8' Tepals obtuse and short, outer segments cucullate-tipped; leaves clearly bladed ..... ***J. compressus***

9. Plants caespitose ..... ***J. triglumis***
9' Plants rhizomatous ..... (10)

10. Leaves equitant, that is, flattened as in *Iris*, or the blade dorsiventrally flattened ..... (11)
10' Leaves terete and hollow, with internal septae, blades sometimes channeled toward the blade-sheath transition, or inrolled throughout ..... (12)

11. Leaf blades dorsiventrally flattened; seeds apiculate ..... ***J. longistylis***
11' Leaves equitant and ensifoliate, that is, folded and flattened as in *Iris* ..... ***J. ensifolius***

12. Leaf blades largely inrolled, becoming terete and septate only in the tip; auricles absent; seeds long-tailed at both ends ..... ***J. castaneus***
12' Leaf blades uniformly terete, hollow and septate; auricles present; seeds apiculate ..... (13)

13. Capsules acuminate ..... (14)
13' Capsules rounded-obtuse ..... (16)

14. Flowers in flowering heads little divergent, mostly erect; inflorescence open, flowering heads on spreading to divaricate branches ..... ***J. articulatus***
14' Flowers in flowering heads radiating in all directions at maturity ..... (15)

15. Tepals long-acuminate, subspinulose and slightly reflexed in the upper 1/2; inner series shorter than the outer; inflorescence of mostly 2–10 crowded, dense, many-flowered (25–70+) clusters; leaves diverging from the stems ..... ***J. torreyi***
15' Tepals merely acuminate, straight; inflorescence open, of many, fewer-flowered (5–10) clusters; leaves erect ..... ***J. nodosus***

16. Flower cluster solitary and terminal; tepals acuminate and exceeding the capsule ..... ***J. mertensianus***
16' Flower clusters numerous on erect branches in an open inflorescence; tepals acute or obtuse and shorter than the capsule ..... ***J. alpinoarticulatus***

Juncus alpinoarticulatus Chaix (alpine rush) Northern green rush. Tufted perennial from a short rhizome. **CULMS** 5–30 cm tall. **LEAVES** 1–2, mostly toward the base, sheath ending in a short, rather cartilaginous auricle, blade terete, hollow and distantly septate. **INFL** of 5–40 small flower clusters; 2–8 flowers borne on ascending to erect branches in a terminal panicle, 2–8 cm long. **INVOLUCRAL BRACTS** leaflike, shorter than the inflorescence. **FLOWERS**

nonprophyllate; tepals 2–2.5 mm long, outer set obtuse to acute, sometimes apiculate, inner tepals shorter, obtuse. stamens 6. **CAPSULES** slightly longer than the tepals, acute, brown. **SEEDS** elliptic, apiculate, less than 0.5 mm long. Seeps, streams, ponds, and lake margins, often in calcareous sites. COLO: Arc. 2255 m (7400'). Flowering Jul–Aug. Scattered, boreal North America.

Juncus articulatus L. (divided into joints) Joint-leaf rush. Perennial, arising from a stout rhizome. **CULMS** terete, 15–40 cm tall. **LEAVES** 3–4, cauline. Lower sheaths bristle-tipped, upper sheaths obtuse, membranous-auriculate, upper leaf blades terete, hollow, and conspicuously septate. **INFL** terminal, of 2–25 flower clusters borne on spreading to divaricate branches, clusters 2–10-flowered. **INVOLUCRAL BRACTS** leaflike, septate, shorter than the inflorescence. **FLOWERS** nonprophyllate, subtended by 1 scarious bract; tepals 2 mm long, lanceolate, acute to acuminate, sometimes slightly apiculate; stamens 6. **CAPSULES** ovoid, triquetrous, style persistent as a beak, 3 mm and exceeding the tepals. **SEEDS** less than 0.5 mm long, ovoid-apiculate, striate-reticulate, brown. Roadsides, ditches, stream banks, pond and lake margins, and wet meadows. ARIZ: Apa; COLO: Arc, LPl, Mon, SJn; NMEX: SJn; UTAH. 1525–3170 m (5000–10400'). Flowering: Jul–Sep. Scattered across North America.

Juncus arcticus Willd. (of the Arctic) Arctic rush. Perennial, arising from a moderate to stout rhizome. **CULMS** 20–110 cm tall. **LEAVES** bladeless, sheaths well developed. **INFL** lateral, of 5–50 pedicellate flowers in a congested to a mostly open panicle. **INVOLUCRAL BRACTS** terete, extending well beyond the inflorescence as continuation of the stem. **FLOWERS** prophyllate; tepals light to chestnut brown, 3–6 mm long, lanceolate, acute to acuminate, stamens 6; anthers twice as long as the filaments. **CAPSULES** brown, shorter or longer than the tepals, ovoid to slightly oblong, apex obtuse to mostly acute, style base persistent as a short beak. **SEEDS** less than 0.5 mm, light brown, ovoid to pyriform, obliquely ellipsoid, not tailed. Mostly riparian, but may occur in hanging gardens, grasslands, sagebrush, piñon-juniper to montane forests; often on alkaline or saline soils. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon, SMg, NMEX: McK, RAr, SJn; UTAH. 1525–2590 m (5000–8500'). Flowering: May–Aug. Scattered across boreal North America, northern and western United States. Our material belongs to **var. *balticus*** (Willd.) Trautv. (of the Baltic)

Juncus bufonius L. (toad, referring to wet habitats) Toad rush. Plants annual, weakly to strongly caespitose. **CULMS** slender, 2–35 cm tall, few to many and crowded, rarely branched. **LEAVES** few per culm, mostly cauline and on the lower culm, or basal in small plants; sheaths well developed, with membranous margins that disappear in the transition to the flat to inrolled blade, up to 1.5 mm wide. **INFL** of 1–20 flowers, sessile to shortly pedicellate in open panicles. **INVOLUCRAL BRACTS** 1 or 2, lowermost often lanceolate-setaceous, upper mostly ovate to lanceolate, scarious. **FLOWERS** with prophylls ovate and entirely scarious; outer tepals 4–7 mm long, lanceolate-acuminate, midvein green, narrow to broad with narrow to wide, scarious margins, inner tepals similar, but generally shorter, tips variable, obtuse, acute, or acuminate; stamens 6. **CAPSULES** greenish to castaneous, oblong to broadly ovoid, mucronate, incompletely 3-celled. **SEEDS** ovoid, brown, lacking appendages, less that 0.5 mm. Moist to wet meadows, pond margins. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, SJn; UTAH. 1125–2775 m (3700–9100'). Flowering May–Sep. Cosmopolitan.

Juncus castaneus Smi. (for the chestnut color) Chestnut rush. Rhizomatous perennial. **CULMS** 10–40 cm tall. **LEAVES** mostly toward the culm base; sheath not auriculate, transition to blade gradual, blade flat, but strongly inrolled through most of its length, becoming terete at the tip. **INFL** of 1–4 flower clusters each with 2–7 flowers, flower clusters nearly sessile to pedicellate. **INVOLUCRAL BRACTS** exceeding the inflorescence; sheath somewhat inflated, but tapering to a terete tip. **FLOWERS** nonprophyllate; tepals lanceolate, acute to slightly apiculate, 5–7 mm long, scarious-brown to brown; stamens 6, filaments much longer than the anthers. **CAPSULES** dark brown, well exceeding the tepals, somewhat broadly lanceolate to oblong with a short stylar beak. **SEEDS** long-tailed at both ends, tails longer than the seed, 1.5 mm overall. Wet meadows, ponds, and stream margins in the subalpine and alpine. COLO: Arc, LPl, SJn. 3505–3810 m (11500–12500'). Flowering: Jul–Aug. Circumboreal in the north, cordilleran in the west.

Juncus compressus Jacq. (compressed, but what it refers to is unclear) Compressed rush. Perennial, arising from a slender rhizome. **CULMS** terete, 30 cm tall. **LEAVES** 1–3, cauline, sheath well developed, with opaque auricles, blades flat but broadly channeled; 1 or 2 basal leaf sheaths bristle-tipped. **INFL** open, of 30–40 individually pedicellate flowers. **INVOLUCRAL BRACTS** leaflike and reaching beyond the inflorescence; bract blade channeled. **FLOWERS** prophyllate; tepals 1.5–2.3 mm long; outer tepals longer than the inner and with distinctly cucullate tips; shorter inner tepals with tips rounded-obtuse; stamens 6. **CAPSULES** to 3 mm long, ovoid, dark brown. **SEEDS** ovoid, slightly curved, less than 0.5 mm long, apiculate, golden. Riparian. One collection along the Mancos River. COLO: Mon. 2135 m (7000'). Flowering: Jun. Widely scattered across North America.

Juncus confusus Coville (confusing) Perplexing rush. Caespitose perennial. **CULMS** 10–40 cm tall. **LEAVES** all attached toward the base, uppermost leaves with well-developed, flat to channeled blades, auricles membranous, about 1 mm long. **INFL** of few to 20 congested, short-pedicellate flowers, clusters less than 2 cm in diameter. **INVOLUCRAL BRACTS** slender, well exceeding the inflorescence. **FLOWERS** prophyllate; tepals 3–4.5 mm long, lanceolate to ovate-lanceolate, acute; stamens 6. **CAPSULES** equaling or shorter than the tepals, ovoid-oblong, completely 3-loculate, apex distinctly retuse. **SEEDS** less than 0.5 mm long, golden, striate, apiculate. Roadside ditches, meadows. COLO: Mon, SJn. 2375–2805 m (7800–9200'). Flowering: Jul–Aug. Western North America.

Juncus drummondii E. Mey. (for Thomas Drummond, 1790–1835, Scottish botanical explorer and naturalist) Drummond's rush. Densely caespitose perennials. **CULMS** terete, 15–40 cm tall. **LEAVES** basal, occupying the lower 1/4 of the stem, sheaths 2–6 cm long, blade absent or present as a 1–2 mm long bristle. **INFL** appearing lateral by means of the erect involucral bract surpassing the flowers. **INVOLUCRAL BRACTS** terete beyond scarious auricles, 1–4 cm long. **FLOWERS** prophyllate, in groups of 1–3, all may be sessile or pedicellate, though the lowermost flower tends to be sessile, while upper flowers tend to be short-pedicellate; prophylls scarious, the first prophyll of the lowermost flower tends to be lanceolate-acuminate, but the acumen is often elongated as a 1–2 mm long awn, other prophylls are broader and acute; tepals 5–7 mm long, lanceolate-attenuate, castaneous with scarious margins; stamens 6. **CAPSULES** oblong, truncate and usually retuse, trilocular. **SEEDS** narrow, elliptic-fusiform, both ends long-tailed, reaching 1.5–2 mm. Very common in upper montane meadows, along stream banks, and under forested slopes. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr; UTAH. 3110–3930 m (10200–12900'). Flowering: July–Aug. Cordilleran.

Juncus dudleyi Wiegand (for William Russel Dudley, 1849–1911, its discoverer) Dudley's rush. Caespitose perennial. **CULMS** 15–50 cm tall. **LEAVES** arising from the lower 1/3 of the culm; sheath margins scarious, ending in short, round, opaque to yelllowish, distinctively cartilaginous auricles; blades narrow, flat, with very slightly ridged margins, shallowly channeled to inrolled. **INFL** 3–60-flowered, flowers pedicellate, congested to lax. **INVOLUCRAL BRACTS** slender, leaflike, 1–12 cm long, exceeding the inflorescence. **FLOWERS** prophyllate; tepals lanceolate-acuminate, 3–5 mm long, scarious-margined, with a broad green midvein; stamens 6. **CAPSULES** ovoid, 1-celled, tip obtuse to slightly retuse with a short stylar beak. **SEEDS** less than 0.5 mm long, apiculate, not tailed, golden brown. In ditches, along streams, around ponds and lakes, wet meadows. ARIZ: Apa; COLO: Arc, LPl, SJn; NMEX: McK, SJn; UTAH. 1125–2620 m (3700–8600'). Flowering: Jun–Sep. Widely scattered throughout North America.

Juncus ensifolius Wickstr. (for the sword-shaped blades) Sword-leaf rush. Rhizomatous perennial. **CULMS** 20–60 cm tall. **LEAVES** 1–3 per culm, upper edges of the sheath scarious-margined, ending in small membranous auricles or transitioning smoothly to the blades, blades equitant and ensifoliate, upper blade irregularly and incompletely septate. **INFL** paniculate, variable, composed in one extreme of 2–6 more or less globose, many-flowered (20+) flower clusters or, in a second extreme, of 10–30 or 40 or more small, few-flowered (10 or fewer) clusters of erect to spreading flowers. **INVOLUCRAL BRACTS** leaflike and ensifoliate, shorter than the inflorescence. **FLOWERS** nonprophyllate; clusters and flowers subtended by single, scarious, acuminate bracts; tepals lanceolate-acuminate, 3–3.5 mm long, greenish brown to dark chestnut; stamens 6, anthers shorter or longer than the filaments. **CAPSULES** shorter than the tepals, ovoid to oblong, rounded toward the apex, style persistent as a short beak, chestnut-brown. **SEEDS** about 0.5 mm long, ellipsoid, apiculate or very short-tailed. Riparian, springs, roadside ditches, seepy cliff crevices. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Min, Mon, SJn; NMEX: McK, SJn; UTAH. 1125–2925 m (3700–9600'). Flowering: Apr–Sep. Western North America. Our material belongs to **var. *montanus*** (Engelm.) C. L. Hitchc. (of mountains). Various botanists have recognized two species (*J. saximontanus* and *J. tracyi*) as segregated from *J. ensifolius* and two varieties within *J. ensifolius*, named var. *montanus* and var. *brunnescens*. The segregate species and the two varieties are distinguished in part from *J. ensifolius* by the presence of three stamens in the latter and six in all of the former. Careful dissections reveal that all specimens seen from the study area have six stamens; therefore, only *J. ensifolius* is recognized in the flora. *Juncus saximontanus* and *J. tracyi* are names that elevate to species various expressions of plants also named *J. ensifolius* var. *montanus*. *Juncus ensifolius* var. *montanus* is characterized by Cronquist et al. (1977) as having few (10 or less), many-flowered (10–25) heads and distinguished from var *brunnescens*, which is said to have "heads relatively numerous, mostly 10–50 and few flowered (4–12)." In the study area there are no consistent differences between the two varieties and the two segregate species. Therefore, only *J. ensifolius* var. *montanus* is recognized for the study area (Brooks and Clemants 2000). However, *Juncus* is a sadly undercollected genus in this region, especially the La Plata and San Juan mountains. Additional collections are needed and will shed much needed insight into the difficulties with the *J. ensifolius* complex.

Juncus hallii Engelm. (for Elihu Hall, 1822–1882, botanist) Hall's rush. Caespitose perennials. **CULMS** 10–40 cm tall. **LEAVES** basal or cauline, mostly toward the base, basal leaves bladeless or bristle-tipped, cauline leaves with terete blades. **INFL** appearing terminal, involucral bract said to be deflected to the side, flowers 2–3 (7) per cluster, sessile to short-pedicellate. **INVOLUCRAL BRACTS** glumelike at the base, with scarious margins and tapering into a terete awn that may exceed the inflorescence. **FLOWERS** prophyllate, usually in clusters of 2–3; tepals 4–5 mm long, acute; stamens 6. **CAPSULES** oblong-ovoid, dark brown, 3-celled, tip retuse. **SEEDS** slightly elongate-ovate, striate, short-tailed, about 1 mm with tails. Dry to boggy meadows, around ponds and lakes, and along streams into montane and aspen forests. COLO: Arc, Dol; NMEX: RAr. 2440–3140 m (8000–10300'). Flowering: Jun–Jul. Rocky Mountains, Montana to Colorado. The species is little known in the region and should be sought. The species is often confused with *J. parryi*, which differs in having acuminate tepals and acute capsules.

Juncus longistylis Torr. (long style) Longstyle rush. Perennial from slender, spreading rhizomes. **CULMS** terete (15–45) 60+ cm tall. **LEAVES** mostly basal, 1–3 cauline and remote from each other, sheath margins scarious-hyaline, terminating in rounded, sometimes slightly cartilaginous auricles, blades flat. **INFL** often of 1–3 crowded and terminal heads, occasionally with 2–3 (4) additional heads elevated and slightly separated on peduncles above the others. **INVOLUCRAL BRACTS** with the lowest inflorescence bract scarious, lanceolate to broadly lanceolate, broad midvein often extending as an awn. **FLOWERS** nonprophyllate, arranged in clusters of 2–4, individual flowers subtended individually or in small groups by a scarious, ovate to lanceolate, often acuminate bract; tepals 5–7 mm long, green, brownish to sometimes reddish anthocyanic, lanceolate, acute to slightly acuminate, margins scarious to hyaline; stamens 6, anthers longer than the filaments. **CAPSULES** oblong or ellipsoid, acute to retuse, incompletely trilocular; style 1 mm or longer, stigma long-exserted. **SEEDS** less than 0.5 mm long, apiculate, but not tailed. Wet meadows, canyon-side seeps and springs, streams; occasionally in saline places from desert shrub to spruce forest. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1675–3050 m (5500–10000'). Flowering: May–Sep. West across Canada into montane western North America.

Juncus mertensianus Bong. (for C. H. Mertens, 1796–1830, botanist at Sitka, Alaska) Mertens' rush. Perennial, arising from a creeping rhizome. **CULMS** slender, 7–35 cm tall. **LEAVES** 1–3, mostly cauline, sheaths scarious toward the blade, ending in a rounded to acute, membranous, 0.5–1 mm long auricle, blades terete, septate, ending below the inflorescence. **INFL** terminal, of 1 or 2 mostly solitary flower clusters of 10–50+ flowers. **INVOLUCRAL BRACTS** diverging from beneath the inflorescence, leaflike, with well-developed sheath, blade terete, shorter than or shortly exceeding the inflorescence. **FLOWERS** nonprophyllate, each subtended by 1 lanceolate-acuminate bract; tepals lanceolate-acuminate, dark shiny purplish brown to nearly black, 3–5 mm long; stamens 6. **CAPSULES** slightly shorter than or equaling the tepal length, apex oblong, truncate to slightly retuse, color similar to the tepals. **SEEDS** less than 0.5 mm long, brown, elliptic, apiculate, not tailed. Wet meadows, ponds, lakes, and stream banks. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn; NMEX: McK. 2925–3840 m (9600–12600'). Flowering: Jul–Sep. Western North America.

Juncus nodosus L. (jointed, referring to the septate leaves) Nodose rush. Slender perennials arising from slender rhizomes. **CULMS** terete, 20–40 cm tall. **LEAVES**: cauline shorter or longer than the inflorescence; sheath ending in slightly cartilaginous auricles; blades hollow and septate, terete or with a slight adaxial channel. **INFL** of 1–6 open to slightly congested flower clusters, included within or exceeded by the length of the involucral bract; flower clusters 6–11 mm diameter, 5–25-flowered, mostly 15 or fewer and radiating in all directions. **INVOLUCRAL BRACTS** slender, leaflike, short or long, but exceeding the inflorescence. **FLOWERS** nonprophyllate, each subtended by a single scarious, ovate-acuminate bract; tepals 3–4 mm long, more or less equal, narrowly lanceolate, subulate-acuminate, more or less straight; stamens 6. **CAPSULES** exceeding the tepals, trigonous, light to dark brown. **SEEDS** less than 0.5 mm long, ovoid and apiculate, striate, light to dark brown. Riparian; in and along ditches and streams from sagebrush to wet montane meadows. COLO: Arc, LPl, Mon, SJn; NMEX: SJn. 1705–2620 m (5600–8600'). Flowering: Jul–Sep. Scattered across North America.

Juncus parryi Engelm. (for Charles Parry, 1823–1890, botanist and explorer) Densely caespitose perennials. **CULMS** terete, 10–40 cm tall. **LEAVES** essentially basal, lower sheaths bristle-tipped, upper sheaths bearing well-developed blades. **INFL** terminal, lowest involucral bract said to reflex away. **INVOLUCRAL BRACTS** with lowest bract 1–3 cm long, glumelike, with scarious basal margins, abruptly narrowed into a terete awn, generally deflected laterally; flowers sessile to short-pedicellate. **FLOWERS** few, 1–3, prophyllate, first prophyll of the only or lowest flower often elongated in a short awn, other prophylls simple hyaline scales; tepals lanceolate-acuminate, 5–7 mm long; stamens 6. **CAPSULES** narrow and acute, brown. **SEEDS** ovoid-elliptic, brown, surface finely striate, to 2 mm long with tails.

Meadows; along streams or on dry, rocky slopes in upper montane forests into the alpine. COLO: Arc, Con, Hin, LPl. 3050–3960 m (10000–13000'). Flowering: Jul–Aug. Cordilleran; British Columbia and Alberta to Colorado. While the capsule is described as having acute tips, occasional specimens are more oblong, with abruptly acute to almost blunt tips; nevertheless, there is no suggestion of their being retuse, and therefore confused with *J. hallii*.

Juncus torreyi Coville (for John Torrey, 1796–1873, botanist) Torrey's rush. Perennials arising from stout, creeping rhizomes. **CULMS** stout, 30–75 cm tall. **LEAVES** 1–4, long cauline-sheathed, with membranous auricles; blades septate thorughout and terete, but the proximal blade is slightly channeled on the adaxial curvature, while completely terete in the extremities. **INFL** terminal, composed of 2–12 (18) generally congested flower clusters, each 10–15 mm in diameter. **INVOLUCRAL BRACTS** equaling or exceeding the inflorescence. **FLOWERS** nonprophyllate, 10–75+ in crowded clusters, radiating in all directions within a cluster; outer tepals dry-grass green to tawny, 4–5 mm long, lanceolate-acuminate, often gently to strongly reflexed in the rigid acumen; inner tepals slightly shorter than the outer; stamens 6, about 1/2 as long as the tepals. **CAPSULES** equal to or slightly exceeding the tepals, narrowly triquetrous and subulate, golden brown. **SEEDS** less than 0.5 mm long, oval, striate, apiculate at either end, golden brown. Seeps and springs, ditches, ponds and lakes, and rivers. COLO: Arc, LPl, Mon; NMEX: RAr, SJn; UTAH. 1125–1980 m (3700–6500'). Flowering: Jun–Sep. Canada to northern Mexico.

Juncus triglumis L. (three flowered) Three-flowered rush. Small, densely caespitose perennials. **CULMS** terete, filiform, 6–12 cm tall. **LEAVES** basal or on the lower culm; sheaths yellow to brownish, well developed and auriculate, blades less than 1/2 the length of the culm, abruptly narrowed, filiform, terete, with callous, septate tips. **INFL** terminal and solitary, 2–3-flowered, 3–5 mm long. **INVOLUCRAL BRACTS** 2, rarely 1, divergent, weakly spathiform, mostly acute, or the lowermost bract rarely tapered into a short (1–2 mm) awn, mostly pale yellow, sometimes pale chestnut at the base. **FLOWERS** nonprophyllate; tepals subequal, 4–5 mm long, oblong-lanceolate, obtuse to acute, mostly pale yellow or colorless, sometimes very pale brown; stamens 6, anthers 1 mm or less long, much shorter that the filaments. **CAPSULES** 3–4 mm long, chestnut, ovoid, mostly acute and apiculate by means of the persistent style, or slightly obtuse. **SEEDS** golden, about 1 mm long, tails white, to about 0.5 mm long. Wet to boggy, peaty meadows and associated lake margins. COLO: LPl, SJn. 3810 m (12500'). Flowering: Jul. North American, Arctic-alpine, Labrador to Alaska and south in the Rocky Mountains to Colorado and New Mexico. Our material belongs to **var. *albescens*** Lange (referring to the white tepals). Inflorescences typically produce two or three flowers that are subtended by two inflorescence bracts that nearly reach the tepal tips. In other individuals one may occasionally find one of the two bracts being awned and reaching beyond the flowers, or just a single awned bract reaching well beyond the inflorescence. In all cases, the tepals are pale.

Luzula DC. Woodrush

(Latin from *gramen luzulae* or *luxae*; *lux*, light; perhaps alluding to the appearance of the heads when covered with dew) Caespitose or rhizomatous, perennial, grasslike herbs. **LEAVES** composed of closed sheaths and flattened blades, sheath collar and lower blade margins bearing few to many, long-pilose hairs, at least in young leaves. **INFL** composed of several to many, few-flowered clusters arranged in open, cymose panicles or in congested, capitate or spikelike heads. **FLOWERS** perfect, subtended by ciliate to ciliate-fimbriate pairs of prophylls; each flower is further subtended by individual secondary bracts with ciliate margins; tepals 6, in 2 similar series of 3, un-petal-like, scarious and chartaceous, hyaline to sometimes greenish, mostly brown, purple-brown, or blackish; stamens 6. **CAPSULES** 3-carpellate, uniloculate, ovules 3 and basal, maturing into 3 seeds. (Cronquist et al. 1977; Hitchcock et al. 1969; Flora of North America Editorial Committee 2000; Weber and Wittmann 2001).

1. Inflorescence an open, regularly drooping, cymoselike panicle, flowers many, arranged in groups of 2–3; leaves mostly glabrous at maturity ..... ***L. parviflora***
1' Inflorescence of several to many clusters of flowers arranged in congested capitate heads or spikes ..... (2)

2. Inflorescence elongated, spikelike; primary and secondary involucral bract margins abundantly ciliate, secondary bracts long-acuminate; prophylls ciliate-fimbriate; leaves 1–4 mm wide ..... ***L. spicata***
2' Inflorescence capitate, composed of a few congested flower clusters; primary and secondary involucral bract margins sparsely hairy; leaf blades to 8 mm wide ..... ***L. subcapitata***

Luzula parviflora (Ehrh.) Desv. (little flowers) Millet woodrush. Caespitose perennials, rarely with a short rhizome. **CULMS** 20–100 cm tall. **LEAVES** 2–4 per culm, 6–11 mm wide. In young plants upper sheath and blade margins may be sparsely hairy, but glabrous at maturity. **INFL** an open, drooping panicle, flowers sessile to mostly pedicellate; nodes

subtended by scarious, hyaline, lanceolate bracts with regularly lacerate margins. **FLOWERS** prophyllate, prophylls scarious-hyaline to brown, ovate with lacerate margins; tepals ovate to broadly lanceolate-acuminate, 2–2.5 mm long, scarious, hyaline to brown; stamens 6, anthers shorter than or equal to the filament length. **CAPSULES** ovoid to ovoid-oblong, slightly shorter or longer than the tepals, green to brown, style remnant persistent as a beak. **SEEDS** ellipsoid, 1–1.4 mm long, brown. Moist meadows, along streams, mixed conifer forest, spruce-fir forest, subalpine to alpine. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: SJn; UTAH. 2590–3690 m (8500–12100'). Flowering: Jun–Sep. Circumboreal; western North America.

Luzula spicata (L.) DC. (for the spicate inflorescence) Spike woodrush. Caespitose perennial. **CULMS** 3–25 cm tall. **LEAVES** basal and crowded, cauline leaves 1–4 mm wide, leaf margins and especially sheath margins pubescent in age. **INFL** of congested, 1–several-flowered clusters of sessile to very short-pedicellate flowers arranged in an erect or drooping, but mostly nodding spike; secondary bracts strongly ciliate and long-awned. **INVOLUCRAL BRACTS** leaflike, shorter to slightly longer that the inflorescence, generally divergent. Sheath and lower blade margin ciliate. **FLOWERS** subtended by irregular, ovate, hyaline to purplish brown, ciliate-fimbriate prophylls; tepals hyaline to mostly dark, purplish brown, ovate to lanceolate, 2–3.5 mm long, acuminate, acumen to almost 1 mm; stamens 6, anthers slightly shorter than to ± equal to the filaments. **CAPSULES** globose, light to dark brown, slightly shorter than to about equal to the tepals. **SEEDS** brown, ovoid-oblong, 1–1.2 mm long, slight caruncle. Rocky ground; subalpine to mostly alpine meadows. COLO: Arc, Hin, LPl, Mon, SJn. 3350–3960 m (11000–13000'). Flowering: Jun–Aug. Western North America, New England, and eastern Canada.

Luzula subcapitata (Rydb.) H. D. Harr. (for the subcapitate inflorescence) Colorado woodrush. Caespitose perennial. **CULMS** crowded on short rhizomes, 10–35 cm tall. **LEAVES** basal and cauline, crowded at the base, cauline leaves 2–4. Blades up to 8 mm wide and often tinged reddish or reddish brown. **INFL** of 6–10 flower clusters arranged into a congested, irregularly shaped capitate group. **INVOLUCRAL BRACTS** leaflike, but reduced, mostly exceeding the inflorescence. **FLOWERS** prophyllate, prophylls entire to slightly lacerate; flowers essentially sessile; tepals up to 2 mm long, ovate to ovate-lanceolate, sometimes slightly acuminate, scarious, reddish brown, outer series slightly keeled; stamens 6, small; anthers about as long as, or slightly longer than the filaments. **CAPSULES** globose, ± equal to the tepals, dark purplish brown. **SEEDS** ellipsoid, slightly over 1 mm long, brown. Bogs and streamsides in the alpine. COLO: SJn. 3780–3830 m (12400–12560'). Flowering: Aug. A Colorado Rockies endemic.

JUNCAGINACEAE Rich. ARROW-GRASS FAMILY

C. Barre Hellquist

Perennial or annual herbs, rhizomatous. **LEAVES** basal, emergent, sessile, sheath longer than the blade, ligulate, auriculate, blade linear. **INFL** pedunculate, a terminal or axillary scapose spike or spikelike raceme, occasionally with solitary flowers. **FLOWERS** bisexual or unisexual, monoecious, perianth usually present; tepals 1, or 6 in 1–2 series; pistils 1, 3, or 6, if 3 or 6, coherent or weakly connate. **FRUIT** a nutlet or schizocarp. **SEED** 1. Four genera, approximately 15 species worldwide.

Triglochin L. Arrow-grass

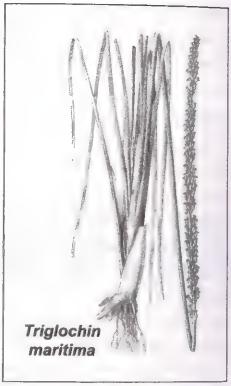
(Greek *treis*, three, + *glochis*, a point) Perennial herbs. Roots occasionally with tubers, rhizomes stout. **LEAVES** erect, terete, sheath with ligule. **INFL** a spikelike raceme, scape shorter or longer than leaves. **FLOWERS** bisexual, short-pedicellate; tepals 6, in 2 series; stamens 4 or 6; pistils 6, 3 fertile, 3 sterile, or 6 fertile. **FRUIT** a schizocarp, mericarps 3 or 6. $x = 6$ (Ford and Ball 1988; Löve and Löve 1958). Species around 12 worldwide. The genus is treated as feminine rather than neuter as treated in some floras (Crow and Hellquist 2000).

1. Carpels and stigmas 6; mature fruit 2–3 mm wide, about 2 times as long as wide; no stolons formed ..... ***T. maritima***
1′ Carpels and stigmas 3; mature fruit 1 mm wide, about 5–7 times as long as broad; stolons present, bearing small bulbs ..... ***T. palustris***

Triglochin maritima L. (of the sea) **LEAVES** erect from stem, 2.2–11.5 cm; sheath 0.7–2.5 cm long; ligules occasionally hoodlike, 2-lobed, apex obtuse to round. **INFL** scape often purple at base, usually exceeding leaves, pedicel 1–4 mm long. **FLOWER** tepals elliptic, apex acute; pistils 6, all fertile. **FRUIT** receptacle lacking wings; schizocarp linear to globose, 2–4.5 mm long; mericarp linear to linear-obovate, 1.5–3.5 mm long, beak 0.2 mm. $2n = 12, 24, 36, 48, 120$. [*T. concinna* Burtt Davy; *T. concinna* var. *debilis* (M. E. Jones) J. T. Howell; *T. debilis* (M. E. Jones) Á. Löve & D. Löve; *T. elata* Nutt.]. Mountain marshes and wet alkaline meadows in our area. ARIZ: Apa; COLO: Arc, LPl, Mon, SJn; NMEX: SJn.

1400–2150 m (4650–8800'). Flowering and fruiting: Jun–Jul. Alaska and Yukon east across Canada to Newfoundland, south to California, New Mexico, Iowa, Indiana, and Rhode Island; Mexico; Central America; Eurasia. *Triglochin concinna* is recognized as synonymous with *T. maritima* following the treatment of Haynes and Hellquist (2000) in the *Flora of North America*, where they also note that *T. maritima* is high in cyanide and is toxic to livestock.

Triglochin palustris L. (of marshes) **LEAVES** erect from sheath, 5–24.5 cm; sheath 3.5–5 cm long; ligule not hooded, unlobed; apex acute. **INFL** scape often purple at base, usually exceeding leaves. **FLOWER** pedicel 0.4–4.5 mm long, tepals elliptic, apex round; pistils 6, 3 fertile, 3 sterile. **FRUIT** a receptacle with wings; schizocarp linear, 7–8.3 mm long; mericarps linear, 6.5–8.5 mm long; beak 0.3 mm. $2n = 24$. Mountain marshes and wet alkaline meadows in our area. ARIZ: Apa; COLO: LPl. 1650–2150 m (5450–7050'). Flowering and fruiting: Jun–Jul. Alaska east across Canada to Newfoundland, south to California, New Mexico, Iowa, Ohio, and Rhode Island; Mexico; South America; Eurasia.



Triglochin maritima

LAMIACEAE Martinov (LABIATAE) MINT FAMILY

Charlotte M. Christy

Plants annual to perennial herbs or shrubs, mostly pubescent and aromatic. **STEMS** typically 4-angled. **LEAVES** opposite (rarely otherwise), simple, rarely entire. **INFL** a cyme, but often congested, forming a dense verticil and these often arranged in a spike, in some forming a head, or flowers 1–few per axil and then forming a raceme or panicle. **FLOWERS** usually perfect; calyx of 5 fused sepals with 2–5 lobes or teeth, actinomorphic to zygomorphic, typically persisting; corolla of 5 fused petals with 4–5 lobes, mostly bilabiate, a few only weakly zygomorphic; stamens 4 or 2 and staminodes 2 or 0; pistil 1; carpels 2; ovary superior, lobes 4, ovules 4; style 1, the stigmas 2, these equal or not, in some appearing only 1. **FRUIT** a schizocarp of 1-seeded nutlets, these spherical, oblong, ovate, or obdeltoid (Cantino 1992). Around 200 genera and 3500–5000 species. Cosmopolitan. The volatile, aromatic oils lead many species to be used as herbal remedies or as culinary herbs; others are cultivated for ornament. Two introduced, naturalized genera (*Lamium* and *Leonurus*) are apparently not known from our area but may perhaps be locally encountered. Both species of *Lamium* (*L. amplexicaule* L. and *L. purpureum* L.) are common weeds of lawns and disturbed areas. *Leonurus cardiaca* L. is most likely to be found in upper-elevation riparian or other moist habitats.

1. Calyx zygomorphic, the teeth or lobes unevenly fused, or markedly different in orientation or size ....(2)
1' Calyx actinomorphic or nearly so, the teeth or lobes at most slightly differing in fusion, orientation, or size ...(11)

2. Fertile stamens 2, staminodia may be present ....(3)
2' Fertile stamens 4, staminodia absent ....(4)

3. Upper calyx teeth apparently 0, or 3 and strongly fused; connective markedly elongate, the filament appearing forked or jointed; only 1/2 of each anther functional ....***Salvia***
3' Upper calyx teeth 3, not strongly fused; connective not unusually elongate, the filament appearing linear; both anther halves fully developed ....***Hedeoma***

4. Calyx teeth strongly fused, appearing 2, forming 2 lips, the upper lip crested and falling at maturity; flowers solitary in the axils ....***Scutellaria***
4' Calyx teeth evidently more than 2, forming 0–2 lips, the upper lip, if present, lacking a crest and attached at maturity; flowers several to many per axil ....(5)

5. Uppermost calyx lobe markedly larger than the other 4 lobes, forming a lip ....***Dracocephalum***
5' Upper calyx sections similar in size, a lip absent or formed by fusion of teeth or lobes ....(6)

6. Upper 3 calyx teeth at least partially fused, forming a lip ....(7)
6' Upper calyx teeth separate, not forming a lip ....(8)

7. Inflorescence a spike; upper 3 calyx teeth almost completely fused ....***Prunella***
7' Inflorescence a single verticil; upper 3 calyx teeth fused approximately halfway ....***Satureja***

8. Calyx with all teeth equal or the upper teeth longer than the lower ..... (9)
8′ Calyx with the lower teeth longer than the upper ..... (10)

9. Upper lip of the corolla so deeply lobed as to appear absent; flowers in terminal spikes ..... ***Teucrium***
9′ Upper lip of the corolla 2-lobed; flowers in terminal panicles ..... ***Trichostema***

10. Plants creeping, sparsely pubescent; axils with 1–few flowers ..... ***Glechoma***
10′ Plants erect, tomentose; axils with many-flowered verticils ..... ***Nepeta***

11. Stamens 2 ..... (12)
11′ Stamens 4 ..... (14)

12. Corolla actinomorphic or only slightly zygomorphic, 4-lobed ..... ***Lycopus***
12′ Corolla zygomorphic, 5-lobed ..... (13)

13. Herbs; flowers in dense verticils at apex or in few axils ..... ***Monarda***
13′ Shrubs; flowers 1–3, forming loose clusters in many axils ..... ***Poliomintha***

14. Calyx teeth usually 10, their tips hooked; plants tomentose ..... ***Marrubium***
14′ Calyx teeth 5, their tips straight; plants glabrous to hairy but not tomentose ..... (15)

15. Flowers 1–3 per axil ..... (16)
15′ Flowers more than 5 per axil ..... (18)

16. Corolla appearing 1-lipped, the upper lip deeply cleft ..... ***Teucrium***
16′ Corolla bilabiate, the upper lip entire or 2-lobed ..... (17)

17. Stamens included or somewhat exserted; upper corolla lip entire or notched ..... ***Stachys***
17′ Stamens long-exserted; upper corolla lip 2-lobed ..... ***Trichostema***

18. Corolla weakly zygomorphic, the lobes all similar ..... (19)
18′ Corolla zygomorphic, 1 or more lobes markedly different in size ..... (20)

19. Verticils many, axillary or a terminal spike ..... ***Mentha***
19′ Verticil single, terminal ..... ***Monardella***

20. Verticils pedunculate and loose, the flowers obviously pedicellate ..... ***Nepeta***
20′ Verticils about sessile, compact, the flowers sessile or subsessile ..... (21)

21. Anther sacs parallel ..... ***Agastache***
21′ Anther sacs divergent ..... (22)

22. Bracts reniform, the edges overlapping and forming a bowl under verticils; corolla red-purple ..... ***Lamium***
22′ Bracts elliptic or narrowly triangular, the edges not overlapping; corolla red, orangish, or pink-purple ..... ***Stachys***

Agastache Gronov. Giant Hyssop

(*agan*, much, + *stachys*, spikes) Herbs, perennial from rhizomes or a crown, pubescent, aromatic. **LEAVES** petiolate, toothed. **INFL** an axillary verticil forming a dense or interrupted spike; bracts leafy or reduced. **FLOWERS** sessile or short-pedicellate; calyx weakly zygomorphic; teeth 5, their apices not spinose; corolla zygomorphic, 2-lipped, upper lip slightly concave, 2-lobed, lower lip 3-lobed; tube longer than calyx; stamens 4, exserted; anther sacs parallel, none abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** papillate or hairy. $x = 9$. Twenty-two species in the southwestern United States and northern Mexico.

Agastache pallidiflora (A. Heller) Rydb. (pale-flowered) Bill Williams mountain giant hyssop. Plants rhizomatous. **STEMS** 11–90 cm tall. **LEAVES** with petioles to 20 mm, the blades broadly ovate to triangular or reniform, 1–5 cm long × 1–4 cm wide, the margins coarsely toothed, the base cordate to truncate or slightly attenuate, the apex rounded to acuminate, gland-dotted below. **INFL** 2.5–7 cm long in flower, the lowest verticils ± distinct, the bracts sessile, only those of the lowest verticils leaflike. **FLOWER** calyx 6–9 mm long, base green, distally usually pink to purple, the 2 upper teeth slightly broader than the 3 lower, 1–2 mm; corolla 13–15 mm long, the lobes pink to purple, the tube paler to white; stamens exserted 1–2 mm, the filaments parallel but often curling in age. **FRUIT** 2 mm long, 1.5 mm wide, the apex hairy. $2n = 18$. [*Brittonastrum pallidiflorum* A. Heller]. Riparian or other moist areas in ponderosa pine and

Douglas-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn. 2450–3300 m (7700–10200'). Flowering: Jun–Sep. Arizona, Colorado, New Mexico, Texas; Coahuila, Mexico. *Agastache urticifolia* (Benth.) Kuntze has been reported for this area but no specimens have been seen. It differs in being overall a larger plant with the filaments markedly nonparallel: the lower pair of stamens are straight and emerge from under the upper corolla lip, and the upper pair angle strongly downward and emerge alongside the lower corolla lip. *Agastache pallidiflora* was used by the Ramah Navajo as a ceremonial chant lotion and cough medicine; the pulverized root was used as a dusting powder for sores or cankers as a fumigant for "deer infection." The Acoma used the leaves for flavoring.

Dracocephalum L. Dragonhead

(*draco*, dragon, + *cephalus*, head) Annual to perennial taprooted herbs, pubescent. **STEMS** erect, single or branched freely from crown. **LEAVES** petiolate; blades obovate or elliptic to linear-lanceolate; margins entire or toothed. **INFL** an axillary verticil, forming a spike; bracts leafy or reduced. **FLOWERS** sessile; calyx zygomorphic; lobes 5, their apices acute to spinose; corolla zygomorphic, 2-lipped, upper lip slightly concave, notched; lower lip 3-lobed; tube included in calyx; stamens 4, exserted or held under upper lip; anther sacs divaricate, none abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** glabrous. $x = 9, 10$. Three species in North America and Europe.

Dracocephalum parviflorum Nutt. (small-flowered) American dragonhead. Plants with a taproot. **STEMS** 9–50 cm tall, the more robust frequently much-branched. **LEAVES** petiolate, the blades broadly to narrowly triangular, 1–7 cm long, margins irregularly toothed, the apex long-acuminate, spinose in upper leaves. **INFL** a spike, the lowest verticils often distinct, bracts leafy and with teeth mostly spine-tipped. **FLOWER** calyx 10–13 mm long, the lobes spine-tipped, the upper lobe larger than lower 4; tube at base of sinus with a prominent tuft of long trichomes; corolla about 1 cm long, scarcely exceeding calyx, pale rose-purple, often drying medium blue, the tube paler to white; stamens held under upper corolla lip, the anther sacs placed end-to-end. **FRUIT** 2 mm long, dark brown to black. [*Moldavica parviflora* (Nutt.) Britton]. Sand or clay soils, sage, piñon-juniper woodland, and ponderosa pine communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2000–3000 m (6200–9000'). Flowering: Apr–Oct. Mostly in the northern half of the United States; southern Canada. Plant used for infants with diarrhea and as a life medicine by the Kayenta Navajo. Used by the Ramah Navajo for headache; infusion of leaves used as an eyewash and for fever.

Glechoma L. Ground Ivy

Perennial herbs, pubescent. **STEMS** creeping, mat-forming. **LEAVES** long-petiolate; blades round to reniform; margins coarsely crenate. **INFL** axillary, interrupted; bracts leafy. **FLOWERS** sessile; calyx zygomorphic, lobes 5, their apices spinose or aristate; corolla zygomorphic, 2-lipped; upper lip slightly concave, entire; lower lip 3-lobed; tube equaling or shorter than calyx; stamens 4, held alongside upper lip; anther sacs parallel, none abortive, ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** apex densely hairy. $x = 9, 10$. Ten species of temperate Eurasia. The genus is often spelled *Glecoma*.

Glechoma hederacea L. (*Hedera*, the genus of ivy) Creeping Charlie, ground ivy. **STEMS** 5–10 cm tall. **LEAVES** petiolate, reniform, toothed. **INFL** a branching cyme, the flowers 1–few per axil, the pedicels about 3 mm long. **FLOWER** calyx 5–6 mm long, reflexed in fruit; corolla 1.5–2 cm long, long-exserted from calyx, blue with white markings. $2n = 18, 36$. Moist areas in ponderosa pine communities. COLO: Arc, LPl. 2285–2550 m (7500–8000'). Flowering: May–Sep. Native of Europe and now widely naturalized in the United States; however, uncommon in our area. This species is regarded as poisonous to horses.

Hedeoma Pers. Mock-pennyroyal

(*hedys*, sweet, + *osme*, scented) Perennial taprooted herbs, pubescent, aromatic. **STEMS** erect, single or branched freely from crown. **LEAVES** with winged petiole or subsessile; blades obovate or elliptic to linear-lanceolate; margins entire to toothed. **INFL** a few-flowered axillary verticil; bracts reduced or leafy. **FLOWERS** pedicellate; calyx zygomorphic, lobes 5, their apices narrowly acute; corolla zygomorphic, 2-lipped; upper lip slightly concave, entire; lower lip 3-lobed; tube equaling or slightly exceeding calyx; stamens 2, exserted; anther sacs divergent, none abortive; ovary sessile, lobed to base; stigma unevenly 2-lobed. **FRUIT** glabrous. $x = 9, 10$. About 20 species; New World.

1. Calyx closed in fruit, the upper lobes parallel with and appressed to the lower, the lower teeth to 3 mm long ..... ***H. drummondii***

1′ Calyx open in fruit, the upper lobes arched upward away from the lower, the lower teeth to 1.5 mm long..... ***H. nana***

Hedeoma drummondii Benth. (for T. Drummond, plant collector) Drummond's false pennyroyal. **STEMS** 6–30 cm tall, often freely branching. **LEAVES** subsessile or petiole to 2 mm, overall 7–13 mm long × 3–8 mm wide, elliptic to oblong (ovate), entire, frequently folded, gland-dotted above and below. **INFL** axillary, 1–5-flowered, the bracts inconspicuous. **FLOWERS** with pedicel 1–3 mm long; calyx 5–7 mm long, sometimes bicolored, the lower lobes to 3 mm long, the upper to 2 mm long, parallel and appressed to the lower in fruit; corolla 6–10 mm long, rose-pink to purple, stamens scarcely exserted, the anther sacs placed end-to-end. **FRUIT** 1–1.5 mm long, brown. $2n = 24, 36$. Sandy or gravelly soils, desert shrub and piñon-juniper woodland communities. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, SJn. UTAH. 1150–2250 m (4600–7000'). Flowering: May–Sep. North Dakota and Montana, south to Arizona, New Mexico to San Luis Potosí, Mexico. Infusion of plant taken in large quantities for influenza by the Ramah Navajo. Plant used for pain by the Navajo.

Hedeoma nana Briq. (dwarf) Dwarf false pennyroyal. **STEMS** 10–23 cm tall, branching at base and below the inflorescence. **LEAVES** with petioles 2–3 mm long; blades 6–15 mm long × 2–5 mm wide, ovate to elliptic or oblong, entire, not folded, gland-dotted. **INFL** axillary, 1–5-flowered, bracts leafy, reduced upward. **FLOWERS** with pedicel 1–4 mm long; calyx 4–6 mm long, often bicolored, the upper side purple, the lower green, the lower teeth to 1.5 mm long, the upper to 1 mm long, angled upward and not appressed to the lower in fruit; corolla 5–10 mm long, rose-purple, the lower lip often white-mottled; stamens scarcely exserted, the anther sacs placed end-to-end. **FRUIT** 1–1.5 mm long, brown. $2n = 36$. [*H. dentata* Torr. var. *nana* Torr.]. Sandy soils, often in crevices of sandstone; piñon-juniper woodlands, and ponderosa pine communities. ARIZ: Apa; NMEX: McK; UTAH. 1150–2400 m (3600–7400'). Flowering: May–Sep. Arizona, California, Colorado, Nevada, New Mexico, Texas; south to central Mexico. The plant used by assistant during the Navajo War Dance. Leaves chewed for the mint flavor by the Isleta.

Lamium L. Dead-nettle

(Greek *lamium*, throat, from the corolla shape) Annual or perennial taprooted herbs, glabrous or somewhat pubescent, aromatic in some. **STEMS** erect or decumbent, usually much branched from base. **LEAVES** petiolate or the upper sessile; blades ovate to orbicular or reniform; margins entire or toothed to incised. **INFL** in axillary verticils; bracts leafy. **FLOWERS** sessile or subsessile; calyx actinomorphic, lobes 5, their apices acuminate or awned; corolla zygomorphic, 2-lipped; upper lip hooded, notched; lower lip 3-lobed; tube exceeding calyx; stamens 4, included in hood; anther sacs divaricate, none abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** glabrous. $x = 9$. About 40 species in Eurasia and North Africa. Several species are grown for ornament.

Lamium amplexicaule L. (*amplexus*, clasping, + *caulis*, stem) Henbit. Plants annual. **STEMS** 5–40 cm tall. **LEAVES** 15–50 mm long, 5–20 mm wide, triangular-ovate to orbicular, the petiole 10–35 mm long, the base truncate to cordate, the margin irregularly coarsely crenate or incised. **INFL** 10–15 mm broad, the bracts sessile, mostly reniform, horizontal to ascending, much exceeding flowers. **FLOWER** calyx 4–7 mm long; corolla red-purple, with white on lower lip, 10–20 mm long or shorter in cleistogamous flowers. **FRUIT** about 2 mm long, brown mottled with white. $2n = 18, 36$. Lawns and other disturbed areas. COLO: LPl; NMEX: SJn. 1850 m (6000'). Flowering: Mar–Sep. Naturalized nearly throughout the Americas; Europe. Known in our area only from one recent collection in Farmington.

Lycopus Tourn. ex L. Bugleweed, Water Horehound

(*lycos*, wolf, + *apus*, footed) Perennial taprooted herbs, glabrous or somewhat pubescent. **STEMS** erect, simple or much-branched from crown. **LEAVES** sessile or subsessile; blades oblong-lanceolate; margins pinnatifid to serrate, much-branched from crown. **LEAVES** sessile or subsessile; blades oblong-lanceolate; margins pinnatifid to serrate, rarely subentire. **INFL** in axillary verticils; bracts leafy. **FLOWERS** sessile; calyx actinomorphic; teeth 4 or 5, their apices aristate; corolla only weakly zygomorphic, 4- or 5-lobed; tube shorter than calyx; stamens 2, exserted or included in corolla tube; anther sacs divaricate, none abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** glabrous, with corklike margin or crest. $x = 11$. Fourteen species in temperate North America and Eurasia.

1. Leaves pectinate; fruits with corky margin at apex ..... ***L. americanus***
1' Leaves serrate; fruits with corky margin extending to base ..... ***L. asper***

Lycopus americanus Muhl. ex W. P. C. Barton (of America) American water horehound. **STEMS** 25–50 cm tall, branching below the inflorescence; if robust, hairs conspicuous only at the nodes. **LEAVES** 3–7.5 cm long × 2–3.5 cm wide, broadly to narrowly elliptic, the petiole 4–9 mm long, winged, the base attenuate, the margin pectinately lobed at least near base, lobed or coarsely toothed above, gland-dotted above and below. **INFL** 5–7 mm broad, in axillary clusters, bracts much exceeding the flowers. **FLOWER** calyx 2–3 mm long, the lobes attenuate and somewhat spinose; corolla white, 3–4 mm long; stamens scarcely exserted. **FRUIT** exceeding calyx tube, corky margin forming a crest at the apex.

$2n = 22$. Riparian or other moist to wet areas; piñon-juniper, ponderosa pine, and Douglas-fir communities. ARIZ: Apa; COLO: LPl; NMEX: SJn. 1700–2450 m (5300–7500'). Flowering: Jun–Jul. Throughout the United States; southern Canada, northern Mexico. It should be looked for in other counties in our area.

Lycopus asper Greene (rough) Rough bugleweed. **STEMS** 25–65 cm tall, may branch below the inflorescence, pubescent. **LEAVES** 4.5–7 cm long × 1–2 cm wide, elliptic, sessile below, the upper leaves with a broadly winged petiole to about 2 mm, the base attenuate, the margins serrate, glandular above and below. **INFL** 5–10 mm broad. **FLOWER** calyx about 3 mm long, the lobes attenuate, the tip herbaceous; corolla white, 3–4 mm long; stamens scarcely exserted. **FRUIT** exceeding the calyx tube, corky margin at apex extending along sides to base. $2n = 22$. Riparian or other moist to wet areas; desert shrub and piñon-juniper communities. COLO: LPl; NMEX: SJn. 1550–1800 m (4900–5600'). Flowering: Jun–Sep. Throughout the western United States and east to New York; western Canada.

Marrubium L. Horehound

(Hebrew *marrob*, bitter juice) Biennial or perennial taprooted herbs, often tomentose, aromatic. **STEMS** usually erect and several to many from crown. **LEAVES** mostly petiolate; blades broadly deltoid, ovate, or orbicular; margins toothed. **INFL** in axillary verticils; bracts leafy. **FLOWERS** subsessile; calyx zygomorphic to actinomorphic; teeth 5 or 10, their apices indurate, curled in some; corolla zygomorphic, 2-lipped; upper lip flat, 2-lobed; lower lip 3-lobed; tube shorter than calyx; stamens 4, included; anther sacs divaricate, none abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** glabrous. Thirty species, Eurasian.

Marrubium vulgare L. (common) Common horehound. Plants with glandular and stellate trichomes, appearing tomentose. **STEMS** 14–100 cm tall. **LEAVES** with petioles to 5 cm long; blades strongly rugose, broadly deltoid to orbicular, to 5 cm long and wide, the upper reduced; margins coarsely crenate to dentate. **INFL** in interrupted spikes of dense verticils, 1–3 cm broad; bracts petiolate, reflexed, much exceeding the flowers. **FLOWER** calyx actinomorphic, 3–6 mm long; teeth usually 10, the apices curled, indurate hooks; corolla white, 5–10 mm long. **FRUIT** about 2 mm long, dark brown. $2n = 34, 36$. Disturbed areas, including roadsides and riparian zones; desert shrub, piñon-juniper woodlands, ponderosa pine, Douglas-fir, and aspen communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1600–2450 m (5000–7500'). Flowering: May–Oct. Naturalized nearly throughout the United States and much of the New World. The pubescent, nearly orbicular and rugose leaves and curled sepals make this a distinctive plant. Originally introduced for medicinal uses and as flavoring for horehound candy. Infusion of plant taken for sore throats by the Navajo. Ramah Navajo uses include: decoction of plant used for stomachache and influenza, strong infusion used for "lightning infection," root used before and after childbirth, and plant taken for influenza.

Mentha L. Mint

(Greek *Minte*, a nymph's name) Perennial rhizomatous herbs, glabrous or pubescent, aromatic. **STEMS** mostly erect from rhizome. **LEAVES** petiolate to subsessile; blades ovate to oblong; margins toothed. **INFL** verticillate, interrupted; bracts leafy. **FLOWERS** subsessile; calyx actinomorphic; teeth 5, their apices acute; corolla weakly zygomorphic, 2-lipped; upper lip flat, 2-lobed; lower lip 3-lobed; tube shorter than calyx; stamens 4, exserted; anther sacs divaricate, none abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** glabrous. About 30 species in temperate zones worldwide. Sometimes confused with *Lycopus*, from which it differs by having pedicellate flowers, four stamens, and fruits without an elaborated, corky margin. About 25 species, temperate, one circumboreal, the others in Eurasia and Australia.

1. Inflorescence bracts exceeding flower clusters; verticils along the leafy stem ..... ***M. arvensis***
1' Inflorescence bracts inconspicuous; verticils forming a terminal spike..... ***M. spicata***

Mentha arvensis L. (of fields) Wild mint. Plants with short hairs. **STEMS** 10–100 cm tall. **LEAVES** 2.5–8.5 cm long × 1–3 cm wide, petioles 5–12 mm long, lanceolate to elliptic to somewhat ovate, the margins serrate, base attenuate, glandular above and below. **INFL** 1–2 cm diameter, in the axils of leaves, these reduced upward but always exceeding the verticils. **FLOWERS** short-pedicellate; calyx 2–3.5 mm long, purplish in some; corolla 5–6 mm long, pale purple, some with a red or blue tinge; stamens exserted 1–3 mm beyond corolla. **FRUITS** less than 1 mm long. $2n = 24, 54, 72, 90$. [*M. canadensis* L.; *M. borealis* Michx.]. Riparian or other moist areas; piñon-juniper woodlands, ponderosa pine, Douglas-fir, aspen, and spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1700–3250 m (5300–10000'). Flowering: Jun–Sep. United States except the southeastern states; Canada and

Europe. Kayenta Navajo uses include: plant used as a lotion for swellings, roots used for prenatal snake infection, and used as flavoring with meats or cornmeal mush. Ramah Navajo uses include: cold infusion taken and used as lotion for fever and influenza, cold infusion given to counteract effects of being struck by a whirlwind.

Mentha spicata L. (bearing a spike) Spearmint. Plants essentially glabrous. **STEMS** to 50 cm tall. **LEAVES** to 4.5 cm long, to 1.5 cm wide, sessile, elliptic, the margins toothed; glandular above and below. **INFL** to 7 mm diameter, forming a terminal spike, the bracts inconspicuous. **FLOWERS** short-pedicellate; calyx 1–2 mm long, green; corolla 2–3 mm long, purple, fading to white in age; stamens included or slightly exserted. **FRUIT** less than 1 mm long. $2n = 36, 48$. Riparian or other moist areas in ponderosa pine communities. ARIZ: Apa; COLO: LPl; NMEX: SJn. 2200–2450 m (6800–7600′). Flowering: Jun–Aug. Naturalized in nearly every state and extensively in the New World; European native.

Monarda L. Bee-balm, Horsemint

(for N. B. Monardes, Spanish physician and botanist) Annual or perennial, rhizomatous or taprooted herbs or shrubs, usually pubescent, aromatic. **STEMS** usually erect, simple or branched. **LEAVES** petiolate to sessile; blades linear, oblong, elliptic, or ovate, margins mostly toothed. **INFL** in dense verticils, these single or forming an interrupted spike, bracts numerous, crowded, large, often colored. **FLOWERS** subsessile; calyx actinomorphic; teeth 5, their apices acute to aristate; corolla zygomorphic, 2-lipped; upper lip hooded, 2-lobed; lower lip 3-lobed; tube longer than calyx; stamens 2, under the hood or exserted; anther sacs divaricate, none abortive; ovary sessile, lobed to base; stigma unevenly 2-lobed. **FRUIT** glabrous. Sixteen species in North America. Several species are cultivated as ornamentals.

1. Verticils of flowers 1; corolla greater than 2 cm long; calyx teeth about 1 mm long ..... ***M. fistulosa***
1′ Verticils of flowers 2 to several; corolla less than 2 cm long; calyx teeth about 3 mm long ..... ***M. pectinata***

Monarda fistulosa L. **CP** (hollow tube, with the ends closed) Bee-balm. Plants rhizomatous. **STEMS** 30–75 cm tall, sparsely branched, sparsely hairy, especially below. **LEAVES** 3–6.5 cm long × 1–3 cm wide, the petioles to 8 mm long, lanceolate to ovate, the apex attenuate, the base more or less rounded or cordate in broader leaves, the margins shallowly serrate, occasionally approaching entire, glandular above and below. **INFL** a single, terminal verticil, 3–8 cm broad including flowers, the bracts several, green or with purple markings, mostly exceeding sepals. **FLOWER** calyx 8–10 mm long, the teeth deltoid, to 1 mm long; corolla medium red-purple, 2.5–4 cm long, the upper lip straight, the lower curved downward, the tube markedly exceeding calyx; stamens long-exserted. Riparian and other moist areas, ponderosa pine and Douglas-fir communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Mon; NMEX: RAr, SJn; UTAH. 2200–2800 m (6900–8600′). Flowering: May–Aug. Continental United States except California, Florida. Cold infusion of plant used as a wash for headaches by the Navajo. Cold infusion taken and used as a lotion for gunshot or arrow wounds by the Ramah Navajo.

Monarda pectinata Nutt. (comblike) Plains bee-balm. Plants taprooted. **STEMS** 10–50 cm tall, branched mostly from base. **LEAVES** up to 3.5 cm long, to 1 cm wide, the petioles to 7 mm long, lanceolate to oblong, the base attenuate, the margins entire to shallowly serrate, glandular above and below. **INFL** of 2–4 (5) verticils, 1.5–2.5 cm broad including flowers, the bracts with 1–2 pairs, leaflike, exceeding flowers, often reflexed, plus several pairs of reduced bracts. **FLOWER** calyx 6–8 mm long, the teeth aristate, 2–3 mm long; corolla pale red-purple to white, with or without darker and lighter spots on lower lip, about 1.5 cm long, the upper and lower lips curving, the tube slightly exceeding calyx; stamens under upper lip or slightly exserted. $2n = 18, 36$. Riparian and other moist areas in ponderosa pine and Douglas-fir communities. ARIZ: Apa, Nav; COLO: LPl; NMEX: McK, RAr, SJn; UTAH. 1850–2700 m (5800–8300′). Flowering: May–Aug. Colorado and Nebraska south to Arizona, New Mexico, and Texas. Plant used for stomach disease by the Kayenta Navajo. Ramah Navajo uses include: cold infusion taken and used as poultice for headache, cough, or influenza, used in a ceremonial lotion. Leaves ground for seasoning and mixed with sausage by the Acoma and Laguna.

Monardella Benth. Monardella

(little *Monarda*) Perennial taprooted herbs or subshrubs, pubescent, aromatic. **STEMS** usually erect, often severalbranched from crown. **LEAVES** petiolate to subsessile; blades linear to elliptic or oblong, margins finely toothed to entire. **INFL** mostly a terminal verticil subtended by several crowded series of mostly leaflike bracts. **FLOWERS** subsessile; calyx actinomorphic; teeth 5, their apices acute; corolla weakly zygomorphic, weakly 2-lipped; upper lip flat, 2-lobed; lower lip 3-lobed; tube longer than calyx; stamens 4, exserted; anther sacs divaricate, none abortive; ovary sessile, lobed to base; stigma unevenly 2-lobed. **FRUIT** glabrous. $x = 21$. Twenty species in western North America.

Monardella odoratissima Benth. (extremely fragrant) Montana monardella. **STEMS** 8–35 cm tall. **LEAVES** 1–2.5 cm long, 0.3–10 mm wide, lanceolate, the petioles to 4 mm long, the base rounded to attenuate, the apex mostly obtuse, glandular beneath. **INFL** a single verticil, 1.5–2.5 cm broad, the bracts 1 pair green and leaflike and 3+ pairs reduced and purple, closely imbricate, broadly ovate to broadly lanceolate. **FLOWER** calyx 5–7 mm long, teeth less than 1 mm; corolla 10–11 mm long, white to pale pink or occasionally purple, the tube slightly exceeding the calyx, lobes of upper lip slightly wider than lower; stamens slightly to obviously exserted. Sandy to clay soils; Gambel's oak, ponderosa pine, and Douglas-fir communities. NMEX: SJn; UTAH. 2900–3350 m (9100–10300'). Flowering: Jul–Sep. Western United States, mostly in mountainous areas.

Nepeta L. Catnip, Catmint

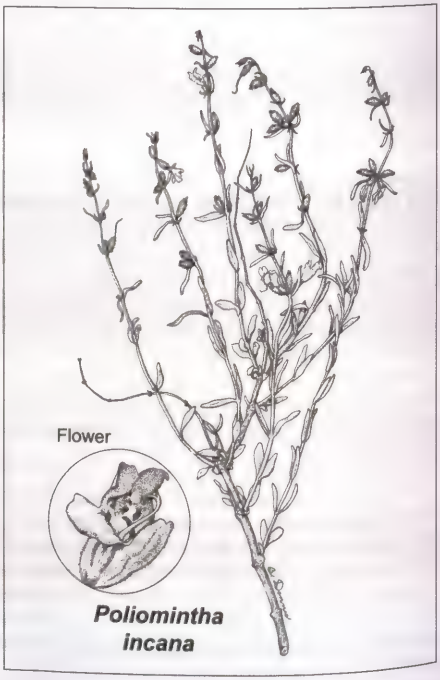
(ancient Latin name for catnip) Mostly perennial taprooted herbs, mostly pubescent, aromatic. **STEMS** usually erect, mostly much-branched. **LEAVES** petiolate to subsessile; blades ovate to deltoid; margins toothed. **INFL** in an axillary verticil, forming an interrupted spike; bracts leafy or reduced; flowers subsessile or short-petiolate. **FLOWER** calyx zygomorphic to nearly actinomorphic; teeth 5, their apices acute; corolla zygomorphic, 2-lipped; upper lip hooded, 2-lobed; lower lip 3-lobed; tube longer or shorter than calyx; stamens 4, under upper lip or slightly exserted; anther sacs divaricate, none abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** glabrous or tuberculate. About 250 species native to Eurasia. Many species are attractive to and eaten by cats.

Nepeta cataria L. (of a cat) Catnip. Plants white-tomentose. **STEMS** to 100 cm tall, freely branched in age, mound-forming if robust. **LEAVES** with petiole 4–40 mm long; blades to 70 mm long, to 40 mm wide, cordate, ovate, or deltoid; margin coarsely toothed. **INFL** many-flowered but in somewhat loose verticils, the lowest separate, the upper forming a spike; bracts inconspicuous. **FLOWER** calyx 6–7 mm long, the opening oblique; teeth narrowly triangular, attenuate, the 2 lower smaller than the 3 upper; corolla 8–9 mm long, white with purple spots, the lower lip reflexed and markedly longer than the erect upper lip. **FRUIT** 1.5 mm long, dark brown. Riparian or other moist areas in ponderosa pine communities. ARIZ: Apa; COLO: LPl, Mon; NMEX: SJn; UTAH. 1750–2350 m (5400–7300'). Flowering: Jul–Sep. Naturalized throughout the continental United States except Florida.

Poliomintha A. Gray Rosemary-mint

(Greek for a hoary white mint) Shrubs, densely white-pubescent, aromatic. **STEMS** erect to spreading, often much-branched. **LEAVES** subsessile; blades linear to oblong; margins mostly entire. **INFL** axillary, few-flowered; bracts leafy. **FLOWERS** subsessile to short-pedicellate; calyx nearly actinomorphic; teeth 5, their apices acute; corolla zygomorphic, 2-lipped; upper lip flat, 2-lobed; lower lip 3-lobed; tube exceeding calyx; stamens 2, held under upper lip or slightly exserted, anther sacs divaricate, none abortive; ovary sessile, lobed to base; stigma unevenly 2-lobed. **FRUIT** glabrous. Four species in the southwestern United States; adjacent Mexico. This genus is sometimes lumped with *Hedeoma*.

Poliomintha incana A. Gray (grayish white) Purple sage, frosted mint. Plants gray-green. **STEMS** to 40 cm tall. **LEAVES** 5–20 mm long, 1–4 mm wide, ascending, the apex truncate, rounded, or slightly apiculate; glandular above and below. **INFL** of 1–3 flowers. **FLOWER** calyx 4–7 mm long, green or purplish, with dense white hairs about 1 mm long; corolla 8–13 mm long, pale red-purple, the lower lip darker and white-mottled, reflexed and larger than the erect upper lip; stamens with anther sacs slightly separated by enlarged connective, placed end-to-end. [*Hedeoma incana* Torr.]. Sandy soils, often on stabilized dunes; salt desert scrub, blackbrush, rabbitbrush, and piñon-juniper communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: San, SJn; UTAH.



1200–1900 m (3800–5800′). Flowering: Apr–Oct. Arizona, California, Colorado, Texas, Utah. Plant used for sores by the Kayenta Navajo. Plant used for rheumatism and ear trouble by the Hopi.

Prunella L. Self-heal

(early German name of a plant) Perennial herbs, mostly pubescent. **STEMS** erect to prostrate and rooting at nodes. **LEAVES** petiolate; blades oblong; margins entire or weakly toothed. **INFL** verticillate, forming a dense spike; bracts leafy or broad and sheathing. **FLOWERS** short-pedicellate; calyx zygomorphic; teeth 5, their apices cuspidate and acute; corolla zygomorphic, 2-lipped; upper lip hooded, weakly 2-lobed; lower lip 3-lobed; tube exceeding calyx; stamens 4, included in hood; anther sacs strongly divaricate, none abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** glabrous. Four species, one nearly cosmopolitan, the others native to Europe and Asia.

Prunella vulgaris L. (common) Common self-heal. Plants rhizomatous. **STEMS** 5–40 cm tall, with 0–few branches. **LEAVES**: the lower long-petiolate, the upper subsessile; 2–7 cm long, 1–3 cm wide; blade lanceolate to ovate or oblong; margins entire to irregularly toothed. **INFL** with lowest pair of bracts leafy, the others sessile, reniform, exceeding calyx, often purple-tipped. **FLOWER** calyx 8–9 mm long, upper lip formed from 3 strongly fused lobes, much broader than the partially fused lower 2; corolla 10–15 mm long, purple with white mottling on the lower lip, this reflexed, erose to fringed, the upper lip erect, hooded; stamens with anther sacs placed end-to-end, appearing laterally attached to the branched filament. **FRUIT** 2 mm long, 1 mm wide, dark brown with darker longitudinal lines. $2n = 28, 32$. [*P. parviflora* Gilib.]. Riparian or other moist areas; ponderosa pine, Douglas-fir, aspen, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, SJn; UTAH. 2150–3250 m (6700–10100′). Flowering: Jun–Sep. Widespread throughout the United States; circumboreal.

Salvia L. Sage

(to save, as from harm) Annual, biennial, or perennial taprooted herbs or shrubs, pubescent, aromatic. **STEMS** usually erect, often much-branched. **LEAVES** long-petiolate to subsessile; blades ovate to orbicular; margins mostly toothed. **INFL** a few- to many-flowered axillary verticil, in some forming a head or spike; bracts leafy or reduced. **FLOWERS** subsessile to pedicellate; calyx zygomorphic, 2-lipped; teeth 5 or apparently 3, their apices acute; corolla zygomorphic, 2-lipped; upper lip hooded or flat, entire or 2-lobed; lower lip 3-lobed; tube usually longer than calyx; stamens 2, included in hood or exserted; anther sacs separated by strongly developed connective, the filament appearing forked or jointed, 1 sac abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** glabrous. At least 700 species, worldwide. Seeds are often a part of traditional diets. Many *Salvia* species used as herbs, especially *S. officinalis*, culinary sage, and many also are cultivated.

1. Leaves primarily basal, typically exceeding 10 cm long; plants tomentose ..... ***S. aethiopis***
1′ Leaves primarily cauline, rarely exceeding 4 cm long; plants sparsely hairy ..... ***S. reflexa***

Salvia aethiopis L. (of Ethiopia) Mediterranean sage. Tomentose biennials. **STEMS** to 60 cm tall, much-branched above, the mature plant often globose. **LEAVES** with petioles to 12 cm long, mostly in a basal rosette, the cauline ones mostly reduced to bracts, blade to 25 cm long, 16 cm wide, the margin coarsely incised or irregularly toothed. **INFL** a panicle with axillary, few-flowered verticils, the bracts broadly ovate to orbicular, spine-tipped. **FLOWER** calyx 10–15 mm long, the lobes spine-tipped, lower 2 longer and broader than upper; corolla 10–20 cm long, yellow, the upper lip strongly arched and mostly including the stamens and stigma. **FRUIT** 2–3 mm long. $2n = 24$. Sandy disturbed soils; piñon-juniper communities. Known from one collection in Mesa Verde National Park. COLO: Mon. 2375 m (7800′). Flowering: Jun–Sep. Arizona, California, Colorado, Idaho, Oregon, Utah, Washington. This is a naturalized invasive, considered a noxious weed in several states, that is sometimes cultivated as an ornamental.

Salvia reflexa Hornem. (bent abruptly backward) Lanceleaf sage. Sparsely hairy perennials. **STEMS** to 50 cm tall, freely branched. **LEAVES** with petioles to 15 mm long, cauline, blade 10–40 mm long, 3–10 mm wide, the margin entire to crenate or serrate. **INFL** a diffuse spike, the flowers solitary in the axils, the bracts strongly reduced, inconspicuous, not spinose. **FLOWER** calyx 4–8 mm long, the teeth not spinose, lower 2 narrower than the apparently single upper one; corolla 6–9 mm long, the lobes pale blue, the tube white, the upper lip hooded and including the stamens, the style slightly exserted. **FRUITS** 2–2.5 mm long, 1.5 mm wide. [*Salvia lanceolata* Brouss.]. Sandy or clay soils; piñon-juniper woodland and ponderosa pine communities. ARIZ: Apa, Nav; NMEX: McK, RAr, SJn. 1650–2300 m (5100–7100′). Flowering: Aug–Sep. Nearly throughout the United States, except the extreme northwest, northeast, and southeast.

Satureja L. Savory

(Latin, of uncertain meaning) Annual or perennial rhizomatous herbs or shrubs, glabrous or pubescent, aromatic. **STEMS** erect, single to several, sparsely or freely branched. **LEAVES** petiolate or sessile; blades linear, lanceolate, ovate, or oblanceolate; margins entire or toothed. **INFL** axillary, few-flowered or in dense verticils; bracts leafy or reduced. **FLOWERS** short-pedicellate; calyx mostly zygomorphic; teeth 5; apices acute to acuminate; corolla zygomorphic, 2-lipped; upper lip flat or cupped; lower lip 3-lobed; tube usually exceeding calyx; stamens 4, held under upper lip; anther sacs divergent, none abortive; ovary sessile, lobed to base; stigma evenly 2-lobed. **FRUIT** glabrous, smooth to reticulate. One hundred fifty species, almost cosmopolitan but mostly Mediterranean. Summer savory (*S. hortensis*) cultivated as an herb.

Satureja vulgaris L. Fritsch (common) Wild basil. Perennial herbs from rhizomes. **STEMS** to 45 cm tall, simple or sparingly branched. **LEAVES** with petioles to 6 mm long; blades ovate to broadly lanceolate, 1–3 cm long, 1–2.5 cm wide; margins entire to toothed; apex obtuse. **INFL** of 1–2 dense verticils with leafy bracts, the floral bracts setaceous. **FLOWER** calyx 5–8 mm long, 2-lipped, the 3 upper teeth shorter and broader than the 2 lower ones; corolla 10–15 mm long, pale red-purple. **FRUIT** 1–1.5 mm long, brown, epidermis smooth. [*Clinopodium vulgare* L.]. Sandy soils; ponderosa pine, Douglas-fir, aspen, and spruce-fir communities. COLO: LPl, Min. 2550–2700 m (8000–8300'). Flowering: Aug–Sep. Northeast to north-central United States and scattered at higher elevations in the arid West. Placed in *Calamintha* by some authors.

Scutellaria Riv. ex L. Skullcap

(like a tray or shield, referring to the calyx shape) Annual or perennial herbs or subshrubs, often rhizomatous or with a woody caudex, pubescent, not aromatic. **STEMS** erect or ascending, simple or branched. **LEAVES** petiolate, the uppermost petiolate or sessile; blade smooth, reniform, ovate, oblong, orbicular, elliptic, or lanceolate; margin serrate, crenate, or entire. **INFL** racemose to paniculate; flowers 1 per axil, on a short branch and pedicellate; bracts leafy or reduced. **FLOWER** calyx strongly zygomorphic, 2-lipped; lips entire; upper with a dome or transverse, arcuate crest or ridge; in fruit markedly enlarging and splitting longitudinally; corolla zygomorphic, 2-lipped; upper lip hooded, entire; lower lip 3-lobed; tube exceeding calyx; stamens 4, all fertile, unequal, included in hood or exserted; anther sacs somewhat divaricate, ciliate, 2 stamens with 1 sac abortive; ovary stalked, deeply lobed; stigma evenly 2-lobed. **FRUIT** variously papillate or tuberculate. Two hundred to 300 species in the Northern Hemisphere, mostly in temperate regions. Some species are cultivated.

Scutellaria galericulata L. (with a helmet) Marsh skullcap. Perennial rhizomatous herbs. **STEMS** 17–50 (–75) cm tall. **LEAVES** 14–55 mm long, 6–20 mm wide; lower leaves with petioles to 5 mm long, the upper subsessile; blade lanceolate to ovate or oblong, the base often slightly cordate; margin shallowly serrate to crenate. **FLOWER** calyx 3–4 mm long, often purple above and green below, crest about 0.8 mm high; in fruit the calyx 5–6 mm long, the crest about 3 mm tall; corolla blue and white, 15–18 mm long, the tube long-exserted, the stamens and style included. **FRUIT** about 1.5 mm long, yellowish brown with an olive cast; epidermis papillate. $2n = 30$. Marshy areas along streams and lakes; ponderosa pine, Douglas-fir, aspen, and spruce-fir communities. ARIZ: Apa; COLO: Arc, LPl, SJn; NMEX: SJn. 1950–3050 m (6100–9500'). Flowering: Jul–Aug. United States except the southeastern states; circumboreal.

Stachys L. Betony, Hedge-nettle

(spike) Annual to perennial herbs, taprooted or rhizomatous, usually pubescent and aromatic. **STEMS** mostly erect, variously branched. **LEAVES** petiolate to sessile; blades lanceolate to ovate or oblong; margins toothed, crenate, or entire. **INFL** in axillary verticils, forming an open or crowded spike; bracts leafy; flowers sessile or subsessile. **FLOWER** calyx zygomorphic or actinomorphic; lobes or teeth 5, their apices acute to spinose; corolla zygomorphic, 2-lipped; upper lip concave or hooded, entire or notched; lower lip usually 3-lobed; tube longer or shorter than calyx; stamens 4, held under upper lip or exserted; anther sacs divaricate, none abortive; ovary sessile, deeply lobed; stigma evenly 2-lobed. **FRUIT** glabrous or roughened. About 300 species, cosmopolitan except Australia, mostly in temperate areas (Epling 1934). Several of the large-flowered species are cultivated ornamentals.

1. Corolla bright red, conspicuously exceeding the calyx; petioles mostly exceeding 10 mm long ..... ***S. coccinea***
1' Corolla pink to purple or brownish orange, only slightly exceeding the calyx; leaves sessile or the petioles less than 7 mm in length ..... (2)

2. Corolla pink to purple with darker markings; plants green ..... ***S. palustris***
2' Corolla brownish orange, the markings purplish; plants gray-green ..... ***S. rothrockii***

Stachys coccinea Ortega (scarlet) Scarlet hedge-nettle. Perennial, rhizomatous herbs, green; hairs sparse, spreading. **STEMS** 30–80 cm tall. **LEAVES** 2–8 cm long, to 4 cm wide, petioles 1–7 cm long, reduced in upper leaves, blades elliptic to triangular-ovate; margins coarsely serrate or crenate; bases cordate to truncate, attenuate in some. **FLOWER** calyx nearly actinomorphic, 5–10 mm long; corolla scarlet, or in some with an orangish tint, 2–3 cm long, its tube markedly exceeding calyx. **FRUIT** 2 mm long and wide. $2n = 84$. Known from one collection in 1940 by Edward Castetter in Chaco Culture National Historic Park, New Mexico. Canyons and rocky slopes; desert grassland and scattered Utah juniper communities. NMEX: SJn. 1860–1950 m (6100–6400'). Flowering: Jun–Oct. West Texas, New Mexico, and Arizona; Mexico. A very showy wildflower often grown for ornament, with several cultivars available.

Stachys palustris L. (swampy) Marsh hedge-nettle. Perennial, rhizomatous herbs, green; hairs sparse, spreading or appressed. **STEMS** 10–100 cm tall. **LEAVES** to 7 cm long, to 2.5 cm wide, sessile or petioles to 7 mm long; blades broadly triangular-ovate to oblong; margins serrate; bases cordate to truncate. **FLOWER** calyx nearly actinomorphic, 5–10 mm long; corolla pink to red-purple, 1–1.8 cm long, its tube slightly exceeding calyx. **FRUIT** about 2 mm long and wide. $2n = 68, 102$. Riparian or other moist areas, ponderosa pine communities. ARIZ: Apa; COLO: LPl, NMEX: SJn. 1830–2725 m (6000–8945'). Flowering: Jul–Sep. United States except southeastern states; Canada and northern Mexico. This is a widespread and variable circumpolar species. Our material belongs to **subsp. *pilosa*** (Nutt.) Epling (hairy), which is considered a full species (*S. pilosa* Nutt.) by some authors. In many specimens the calyx is bicolored, purple above and green below.

Stachys rothrockii A. Gray (for J. Rothrock) Rothrock's hedge-nettle. Perennial, rhizomatous herbs; grayish from appressed pubescence. **STEMS** to 20 cm. **LEAVES** 3–4 cm long, 0.5–1.5 cm wide, subsessile; petioles to 2 mm long; blades oblong to narrowly elliptic; margins finely serrate to entire; bases short-attenuate. **FLOWER** calyx nearly actinomorphic, 5–7 mm long; corolla brownish orange with purple markings, 7–10 mm long, its tube equaling or slightly exceeding calyx. **FRUIT** 1.5–2.5 mm long, 1.5 mm wide. $2n = 34$. Sandy or gravelly soils, grassland, piñon-juniper woodlands, and ponderosa pine communities. ARIZ: Apa, Nav; NMEX: McK, SJn. 2150–2400 m (6700–7400'). Flowering: Jun–Sep. Arizona, New Mexico, and Utah. Ramah Navajo uses include: dried leaves used as a ceremonial medicine and plant used in the chant lotion, used as a foot deodorant, and dried leaves used for "deer infection."

Teucrium L. Germander

(for Teucer, the first king of Troy) Annual or perennial herbs, taprooted or rhizomatous, glabrous or pubescent, aromatic. **STEMS** mostly erect, simple or branched. **LEAVES** petiolate; blades lanceolate, elliptic, or ovate; margins lobed or toothed. **INFL** axillary, few-flowered; bracts leafy or reduced. **FLOWERS** pedicellate; calyx actinomorphic or zygomorphic; teeth or lobes 5, their apices acute to acuminate; corolla zygomorphic, the upper lip deeply lobed and appearing absent, not 2-lipped, 5-lobed; tube mostly shorter than calyx; stamens 4, exserted; anther sacs divaricate, none abortive; ovary sessile, not lobed to base; stigma evenly 2-lobed. **FRUIT** pubescent or glabrous. $x = 5, 8, 13$. About 100 species, cosmopolitan in temperate areas. The herb germander, *T. chamaedrys* L., is often cultivated.

Teucrium canadense L. (of Canada) Canada germander. Perennial from rhizomes, pubescent. **STEMS** 60–150 cm tall, branching above. **LEAVES** elliptic or some lanceolate to narrowly ovate, 4.5–9 cm long, 1–3 cm wide, the margins serrate. **INFL** 1–few flowers per axil, in loose spikes, the lowest with leafy bracts; pedicels 2–4 mm long. **FLOWER** calyx zygomorphic, 5–7 mm long; 2 lower teeth narrower and longer than the 3 upper ones; corolla 8–15 mm long, white with red-purple markings or mostly purplish, the center lobe markedly larger than the 4 lateral ones. **FRUIT** about 2 × 2 mm, brown, glabrous. $2n = 16$. Riparian areas; ponderosa pine, Douglas-fir communities. Known from one collection by Herb Owen in 1964 at Spruce Haven, Colorado. COLO: LPl. 2375 m (7800'). Flowering: Jul–Sep. Continental United States; southern Canada and southern Mexico. This widespread and variable species includes many named variants, none of which are recognized here.

Trichostema L. Blue Curls, Flux Weed, Turpentine Weed

(Greek *thrix*, hairy, + *stema*, stamen) Annuals or perennials, herbs or suffrutescent, taprooted, pubescent, aromatic. **LEAVES** petiolate or subsessile; blades linear, lanceolate, elliptic, ovate, or obovate; margins mostly entire. **INFL** axillary elongate cymes, forming an open panicle; bracts leafy or reduced. **FLOWERS** pedicellate; calyx actinomorphic or somewhat zygomorphic; teeth or lobes 5, their apices acuminate or obtuse; corolla zygomorphic, the upper lip deeply 5-lobed; tube mostly markedly exceeding calyx; stamens 4, often long-exserted and strongly curved; anther sacs slightly to strongly divaricate, none abortive; ovary sessile, lobed in upper 2/3; stigma unevenly 2-lobed. **FRUIT** glabrous or pubescent, often reticulate. $x = 7, 10, 19$. About 16 species, throughout America; southeastern Canada, Mexico.

Trichostema arizonicum A. Gray (of Arizona) Arizona blue curls. Perennial. **STEMS** woody at the base, 20–60 cm tall, bearing short, downward-curling hairs, sometimes glandular. **LEAVES** oblong to ovate, 1–3 cm long, to 12 mm wide,

entire or crenate, often glandular, acute or rounded at the base, often subsessile. **FLOWER** calyx actinomorphic, about 2 mm long in flower, to about 6 mm long in fruit, the teeth about as long as the tube; corolla 7–14 mm long, white with blue or violet lower lip, the lower lip 5–10 mm long; stamens strongly arched and longer than corolla, emerging between lobes of upper corolla lip. **FRUIT** about 2.5 mm long, the apex glandular. $2n = 20$. Rocky sites; desert grasslands and scattered Utah juniper communities. Known from one collection in 1940 by Clark in Chaco Culture National Historic Park (Stony Point, New Mexico). NMEX: SJn. 1860–1950 m (6100–6400'). Flowering: Jul–Oct. This plant is much more common in southern New Mexico and Arizona.

LENTIBULARIACEAE Rich. BLADDERWORT FAMILY

C. Barre Hellquist

Perennial or annual herbs; aquatic or terrestrial; many insectivorous. **LEAVES** alternate, cauline or in basal rosettes, simple or dissected. **INFL** with 1–several flowers on an erect scape. **FLOWER** calyx 2-lobed; corolla deeply 2-lipped, the lower 3-lobed, spurred at base; with a conspicuous palate, palate usually branched; stamens 2; ovary free, style short or lacking; stigma 1–2-lipped. **FRUIT** ovoid to globose, 2- or 4-valved capsule. **SEEDS** minute (Crow and Hellquist 1985, 2000). Four genera and about 170 species worldwide.

Utricularia L. Bladderwort

(from *utriculus*, a little bladder) Herbs perennial, aquatic or terrestrial. **STEMS** submersed, creeping, or floating. **LEAVES** dissected, green, usually bearing bladderlike carnivorous traps or these sometimes on separate nonphotosynthetic leaves; bladderlike traps with a valvelike action for trapping microorganisms; producing winter buds in autumn. **INFL** 1–few on erect scapes. **FLOWER** corolla 2-lipped, the lower lip 3-lobed with conspicuous palate, upper lip erect, usually entire; stamens 2; ovary superior. **FRUIT** a 2-valved capsule (Lloyd 1935; Taylor 1989). About 200 species worldwide.

Utricularia macrorhiza J. Le Conte (large-rooted) Common bladderwort. Herbs, perennial, submersed aquatic, floating just below surface. **STEMS** elongate, 1–3 m, 0.5 mm or more in thickness, plumose branches to 12 cm in diameter; the terminal bud becoming a winter bud. **LEAVES** elliptic to ovate, 14–20 mm long, much dissected, with capillary segment bearing bladderlike traps; scape erect, 1–8 dm tall, emergent, bearing 5–20 yellow flowers. **FLOWERS** with corolla 12–18 mm broad, the lips closed, the lower lip slightly longer than the upper one and more or less 3-lobed, palate conspicuous, spur conical. **FRUIT** pedicel reflexed. **SEEDS** brown, shiny, striate-reticulate. [*U. vulgaris* L.; *U. vulgaris* var. *americana* A. Gray; *U. vulgaris* subsp. *macrorhiza* (J. Le Conte) R. T. Clausen]. Ponds, lakes, streams, and ditches. ARIZ: Apa; COLO: Arc, LPl, SJn; NMEX: McK, SJn. 2450–2850 m (8150–9450'). Flowering and fruiting: Jun–Aug. Alaska east to Newfoundland, south to California, New Mexico, Texas, Ohio, and Virginia; Mexico. Taylor (1989) considers the North American *U. macrorhiza* separate from the Eurasian *U. vulgaris* but notes that the differences between the two species appear small, being based mainly on spur shape. The name *macrorhiza* is a misnomer because bladderworts lack roots.

LILIACEAE Juss. LILY FAMILY

William Jennings

(Greek *leirion*, lily) Perennial herbs, sometimes woody. Underground stems scaly or tunicate (fiber- or membranous-coated) bulbs, solid corms, or short or elongate rhizomes. **STEMS** simple or branched, leafy or scapose. **LEAVES** basal or cauline or both, usually alternate, sometimes opposite or whorled, usually narrow, even grasslike, but sometimes broad, usually parallel-veined. **INFL** of various forms (racemose, paniculate, spicate, cymose, umbelliform, or single or paired in leaf axils). **FLOWERS** perfect to polygamous or imperfect, small to large, often showy individually or as an inflorescence; tepals usually 6 (4 or 8 in some genera), distinct or fused into a tube, frequently all 6 alike, but in some genera differentiated into petals and sepals; stamens usually 6, or otherwise in some genera; filaments slender to dilated or united into a crown or an expanded winglike base, anthers of various forms, most often cordate, oblong, linear, or lanceolate and extrose, versatile, or introrse; ovary superior or partly inferior, usually 3-celled with 1 to numerous ovules in each locule; styles 1 to 3, terminated by a capitate or lobed stigma. **FRUIT** a loculicidal or septicidal capsule or a fleshy berry. **SEEDS** 1 to many, with abundant endosperm.

As broadly recognized here, a family of many diverse forms, widely distributed in temperate, subtropical, and tropical regions, up to 280 genera and 4200 species. It seems inevitable that a broadly defined lily family eventually will be broken into several segregate families. Many proposals have been advanced over the years, with more in recent years as

molecular and genetic research has progressed. *Flora of North America* indicates that the 70 genera in North America north of Mexico could be divided among as many as 20 families, leaving only *Lilium*, *Tulipa*, *Erythronium*, *Lloydia*, and *Fritillaria* in Liliaceae. The problem is how to do it. As yet, a consensus has not emerged. In the *Flora of the Four Corners*, Agavaceae and Asparagaceae are recognized, with the other traditional liliaceous genera left in the family. Editors' note: If the genera here assigned to Liliaceae were to be assigned to the maximum number of segregate families proposed, their disposition would be as follows (Flora of North America Editorial Committee 2002): Alliaceae (*Allium*); Anthericaceae (*Echeandia*, *Eremocrinum*, *Leucocrinum*); Calochortaceae (*Calochortus*); Convallariaceae (*Maianthemum*); Melanthiaceae (*Veratrum*, *Zigadenus*); Liliaceae s. s. (*Erythronium*, *Fritillaria*, *Lilium*, *Lloydia*); Themidaceae (*Androstephium*); and Tricyrtidaceae (*Prosartes*, *Streptopus*). Most authors do, however, continue to include *Calochortus* in Liliaceae s. s. (e.g., Judd et al. 2008; Simpson 2010). Further, recent research has shown that species here placed in *Zigadenus* are better assigned to *Anticlea* (*A. elegans* and *A. vaginatus*) and *Toxicoscordion* (*T. paniculatum* and *T. venenosum*; Zomlefer and Judd 2002). We have noted in the key below where segregate families appear.

1. Flowers several to many in a terminal, umbel-like inflorescence on a leafless scape, subtended by spathelike bracts ..... (2)
1′ Flowers solitary or racemose or paniculate; not in a scapose umbel subtended by spathelike bracts ..... (3)

2. Tepals distinct or nearly so; plants with an onion odor and taste [Alliaceae—eds.] ..... ***Allium***
2′ Tepals united into a basal tube; filaments united into a tubular corona [Themidaceae—eds.] ..... ***Androstephium***

3. Plants from rhizomes or thickened underground stems; not bulbous ..... (4)
3′ Plants from tunicate (coated) or scaly bulbs, or from corms; not from rhizomes ..... (10)

4. Leaves all basal or the basal leaves much larger than the reduced cauline leaves [Anthericaceae—eds.] ..... (5)
4′ Leaves well distributed on the stem, not all basal ..... (7)

5. Plants acaulescent, inflorescence a sessile cluster at ground level atop a tuft of leaves; perianth segments united into a tube; plants of piñon-juniper, sagebrush, and ponderosa pine communities ..... ***Leucocrinum***
5′ Plants caulescent, inflorescence atop a long, slender scape or stem ..... (6)

6. Anthers dorsifixed near the base, tepals reflexed ..... ***Echeandia***
6′ Anthers basifixed, tepals not reflexed but spreading distally ..... ***Eremocrinum***

7. Inflorescence a large, densely flowered panicle 20–80 cm long; plants up to 2 m tall; fruit a capsule [Melanthiaceae in part—eds.] ..... ***Veratrum***
7′ Inflorescence a raceme or panicle less than 20 cm long, of few to many flowers or solitary; fruits ovoid or globose berries ..... (8)

8. Flowers in terminal panicles or racemes [Convallariaceae—eds.] ..... ***Maianthemum***
8′ Flowers solitary or at most 2 or 3, flowers pendulous [Tricyrtidaceae—eds.] ..... (9)

9. Flowers terminal, 1 to 3, on stout, pendulous, pubescent pedicels ..... ***Prosartes***
9′ Flowers on the back side of the leaf, on slender, geniculate (with a joint like a knee), twisted, glabrous pedicels; pendulous ..... ***Streptopus***

10. Inflorescence a densely flowered panicle or raceme; flowers small, no more than about 10 mm long [Melanthiaceae in part—eds.] ..... ***Zigadenus***
10′ Flowers solitary or few, if few, in an open raceme; flowers 10 mm long or more [Liliaceae s. s.—eds.] ..... (11)

11. Flowers 2–5, nodding, yellow, the tepals spreading and becoming reflexed ..... ***Erythronium***
11′ Flowers erect or nodding, but if nodding, the flowers brownish or purplish and the perianth parts not reflexed ..... (12)

12. Flowers erect, petals and sepals dissimilar, with a large, conspicuous gland (about 5 mm) at the adaxial base of the petal ..... ***Calochortus***
12′ Flowers erect or nodding, petals and sepals (tepals) in 2 very similar series; a gland, if present, small and indistinct ..... (13)

13. Flowers erect, small, white with greenish or purplish veins; leaves basal and cauline; alpine ..... ***Lloydia***
13′ Flowers erect or nodding, red, orange, purple, or brownish; leaves various; not alpine ..... (14)

14. Flowers large, erect, red or orange; uppermost cauline leaves whorled ..... ***Lilium***
14′ Flowers small, nodding, brownish or purplish; cauline leaves all alternate ..... ***Fritillaria***

Allium L. Wild Onion, Wild Garlic

(the classical name for garlic) Perennial herbs, with an onion or garliclike odor, scapose from a bulb, or terminated on primary or secondary rhizomes. **LEAVES** sheathing, linear, terete to flat, solid or hollow, soon withering and deciduous in some species. **INFL** scapose, terminal, umbelliform; bracts free or partly connate, usually dry and membranous, persistent, 1–several-nerved. **FLOWERS** perfect, perianth parts 6 (tepals), all alike, white, pink, rose, or white with a colored midvein, usually persistent in fruit; or some flowers replaced by bulblets; stamens 6, more or less connate at the base and adnate to the perianth base; ovary 3-celled, 3-lobed, and crested in some species; style 1, capitate to trifid. **FRUIT** a capsule, loculicidal. **SEEDS** usually 6 or fewer, black, alveolate. Widely distributed in the Northern Hemisphere in a variety of habitats, about 500 species (Ownbey 1947; Ownbey and Aase 1955). The important diagnostic features of *Allium* are: bulb coat, bulb shape, or the presence of rootstocks and/or rhizomes; relative length of the scape and leaves; color and shape of the tepals (or if the flowers are replaced by bulblets); and characteristics of the ovary and capsule (presence or absence of crests). When collecting onion specimens, carefully dig a large hole to obtain the bulb, and *gently* break apart the dirt clod to make sure any rhizomes are collected (see *A. bisceptrum* var. *palmeri*). Do not pull the onion from the ground or outer bulb coats and any rootstocks or rhizomes will be left behind. Press the specimen, if possible, between foam sheets; do not mash the bulb flat in a regular press. This makes for a bulky specimen but preserves the diagnostic features.

1. Scape more or less recurved at the apex, umbel at least partially nodding; flowers pale lavender; stamens exserted beyond the perianth ..... ***A. cernuum***
1′ Scape straight (more or less erect); umbel erect, not nodding; stamens included ..... (2)

2. Bulb elongate and little more than a slightly swelled base of the stem and terminating a short, stout, irislike rhizome; leaves flat and greater than 5 mm wide ..... ***A. gooddingii***
2′ Bulb traditional onion shape (more or less spherical or ovoid); leaves narrow, less than 5 mm wide ..... (3)

3. Ovary with 6 conspicuous "crests" (like miniature triangular sails; use strong hand lens) ..... (4)
3′ Ovary lacking "crests" (top of ovary may have knobs or be rounded or flat, but not with triangular sail-like prominences; *A. textile* has rather prominent knobs on top of the ovary, but in this key it goes with the crestless group) ..... (6)

4. Plants with 1 leaf, this much exceeding the short (3–5 cm) scape, often dried up and coiled at the tip ("curlicued" like a pig's tail); Utah ..... ***A. nevadense***
4′ Plants with 2 or more leaves, these either shorter or longer than the scape, green at anthesis, not coiled; widespread throughout the Four Corners region ..... (5)

5. Crests large, about the same length as the ovary beneath; leaves 2 or more, shorter than the scape; bulb with a reticulate coat; Utah and Arizona ..... ***A. bisceptrum***
5′ Crests small, shorter than the ovary beneath; leaves 2, exceeding the scape; bulb with a coarsely fibrous coat; widespread in our area ..... ***A. macropetalum***

6. Outer bulb coats thin and membranous to tough and leathery, marked on surface with fine, quadrangular or hexagonal reticulations, but with no coarse fibers present (more or less like commercial onions) ..... ***A. acuminatum***
6′ Outer bulb coat traversed by coarse, often interwoven fibers, becoming loose and twinelike or netted (rather like coarse burlap) ..... (7)

7. Plants of moist areas in the mountains (primarily montane or subalpine, but sometimes at higher or lower elevations); leaves 3 or more, generally shorter than the scape; flowers pink; tepals with a slightly darker pink midrib ..... ***A. geyeri***
7′ Plants of dry areas, at elevations below 2285 m (7500′); leaves 2, rarely 3, about equaling the scape; flowers white; tepals with a red-brown midrib, the midrib color not "bleeding" into the rest of the tepal ..... ***A. textile***

Allium acuminatum Hook. (Latin: drawn out at the apex into a tapering point, alluding to the shape of the floral parts) Acuminate onion. **BULBS** ovoid, subglobose, or nearly spherical; outer bulb coat with square or hexagonal reticulations. **LEAVES** 2 to 4, narrow, concavo-convex, shorter than the scape, early-deciduous. **INFL** scape 10–40 cm; bracts 2, lanceolate to ovate, acuminate; umbelliform, flowers erect. **FLOWER** tepals 6, rose or pink, with long, recurved tips,

the inner tepals serrate-denticulate on the margins, and shorter than the outer tepals; stamens shorter than the tepals; ovary inconspicuously crested with 3 low, rounded processes; stigma capitate. Dry hillsides and slopes, rocky and bare places, sometimes under ponderosa pine and Gambel's oak. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX. RAr, SJn, UTAH. 2065–2655 m (6780–8710'). Flowering: Jun–early Jul. Southern Canada to central California and east to Idaho, Wyoming, western Colorado, northwestern New Mexico, and central Arizona. Bulbs and leaves used by Utes for food.

Allium bisceptrum S. Watson (two scepters, an allusion to the paired crests on the ovary) Palmer's onion. **BULBS** ovoid, commonly producing either a cluster of basal bulblets or rhizomes up to 10 cm long terminated by larger bulblets; some of the outer bulb coats with rectangular reticulations, varying to irregular shapes with sinuous walls. **LEAVES** 2 or more, tapering from a broad base, usually shorter than the scape, green at anthesis. **INFL** scape 10–30 cm; bracts 2, ovate to lanceolate, acuminate, 3–5-nerved; umbelliform, **FLOWER** tepals pale pink to lilac, purplish, or white; stamens shorter than the tepals; ovary conspicuously crested with 6 distinct (3 pairs), erect, papillose-denticulate processes; style included; stigma capitate. **FRUIT** a capsule, the pedicel becoming flexuous or deflexed in fruit. [*A. palmeri* S. Watson]. Meadows, slopes, and aspen groves. ARIZ: Apa, Nav; UTAH. 1220–2950 m (4000–9685'). Flowering: May–Jul. Four Corners material belongs to **var.** ***palmeri*** (S. Watson) Cronquist (for E. J. Palmer, plant collector of the Southwest and Mexico). Central Nevada, central Utah, southward and southeastward to central Arizona and western New Mexico. Paiutes used the roasted bulbs, seed heads, and leaves for food.

Allium cernuum Roth (nodding, alluding to the flowers that face downward) Nodding onion. **BULBS** elongate, often clustered, sometimes short-rhizomatous; outer bulb coats membranous, often tinged reddish or purplish (rather like an elongated miniature red cultivated onion or scallion); the bulb coats minutely striate with elongate cells in regular rows. **LEAVES** several per bulb, concavo-convex to nearly flat, shorter than the scape. **INFL** scape 10–50 cm tall, abruptly recurved near the apex, the inflorescence nodding; bracts acuminate, breaking into 2 separate 3- to 5-nerved, reflexed portions; campanulate. **FLOWER** tepals lavender, elliptic-ovate, obtuse, entire; stamens exserted; style exserted; ovary crested. **FRUIT** a capsule, the pedicels elongating in fruit, bending upward, so that the capsules are held erect. [*Allium cernuum* Roth var. *obtusum* Cockerell ex J. F. Macbr.]. Gambel's oak, sagebrush, ponderosa pine, Douglas-fir, and aspen communities; mostly in cool, usually shaded spots. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2015–2720 m (6610–8920'). Flowering: late Jul–Aug. Widespread in northern North America, southward in the mountains to Mexico. Used by Hopis, Navajos, and Apaches to flavor soups and gravies. The leaves used in salads and bulbs stored for winter use.

Allium geyeri S. Watson (for C. A. Geyer, plant collector on the Oregon Trail) **BULBS** ovoid, often clustered; the outer bulb coats persisting as a coarse, open-fibrous, reticulate coat. **LEAVES** usually 3 per bulb, sometimes more; shorter than the scape. **INFL** scape 10–60 cm tall; bract breaking into 2 or 3 acuminate, 1-nerved portions. **FLOWER** tepals pink, occasionally white; or replaced partially or wholly by bulblets; stamens included or about as long as the perianth; style included; ovary with inconspicuous mounds (crests). **FRUIT** a capsule, with the dried tepals investing the capsule. $n = 7$. Apaches and Hopis used the bulbs as flavoring or raw with piki bread.

1. Some or all the flowers replaced by bulblets ..... **var. *tenerum***
1' None of the flowers replaced by bulblets ..... (2)

2. Bulb coats many-layered, extending from the base of the bulb nearly to the base of the leaves, loosely wrapping the bulb ..... **var. *chatterleyi***
2' Bulb coats of fewer layers, from the base to the top of the bulb, but not extending far up the stem, more tightly wrapping the bulb ..... **var. *geyeri***

var. ***chatterleyi*** S. L. Welsh (for M. Chatterley, associate of S. L. Welsh) Similar to var. *geyeri*, but differing in the many-layered marcescent bulb coats, 4.5–11 cm in length, extending from the base of the bulb to the base of the leaves. UTAH. 2680 m (8800'). The features that purport to separate this from typical *A. geyeri* do not seem to be significant. Specimens seen had large bulbs with thick bulb coats but seemed to be otherwise typical.

var. ***geyeri*** Piñon-juniper, ponderosa pine, aspen, spruce-fir, and alpine communities; mostly in moist sites. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2240–3960 m (7355–13000'). Flowering: May–Jul. Mostly in the Rockies from southern Canada to New Mexico and western Texas, and west to portions of Washington, Oregon, Nevada, and Arizona.

var. ***tenerum*** M. E. Jones (tender or delicate) [*Allium rubrum* Osterh.]. Similar to var. *geyeri*, except most of the flowers replaced by bulblets on short pedicels. The flowers that do remain seem to be on pedicels that are overly long, giving

the inflorescence an unkempt appearance. Wet meadows, mostly in the subalpine zone. COLO: Arc, Hin, LPl, RGr, SJn. 2775–3650 m (9100–11980'). Flowering: Jun–Jul.

Allium gooddingii Ownbey (for Leslie Goodding, plant collector of southern Arizona, who collected the type specimen) Goodding's onion. **BULBS** elongate, terminating a thick, irislike rhizome; inner bulb coats whitish or pinkish; outer bulb coats brownish, membranous, minutely striate with elongate cells in regular rows; not fibrous-reticulate, but with persistent parallel fibers. **LEAVES** several, plane, obtuse, entire, 4–8 mm broad, shorter than the scape, green at anthesis. **INFL** scape 35–45 cm tall; bracts 2, membranous, withering. **FLOWER** tepals elliptic, obtuse, entire, pink, withering in fruit; stamens about as long as the perianth; style capitate; ovary crestless. **FRUIT** a capsule, broader than long. Aspen and spruce-fir communities; usually moist areas. ARIZ: Apa; NMEX: SJn. 2285–2745 m (7500–9000'). Flowering: mid-Jul–mid-Aug. Arizona and New Mexico. Distribution of this species is scattered. Specimens have been seen from areas to the south of the San Juan drainage area (the high country of the White Mountains area, Arizona; the Mogollon Mountains and the Sierra Blanca areas, New Mexico).

Allium macropetalum Rydb. (big petals, alluding to the size of the flowers, which are a little larger than most other western onions) **BULBS** ovoid, usually clustered, outer coats coarse, fibrous, persistent. **LEAVES** usually 2, surpassing the scape. **INFL** scape 5–20 cm tall; bract membranous, breaking into 2 or 3 separate 3- to 5-nerved portions; perianth campanulate. **FLOWER** tepals usually white or pinkish with a dark red midrib, the color of which "bleeds" away from the midrib, lanceolate, obtuse to acuminate, entire; stamens shorter than the perianth; stigma capitate; ovary crested. **FRUIT** a capsule, the crests on the ovary best developed in fruit; tepals persistent and papery. [*Allium reticulatum* J. Presl & C. Presl var. *deserticola* M. E. Jones; *Allium deserticola* (M. E. Jones) Wooton & Standl.]. Shadscale and other salt desert shrub, and piñon-juniper communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1340–2405 m (4400–7890'). Flowering: mid-Apr–early Jun. Southeastern quarter of Utah, west-central and southwestern Colorado, eastern half of Arizona, western half of New Mexico, western Texas; Mexico. *Allium macropetalum* and *A. textile* are very similar in many ways, and the two species come in contact in a zone along the Colorado-Utah and Colorado-New Mexico state lines. *Allium macropetalum* has leaves surpassing the scape, a 3- to 5-nerved bract, the color of the midrib diffusing into the background color of the tepal, and crests on the ovary. *Allium textile* has a scape surpassing or about equaling the leaves, a 1-nerved bract, a sharp demarcation between the color of the midrib and the rest of the tepal, and only low mounds on the ovary. In close cases, the deciding factor is the number of nerves on the bract.

Allium nevadense S. Watson (of Nevada, where it was first collected) **BULBS** ovoid, sometimes proliferating by stalked basal bulblets; outer bulb coats with contorted cellular reticulations. **LEAVES** 1, at least twice as long as the scape, the proximal portion of the leaf usually green at anthesis, the distal portion coiled or frequently dried up and broken off. **INFL** scape short, 3–5 cm tall; bracts 2 or 3, ovate to lanceolate, acuminate, spreading or reflexed, 3- to 7-nerved. **FLOWER** tepals whitish with a pale green midrib or pinkish with deep pink midrib; stamens shorter than the tepals; stigma almost as long as the stamens, capitate; ovary crested with 6 distinct (3 pairs), thin, entire or toothed processes. **FRUIT** a capsule, with the persistent papery tepals present. Sandy, gravelly, or clayey soils in desert regions. UTAH. 1635 m (5360'). Flowering: Apr–Jun. Southern Idaho and southeastern Oregon, south through extreme western Colorado (Moffat and Mesa counties only), much of Utah, and Nevada, to southeastern California and northwestern Arizona. The very short scape, the single long leaf, typically with the tip coiled, and the very conspicuous crests characterize this species. Four Corners material belongs to **var**. ***nevadense***.

Allium textile A. Nelson & J. F. Macbr. (woven, alluding to the fibrous bulb coats, which look like burlap) **BULBS** ovoid, usually in a cluster; inner bulb coats whitish, with epidermal cells vertically elongate and regular; outer bulb coats persisting as a fibrous, fine-meshed, open reticulum. **LEAVES** usually 2 per bulb, about equaling the scape, green at anthesis. **INFL** scape 6–30 cm tall; bracts 3, ovate, acuminate, 1-nerved; tepals white, with a reddish brown midrib; stamens shorter than the perianth; stigma capitate; ovary with obscure or obvious mounds, but not the sail-like processes of the conspicuously crested species. **FRUIT** a capsule, invested by the callous-keeled tepals. [*Allium reticulatum* Nutt., not J. Presl & C. Presl; *A. aridum* Rydb.]. Shadscale, mat-atriplex, greasewood, sagebrush, and piñon-juniper communities. COLO: Arc, LPl, Mon; NMEX: RAr, San, SJn. 1865–2040 m (6115–6700'). Flowering: May–Jun. The northern Great Plains, westward into Montana, Idaho, and northern Utah, south to western Nebraska, Colorado, and northern New Mexico. The northern edge of the San Juan River drainage in Colorado and New Mexico is the southern limit of the range of this species.

Androstephium Torr. Funnel-lily

(Greek *andros*, stamens, + *stephanos*, crown, referring to the united filaments) Erect, glabrous, scapose, perennial herbs. **CORMS** ovoid, fibrous-coated. **LEAVES** usually several, linear, channeled. **INFL** scape 10–30 cm; inflorescence umbellate, subtended by 3 bracts, lanceolate to broadly lanceolate. **FLOWER** tepals 6, all alike, joined below to form a funnelform tube, about 1/2 the length of the tepals, narrowly oblong, spreading; stamens 6, the filaments partly united into a tube with erect, bifid lobes between the introrse, basifixed, mostly acute anthers; style slender, persistent, terminated by 3 small stigmas; ovary superior, 3-celled, sessile. **FRUIT** a capsule, subglobose, obtusely 3-angled. **SEEDS** black, flat. Southwestern United States and northern Mexico. Two or three species.

Androstephium breviflorum S. Watson (short flower) Erect perennial herb. **CORMS** ovoid, fibrous-coated. **LEAVES** usually several, but occasionally just 1, equaling or exceeding the scape. **INFL** a scape, 10–30 cm; bracts lanceolate or broadly lanceolate, 8–15 mm long; flowers on ascending pedicels, 1–3 cm long. **FLOWERS** usually light violet-purple to whitish, with a diffuse grayish or brownish stripe down the center of the tepal; tepals united to form a tube; stamens 6, the filaments united and longer than the anthers, the lobes of the crown shorter than the anthers. **FRUIT** a capsule, 3-lobed, 10–15 mm long. **SEEDS** black, 7–9 mm long, flat, 4 to 6 per capsule. [*Brodiaea breviflora* (S. Watson) J. F. Macbr.; *Brodiaea paysonii* A. Nelson]. Blackbrush, shadscale, mat-atriplex, sagebrush, and piñon-juniper communities; usually in dry, sandy places, to rocky soil, often saline and seleniferous. ARIZ: Apa, Nav, Coc; COLO: Arc, LPl, Mon; NMEX: McK, SJn; UTAH. 1220–2135 m (4000–7000'). Flowering: mid-April–May. Southwestern Wyoming, western Colorado, northwestern New Mexico, west across Utah and northern Arizona, and Nevada. Reported for California. Occurrences in the Four Corners region represent the southeastern limit of the species range.

Calochortus Pursh Sego Lily, Mariposa

(beautiful grass) Perennial herbs. **BULBS** deep-seated, tunicate, membranous- or fibrous-coated. **STEMS** simple or branched, erect or somewhat twining, frequently bulbiferous at about ground level or from the lower leaf axils. **LEAVES** few, linear, alternate, the basal one solitary and larger, the cauline ones reduced up the stem. **INFL** solitary or a few, umbelliform, erect or nodding. **FLOWERS** large, showy, white, yellow, red, lavender, or purple and usually tinged with other colors; the sepals and petals distinct and different, the sepals ovate to lanceolate, greenish, brownish, or colored the same as the petals; petals larger and broader, cuneate to clawed, hairy in some species, usually with a depressed gland near the base, which is often spotted, colored, and hairy; stamens 6, in 2 series; ovary superior, 3-celled, contracting or tapering to a trifid, sessile, persistent stigma. **FRUIT** a capsule, linear to orbicular, 3-angled or winged, septicidal, erect or nodding. **SEEDS** numerous, irregular or flattened (Ownbey 1940). Western North America from southern Canada to Central America. About 60 to 70 species, best developed in California, where there are numerous species of different forms (43 species in *The Jepson Manual*). In *Flora of North America*, 56 species are treated; we have 4 in our area. The features of the gland (near the base of the petal) are very important for identification of *Calochortus*. When collecting, be sure that the flower is pressed wide open so the gland can be examined, and attach a note on the label whether the gland is depressed or not (look on the back of the petal for a "bump"). Bulbs tend to be buried deeply and pulling will not yield the bulb; it has to be dug up.

1. Anthers acute to strongly apiculate (a point on the tip); glands on petals oblong, depressed; hairs on faces of petals usually branched, densely hairy on petals above gland; purplish band on petals above gland and purple dot on claw (below gland) ..... ***C. gunnisonii***

1' Anthers obtuse; glands on petals circular to lunate (crescent moon shape), depressed or not; hairs on faces of petals seldom branched, sparsely hairy on petals above gland; marked either above or below gland on petal but not both places ..... (2)

2. Stems flexuous (zigzag, not usually fully erect, sometimes twining), not bulbous near the base of the stem; glands on petals not depressed and not surrounded by membranes; flowers a soft lavender above, yellow near the gland, and with purple spot on claw below gland ..... ***C. flexuosus***

2' Stems straight, erect or nearly so, usually bulbous near the base of the stem; glands on petals more or less depressed (look on back of petal for a "bump"), surrounded by membranes; flower color various ..... (3)

3. Petals and sepals both a clear, uniform, golden yellow; with a red-brown or maroon band above gland on the petal and a similar mark on the sepal ..... ***C. aureus***

3' Petals variously colored, but most often white, or white suffused with pink, fully pink, or with pale yellowish highlights, and always with a yellow claw and a red-brown or maroon band above the gland; sepals most often whitish with brownish lengthwise striations and red-brown band and yellow base, but may be the same color as the petal ..... ***C.nuttallii***

Calochortus aureus S. Watson **CP** (golden yellow) Golden mariposa. Perennial herb, erect. **STEMS** usually simple, 10–30 cm tall. **LEAVES** few, basal leaf largest, up to 15 cm long. **INFL** campanulate. **FLOWER** petals and sepals golden yellow, with a maroon band above the gland on the petal, the sepal similarly marked; sepals broadly lanceolate, acuminate; petals broadly obovate, cuneate, short-acuminate, with a few hairs near the gland; gland circular, depressed, surrounded by a conspicuously fringed membrane, and covered with short, simple or distally branched prosesses; anthers oblong, obtuse, yellowish to cream, about equaling the length of the filaments; ovary linear, not winged. **FRUIT** a capsule, linear-lanceolate, acuminate, 3-angled, 2.5–5 cm long. [*Calochortus nuttallii* Torr. var. *aureus* (S. Watson) Ownbey]. Blackbrush, shadscale, and piñon-juniper communities; often in dry sandy, clayey, or rocky places. ARIZ: Apa, Coc, Nav; NMEX: McK, SJn; UTAH. 1740–2255 m (5700–7400'). Flowering: mid-May–mid-Jun. Southern Utah, northern Arizona, northwestern New Mexico. This is our only species of sego lily with bright yellow flowers. Plant used in the Hopi flute ceremony. Bulbs, flowers, and root eaten raw by Navajos and Hopis. Bulb is a Navajo life medicine.

Calochortus flexuosus S. Watson (bent alternately in different directions; zigzag; alluding to the twisted nature of the stem) Sinuous mariposa. Perennial, erect or decumbent or twining among other plants or straggling along the ground. **STEMS** usually branched, 20–40 cm long. **LEAVES** linear, sparse. **INFL** campanulate, erect. **FLOWERS** soft lavender or lilac-tinged, each petal with a yellow band at the gland and a purple spot on the claw; sepals lanceolate to obtuse, shorter than the petals, colored similarly to petals; petals obovate, cuneate, rounded to obtuse at the apex, glands transverse-lunate to nearly circular, not depressed and not covered with a membrane, but densely covered by short processes; anthers oblong, about as long as the filaments; ovary linear, not winged. **FRUIT** a capsule, lanceolate, acute, 3-angled, 2.5–3.5 cm long, erect. Blackbrush, shadscale, and piñon-juniper communities; often on dry stony slopes, rocky mesas, and flats. ARIZ: Apa, Nav; COLO: Arc, Mon; NMEX: SJn; UTAH. 1190–1765 m (3900–5800'). Flowering: mid-Apr–mid-May. Southeastern California, southern Utah, southwestern Colorado, northwestern New Mexico, northern and central Arizona.

Calochortus gunnisonii S. Watson (for John W. Gunnison, leader of the Gunnison Expedition) Gunnison's mariposa lily. Perennial, erect. **STEMS** usually simple, 30–60 cm tall. **LEAVES** linear, becoming slightly reduced above, not exceeding the inflorescence. **INFL** campanulate, erect. **FLOWERS** usually white, but plants with purple or yellow flowers are known, usually with a transverse purple band above the gland and a purple spot on the claw; sepals lanceolate to broadly lanceolate, acute, shorter than the petals, colored similarly to petals; petals obovate, cuneate, obtuse to rounded at the apex, with numerous distally branched, gland-tipped hairs on the claw and near the gland; glands transversely oblong, depressed, surrounded by a deeply fringed but indistinct membrane, and densely covered with short, distally branched processes; anthers acute to strongly apiculate, yellowish to cream, longer than the filaments; ovary linear, not winged. **FRUIT** a capsule, linear-oblong, acute, 3-angled, 3–5 cm long, erect. Sagebrush, piñon-juniper, and aspen communities; dry to moist, often grassy, slopes. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 2115–2775 m (6940–9110'). Flowering: mid-Jun–mid-July. Montana, Wyoming, South Dakota (Black Hills), Colorado, eastern Utah, northeastern Arizona, northern New Mexico. In northeastern Arizona, *C. gunnisonii* replaces *C. ambiguus* and their ranges do not overlap. Plant used as a ceremonial medicine by Navajos. Also a "life medicine" and used to deliver placentas. Bulbs eaten as food.

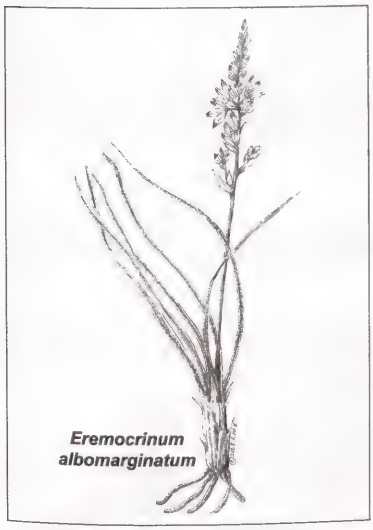
Calochortus nuttallii Torr. (for Thomas Nuttall of Harvard University, botanist of the early 19th century) Sego lily. Perennial, erect. **STEMS** usually simple, 20–40 cm tall, often bulbiferous at the base. **LEAVES** few, linear, reduced above, seldom exceeding the inflorescence. **INFL** campanulate, erect. **FLOWERS** most often white, but can be white suffused with pink, fully pink, or magenta, or with pale yellowish highlights, and always with a yellow claw and a red-brown or maroon band above the gland; sepals lanceolate to broadly lanceolate, acuminate, shorter than the petals, often whitish with brownish lengthwise striations and a red-brown band and yellow base, but may be the same color as the petals; petals broadly obovate, cuneate, short-acuminate, 3–4 cm long, with scattered yellowish hairs near the gland; gland circular, depressed, surrounded by a conspicuously fringed membrane and densely covered with short, simple or distally branched processes; anthers oblong, yellowish or pinkish, about equaling the length of the filaments; ovary linear, not winged. **FRUIT** a capsule, linear-lanceolate, acuminate, 3-angled, 3–5 cm long, erect. Dry slopes and flats in shadscale, greasewood, mat-atriplex, sagebrush, piñon-juniper, and ponderosa pine communities. [*Calochortus luteus* Nutt., not Douglas; *C. watsonii* M. E. Jones; *C. rhodothecus* Clokey]. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1510–2560 m (4960–8400'). Flowering: May–Jun. Eastern Montana, western North Dakota, South Dakota (Black Hills), most of Wyoming, southeastern Idaho, eastern Nevada, much of Utah (except where displaced by *C. aureus* in south-central and southeastern Utah), western Colorado, Kaibab Plateau of

Arizona, and northwestern New Mexico. *Calochortus nuttallii* reaches the southeastern limit of its range in the northeastern quarter of the Four Corners. Bulbs eaten by Navajo children. Paiutes used bulbs as food in spring, eaten roasted or raw. Flower used ceremonially by Hopis.

Echeandia Ortega Amber Lily

(for Pedro Echeandia, Spanish botanist) Perennial herbs, from corms with enlarged storage roots. **LEAVES** both basal and cauline; narrowly linear to narrowly oblong or elliptic, with the base surrounded by marcescent fibrous leaf bases. **INFL** scapose, racemose, or paniculate, 1–4 flowers per node. **FLOWERS** perfect or pseudohermaphroditic, staminate, more or less erect to pendulous, tepals 6, strongly reflexed to spreading, outer whorl distinct from inner whorl, yellow (ours), to orange, cream, or white, 3-veined, more or less elliptic; stamens 6; anthers connate or distinct, yellow; style 1; ovary superior, ellipsoid. **FRUIT** a capsule, broadly to narrowly oblong, dehiscence loculicidal. **SEEDS** black, irregularly compressed and folded. Southwestern United States, south to Argentina, Bolivia, and Peru. About 80 species, with at least 60 of those in Mexico and Central America (Cruden 1981).

Echeandia flavescens (Schult. & Schult. f.) Cruden (turning yellow) Amber lily. Perennial, erect, storage roots enlarged from corms. **LEAVES** basal, 3 to 15, 8–40 cm long, narrowly linear, margins denticulate, ciliate; cauline leaves reduced. **INFL** scape unbranched or branched, very slender, 20–40 cm tall (taller to the south of us), glabrous, paniculate, usually with 3 flowers per node, but occasionally more at the lower nodes and occasionally solitary at the upper nodes; flowers facing away from scape or somewhat upward. **FLOWERS** pale yellow, with 3 to 5 central veins accented in greenish or brownish; tepals elliptic, 9–12 mm long, with those of the outer whorl 2–4 mm wide and those of the inner whorl 4–8.5 mm wide; anthers bright yellow; style about 1/3 longer than the anthers, with a minutely 3-lobed apex; ovary obovate, 2–5 mm. **FRUIT** a capsule, broadly oblong to oblong, 3-lobed, 8–12 mm long. $2n = 16, 32, 48$. [*Anthericum flavescens* Schult. & Schult. f.; *Anthericum torreyi* Baker; *Anthericum stenocarpum* Baker]. Dry grasslands and canyons, piñon-juniper woodlands, and openings in ponderosa pine forests. ARIZ: Apa; NMEX: McK. 2155 2470 m (7065–8100'). Flowering: Jul–Aug. Arizona, New Mexico, western Texas; Mexico. The species reaches the northern limit of its range in the southern San Juan River drainage.



Eremocrinum albomarginatum

Eremocrinum M. E. Jones Sand Lily, Desert Lily

(desert lily) Perennial herbs, from a short rhizome with fleshy roots. **LEAVES** all basal, narrowly linear, 10–40 cm long, 1–3 mm wide, erect or spreading, grasslike, each tuft surrounded by fibrous, marcescent sheaths. **INFL** scape 15–30 cm long, racemose, densely flowered. **FLOWERS** erect or spreading, rather showy but small, on a short pedicel subtended by a scarious bract; tepals 6, 1–2 cm long, oblong, alike, united below into a tubular stipelike base, white to greenish white, the 3 central veins accented with green to brown; stamens 6, shorter than the tepals, anthers lanceolate; style terminated by a discoid stigma; ovary superior, 3-celled. **FRUIT** a loculicidal capsule, 3-lobed, oblong, 4–6 mm long. **SEEDS** black, angled. A monotypic genus of the Southwest. The description for the species is the same as that for the genus.

Eremocrinum albomarginatum (M. E. Jones) M. E. Jones (with white margins) Sand lily. [*Hesperanthes albomarginata* M. E. Jones]. Deep sandy places or sand dunes. ARIZ: Apa, Nav; UTAH. 1220–1660 m (4000–5455'). Flowering: mid-Apr–mid-Jun. Southeastern quarter of Utah and northeastern Arizona. This looks superficially like a *Zigadenus*, but its affinities are with *Echeandia* and *Anthericum*. Plant used for snakebites by Navajos.

Erythronium L. Dogtooth Violet

(red, alluding to the pink or red flowers of some species) Perennial herbs, from deep-seated, elongate corms. **LEAVES** basal, in pairs, opposite, in some species with a reduced leaf at the base of the lowermost flower, petiolate to subsessile, green or mottled. **INFL** solitary or racemose. **FLOWERS** large and showy, pale to deep yellow (ours), or white, deep pink, or violet, nodding; tepals 6, alike or with the inner series broader, lanceolate or acuminate, spreading at anthesis and later becoming reflexed; stamens 6, in 2 slightly unequal sets, filaments slender and erect, tapering

slightly from the base or with a broadly dilated base, covering the ovary, and surrounding the style; anthers shrinking by 1/2 after pollen dehiscence; style 1, with a 3-lobed stigma; ovary superior, 3-celled. **FRUIT** a capsule, obovoid to cylindric-clavate, loculicidal. Mostly in North America, about 12 species.

Erythronium grandiflorum Pursh (large-flowered) Dogtooth violet, trout lily, fawn lily, glacier lily, avalanche lily. Perennial herbs, erect, from an elongated corm. **LEAVES** usually 2, narrowly to broadly oblong-elliptic, 10–20 cm long, 1–5 cm wide, acuminate, subsessile, green, not mottled. **INFL** scape 10–30 cm, flowers 2 to 4 on naked peduncles, nodding. **FLOWERS** golden yellow, becoming pale yellow as flowers fade, the base lighter within and streaked with green without; tepals 6, all alike, 2.5–3.5 cm long × 4–7 mm wide, lanceolate, spreading, becoming reflexed; stamens 6, exserted when the tepals reflex, but actually shorter than the tepals, filaments erect, not concealing the ovary or surrounding the style, the anthers yellow, red, somewhat purplish, or white, 10–12 mm long before dehiscence; style projecting the 3 spreading stigmatic lobes beyond the anthers; ovary superior. **FRUIT** a capsule, cylindric-clavate, 3–6 cm long. Moist sites in aspen and spruce-fir communities. COLO: Arc, Hin, LPl, Mon. 2405–3675 m (7900–12060'). Flowering: May–Jul, usually just after snowmelt in areas where snow accumulates. In the Rockies and Cascades from southern Canada to California, Utah, and Colorado. In the region of the Four Corners, known only from the San Juan Mountains. In spite of the common name of "dogtooth violet," this lily does not look anything like a violet (*Viola* spp.). A mass blooming just after snowmelt turns the forest floor yellow, a dramatic sight early in the season, when nothing else is in flower.

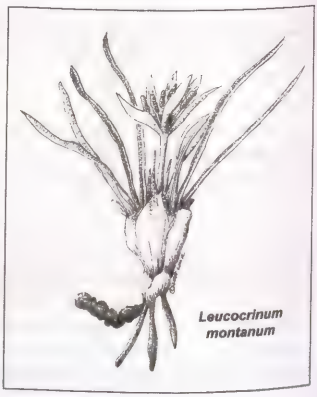
Fritillaria L. Fritillary

(dice box, either an allusion to the cubical shape of the capsule or to the checkered markings of some species) Perennial herbs, erect, glabrous, unbranched. **BULBS** small, consisting of a few fleshy scales, and often accompanied by numerous offset bulblets the size of rice grains. **LEAVES** few, alternate to whorled, sessile, linear to lanceolate. **INFL** scapose, solitary or a few flowers in a raceme. **FLOWERS** showy, white, yellow, red, or purplish, and often mottled or striped with white, yellow, red, brown, or purple, usually nodding, campanulate, tepals 6, similar, spreading, each with a gland at the base; stamens 6; style 1, entire or trifid; ovary superior, 3-celled. **FRUIT** a capsule, 6-angled or -winged, loculicidal. **SEEDS** flat, brownish, obovate. Northern Hemisphere, about 50 species.

Fritillaria atropurpurea Nutt. (blackish or very dark purple) Checker lily, chocolate lily. Perennial herb, erect, slender. **BULBS** tan, 1–2 cm in diameter, composed of a few small, thin scales and few, if any, auxiliary bulblets. **LEAVES** several, linear, 6–10 cm long, alternate or whorled, scattered on the upper 1/2 of the stem. **FLOWERS** campanulate, nodding, usually 1 to 4, brown or purple (liver-colored), with yellow or white spots or mottling; tepals 6, alike, oblong or rhombic, tapering abruptly at the base, 10–20 mm long, with the gland as an indistinct brownish yellow spot at the base; stamens with slender filaments, 6–15 mm long; style connate at base only, branches 6–9 mm long. **FRUIT** a capsule, broadly obovoid, acutely angled. Mountain foothills, often among Gambel's oak, sagebrush, or under aspen or conifers. ARIZ: Apa, Nav; COLO: Dol, LPl, Mon; UTAH. 2255–2805 m (7405–9200'). Flowering: May–Jun. North Dakota to Oregon, south to California, Arizona, and New Mexico. Utes regarded a decoction of this plant to be dangerously poisonous, but used as a medicine.

Leucocrinum Nutt. ex A. Gray Star Lily, Sand Lily

(white lily) Perennial herb, acaulescent, tufted, from a short, vertical, deeply buried rootstock. **LEAVES** tufted, narrowly linear, grasslike, spreading, 10–20 cm long × 2–6 mm wide, with each tuft of leaves surrounded at the base by membranous sheathing bracts. **INFL** in a central cluster at ground level, with underground jointed pedicels arising directly from the rootstalk. **FLOWERS** showy; tepals 6, white, all alike, united below the middle into a long, slender tube, separate above, with spreading oblong segments, glandless and clawless; stamens 6, inserted near the apex of the floral tube, exserted, but actually shorter than the spreading tepal segments; style filiform, with 3 short stigmatic lobes; ovary superior. **FRUIT** a capsule, 3-angled, loculicidal, subterranean and thus seldom seen or collected. **SEEDS** few to several, black, angled. A monotypic genus of the western United States. The description of the species is the same as that for the genus.



Leucocrinum montanum

Leucocrinum montanum Nutt. ex A. Gray (of the mountains) Common star lily. The description of the species is the same as that for the genus. Sagebrush,

piñon-juniper, and ponderosa pine communities. COLO: Arc, LPl; NMEX: RAr. 1875–2440 m (6150–8000'). Flowering: Apr–Jun. Central Oregon, south to central California, Idaho, northern Nevada, Montana, South Dakota (Black Hills), south to southern Utah and northern New Mexico. Paiutes applied a poultice of pulverized roots to sores or swellings

Lilium L. Lily

(Greek *leirion*, the classical name for lilies) Perennial herbs, tall, erect, glabrous, from fleshy-scaled bulbs or short, scaly rhizomes. **STEMS** unbranched, leafy. **LEAVES** numerous, alternate or whorled, sessile, often lanceolate. **INFL** solitary or 2 or more in a terminal raceme, often leafy-bracted. **FLOWERS** showy, variously colored in the different species (white, pink, orange, or brick-red), frequently spotted with red, brown, or purple; nodding or erect; funnelform to campanulate; tepals 6, all alike, separate, spreading to recurved, often semiclawed and with a gland near the base; stamens 6, borne on the receptacle, filaments slender, anthers usually facing away from the axis; ovary superior, 3-celled; style slender or stout, with 3 short lobes. **FRUIT** a capsule, loculicidal, ovoid to cylindric. **SEEDS** many, flat. North America and Eurasia, about 75 species; well developed in California, where there are 12 species.

Lilium philadelphicum L. (loving brother, possibly an allusion to the proximity of the anthers to one another as the flower is opening) Wood lily. **BULBS** depressed-globose, of thick, fleshy scales. **STEMS** erect, 30–60 cm tall. **LEAVES** alternate, but the uppermost in 1 or 2 whorls, linear to lanceolate, glabrous. **INFL** usually solitary, uncommonly umbelliform with 2 or 3 flowers. **FLOWERS** large, very showy orange-red to red, with purplish red spots at the base; tepals 6, all alike, 5–6 cm long, elliptic-oblong, acute, clawed. **FRUIT** a capsule, cylindric to cylindric-ovoid. [*Lilium umbellatum* Pursh; *Lilium montanum* A. Nelson]. Moist, open woods, often in aspen groves or bordering ponds; rare west of the Continental Divide. COLO: Arc, Hin, LPl. 2315–2515 m (7600–8260'). Flowering: mid-Jun–early Aug. Ohio to Alberta, south to Arkansas and New Mexico, with a population known from the Guadalupe Mountains of west Texas. Wood lily is one of our most beautiful wildflowers, with large, red-orange flowers about the size of the palm of the hand. Even to the novice wildflower lover, the plant is instantly recognizable as a lily, and herbarium specimens are never misidentified. Populations tend to be small and scattered and wood lilies should not be picked for a bouquet.

Lloydia Salisb. ex Rchb. Alp Lily

(for Edward Lloyd, curator of the Oxford Museum) Perennial herbs. Rhizomes oblong, with persistent sheaths, simulating the look of an onion bulb, and terminating a creeping rootstock. **STEMS** slender, erect, less than about 15 cm tall. **LEAVES** 2 to a few, linear, reduced above. **INFL** solitary or a few in a terminal raceme. **FLOWERS** small, white, with colored veins; tepals 6, all alike, separate, spreading, with a small gland near the base; stamens 6; ovary superior, 3-celled; style short, persistent, with 3 short stigmatic lobes. **FRUIT** a capsule, loculicidal, more or less globose. Eurasia and North America, about 12 species.

Lloydia serotina

Lloydia serotina (L.) Salisb. ex Rchb. (late-coming) Alp lily. Perennial herbs, erect, slender, with a short, thick rhizome, the withered stems and leaves of prior years' growth persistent and coating the rhizome, making it resemble a bulb. **LEAVES** both basal and cauline, the basal leaves linear and about as long as the stem, the cauline ones lanceolate and reduced. **FLOWERS** 1 or 2, sometimes as many as 4, erect, broadly turbinate, white to yellowish white, with greenish or brownish coloration on the central veins and usually tinged rose on the back; tepals 6, oblong or broadly oblanceolate, obtuse, 9–12 mm long. **FRUIT** a capsule, obovoid, 6–8 mm long. Occurs mainly at or above timberline. COLO: Hin, LPl, Min, Mon, SJn. 3175–3870 m (10420–12700'). Flowering: Jun–Jul. Eurasia, North America (circumpolar); from Alaska south to Oregon in the Cascades and from Alberta south to northern New Mexico in the Rockies. Utah populations are in the Uinta Mountains.

Maianthemum F. H. Wigg. False Solomon-seal

(Latin *Maius*, month of May, + Greek *anthemon*, flower) Perennial herbs, terrestrial (ours) or aquatic. Rhizomes spreading and filiform or densely clumped, cylindrical, fleshy, zigzag by virtue of one branch of the rhizome growing and the other aborting (sympodial). **STEMS** simple, erect or arching. **LEAVES** cauline, alternate, clasping or short-petiolate,

glabrous or puberulent, ovate, with a round or cordiform base, the margins flat or undulate, denticulate or entire, the apex acute or caudate. **INFL** paniculate or racemose. **FLOWERS** with 6 tepals and 6 stamens (ours) or with 4 tepals and 4 stamens, perianth spreading, tepals white, separate, ovate to triangular; stamens inserted at base of tepal; ovary superior, 2- or 3-celled; style short, stigma 2- or 3-lobed. **FRUIT** a berry, variously mottled when immature, bright red at maturity, usually lobed. **SEEDS** 1 to 12, globose (LaFrankie 1986). North America, Central America, northern Europe, eastern Asia, 30 species.

1. Inflorescence paniculate; flowers numerous; tepals 1–2 mm long; stamens exceeding the tepals ....***M. racemosum***
1' Inflorescence racemose; flowers few; tepals 4–7 mm long; stamens not exceeding the tepals .....***M. stellatum***

Maianthemum racemosum (L.) Link **CP** (with the flowers in a raceme; a misnomer, the flowers of this species are in a panicle) Solomon's plume; false Solomon-seal. Perennial herbs, erect to suberect, to arching. Rhizomes rather thick. **STEMS** 30–90 cm, glabrous or finely pubescent. **LEAVES** alternate, sessile or short-petiolate, with a clasping base, flat, broadly ovate to elliptic, 7–20 cm long, the apex acuminate to acute. **INFL** a panicle with dense clusters of flowers, 5–12 cm long. **FLOWER** tepals 6, all alike, white, narrowly oblong, 1.5–2 mm long; stamens 6, the filaments broadly dilated at the base and usually broader than the tepals; style less than 1 mm long. **FRUIT** a berry, red at maturity, speckled with purple, particularly noticeable when immature, globose, 4–6 mm in diameter. [*Smilacina racemosa* (L.) Desf.]. In shaded, cool, moist places, in oak-maple, piñon-juniper, Douglas-fir, aspen, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1985–3230 m (6520–10600'). Flowering: Jun–Jul. Throughout most of North America.

Maianthemum stellatum (L.) Link (with narrow divisions radiating from the center like rays of a star, an allusion to the shape of the flower) Stellate Solomon-seal. Perennial herbs, erect. Rhizome stout. **STEMS** 20–60 cm, glabous or finely pubescent. **LEAVES** alternate or spiraling, sessile, sometimes with a clasping base, flat to folded on the midvein, lanceolate to oblong-lanceolate, 6–15 cm long, the apex acute. **INFL** a raceme, rather few-flowered. **FLOWER** tepals 6, all alike, white, lanceolate to narrowly oblong, 4–7 mm long; stamens 6, erect; style 1–2 mm long. **FRUIT** a berry, greenish yellow when immature, often dark striped, red, or reddish purple at maturity, globose, 5–8 mm in diameter. [*Smilacina stellata* (L.) Desf.]. Moist, shaded or open ground in hanging gardens, piñon-juniper, sagebrush, oak-maple, ponderosa pine, aspen, and spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 1125–3720 m (3700–12200'). Flowering: Apr–Jun. Alaska to Newfoundland, south to the Ohio Valley, southern Kansas, western Oklahoma, much of New Mexico, eastern and northern Arizona, California; Mexico. Used as a ceremonial emetic by Navajos and in the Fire Dance.

Prosartes D. Don Fairybells

(to append, alluding to the pendulous ovules in the type species) Perennial herbs. Rhizomes slender, knotty, with fibrous roots. **STEMS** branched distally, generally pubescent. **LEAVES** sessile or subsessile, broadly ovate to oblanceolate, with reticulate veining. **INFL** terminal, more or less umbellate, 1 to 4, up to 7 in some species, drooping, pedicellate. **FLOWER** tepals 6, not persistent in fruit, separate, weakly gibbous proximally; stamens hypogynous, basally adnate to tepals, filaments filiform to basally dilated; overy superior, 3-celled; style included or exserted, stigma not lobed or weakly 3-lobed. **FRUIT** a berry, yellowish to red, and more or less fleshy. **SEEDS** light yellow to orange-brown, ellipsoidal to oblong, smooth (Shinwari et al. 1994). North America, five species.

Prosartes trachycarpa S. Watson (rough fruit, alluding to the papillate nature of the surface of the berry) Fairybells. Perennial herbs. Rhizomes slender to thickish. **STEMS** suberect, sparsely branched, crisp-pubescent. **LEAVES** alternate, 4–10 cm long, ovate to ovate-oblong, apex acute, pubescent below, glabrous above, the margins ciliate. **INFL** 1 to 3 flowers on stout, pendulant, pubescent pedicels, flowers facing downward. **FLOWERS** narrowly campanulate, 10–15 mm long, tepals 6, creamy white, narrowly oblanceolate, spreading from near the narrowed base; stamens 6, mostly exserted; ovary broadly ovoid to obovoid, 3-celled; style 9–12 mm long, with short stigmatic lobes up to 1 mm long. **FRUIT** a berry, 7–10 mm long, depressed-globose, strongly papillate, reddish orange when mature. [*Disporum trachycarpum* (S. Watson) Benth. & Hook. f.]. Oak-maple, Douglas-fir, white fir, ponderosa pine, and spruce-fir communities; often in shady, wooded places, often near streams or on north-facing slopes. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn; UTAH. 2150–2805 m (7050–9205'). Flowering: Jun–Jul. Ontario to British Columbia, south in the mountains to Utah, Colorado, northern New Mexico, and Arizona. The New World species have traditionally been treated as section *Prosartes* of the genus *Disporum*, which otherwise occurs only in Asia. Recent work suggests that there is sufficient difference to recognize two genera.

Streptopus Michx. Twisted Stalk

(twisted foot, alluding to the bent or twisted peduncles) Perennial herbs. Rhizomes horizontal, extensive **STEMS** simple to highly branched and leafy. **LEAVES** numerous, alternate, elliptic to ovate, bases sessile to mostly clasping, apex acute to acuminate. **INFL** rotate to campanulate. **FLOWERS** small, white, greenish white, pink, or rose-red, depending upon the species, borne beneath the leaf (extra-axillary), 1 or sometimes 2 together, on a bent or twisted peduncle; tepals 6, alike, mostly oblanceolate to oblong, erect, spreading, or recurved; stamens 6, hypogynous, filaments short and flat; ovary superior, 3-celled; style slender to bulbous, with an entire or short-trifid stigma. **FRUIT** a berry. North America and Eurasia, seven species.

Streptopus amplexifolius (L.) DC. (with leaves clasping the stem) Twisted stalk. Perennial herbs, stout, erect. Rhizomes thick, highly branched. **STEMS** 50–80 cm tall, glabrous to pubescent stems and branches, the thick rigid hairs red at the base. **LEAVES** ovate-oblong to oblong-lanceolate, 5–15 cm long, clasping at the base, apex acuminate. **INFL** campanulate. **FLOWERS** white with a greenish or yellowish tinge, 9–15 mm long, arising extra-axillary (back side of leaf), the arched peduncle 1–3 cm long, bearing a short-stalked gland at the tip, then sharply geniculate (like a knee joint), the twisted pedicel 1–2 cm long, bearing 1 or 2 flowers; tepals narrowly oblong-lanceolate, spreading, recurved at the tip; stamens unequal, outer series 1 mm long, inner series 2–3 mm long, the filaments only slightly less broad than the anthers; ovary elliptic; style 4–5 mm long, with an unlobed or minutely lobed stigma. **FRUIT** a berry, 10–12 mm long, ellipsoid, whitish green when immature, yellowish orange or red when mature. $2n = 16, 32$. [*Uvularia amplexifolia* L.; *Convallaria amplexifolia* (L.) E. H. L. Krause; *Streptopus fassettii* Á. Löve & D. Löve]. Aspen and spruce-fir communities; moist places, especially along streams. COLO: Arc, Hin, LPl, Min, Mon, SJn; UTAH. 2325–3290 m (7630–10790'). Flowering: mid-May–Jul. Eurasia and North America, from Alaska across Canada and the northern United States; in the West, south to Arizona.

Veratrum L. False Hellebore, Cornhusk Lily, Skunk Cabbage

(an ancient name for hellebore, probably from *vere*, true, + *ater*, black, alluding to the black rhizomes of some species) Perennial herbs. Rhizomes short, thick, stout. **STEMS** tall, stout, erect, leafy, unbranched. **LEAVES** numerous, narrow to broad, often with lengthwise plaits, strongly clasping in most species. **INFL** a terminal panicle or compound raceme. **FLOWERS** small, greenish white, yellow, or purple, depending upon the species, broadly spreading, polygamous (upper perfect; lower staminate), on a short pedicel; tepals 6, separate or sometimes with a short hypanthium, generally without a gland, clawed in some, oblong-ovate, obtuse; stamens 6, opposite the tepals, free, almost as long as the tepals, filaments slender, anthers cordate-ovoid; ovary superior, 3-celled, glabrous or woolly; styles 3, terminated by an elongated stigma. **FRUIT** a capsule, 3-lobed, septicidal, membranous, ovoid, and tipped with the persistent styles. **SEEDS** numerous, flat, and surrounded by a broadly winged, loose outer seed coat. Northern Hemisphere, about 30 species.

Veratrum californicum Durand (of California) Skunk cabbage. Perennial herbs, tall, erect, stout. **STEMS** typically 1.5–2 m tall, glabrous below, becoming tomentose in the inflorescence. **LEAVES** numerous, large, oblong-lanceolate to broadly elliptic or ovate, 25–40 cm long, 10–20 cm wide, gradually reduced up the stem, leaves pubescent below and sometimes above on the veins, plicate and strongly nerved, the base sheathing, apex acute. **INFL** a panicle, freely branching, stiffly erect. **FLOWERS** spreading, greenish white to dull white, subsessile or on a short pedicel, gradually reduced upward; tepals 6, lanceolate to oblong-ovate or elliptic, 10–14 mm long, entire, erose, or somewhat denticulate, glabrous or slightly woolly, the margin green, with a gland at the base, V-shaped (2 confluent glands); stamens 6, late, glabrous or slightly woolly, the margin green, with a gland at the base, V-shaped (2 confluent glands); stamens 6, shorter than the tepals, 6–8 mm long, filaments slender, anthers broader than long; ovary glabrous or with a few hairs; styles 3. **FRUIT** a capsule, narrowly ovoid, 2–3 cm long, glabrous. **SEEDS** flat, winged, 10–12 mm long. [*Veratrum tenuipetalum* A. Heller]. Aspen, mixed conifer, and spruce-fir communities; moist open meadows, along streams, and by lakes. ARIZ: Apa; COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr, SJn. 2345–3650 m (7700–11975'). Flowering: Jun–Aug. Montana to Washington, south to California, Nevada, Utah, Colorado, Arizona, and New Mexico. *Veratrum* has some alkaloids that have been useful for the treatment of hypertension. The plant is also the cause of occasional livestock poisoning. Paiutes applied a poultice of root for rheumatism. Also for burns and bruises. Used as a gynecological aid and gland medicine. Also used to cover berries to keep them fresh.

Zigadenus Michx. Death Camas

(*zygos*, yoke, + *aden*, gland, an allusion to the paired glands of some species) Perennial herbs, erect, simple, leafy, glabrous. **BULBS** deep-seated, coated (ours) or rhizomatous. **LEAVES** linear, grasslike, clasping, mostly basal, cauline leaves reduced. **INFL** terminal raceme or panicle. **FLOWERS** small, greenish to yellowish white or white, rotate to shallowly campanulate, perfect or unisexual, on an erect spreading pedicel, subtended by long-acuminate bracts; tepals 6, all alike, lanceolate to ovate, separate or adnate to the lower part of the ovary, clawed at the base, 1 or 2 yellow to

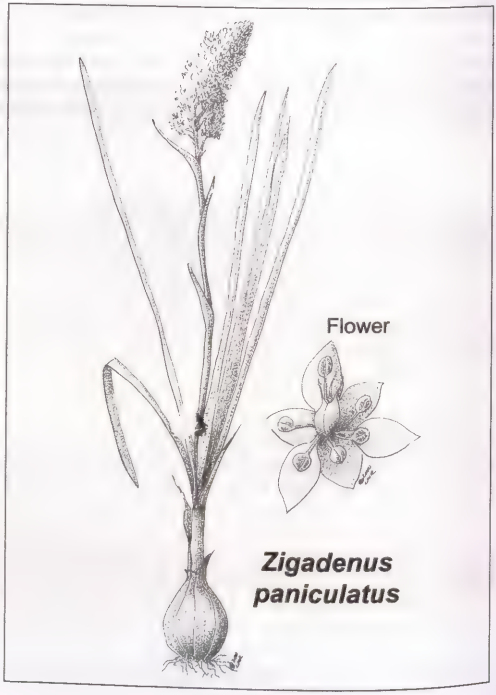
greenish glands near the base; stamens 6, hypogynous or perigynous, filaments basally dilated, anthers basifixed, extrorse, cordate-reniform; ovary superior or partly inferior; 3-celled; styles 3, distinct, stigmatic at tips. **FRUIT** a capsule, 3-lobed, loculicidal. **SEEDS** subrhomboid, irregularly angled. North America and Asia, about 15 species. As recognized here (and following *Flora of North America*), the genus is polyphyletic. Most species of *Zigadenus* are quite poisonous, and the toxicity is said to increase upon drying. *Zigadenus* poisoning can be fatal. Many of the alkaloids found in *Veratrum* are found in *Zigadenus* as well. Persons mistakenly eating *Zigadenus* and then dying, when they thought they had collected the edible bulbs of *Camassia*, has led to the common name of "death camas."

1. Perianth segments no more than 7 mm long; ovary superior; glands of perianth ovate or semicircular, often with an indefinite margin ..... (2)
1′ Perianth segments at least 6 mm long; ovary partly inferior; glands of perianth obcordate (heart-shaped with the point facing the stem), with a definite margin ..... (3)

2. Inflorescence usually a panicle, with at least 2 basal branches, less frequently a raceme; basal leaves 5–15 mm wide; tepals usually clawless or with short claws ..... ***Z. paniculatus***
2′ Inflorescence usually a raceme, less frequently a near-panicle with 1 basal branch; basal leaves 3–6 mm wide; tepals usually clawed, less frequently clawless ..... ***Z. venenosus***

3. Plants 30–60 cm tall, inflorescence a raceme, sometimes a near-panicle with 1 basal branch, usually at elevations above 1980 m (6500′) in the mountains ..... ***Z. elegans***
3′ Plants 60–100 cm tall or more, inflorescence a large, diffuse panicle, usually at elevations below 1980 m (6500′) in hanging gardens and seeps in canyon country ..... ***Z. vaginatus***

Zigadenus elegans Pursh **CP** (elegant, referring to the showy flowers) Mountain death camas. Perennial herbs, 15–70 cm tall. **BULBS** deep-seated, narrowly globose, 1–3 cm long. **LEAVES** basal, linear, 10–25 cm long, 2–15 mm wide, cauline leaves becoming much reduced above. **INFL** a raceme, or sparingly branched below with ascending branches, rather few-flowered. **FLOWERS** rotate, creamy white or greenish white, on a spreading or ascending pedicel, 10–35 mm long; tepals 6, spreading, obovate or oblong, 6–11 mm long, not clawed, with an obcordate gland at the base of each tepal, yellow, yellow-green, or green; stamens 6, perigynous, as long as the tepals, the filament broadly dilated basally, anther reniform; ovary partly inferior, 3 distinct styles, 2.5–3 mm long. **FRUIT** a capsule, 15–20 mm long. [*Anticlea elegans* (Pursh) Rydb.; *Zigadenus chloranthus* Richardson; *Z. longus* Greene; *Z. dilatatus* Greene; *Z. alpinus* Blank.]. Aspen, spruce-fir, and alpine communities; often in moist meadows. ARIZ: Apa; COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr, SJn; UTAH. 2325–3765 m (7630–12350′). Flowering: Jun–Jul. Alaska, south to British Columbia and Alberta, south in the more western mountains to Washington, Oregon, and northern Nevada, and south in the Rockies to Arizona, New Mexico, western Texas, and Mexico. Navajos used infusion of plant for mad coyote bites.

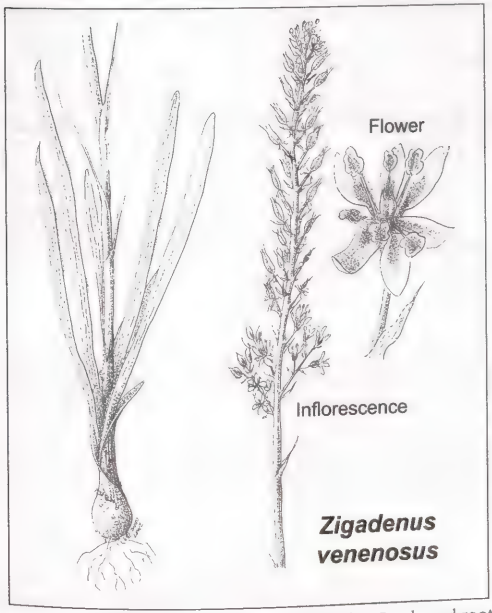


Zigadenus paniculatus (Nutt.) S. Watson (with the flowers in a panicle) Foothills death camas. Perennial herbs, 30–50 cm tall. **BULBS** oblong-ovoid, deep-seated, 3–4 cm long, with persistent bulb coats. **LEAVES** mostly basal, some along the lower stem, linear, 15–40 cm long, 5–15 mm wide, much reduced above. **INFL** a terminal panicle, densely flowered, 10–30 cm long. **FLOWERS** broadly campanulate, perfect or staminate only, white or yellowish white; tepals 6, persistent in fruit, those of the outer series broadly ovate, 3.5–4.5 mm long, scarcely or not clawed, those of the inner series oblong-lanceolate, 4–5 mm long, with a narrow claw less than 1 mm long, gland 1,

yellow or yellowish green, broadly ovate or obovate, distal margin evident or indefinite; stamens 6, usually equaling or slightly longer than the tepals, filaments slender, anther reniform or cordate; ovary superior; styles 3, distinct, 2.5–3 mm long. **FRUIT** a capsule, 10–20 mm long. [*Toxicoscordion paniculatum* (Nutt.) Rydb.]. Blackbrush, piñon-juniper, sagebrush, ponderosa pine, and Douglas-fir communities; often in dry, sandy or rocky areas. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1820–2500 m (5970–8200'). Flowering: Apr–Jun. Washington south to California, east to Idaho, western Montana, western Wyoming, south through Nevada, Utah, western Colorado to northern Arizona and northwestern New Mexico. Navajos gave the plant to sheep with bloat. Paiutes used the bulb for neuralgia and rheumatism, for swellings, toothache, and as an emetic. Navajos cooked the bulbs with meat and ate the greens.

Zigadenus vaginatus (Rydb.) J. F. Macbr. (sheathed) Alcove death camas. Perennial herbs, 30–100 cm or more, base of stem with marcescent leaf bases. **BULBS** narrowly ovoid, 3–6 cm, with persistent bulb coats. **LEAVES** mostly basal, 20–75 cm long × 6–18 mm wide, sheathing the stem below, reduced up the stem. **INFL** a large, broad, diffuse panicle, up to 45 cm long. **FLOWERS** perfect, rotate, white; tepals 6, obovate to spatulate or elliptic, 6–7 mm long, rounded to obtuse, with a yellow obcordate gland at the base, clawless; stamens 6, shorter than the tepals; ovary partly inferior, styles 3, about 2–3 mm long. **FRUIT** a capsule, 10–15 mm long. [*Anticlea vaginata* Rydb.]. Hanging garden communities in seeps and alcoves. ARIZ: Apa, Nav; UTAH. 1125–1980 m (3700–6500'). Flowering: Aug–Oct. Arizona, Utah, and Colorado.

Zigadenus venenosus S. Watson (very poisonous) Meadow death camas. Perennial herbs, 20–60 cm tall. **BULBS** oblong-ovoid, deep-seated, 1.5–2.5 cm long, with persistent bulb coats. **LEAVES** mostly basal, some along the lower stem, linear, 15–30 cm long, 3–6 mm wide, much reduced above. **INFL** a terminal raceme, sometimes with 1 or 2 basal branches and thus paniculate, densely flowered, up to 20 cm long. **FLOWERS** campanulate, perfect or staminate only on some branches, white or yellowish white; tepals 6, persistent in fruit, those of the outer series ovate, 4.5–5 mm long, clawed (up to 1 mm long) or not clawed, those of the inner series oblong-lanceolate, 5–6 mm long, with a narrow claw 0.7–1.2 mm long, gland 1, yellow or yellowish green, broadly ovate, distal margin evident or indefinite; stamens 6, usually equaling or slightly longer than the tepals, filaments slender, anther reniform or cordate; ovary superior; styles 3, distinct, 2–3 mm long. **FRUIT** a capsule, 10–20 mm long. [*Toxicoscordion venenosum* (S. Watson) Rydb.; *Zigadenus gramineus* Rydb.; *Z. intermedius* Rydb.; *Z. falcatus* Rydb.; *Z. acutus* Rydb.; *T. arenicola* A. Heller; *Z. salinus* A. Nelson]. Sagebrush, piñon-juniper, oak-maple, and white fir communities; often in dry, sandy or rocky areas. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon, SMg; NMEX: RAr, SJn. 1605–2065 m (5275–6775'). Flowering: Apr–Jun. Southwestern Canada, Pacific Northwest, south to California, east to the Dakotas, south to Nevada, Utah, Colorado. Ours are **var. *gramineus*** (Rydb.) O. S. Walsh ex C. L. Hitchc. Seeds and roots considered deadly poison. Paiutes used the bulb as a poultice for swellings, snakebite, rheumatism, and burns.



LINACEAE DC. ex Perleb FLAX FAMILY

Kenneth D. Heil and J. Mark Porter

Ours taprooted annual or perennial herbs. **LEAVES** alternate, simple. **INFL** terminal racemes or cymes. **FLOWERS** perfect, actinomorphic, nodding in bud; sepals 5, persistent; petals 5, free, blue, yellow, or orange, soon falling;

stamens 5, alternate the petals, often appendaged, staminodia 0 or 5, alternate the stamens, the filaments united at the base; pistil 1, the ovary superior, of 5 united carpels, locules 2–5, becoming 4–10 by the growth of false septa (secondary partitions); styles 2–5, distinct or united below. **FRUIT** a capsule. **SEEDS** compressed, shining, becoming gelatinous when wet. $x = 6–11+$. Fifteen genera, 300 species, widely distributed.

Linum L. Flax

(flax) Annual or perennial herbs from a taproot; stems 4–80 cm tall, often branched. **LEAVES** 3–30 mm long, 0.5–4 mm wide, appressed-ascending to ascending, stipular glands present or absent. **FLOWERS** with peduncle 0.5–35 mm long; sepals 3.5–9 mm long, lanceolate, acuminate, or elliptic; entire, often with a slender awn tip; petals yellow, orange, blue, or white, 5–23 mm long; style 2.5–10 mm long, often cleft at apex. **FRUIT** ellipsoid, or ovoid to globose, 3–8 mm long. **SEEDS** mucilaginous. More than 90 species of temperate and warm regions. Commercial flax is derived from retting stems of *L. usitatissimum* L. Other uses include linseed oil, stock feed, medical, and ornamental. Flax blossoms open early in the morning and fall by afternoon. Mature petals are seldom preserved on specimens; therefore, care should be taken during collection.

1. Petals blue or rarely white ..... ***L. lewisii***
1' Petals yellow or orange ..... (2)

2. Styles distinct to the base; flowers in racemes; pine forests in Apache County, Arizona, and McKinley County, New Mexico ..... ***L. neomexicanum***
2' Styles united nearly to the apex; flowers in terminal cymes; widespread ..... (3)

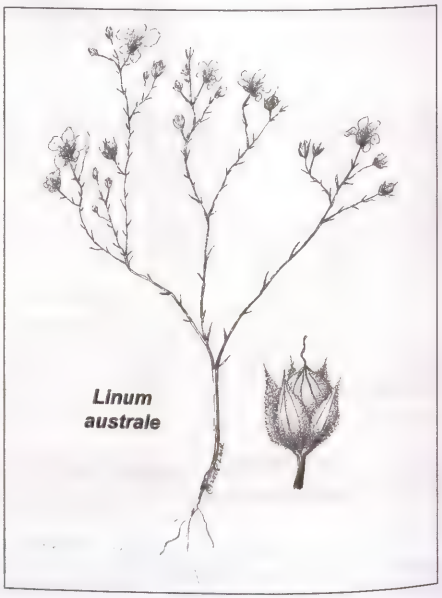
3. Plants short-lived perennials (rarely annual); sepals persistent in fruit; secondary partitions of carpels incomplete, edges hairy; no stipular glands evident; flowers 0.5–6 cm long ..... ***L. subteres***
3' Plants annual; sepals soon deciduous; secondary partitions complete, edges glabrous; stipular glands brown to dark brown; flowers 0.5–2.5 cm long ..... (4)

4. Stems densely hirtellous with spreading hairs; petals mostly orange to salmon, the bases reddish ..... ***L. puberulum***
4' Stems glabrous or scaberulous; petals yellow to yellow-orange ..... (5)

5. Styles 2–4 mm long; stems scaberulous below, usually simple below the middle; stipular glands brown ..... ***L. australe***
5' Styles 4.5–7 mm long; stems glabrous, usually branched from the base; stipular glands dark brown ..... ***L. aristatum***

Linum aristatum Engelm. (an awn or bristle, referring to the awn at the apex of the leaf or sepal) Broom flax. Annual to short-lived perennial, glabrous herbs from taproots. **STEMS** 8–45 cm tall, usually branched from near the base. **LEAVES** 3–15 mm long, 0.5–1 mm wide, appressed-ascending, stipular glands present. **INFL** a cyme, the peduncles 5–35 mm long. **FLOWER** sepals 5–9 mm long; petals yellow to yellow-orange, 7–12 mm long; anthers 0.8–1 mm long; style 4–7 mm long, cleft at apex. **FRUIT** ellipsoid, 3.5–4.5 mm long; secondary partitions hyaline, almost complete. $n = 15$. Sand dunes and other sandy sites in blackbrush, sand sagebrush, resinbush, piñon-juniper, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1180–2000 m (3900–6060'). Flowering: May–Aug. Fruit: Jun–Sep. Texas south to Mexico.

Linum australe A. Heller (southern) Southern flax. Annual, scabrous herbs from taproots. **STEMS** 10–40 cm tall, usually branched above the base. **LEAVES** mostly 6–20 mm long, 0.5–1.5 mm wide, appressed-ascending to ascending, stipular glands present on ours. **INFL** a cyme, the peduncles mostly 3–15 mm long. **FLOWER** sepals 4.5–7 mm long; petals yellow to yellow-orange, 5–9 mm long; anthers 0.4–0.8 mm long; style 2.5–4 mm long, cleft at apex. **FRUIT**



ovoid, 3.5–4.5 mm long; secondary partitions hyaline, almost complete. $n = 15$. Piñon-juniper, sagebrush, and ponderosa pine communities. COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn. 2000–2750 m (6600–9075'). Flowering: May–Aug. Fruit: Jun–Sep. Montana, Wyoming, Nevada south to Texas and northern Mexico. Used as a drug for stomach disorders by the Hopi, and for kidney disease by the Navajo.

Linum lewisii Pursh (honoring Meriwether Lewis of Lewis and Clark) Blue flax. Perennial, glabrous herbs from a caudex and stout taproot. **STEMS** 15–80 cm tall, usually simple. **LEAVES** 4–30 mm long, 0.5–4 mm wide, ascending to spreading-ascending. **INFL** in cymose clusters, the peduncles 1–3 cm long. **FLOWER** sepals 3.5–6 mm long; petals blue with a whitish or yellowish base or white, 12–23 mm long; staminodia present, about 1 mm long; styles distinct. **FRUIT** ovoid to globose, 6–8 mm long, opening from the top, primary and secondary sutures fringed-ciliate. [*L. perenne* L. subsp. *lewisii* (Pursh) Hultén; *L. perenne* L. var. *lewisii* (Pursh) Eaton & Wright]. $2n = 18$. Frequently found along roadsides; sagebrush, mountain brush, piñon-juniper, and ponderosa pine communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1440–3180 m (4750–10500'). Flowering: May–Sep. Fruit: Jun–Oct. Alaska to Mexico; Asia. Used for fiber, food, and drugs.

Linum neomexicanum Greene (of New Mexico) New Mexico yellow flax. Perennial, glabrous herbs from a caudex. **STEMS** up to 40 cm tall, usually branching above the base. **LEAVES** mostly 5–15 mm long, 1–2 mm wide, appressed-ascending to ascending. **INFL** in racemes, the peduncles 1–3 mm long. **FLOWER** petals yellow, 5–8 mm long; sepals 3–4 mm long; styles distinct to the base. **FRUIT** ovoid, 4–5 mm long, opening from the top, primary partitions ciliate-hairy adaxially, secondary partitions incomplete and sometimes fringed. Rocky hillsides in coniferous forest communities. ARIZ: Apa; NMEX: McK. 2135–2515 m (7050–8300'). Flowering: Jul–Sep. Fruit: Aug–Sep. New Mexico and Arizona south to northern Mexico.

Linum puberulum (Engelm.) A. Heller (minutely downy) Plains flax. Annual, hirtellous herbs from a taproot. **STEMS** 4–20 cm tall, usually branched from the base. **LEAVES** 3–15 mm long, 0.5–1 mm wide, appressed-ascending to ascending, stipular glands present in ours. **INFL** in cymose peduncles mostly 0.5–2.5 cm long. **FLOWER** sepals 4–7 mm long; petals orange to salmon, with a dark base, 8–15 mm long; styles 3–6 mm long, cleft apically. **FRUIT** ovoid, 3–4 mm long, the secondary partitions hyaline, almost complete. $n = 15$. Grassland, salt desert scrub, sagebrush, and piñon-juniper communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1620–2075 m (5340–6290'). Flowering: May–Aug. Fruit: Jun–Sep. California, Nevada east to Nebraska, south to Texas; Mexico. Used as a drug; eye medicine and heartburn.

Linum subteres (Trel.) J. P. Winkl. (somewhat terete or circular in cross section) Utah yellow flax. Perennial (or annual), glabrous, herbs from taproots. **STEMS** 10–45 cm tall, usually branched above the base. **LEAVES** 4–20 mm long, 0.5–2 mm wide, appressed-ascending to ascending, stipular glands not present in ours. **INFL** cymose on peduncles 0.5–6 cm long. **FLOWER** sepals 4–7 mm long; petals yellow, 7–10 mm long; anthers 1–2 mm long; styles 4.5–9 mm long, cleft apically. **FRUIT** ovoid, 3.5–4.5 mm long, the secondary partitions prominently lacerate-fringed, incomplete. $n = 15$. Sandy soils in salt desert scrub, mountain shrub, rabbitbrush, and piñon-juniper communities. UTAH. 1635–2045 m (5400–6700'). Flowering: Jun–Aug. Fruit: Jul–Sep. Utah to Nevada.

LOASACEAE Juss. STICKLEAF or BLAZING-STAR FAMILY

Charlotte M. Christy

Annuals or perennials, mostly herbs; hairs harsh, often barbed, some stinging. **STEMS** mostly erect, usually brittle. **LEAVES** exstipulate, mostly alternate, simple. **INFL** cymose in ours. **FLOWERS** perfect, actinomorphic, epigynous; sepals 4–5, usually persistent; petals 4–5, ours free; petaloid staminodia present or absent; stamens mostly 10–many, mostly free; pistil 3–5-carpellate, unilocular; placentation usually parietal; style 1, often persistent. **FRUIT** a capsule (ours). **SEEDS** 1 to many (Hufford 1989; Schenk 2009; Schenk and Hufford 2010). Fifteen genera, about 250 species. New World except *Kissenia* (Africa and Arabia) and *Plakothira* (Marquesas Islands). Uses include ornamentals and some herbal remedies.

Mentzelia L. Blazing-star, Stickleaf

(for Christian Mentzel, 17th-century German botanist) Annuals or perennials; ours herbaceous. **STEMS** often with mature epidermis white. **LEAVES** sessile or petioles winged and usually indistinct; blades linear, lanceolate, elliptic, ovate, or oblanceolate; margins sinuate-dentate or pinnately lobed, entire or crenate in some. **FLOWERS** usually bracteate; sepals 5; petals 5, white to yellow or orangish; petaloid staminodia present or absent; outer stamens with

filiform to petaloid filaments. **CAPSULES** dehiscent by 3 apical valves, exceptionally more. **SEEDS** mostly 10–many, 1–4 mm long, endosperm present; seed coat sculptured, appearing smooth or reticulate at low magnification, some requiring 40–100× magnification to see structural details. $x = 14$. At least 100 species, New World. Fruit measurements refer to the body (the seed-containing portion). Seeds provide important characters; thus immature specimens may be unidentifiable.

1. Plants biennials or short-lived perennials; seeds 2–4 mm long, the embryo-containing portion ovate, the margin winged; petals exceeding 5 mm long; petaloid stamens or staminodia often present (section *Bartonia*) ..... (2)
1' Plants annual; seeds 1–2 mm long, the embryo-containing portion irregular, often blocky or faceted, wingless; petals rarely exceeding 5 mm long in ours; petaloid stamens or staminodia absent (section *Trachyphytum*) ..... (9)

2. Outer surface of petals with evident trichomes; seed epidermal cells with wavy adjoining walls ..... ***M. cronquistii***
2' Outer surface of petals glabrous except for an apical tuft; seed epidermal cells with straight, wavy, or strongly sinuate adjoining walls ..... (3)

3. Plants branching only in upper 1/2, the branches strongly ascending; petals nearly erect; adjoining walls of seed epidermal cells strongly sinuate ..... ***M. rusbyi***
3' Plants potentially producing branches at most nodes, the branches spreading; petals widely spreading; adjoining walls of seed epidermal cells straight, wavy, or strongly sinuate ..... (4)

4. Cauline leaves obovate to oblanceolate, the margins crenate; wing of seed 1 mm broad, the epidermal cells with straight walls ..... ***M. pterosperma***
4' Cauline leaves narrowly elliptic to lanceolate or linear, the margins sinuate-dentate to lobed; wing of seed less than 1 mm broad, the epidermal cells with wavy to strongly sinuate walls ..... (5)

5. Seed with wing about 0.5 mm broad, the epidermal cells with strongly sinuate walls; cauline leaves with broad to clasping bases, the lobes or teeth usually irregular ..... ***M. multiflora***
5' Seed with wing nearly obsolete to 0.3 mm broad, the epidermal cells with wavy to sinuate walls; cauline leaves sessile but not clasping, the lobes or teeth similar in size and spacing, mostly deeply pinnately lobed ..... (6)

6. Wing of seed nearly obsolete to 0.25 mm broad, the epidermal cells with wavy to sinuate walls ..... ***M. laciniata***
6' Wing of seed about 0.3 mm broad, the epidermal cells with sinuate walls ..... (7)

7. Leaves oblanceolate to elliptic, the lobes filiform, 1.4 mm wide or less, up to 17 mm long ..... ***M. filifolia***
7' Leaves spatulate, the lobes narrow but not filiform, more than 1 mm wide, less than 13 mm long ..... (8)

8. Leaves to 1.2 cm wide; seeds less than 3 mm long ..... ***M. sivinskii***
8' Leaves to 3.2 cm wide; seeds more than 3 mm long ..... ***M. holmgreniorum***

9. Plants rarely exceeding 9 cm tall; leaves entire ..... ***M. thompsonii***
9' Plants usually exceeding 20 cm tall unless depauperate; leaves, at least the basal, toothed or lobed ..... (10)

10. First-produced fruits bending more than 90°, often at least 180°; seeds rounded, only weakly faceted ..... ***M. obscura***
10' First-produced fruits straight or bending no more than 90°; seeds angular, strongly faceted ..... (11)

11. Fruits long-tapering to base, the first-produced ones often bending, potentially to 90°; bracts mostly subtending ovary and fruit, rarely white-based ..... ***M. albicaulis***
11' Fruits slightly tapering, the first-produced ones straight or rarely with a slight bend; bracts commonly attached to ovary and fruit, mostly white-based ..... ***M. montana***

Mentzelia albicaulis (Douglas ex Hook.) Douglas ex Torr. & A. Gray (white-stemmed) Western blazing-star. Annual. **STEMS** to 30 (–45) cm tall, branching throughout unless depauperate. **LEAVES** to 12 (–15) cm long, to 1 (2) cm wide, narrowly elliptic to lanceolate; basal leaves petiolate, the margins deeply lobed, rarely entire; cauline leaves sessile, often with fewer lobes or entire, the bases often clasping. **BRACTS** of early flowers leaflike, the others strongly reduced, narrowly lanceolate to ovate, green, sometimes with faintly whitish bases, mostly subtending the ovary; margins entire or few-toothed. **FLOWERS** with calyx lobes 2–3 mm long; petals yellow, spreading, broadly obovate or obcordate, 2–6 mm long, 2–4 mm wide; staminodia and broad-filament stamens absent; ovary 4–10 mm long; style 2–4 mm long. **CAPSULES** sessile, clavate, often long-tapering to base; body 8–28 mm long, 3–4 mm wide at apex.

usually straight or the first-formed bent slightly, occasionally as much as 90°. **SEEDS** irregularly blocky, several-faceted, the angles sharp, 1–2 mm long, wingless; epidermal cells with straight adjoining walls, their surface flat to strongly pointed-papillate. $2n = 54, 72$. [*Bartonia albicaulis* Douglas ex Hook.; *Acrolasia albicaulis* (Douglas ex Hook.) Rydb.; *A. gracilis* Rydb.]. Sand, clay, or gravelly soils, grassland, desert shrub, piñon-juniper woodlands, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1125–2250 m (3700–7400'). Flowering: Mar–Jun. Fruit: Apr–Jul. Arizona, California, Colorado, Idaho, New Mexico, Nevada, Oregon, Utah, Washington, Wyoming; British Columbia, Canada; Baja California, Sonora, Mexico. A widespread species with many named variations, commonly intergrading with *M. montana* and others of its relatives where they co-occur. The Ramah Navajo formed a poultice of crushed and soaked seeds and applied it for toothaches; a compound of the leaves was used for snakebite. The Hopi used the plant as a substitute for tobacco.

Mentzelia cronquistii H. J. Thomps. & Prigge (for Arthur Cronquist, 20th-century botanist) Cronquist's blazing-star. Perennial. **STEMS** to 60 cm tall, potentially branching throughout. **LEAVES** to 10 cm long, to 2 cm wide, oblanceolate to narrowly elliptic or lanceolate; basal leaves petiolate, sinuate-dentate; cauline leaves sessile, the bases or basal lobes often clasping; margins lobed, toothed, or entire. **BRACTS** of early flowers reduced leaves, the others further reduced, linear-lanceolate, often entire, subtending the ovary. **FLOWERS** with calyx lobes 5–10 mm long; petals yellow, widely spreading at anthesis, 5–10 (–16) mm long, 1.5–5 mm wide, narrowly oblanceolate, the apex acute, with trichomes covering the outer surface; staminodia (0) 3–5, slightly shorter and narrower than petals; outer 1–2 whorls of stamens with broadened filaments; ovary 3–5 mm long; style 4–8 mm long. **CAPSULES** usually pedicellate, cylindrical or subglobose when short, 4–10 (–15) mm long, 3–7 mm wide, straight. **SEEDS** oval, 2–3 mm long, the wing about 0.5 mm wide; epidermal cells with curved to wavy adjoining walls, the surface walls with 15–20 small bumps. $2n = 20$. [*Nuttallia cronquistii* (H. J. Thomps. & Prigge) W. A. Weber]. Most commonly on sandy soils; desert shrub, sagebrush, and piñon-juniper woodland communities. ARIZ: Apa, Coc; COLO: Dol, Mon; NMEX: SJn; UTAH. 1125–1900 m (3700–6200'). Flowering: Apr–Sept. Fruit: May–Nov. Arizona, Colorado, New Mexico, Utah. This species should be looked for in Navajo County, Arizona. Best recognized by the relatively small flowers and fruits and the trichomes that cover the dorsal surface of its often relatively narrow petals. A somewhat similar species, *M. marginata* (Osterh.) H. J. Thomps. & Prigge, occurs north of our area. It also has trichomes on the dorsal surface of the petals but has straight adjoining walls in the seed coat, somewhat larger flowers, and broader leaves.

Mentzelia filifolia J. J. Schenk & L. Hufford **CP** (narrow leaf) Filiform blazing-star. Biennial. **STEMS** to 75 cm tall, usually branching throughout. **LEAVES** to 11.5 cm long, to 3.5 cm wide; mostly oblanceolate to elliptic, rachis filiform, 8–20 lobes. **FLOWERS** with calyx lobes 6–11 mm long; petals yellow, 14–18.5 mm long, 3.5–6 mm wide, oblanceolate, glabrous on abaxial surface; outer whorl of stamens fertile and staminodial; second whorl of stamens fertile; style 10–14 mm long. **CAPSULES** cylindrical, 11–19 mm long, 5–7.5 mm wide, straight. **SEEDS** gray to light brown, lenticular-ovoid, 2.9–3.2 mm long, winged, seed coat anticlinal cell walls sinuate, with central papillae. $n = 10$. Loamy and rocky soils. Sagebrush, piñon-juniper, and mixed conifer communities. ARIZ: Apa; NMEX: McK. 2100 m (6960'). Flowering: Jun–Aug. Fruit: Jul–Sep. In the past, this taxon was treated as part of *M. laciniata*.

Mentzelia holmgreniorum J. J. Schenk & L. Hufford (in honor of Noel and Patricia Holmgren) Holmgren blazing-star. Biennial. **STEMS** to 50 cm tall, main stem erect, straight. **LEAVES** to 9 cm long, to 3.2 cm wide; narrowly to broadly spatulate, petiolate, margins pinnatisect with 14–20 lobes. **FLOWERS** with calyx lobes 6.5–9.5 mm long; petals 5, yellow, 13.5–18.5 mm long, mostly 5–6 mm wide, narrowly spatulate, glabrous on abaxial surface; outer whorl of stamens fertile and staminodial; second whorl of stamens fertile; style 8.5–10.5 mm long. **CAPSULES** cylindrical, 13–14.5 mm long, 6–7 mm wide, base tapering. **SEEDS** pale gray with a white wing, lenticular-ovoid, 3.7–3.8 mm long, seed coat anticlinal cell walls sinuate, with central papillae. $n = 10$. Sandy soils in washes, roadsides, and other disturbed sites. Mixed conifer communities. ARIZ: Apa. 1495–2225 m (6000–7200'). Flowering: Jun–Aug. Fruit: Jul–Sep. This species has broader lamina lobes and rachises than *M. filifolia*. Within our study area, the Holmgren blazing-star is found in the Canyon de Chelly region.

Mentzelia laciniata (Rydb.) J. Darl. (laciniate leaves) Cutleaf blazing-star. Perennial. **STEMS** to 60 cm tall, usually branching throughout. **LEAVES** to 10 cm long, to 3 cm wide; elliptic to lanceolate or linear, basal leaves petiolate, usually deeply and narrowly pinnately lobed, sometimes merely toothed or approaching entire; cauline leaves sessile, usually without clasping bases or basal lobes, narrowly and regularly lobed or toothed, approaching entire only if very narrow. **BRACTS** of early flowers reduced leaves; others linear to lanceolate, entire or toothed, mostly subtending the ovary. **FLOWERS** with calyx lobes 5–6 mm long; petals yellow, widely spreading, 8–15 mm long, 3–5 mm wide, oblance-

olate to spatulate, obtuse to acute, with trichomes at apex only; staminodia (0) 3–5, slightly smaller than petals; outer several whorls of stamens with slightly broadened to petaloid filaments; ovary 4–7 mm long; style 7–10 mm long. **CAPSULES** pedicellate, cylindrical, 9–18 mm long, 3–5 mm wide, straight. **SEEDS** oblong to oval, 2–3 mm long, the wing nearly obsolete to about 0.25 mm wide; epidermal cells with wavy to slightly sinuate adjoining walls, the surface walls with 5–10 (–15) small bumps. $2n = 20$. [*Nuttallia laciniata* (Rydb.) Wooton & Standl.]. Sandy or clay soils, desert shrub, and piñon-juniper communities. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn. 1900–2200 m (6000–7200'). Flowering: Jun–Oct. Fruit: Jul–Oct. Colorado, New Mexico, possibly adjacent Apache County, Arizona. Often misidentified as *M. humilis* (Urb. & Gilg) J. Darl., a species with similar leaves but more broadly winged seeds, that is gypsiferous, and common in southeastern New Mexico and west Texas. An infusion of the flowers used as an eyewash by the Ramah Navajo.

Mentzelia montana (Davidson) Davidson (of mountains) Variegated-bract blazing-star. Annual. **STEMS** to 50 cm tall, potentially branching throughout. **LEAVES** to 10 cm long, to 1.5 cm wide, narrowly elliptic to lanceolate or nearly linear; margins often entire; basal leaves petiolate, toothed to lobed; cauline leaves sessile, mostly entire, occasionally lobed throughout, the bases broad to clasping. **BRACTS** of early flowers leaflike, the others shorter but broader, often ovate or obovate, with whitish bases, commonly on the ovary; margins mostly entire or few-toothed. **FLOWERS** with calyx lobes 1–5 mm long; petals yellow, spreading, broadly obovate or obcordate, 2.5–5 (–10) mm long, 2–5 mm wide; staminodia and broad-filament stamens lacking; ovary 4–10 mm long; style 1.5–4 (–7) mm long. **CAPSULES** sessile, clavate to nearly cylindric, mostly tapering only near base; body 10–16 (–20) mm long, apex 2–3 mm wide, when mature straight, rarely with a slight bend. **SEEDS** irregular, several-faceted, the angles sharp; epidermal cells with adjoining walls straight, the surface walls flat to strongly pointed-papillate. $2n = 36$. Sand and clay soils, desert shrub, and piñon-juniper communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1350–2350 m (4500–7700'). Flowering: Apr–Aug. Arizona, California, Colorado, New Mexico, Oregon, Texas, Utah; northern Mexico. Immature and depauperate specimens are difficult or impossible to separate from *M. albicaulis*. Best recognized by its shorter, straight fruits that taper only near the base and its white-based bracts.

Mentzelia multiflora (Nutt.) A. Gray (many-flowered) Adonis blazing-star, desert blazing-star. Perennial. **STEMS** to 80 cm tall, potentially producing branches throughout. **LEAVES** to 15 cm long, to 3 cm wide; narrowly elliptic to lanceolate, occasionally oblanceolate; basal leaves petiolate, the margins toothed to lobed; cauline leaves sessile, commonly with clasping bases or basal lobes, the margins deeply and unevenly lobed, toothed or sometimes approaching entire in very narrow leaves. **BRACTS** of early flowers reduced leaves, the others linear-lanceolate and entire, few-toothed or lobed, mostly subtending the ovary. **FLOWERS** with calyx lobes 6–12 mm long; petals yellow, rarely cream or nearly white, widely spreading, 9–23 mm long, 3–10 mm wide, the apex rounded to obtuse, with trichomes at apex only; staminodia (0–) 5, slightly smaller than petals; outer several whorls of stamens with petaloid or broadened filaments; ovary 4–7 mm long; style (7–) 10–14 mm long. **CAPSULES** pedicellate, cylindrical, (6–) 10–20 mm long, 4–6 mm wide, straight. **SEEDS** oval, 2.5–4 mm long, the wing 0.5 mm wide or slightly wider; epidermal cells with sinuate adjoining walls, the surface walls with a finely cobbled dome. $2n = 18$ (20). [*Bartonia multiflora* Nutt.; *Nuttallia multiflora* (Nutt.) Greene]. Sand, clay, alluvium, shale soils, desert shrub, piñon-juniper woodlands, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1125–2300 m (3700–7500'). Flowering: Apr–Sep. Fruit: May–Oct. Arizona, California, Colorado, Nebraska, New Mexico, Oklahoma, Texas, Utah, Wyoming; northern to central Mexico. A widespread, common species, distinguishable from *M. laciniata* by its wider seed wings and frequently irregular lobes or teeth of its leaves. Often misidentified as *M. pumila* Torr. & A. Gray, due to previous misapplication of that name. This species occurs much further north of the study area and has seeds with straight adjoining walls. The plant is used as an emetic by the Navajo and the seeds are used for food; the leaves are chewed and sprayed with the mouth on offerings before and after making prayer sticks. The plant is used as a fumigant for the collared lizard ceremony by the Kayenta Navajo.

Mentzelia obscura H. J. Thomps. & J. E. Roberts (poorly known) Pacific blazing-star. Annual. **STEMS** to 30 cm tall, potentially branching throughout. **LEAVES** to 8 cm long, to 1 cm wide, elliptic to broadly lanceolate; basal leaves petiolate, the margins usually lobed or toothed; cauline leaves sessile, the bases broad to clasping, the margins entire or toothed. **BRACTS** of early flowers leaflike, usually entire; others smaller and broader, when ovate mostly 2-toothed near base, green, occasionally with whitish bases, mostly subtending the ovary. **FLOWERS** with calyx lobes 1.5–4 mm long; petals yellow, spreading, broadly obovate or obcordate, 2.5–6 mm long, 1.5–3.5 mm wide; staminodia and broad-filament stamens lacking; ovary 3–5 (–9) mm long; style 2–4 mm long. **CAPSULES** sessile, clavate, long-tapering to base; body 11–25 mm long, apex 2–3 mm wide, the earliest usually bent 180°, less commonly S-shaped or bent at

least 90°. **SEEDS** irregularly ovate, weakly several-faceted, the angles rounded, 1 mm long, wingless; epidermal cells with straight adjoining walls, the surface walls domed or with a short central papilla. $2n = 36$. Silty to gravelly alluvial soils, riparian and desert shrub communities. UTAH. 1125–1350 m (3700–4500'). Flowering: Mar–May. Fruit: Apr–May. Arizona, California, Nevada, Utah; northern Mexico. Apparently reaching the northeastern limits of its range here, in the low-elevation river channels and canyon bottoms.

Mentzelia pterosperma Eastw. (winged seed) Wingseed blazing-star. Perennial. **STEMS** to 25 cm tall, potentially branching throughout when robust. **LEAVES** to 6 cm long, to 2.5 cm wide; oblanceolate, or obovate to broadly lanceolate; basal leaves long-petiolate, entire, crenate or shallowly toothed, rarely lobed; cauline leaves sessile, often clasping, crenate, toothed or sometimes entire. **BRACTS** of all flowers lanceolate or linear, entire or shallowly toothed, subtending the ovary. **FLOWERS** with calyx lobes 6–10 mm long; petals yellow, widely spreading, 10–15 (–20) mm long, 3–5 mm wide, oblanceolate, the apex acute, with trichomes at apex only; staminodia 0 (–5), smaller than petals; stamens with broad filaments common in outer whorl; ovary 7–10 mm long; style (8–)10–15 mm long. **CAPSULES** pedicellate, cup-shaped to cylindrical, 8–15 mm long, 5–10 mm wide, straight. **SEEDS** nearly orbicular, 3–4 mm long, the wing 1 mm wide; epidermal cells with straight to slightly curved adjoining walls, the surface walls with about 10–15 bumps. $2n = 22$. [*Touterea pterosperma* (Eastw.) Rydb.; *Nuttallia pterosperma* (Eastw.) Greene]. Sand or clay soils, sometimes also on gypsum; desert shrub, sagebrush, and piñon-juniper communities. COLO: Mon; UTAH. 1125–1350 m (3700–4500'). Flowering: May–Sep. Fruit: Jun–Oct. Arizona, California, Colorado, Nevada, Utah. The diminutive stature of many specimens suggests that this species may be facultatively annual.

Mentzelia rusbyi Wooton (for H. H. Rusby, botanist) Rusby's blazing-star. Perennial. **STEMS** to 100 cm tall, branches strongly ascending and restricted to the upper 1/2. **LEAVES** to 15 cm long, to 2 cm wide; narrowly elliptic to lanceolate; basal leaves short-petiolate, shallowly toothed, occasionally subentire; cauline leaves sessile, toothed, the bases clasping. **BRACTS** of early flowers broadly lanceolate, lobed, the others further reduced, often arising from the ovary. **FLOWERS** with calyx lobes 7–10 mm long, petals white or cream but drying pale yellow, erect-spreading, 10–23 mm long, 4–6 mm wide, narrowly oblanceolate or spatulate, the apex acute, with trichomes at apex only; staminodia usually 3, equal to or smaller than petals; stamens with broad filaments few; ovary 4–10 mm long; style 9–12 mm long. **CAPSULES** mostly pedicellate, cylindrical, 14–32 mm long, to 10 mm wide, straight. **SEEDS** oval, 3–4 mm long, the wing about 0.5 mm wide; epidermal cells with strongly sinuate adjoining walls, the surface walls a finely cobbled dome. $2n = 20$. [*M. pumila* Torr. & A. Gray var. *rusbyi* (Wooton) Urb. & Gilg; *M. nuda* (Pursh) Torr. & A. Gray var. *rusbyi* (Wooton) H. D. Harr.; *Nuttallia rusbyi* (Wooton) Rydb.]. On a wide range of substrates; piñon-juniper woodlands, Gambel's oak, and ponderosa pine communities. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 2000–2600 m (6500–8500'). Flowering: Jun–Sep. Fruit: Jul–Oct. Arizona, Colorado, New Mexico, Utah. This species is easily recognized by its height, branching pattern, large fruits, and conspicuous bracts.

Mentzelia sivinskii J. J. Schenk & L. Hufford **CP** (in honor of Robert Sivinski, New Mexico state botanist) Sivinski blazing-star. Biennial. **STEMS** to 70 cm tall, main stem erect, straight, epidermis pubescent. **LEAVES** to 11.2 cm long, to 11.5 mm wide; narrowly to broadly spatulate, petiolate, margins pinnate with 18–24 lobes. **FLOWERS** with calyx lobes 5.5–9.3 mm long; petals 5, light yellow to yellow, 9–14.5 mm long, mostly 3–6.5 mm wide, narrowly spatulate, glabrous on abaxial surface; outer whorl of stamens fertile and staminodial; second whorl of stamens fertile; style 4.5–10 mm long. **CAPSULES** cup-shaped, 8.2–12.5 mm long, 5–7.5 mm wide. **SEEDS** pale gray to light brown with a white wing, lenticular-ovoid, 2.7–2.8 mm long, seed coat anticlinal cell walls sinuate, with central papillae. Sandy, clay soils of the Nacimiento Formation. Desert scrub and Utah juniper communities. COLO: LPl; NMEX: RAr, SJn. 1525–1815 m (5000–5955'). Flowering: Jun–Aug. Fruit: Jul–Sep. Schenk (2009) found *M. sivinskii* to be most closely related to *M. integra* (M. E. Jones) Tidestr. and *M. procera* (Wooton & Standl.) J. J. Schenk & L. Hufford. The Sivinski blazing-star is a narrow endemic in northwest New Mexico.

Mentzelia thompsonii Glad (for H. J. Thompson, botanist) Thompson's mentzelia, Thompson's blazing-star. Annual. **STEMS** to 9 cm tall, branching throughout when robust. **LEAVES** to 5 cm long, 1.5 cm wide, elliptic to lanceolate; basal leaves short-petiolate, entire; cauline leaves sessile to short-petiolate, entire (rarely with 1–few teeth). **BRACTS** of early flowers leaflike, the others reduced, narrowly lanceolate to ovate, green, mostly subtending the ovary; margins entire, rarely few-toothed. **FLOWERS** with calyx lobes 1–2 mm long; petals yellow, broadly obovate or obcordate, 2–3 mm long, about 2 mm wide, with a few trichomes at the apex; petaloid staminodia and broad-filament stamens absent; ovary 4–7 mm long at anthesis; style 1–2 mm long. **CAPSULES** sessile, cylindric but slightly tapering to base, straight (rarely slightly bent); body 6–16 mm long; apex 2–3 mm wide. **SEEDS** rounded to weakly faceted, the angles blunt, 2 mm long, wingless; epidermal cells with straight adjoining walls, the exposed surface flat or with a raised, conic center. Mostly on

Mancos clay soils; salt desert shrub communities. COLO: Mon; NMEX: SJn; UTAH. 1600–1950 m (5100–6400'). Flowering: Apr–May. Fruit: Apr–Jun. Colorado, New Mexico, Utah. Its combination of short stature; relatively long, broad, entire leaves; and small flowers makes this an easy species to recognize.

MALVACEAE Juss. MALLOW FAMILY

S. L. Welsh & N. D. Atwood

Herbs or less commonly shrubs, and some trees, usually pubescent with branched or stellate hairs, annual, biennial, or perennial, with mucilaginous juice. **LEAVES** alternate, stipulate, simple, mostly palmately veined. **INFL** solitary or in thyrsoid cymes or more or less racemose or paniculate, sometimes with an involucel of sepaloid bractlets. **FLOWERS** perfect (or imperfect), regular; sepals 5, more or less persistent; petals 5, separate, adnate to the staminal sheath; stamens numerous, united by the filaments (monadelphous); ovary superior, 3- to many-loculed. **FRUIT** a capsule or schizocarp. $x = 6–17+, 20+$. (Welsh 1980.) Cosmopolitan, especially the tropics; approximately 1550 species.

1. Involucel (epicalyx of sepaloid bractlets) lacking; petals white, pink, or lavender; plants of moist sites, usually at middle and higher elevations ..... ***Sidalcea***
1' Involucel (epicalyx of sepaloid bractlets) present, or if lacking, otherwise different than above; petals variously colored ..... (2)

2. Petals orange or rarely purplish pink; plants indigenous perennial herbs mainly of arid habitats at middle and low elevations ..... ***Sphaeralcea***
2' Petals variously colored, but not orange; plants indigenous or introduced perennial, biennial, or annual plants of various distribution ..... (3)

3. Flower corolla rose-pink or rarely white; plants indigenous, 7–15 dm tall, perennial, of middle and higher elevations ..... ***Iliamna***
3' Flower corolla white, pink, rose, yellow, or other hues; plants differing in one or more ways from above ..... (4)

4. Flower mostly 6–10 cm broad, opening flat; plants tall, adventive or cultivated biennials ..... ***Althaea***
4' Flower less than 6 cm broad or, if broader, the plants shrubby or perennial ..... (5)

5. Style branches 5, elongate; fruit a capsule; plants low annual ..... ***Hibiscus***
5' Style branches more than 5, short; fruit a schizocarp; plants annual or biennial ..... (6)

6. Style branches filiform, with elongate stigmatic lines; plants common, weedy ..... ***Malva***
6' Style branches with capitate or truncate stigmas; plants rare ..... ***Anoda***

Althaea L. Hollyhock

(in Greek mythology, the wife of Oeneus, King of Calydon) Plants herbaceous, biennial, with coarse stellate hairs. **LEAVES** alternate, petiolate, cordate at the base, lobed. **INFL** a solitary flower, (2) or borne in racemiform inflorescence; involucel of 6–9 bractlets, connate at the base. **FLOWER** corolla of various colors; calyx 5-cleft. **FRUIT** flattened, wheel-like, invested by the calyx, the numerous carpels separating at maturity. Europe to Asia, naturalized in the United States; approximately 12 species.

Althaea rosea (L.) Cav. (rose-colored) Hollyhock. Coarse biennials to 20 dm tall or more, the stems erect, stellate-hairy. **LEAVES** (3) 5- to 7-lobed, mostly 3–15 cm long (from sinus to apex) and often much broader. **FLOWERS** shortly pedicellate, 6–12 cm wide or more; calyx lobes triangular, investing the fruit at maturity, the involucel calyxlike; corolla variously colored, often rose to pink or lavender or sometimes white, usually with a dark center; carpels numerous; stellate along the margins, and reticulate on the sides, 5–7 mm long. $2n = 42$. [*Alcea rosea* L.]. Cultivated ornamental, persisting and escaping. ARIZ: Nav; COLO: LPl, Mon; NMEX: SJn. 1615–2160 m (5300–7095'). Flowering: Jul–Aug. Widespread in North America; introduced from China. This is a hardy, robust species with flowers of great charm and beauty. It has been widely grown in the American West since pioneer times. Given any chance at all, it seeds spontaneously and grows in the same place for long periods. It is a not-infrequent roadside waif.

Anoda Cav. Anoda

(Ceylonese name) Herbaceous annuals from taproots, the pubescence sparsely hirsute to densely puberulent or tomentose. **LEAVES** alternate, long-petiolate, usually more or less truncate to subcordate basally, commonly 3–5-

lobed, the midlobe comprising 1/2 or more of the leaf length. **INFL** a solitary flower, axillary; involucel lacking. **FLOWER** calyx 5-cleft. **FRUIT** a schizocarp, the inner layer forming a saclike envelope around the seed or becoming closely adherent to the seed coat, the dorsal wall more persistent. Mostly in tropical America; approximately 10 species.

Anoda cristata (L.) Schltdl. (crested) Crested anoda. Plants to approximately 8 dm tall, branching from near the base, the herbage sparingly hirsute with mostly simple hairs. **LEAVES** long-petiolate, the blades 2–6 cm long, deltoid to triangular-ovate, from longer than broad to about as broad as long, 3–5-lobed, the terminal lobe making up 1/2 or more of the blade length, often marked or margined with purple. **INFL** axillary, a solitary flower, long-pedicellate. **FLOWER** petals purple, 1–2.5 cm long; carpels 15–20, rather conspicuously beaked, hispid, the basal portion entirely thin-scarious and veinless, and with slender midnerve, the partitions wholly obliterated and breaking up in fruit. [*Sida cristata* L.]. The solitary specimen examined from the Four Corners (B-Square Ranch) was collected in a hayfield (*Heil & Bolack 14364* SJNM). NMEX: SJn. 1625 m (5335′). Flowering: Sep–Oct. Texas to Arizona and South America.

Hibiscus L. Rosemallow

(Greek *hibiscos*, mallow, derived from Ibis, an Egyptian deity) Plants herbaceous or woody, annual or perennial, with stellate or simple hairs. **LEAVES** alternate, petiolate, obtuse to truncate or cordate basally, lobed to incised. **INFL** axillary, solitary-flowered; involucel of 5–10 distinct bractlets. **FLOWER** calyx 5-cleft, more or less accrescent in fruit. **FRUIT** a loculicidal capsule, the carpels 5. **SEEDS** several in each locule. Warm-temperate to tropical; approximately 200 species.

Hibiscus trionum L. (three-parted) Flower-of-an-hour. Annual, commonly 1.5–5 dm tall, the lower branches often prostrate, coarsely hispid-stellate to glabrate. **LEAVES** 3-lobed or more commonly 3–5-parted, the main lobes cuneate basally, the middle lobe the largest. **INFL** a solitary flower, axillary, mostly 3–6 cm wide; bractlets usually 10, linear, often coarsely hispid, much shorter than the fruiting calyx. **FLOWER** petals cream-colored to yellowish, with a purple center, closing in shade. $2n = 28, 56$. Weedy species of gardens, open spaces, and cultivated land. ARIZ: Nav; COLO: Mon; NMEX: SJn. 1590–1750 m (5215–5740′). Flowering: Sep–Oct. Widespread in North America; adventive from central Africa.

Iliamna Greene Wild Hollyhock

(possibly from the place name *Iliamna*, for a lake, a volcano, and a town in Alaska) Plants herbaceous, perennial, sparingly and minutely stellate-hairy. **LEAVES** alternate, petiolate, the blade cordate to truncate basally, the margin lobed. **INFL** a thyrsoid panicle; involucel of 3 narrow, persistent bractlets. **FLOWER** calyx 5-cleft. **FRUIT** a loculicidal capsule, the carpels many. **SEEDS** usually 3 in each locule (Wiggins 1936). North American, seven species.

Iliamna grandiflora (Rydb.) Wiggins (large-flowered) Wild hollyhock. Perennial. **STEMS** few to many from a woody caudex, mostly 10–15 dm tall, minutely stellate-puberulent, green. **LEAVES** 5–7-lobed, cordate to truncate basally, 2.5–15 cm long (from petiole apex to tip), 6–10 cm broad, the lobes triangular to lanceolate, crenate-serrate, finely stellate; petioles mostly less than 1 (15) cm long; bracteoles lanceolate, more than 1/2 as long as the calyx. **FLOWER** calyx lobes 5–8 mm long (longer in fruit); petals rose-pink (rarely white), 30–37 mm long; carpels about 10 mm long in fruit, hispid and stellate. [*Sphaeralcea grandiflora* Rydb., not *S. grandiflora* Phil; *S. rydbergii* Tidestr.]. Streamsides and mesic slopes. COLO: LPl, Mon (Mesa Verde National Park); UTAH (Abajo Mountains). 2105–2590 m (6900–8500′). Flowering: Jul–Aug. Colorado, Utah, Arizona, and New Mexico.

Malva L. Mallow

(Greek *malache*, soft) Herbaceous annual, biennial, or perennial, from taproots, the pubescence simple to branched or stellate. **LEAVES** alternate, petiolate, usually more or less cordate basally, commonly lobed. **INFL** in an axillary cluster (sometimes solitary) or in subterminal panicles; involucel of 3 narrow to broad persistent bractlets. **FLOWER** calyx 5-cleft, the petioles to 20 cm long or more; the carpels mostly 10–15. **FRUIT** a schizocarp. European; 30 species.

Malva neglecta Wallr. (overlooked) Cheese mallow. Annual or biennial. **STEMS** prostrate-spreading, commonly 1–6 dm long, stellate-hairy. **LEAF BLADES** reniform-orbicular, 0.6–3 cm long (from sinus to apex) or more, and much broader, crenate and not at all to only shallowly 5- to 7-lobed, the petioles to 20 cm long or more. **INFL** clustered (or solitary) in the axils; bractlets linear. **FLOWER** calyx (3) 4–6 mm long at anthesis, the lobes acuminate; petals white to pink or lilac, about twice as long as the sepals; carpels hairy, rounded on the back. $2n = 42$. Weeds of disturbed sites and cultivated land. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1525–2430 m (5000–8000′). Flowering: May–Oct. Likely universal; widespread in North America; native to Eurasia. This is

a persistent, vigorous weed of gardens. The taproot is far-reaching and difficult to pull. Most herbicides do not kill this plant. It seeds heavily, and the seeds persist in the soil for a long time. Immature fruits are edible and have a good flavor; they have been eaten by generations of children.

Sidalcea A. Gray Checker Mallow

Herbaceous perennial from taproots or short rhizomes, usually stellate and somewhat hirsute. **LEAVES** alternate, petiolate, often dimorphic, the lowermost merely palmately lobed, the upper ones commonly cleft and with linear lobes. **INFL** a semispicate raceme, dimorphic, those of plants with perfect flowers the largest; involucel lacking. **FLOWER** calyx 5-cleft; carpels 5–10, 1-seeded, tardily separating (Hitchcock 1957; Roush 1931). Western North America; 20 species.

1. Petals white or merely pinkish-tinged, often drying yellow; anthers bluish pink; plants rhizomatous; stems hirsute below ..... ***S. candida***
1′ Petals pink to lavender; anthers usually yellow to white; plants rhizomatous or not; stems hirsute to glabrous or tomentose below ..... ***S. neomexicana***

Sidalcea candida A. Gray (very white) White checker. Plants from slender rhizomes. **STEMS** 4–10 dm tall, glabrous to hirsute with simple hairs below, more or less stellate above. **LEAVES** with blades 6–20 cm wide, the basal ones shallowly 5- to 7-lobed and coarsely crenate, the upper ones divided into 3–5 entire segments. **FLOWER** calyx 7–10 mm long, variously stellate-hairy and glandular-puberulent; petals white to pinkish, often drying yellow, 12–20 mm long; carpels about 3 mm long. Stream banks, lake shores, wet meadows, and seeps, mainly in sagebrush, mountain brush, and aspen-spruce-fir communities. COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr. 2365–2730 m (7800–9000′). Flowering: June–Sep. Wyoming west to Nevada.

Sidalcea neomexicana A. Gray (of New Mexico) New Mexico checker. Plants from thickened taproot or fascicled roots, and often with a caudex. **STEMS** 2–9 (10) dm tall, hirsute below (or rarely glabrous) with simple or bifurcate hairs. **LEAVES** with blades 1.5–11 cm wide, the basal ones crenate to shallowly 5- to 7-lobed, the cauline ones divided usually into 5 laciniate to entire segments; petioles slender, usually equaling or surpassing the calyx (to 2 cm long or more). **FLOWER** calyx 5–10 mm long, usually with some simple pustulose hairs interspersed with the stellate ones; petals rose-pink (fading blue-purple), 11–19 mm long; carpels 2–3 mm long. $2n = 20$. Wet meadows, stream banks, and seeps. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon; NMEX: McK, RAr, SJn; UTAH. 1980–2680 m (6500–8800′). Flowering: Jun–Sep. Utah, Oregon, Idaho, and Wyoming, south to California, Arizona, and Mexico. The Ramah Navajo used a cold infusion for internal injuries.

Sphaeralcea A. St.-Hil. Globemallow

Herbaceous perennial from taproots or rhizomes, glabrescent to canescent with stellate hairs. **LEAVES** alternate, petiolate, sometimes dimorphic, the lowermost merely toothed or palmately lobed (rarely entire), the upper ones cleft to entire. **INFL** a racemose to thyrsoid cyme; involucel of 3 or fewer filiform bractlets. **FLOWER** calyx 5-cleft; carpels 8–20, the seeds 1 or 2 per carpel. **FRUIT** a schizocarp, the mature fruit segments divided into a basal indehiscent, reticulate portion and an apical dehiscent portion (Atwood and Welsh 2002; Jefferies 1972; Kearney 1935). Flowers of *Sphaeralcea* are characteristically grenadine (a shade of orange), typically the only flowers so colored in vast stretches of the American Southwest; occasional plants and even small populations bear flowers that are pink, which fade mainly a violet color. Deserts of America; approximately 60 species.

1. Inflorescence racemose, rarely with more than 1 flower per node; reticulate part of carpel conspicuously wider than the nonreticulate part, forming 2/3 of the carpel ..... (2)
1′ Inflorescence thyrsoid to thyrsoid-glomerate, with usually more than 1 flower per node; reticulate part of carpel not much wider than the dehiscent part, less than 2/3 of the carpel. ..... (3)

2. Leaf blades distinctly 2–5-lobed, -parted, or -divided, the uppermost ones entire; hairs of rays radiating in a single plane; carpels 7–9; plants often 1.5 dm tall or more ..... ***S. leptophylla***
2′ Leaf blades usually 3–5-lobed, the lobes usually toothed or again lobed, the upper ones not or seldom entire; carpels 10–14; rays of hairs usually radiating in several planes ..... ***S. coccinea***

3. Leaf blades 1.5–3.5 times longer than broad, the terminal lobe exaggerated ..... (4)
3′ Leaf blades as broad as long or almost so ..... (5)

4. Calyx lobes much surpassing the capsuloid schizocarp; reticulations of the carpel coarse and prominent ..... ***S. subhastata***

4' Calyx lobes shorter than, subequal to, or only slightly surpassing the capsuloid schizocarp; reticulations of the carpel neither especially coarse nor prominent ..... ***S. fendleri***

5. Leaves shallowly 3–5-lobed; carpels with well-defined to nearly obscure reticulae on the lower 1/3, plants mainly of western Colorado, east across Utah to eastern California, and south to northwest New Mexico and central Arizona ..... ***S. parvifolia***

5' Leaves 3–5-cleft, -parted, or -divided; carpels with well-defined reticulae on less than 1/2; plants of various distribution ..... (6)

6. Midlobe of leaf not more than 5 mm wide; inflorescence racemiform or subthyrsoid, few-flowered ..... ***S. digitata***

6' Midlobe of leaf often more than 5 mm wide, mainly 10–20 mm; inflorescence interrupted-thyrsoid, many-flowered ..(7)

7. Herbage bright green; leaves thin-textured, often narrowly lobed; plants of the San Juan arm of Lake Powell, San Juan County, Utah ..... ***S. moorei***

7' Herbage gray-green to whitish-canescent; leaves often thick-textured, seldom narrowly lobed; plants more widely distributed ..... ***S. grossulariifolia***

Sphaeralcea coccinea (Nutt.) Rydb. (scarlet) Common globemallow. **STEMS** solitary or few to many from the apex of a woody caudex and stout taproot, or less commonly from creeping rhizomes, 0.6–4.2 dm tall, white to yellowish-canescent. **LEAVES** with blades 1.1–3.7 cm long, 1.2–5.2 cm wide, usually wider than long, ovate to cordate-ovate in outline, the base often cordate, usually 3–5-lobed, with main divisions cleft almost or quite to the base, the lobes usually again toothed or lobed, varying from linear to broadly spatulate-obovate and more or less confluent. **INFL** racemose, sometimes paniculate, rarely thyrsoid, the flowers mostly solitary at the nodes; pedicels shorter than calyx. **FLOWER** calyx uniformly stellate, the rays or hairs not radiating in a single plane, the lobes lance-acuminate; petals 8–15 mm long, orange; carpels 8–14, 2–3 mm high, the indehiscent part forming 2/3 or more of the carpel, reticulate on the sides and on the back. $n = 5$. [*Malva coccinea* Nutt.; *Cristaria coccinea* (Nutt.) Pursh; *Malva coccinea* Nutt.; *Malvastrum coccineum* (Nutt.) A. Gray; *Sida dissecta* Nutt. ex Torr. & A. Gray; *Malvastrum coccineum* var. *dissectum* (Nutt. ex Torr. & A. Gray) A. Gray; *M. dissectum* Harv.; *Sphaeralcea dissecta* (Nutt. ex Torr. & A. Gray) Rydb.; *S. coccinea* subsp. *dissecta* (Nutt. ex Torr. & A. Gray) Kearney; *S. coccinea* var. *dissecta* (Nutt. ex Torr. & A. Gray) Garrett; *Malvastrum coccineum* var. *elatum* Baker f.; *M. elatum* (Baker f.) A. Nelson; *S. elata* (Baker f.) Rydb.; *S. coccinea* var. *elata* (Baker f.) Kearney; *Malvastrum cockerellii* A. Nelson; *M. micranthum* Wooton & Standl.]. Blackbrush, greasewood, shadscale, mat-atriplex, *Ephedra*, Indian ricegrass, galleta, sagebrush, juniper-piñon, mountain brush, and ponderosa pine communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SIn; UTAH. 1555–2390 m (5100–7850'). Flowering: Apr–Sep. Saskatchewan and Alberta south to Arizona, New Mexico, and Texas. Used as a ceremonial medicinal plant, dermatological aid, dietary aid, disinfectant, and beverage by the Kayenta Navajo. The Ramah Navajo used the plant as a "life medicine."

Sphaeralcea digitata (Greene) Rydb. (fingered) Juniper globemallow. Perennial. **STEMS** few to many from a woody caudex, mainly 2–5.5 dm tall, the herbage mainly thinly canescent to rather sparsely stellate-hairy and green. **LEAVES** with blades 1.5–4 cm long, and about as wide, pedately 5-lobed, the lobes distinct to the base, all divisions oblanceolate to narrowly obovate, cuneate at base, obtuse to acute and often mucronulate apically, the midlobe not more than 5 mm wide and not much surpassing the main lateral lobes, the lobes entire or the midlobe irregularly few-toothed or cleft. **INFL** usually 10–20-flowered, narrowly thyrsoid, with often only the lowermost nodes with more than 1 flower per node; pedicels shorter than to much longer than the calyx. **FLOWER** calyx 3.5–7 mm long, uniformly stellate, the rays of hairs not or less commonly radiating in a single plane, the longest trichome rays mainly less than 0.4 mm long except on some calyx bases, the calyx lobes ovate to lance-acuminate; petals 8–14 mm long, orange (grenadine); carpels 9–13, 3–4 mm high, the indehiscent portion forming from 1/3–1/2 of the carpel, not prominently reticulate on the sides, with lacunae opaque or nearly so. [*Malvastrum digitatum* Greene]. Piñon-juniper woodland communities, often along or near drainages. ARIZ: Nav. 1525–2135 m (5000–7000'). (*O'Kane et al. 5277*, 5 Jun 2001, w. branch Piute Creek, SJNM). We have not seen any specimens matching the above description from the Four Corners except that from Navajo County. Flowering: May–Jun. The Ramah Navajo used an infusion of the whole plant for stomachaches and the root as a "life medicine."

Sphaeralcea fendleri A. Gray (for Augustus Fendler, German-American botanical collector) Fendler's globemallow. Perennial. **STEMS** few to several from a woody caudex, 4–14 dm tall or more, the herbage green and sparsely to

densely white to gray-canescent. **LEAVES** with blades 2–6 cm long, 1.3–5.2 cm wide, from longer than wide to wider than long, ovate-oblong to very broadly ovate, the base usually strongly cuneate, shallowly to deeply 3-lobed, the lateral lobes about 1/4 as long as the midlobe, the main division sometimes coarsely and irregularly few-toothed or -cleft. **INFL** a very narrow, interrupted, few- to many-flowered thyrse, with lower branches seldom exceeding 3 cm, with usually more than 1 flower per node; pedicels equaling to longer than the calyx. **FLOWER** calyx 4.5–6 mm long, uniformly stellate, the rays of hairs not or less commonly radiating in a single plane, the longest trichome rays mainly less than 0.4 mm long except on some calyx bases, the calyx lobes deltoid to ovate-lanceolate and acuminate; petals 8–13 mm long, orange (grenadine) or less commonly rose-pink and drying violet; carpels 11–15, 4–5 mm high, the indehiscent portion forming from 1/5–1/3 of the carpel, faintly and finely reticulate on the sides, with lacunae opaque or nearly so. [based on *S. miniata* A. Gray, not *S. miniata* (Cav.) Spach; *S. leiocarpa* Wooton & Standl.]. Desert shrublands in sagebrush upward to ponderosa pine and spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, LPl; NMEX: McK, RAr, San, SJn. 1470–2350 m (4820–7710'). Flowering: Jun–Sep. Texas and south to Mexico. Perhaps the leaf shape of this species most closely simulates *S. subhastata*, which is generally a much smaller plant, mainly much less than 5 dm tall, which is further distinguished by the coarsely and prominently reticulate portion of the fruiting carpel, the reticulate portion forming 1/3–1/2 of the carpel, and by the calyx lobes much surpassing the capsuloid schizocarps. The Kayenta Navajo used the plant for sand cricket bites and for a sore mouth. The Ramah Navajo used the plant for internal injuries, hemorrhage, and as a lotion for external injuries.

Sphaeralcea grossulariifolia (Hook. & Arn.) Rydb. (gooseberry-like leaves) Gooseberry-leaf globemallow. **STEMS** few to many from a woody caudex, 3.5–7.5 dm tall or more, the herbage mainly white to gray- or yellowish-canescent to rather sparsely stellate-hairy and green. **LEAVES** with blades 1.2–5 cm long, 1.3–5.2 cm wide, from longer than wide to wider than long, cuneate-ovate to ovate or cordate-ovate in outline, the base cordate to truncate or obtusely 3–5-lobed, the lobes distinct to the base or confluent to well above the base, the main division usually cleft or parted to irregularly toothed. **INFL** compact-thyrsoid, with usually more than 1 flower per node; pedicels shorter than to much longer than the calyx. **FLOWER** calyx 4.5–9 mm long, uniformly stellate, the rays of hairs not or less commonly radiating in a single plane, the longest trichome rays mainly less than 0.5 mm long except on some calyx bases, the calyx lobes ovate to lance-acuminate; petals 8–18 mm long, orange or rarely rose-pink; carpels 10–14, 2.9–3.7 mm high, the indehiscent portion forming from 2/5–3/5 of the carpel, reticulate on the sides, with lacunae opaque or nearly so. [*Sida grossulariifolia* Hook. & Arn.; *Malvastrum coccineum* (Nutt.) A. Gray var. *grossulariifolium* (Hook. & Arn.) Torr.; *M. grossulariifolium* (Hook. & Arn.) A. Gray; *Sphaeralcea pedata* Torr. ex A. Gray; *S. grossulariifolia* subsp. *pedata* (Torr. ex A. Gray) Kearney]. Salt, warm, and cool desert shrub, piñon-juniper, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: SJn; UTAH. 1485–1880 m (4870–6160'). Flowering: Apr–Aug. Washington, Oregon, Idaho, California, Nevada, and Arizona. There is much variation within the widely distributed *S. grossulariifolia*, with herbage varying in aspect from gray to gray-green or brownish, to yellow-green, or green. Leaf blades tend not to be cut completely to the base as is often the case in the related *S. moorei*, *S. fumariensis*, *S. rusbyi*, and *S. gierischii*. Most specimens range in size from 3.5–5.5 dm in height, while all of the other closely allied species except *S. fumariensis* commonly tend to exceed that height. The roots have been chewed by the Hopi and boiled with cacti roots for difficult defecation, and boiled and chewed for broken bones.

Sphaeralcea leptophylla (A. Gray) Rydb. **CP** (thin-leaved) Slenderleaf globemallow, rimrock globemallow. **STEMS** few to many from a woody caudex, clump-forming, 2–5.5 dm tall, grayish-canescent throughout, the stems of the season often growing up through those of the previous years. **LEAVES** with blades 10–32 mm long, digitately 3-lobed, the lobes entire, linear to oblanceolate, 1–4 mm wide, or the upper leaves simple and linear. **INFL** racemose, elongate, usually with 1 flower per node; pedicels from much shorter to longer than the calyx. **FLOWER** calyx uniformly stellate, the rays of hairs radiating in a single plane, the lobes lance-attenuate; petals 8–12 mm long, orange; carpels 7–9, 3–3.5 mm high, the indehiscent portion forming 2/3–3/4 of the carpel, coarsely reticulate, ridged or tuberculate on the back. [*Malvastrum leptophyllum* A. Gray]. Shadscale, blackbrush, ephedra, rabbitbrush, piñon-juniper communities; on the Carmel, Morrison, Entrada, Navajo, Kayenta, Chinle, Moenkopi, and Cutler formations. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: SJn; UTAH. 1460–1785 m (4790–5855'). Flowering: Apr–Jul. Texas and Mexico.

Sphaeralcea moorei (S. L. Welsh) N. D. Atwood & S. L. Welsh (named for G. Moore, Utah botanist) Moore's globemallow. **STEMS** few to many from a woody caudex, 3–7.5 dm tall or more, the stems typically dark red-purple at least near the base, the herbage green and rather sparsely stellate-pubescent, the trichomes 0.3–0.8 mm wide, the rays radiating in a horizontal plane. **LEAVES** with blades 0.9–3.5 (7.4) cm long, 1–2.6 (15, a rare excption) cm wide, often longer than wide, ovate to cordate-ovate or cordate in outline, the base cordate to truncate or obtuse, digitately 3- to 5-

lobed, the main lobe 0.8–3.5 (7.4) cm long and 0.8–1.5 cm wide, entire or cleft or parted to irregularly toothed, or rarely the blade confluent and merely palmately lobed. **INFL** rather compactly thyrsoid, with usually more than 1 flower per node, or rather compactly glomerate-paniculate with 2–5 flowers on an axillary peduncle; pedicels shorter than to much longer than the calyx; bracteoles linear, sometimes red-purple, but not especially contrasting with the calyx. **FLOWER** calyx 4.5–7.2 (8.5) mm long at anthesis, green, becoming stramineous in fruit, uniformly stellate-hairy or less commonly glabrous externally only near the apex, the rays of hairs mainly radiating in a single plane, the lobes ovate to lance-acuminate; petals 11–15 mm long, orange (grenadine); carpels 10–14, 4.5–5.1 mm high, 2.1–2.3 mm wide, the reticulate portion forming about 1/2 of the carpel, the lacunae opaque. [*S. grossulariifolia* (Hook. & Arn.) Rydb. var. *moorei* S. L. Welsh]. Blackbrush, ephedra, matchweed, resinbush, *Yucca*, piñon-juniper, chaffbush, indigo bush, sagebrush, and hanging garden communities, typically in sandy substrates. UTAH. 1130–1355 m (3710–4440'). Flowering: Apr–Jul. Along the Colorado River in Glen Canyon and its tributaries. This is mainly a low-elevation species of sandy tracts along Glen Canyon and the San Juan River arm of Lake Powell.

Sphaeralcea parvifolia A. Nelson (small-leaved) Small-leaf globemallow. **STEMS** few to many from branching woody caudex. **LEAVES** with blades 1.5–5.5 cm long, 1.2–5.2 cm wide, ovate to orbicular, reniform, or cordate-ovate, the base cordate to truncate or obtuse, usually shallowly 3–5-lobed, the sinuses usually shallow, the lobes crenate-dentate. **INFL** commonly narrowly thyrsoid, typically with more than 1 flower per node; pedicels usually shorter than the calyx. **FLOWER** calyx uniformly stellate, the rays of hairs not in a single plane, the lobes lance-ovate to deltoid; petals 7–15 mm long, orange (grenadine), rarely white; carpels 10–12, 3–4 mm high, the indehiscent part forming from 1/4–1/3 of the carpel, faintly reticulate on the sides. [*S. marginata* York ex Rydb.; *S. arizonica* A. Heller ex Rydb.]. Blackbrush, other warm desert shrub, salt desert shrub, sagebrush, piñon-juniper, and mountain brush communities. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn. 1215–2135 m (3990–7005'). Flowering: May–Sep. Arizona, New Mexico, Colorado, and Utah; west to Nevada and California. The confluent leaf blades are diagnostic for most specimens but should not be taken as indicative in all cases. Color of the herbage varies from distinctly gray-canescent to green or yellow-green. The Hopi used the plant for sores, cuts, and wounds and chewed or boiled the root for broken bones.

Sphaeralcea subhastata J. M. Coult. (somewhat spear-shaped) Spear globemallow. **STEMS** few to many from a rather stout taproot, 1–5 dm tall or long (mainly less than 2.5 dm), the herbage canescent. **LEAVES** with blades 2–5.5 cm long, 1–3 cm wide, longer than wide, oblong-lanceolate to narrowly ovate, acute to short-acuminate at the apex, less densely pubescent above, scarcely lobed but subhastately angled or toothed at base, the margins subentire to irregularly crenate or dentate, the base cuneate, prominently veined beneath. **INFL** racemose, with usually more than 1 flower per node at the lowermost nodes, few-flowered (mostly fewer than 12), usually leafy near the apex; pedicels usually stout and shorter than the calyx, rarely exceeding 1 cm. **FLOWER** calyx 4–11 mm long, uniformly stellate, the calyx lobes ovate-lanceolate to lanceolate; petals 10–18 mm long, orange (grenadine) or rarely rose-pink or drying violet; carpels 10–17, 4–6 mm high, the dehiscent portion usually acute and with cusps to about 2 mm long, the indehiscent portion coarsely and prominently reticulate, often blackish, forming from 1/3–1/2 of the carpel. Greasewood and mixed desert shrubland. ARIZ: Apa, Nav; NMEX: RAr. 1615–2535 m (5300–8320'). Flowering: May–Sep. Arizona and New Mexico south to Texas and Mexico. Subhastate globemallow is evidently uncommon in the Four Corners region and has been confused with *S. fendleri*, which also has elongate leaves. The long-attenuate calyx lobes far surpassing the carpels, the conspicuous reticulum on the carpels, and the small stature of the plant are the features that are diagnostic from that species (Welsh and Erdman 1964).

MENYANTHACEAE Dumort. BOGBEAN FAMILY

C. Barre Hellquist

Perennial aquatic herbs; rhizomatous. **LEAVES** submersed, floating, or erect; basal, alternate, petiolate, simple or trifoliate. **INFL** a raceme or umbel in leaf axils. **FLOWERS** perfect, regular; corolla sympetalous, petals 5, margins valvate, rolled inward in bud, entire or fimbriate; stamens 5, inserted on corolla; styles short or long. **FRUIT** a 2-valved capsule. Five genera and about 70 species, worldwide. Family is sometimes treated in the Gentianaceae.

Menyanthes L. Bogbean, Buckbean

(Greek *mei*, small, + *antheo*, flower). One species, mainly boreal, worldwide.

Menyanthes trifoliata L. **CP** (three-leaved) Bogbean, buckbean. A perennial, glabrous, herbaceous aquatic. Rhizomes thick, creeping, sheathed by membranous bases of long petioles. **LEAVES** with 3 oval or oblong leaflets, narrowed at

base and 2–6 cm long, entire; petioles 3–30 cm long. **INFL** 5–20-flowered raceme on a naked peduncle 20–40 cm long, pedicels 3–5 mm long. **FLOWER** calyx 5-lobed, persistent; corolla short-funnelform, the tube as long as the calyx, 1.5–2 cm long, mainly white, slightly reddish or purplish, fimbriate; stamens 5, sympetalous, alternate with corolla lobes; anthers sagittate, longitudinally dehiscent, filaments short; ovary superior. **FRUIT** a 2-valved capsule, irregularly dehiscent, ovoid, 8 mm long. **SEEDS** subglobose. $2n = 54$. |*Menyanthes trifoliata* var. *minor* Fernald|. Ponds, bogs, and marshes. COLO: Hin, LPl, SJn. 2620–3505 m (8600–11500'). Flowering: May–Jul. Alaska east to Labrador and Newfoundland, south to California, Arizona, New Mexico, Colorado, Nebraska, Missouri, Illinois, West Virginia, and North Carolina.

MORACEAE Gaudich. FIG (MULBERRY) FAMILY

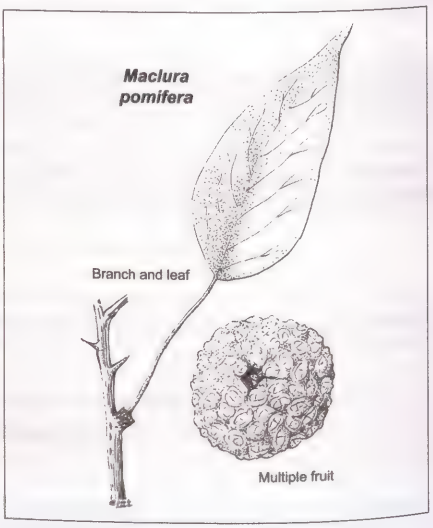
Linda Mary Reeves

Primarily trees and shrubs with milky sap, of warm-temperate and tropical regions worldwide. **LEAVES** most often alternate, but also spiral or opposite; stipules present; blade variously shaped, but often elliptic, lanceolate, ovate, or cordate; occasionally fleshy or prominently veined; margins entire, dentate, serrate, or lobed. **INFL** monoecious or dioecious, sometimes cauliflorous on large branches or trunks; rarely solitary, in catkins, aments, or sometimes on flattened, hollowed and/or variously thickened receptacles (syconia). **FLOWERS** imperfect; actinomorphic or tubular; small, often minute; perianth parts 4; corolla generally none; stamens 4, rarely 1 or 2; carpels 2, 1 abortive, with persistent style; ovary superior trending toward inferior in more advanced genera, with intermediate states; ovule single, pendulous. **FRUIT** variable, fleshy, multiple and/or accessory, produced by the receptacle (syconium), occasionally an achene or drupe. About 70 genera with about 3000 species. An important economic and ornamental family, it includes the edible fig *Ficus carica*, *Artocarpus* (breadfruit and jackfruit), and *Morus* (mulberries). Many useful tropical landscape plants (*Ficus lyrata*, *F. elastica*) and timber trees (*Chlorophora*, *Maclura*), as well as ecologically important plants, are represented within this family. Many species of *Ficus* are pollinated by minute female wasps, which use the inflorescence as a brood chamber. Fig species in tropical forests are known to be continuously fruit bearing, providing reliable food between major fruiting seasons.

1. Leaves with entire margins; branches spiny; flowers in heads or clusters; fruit globose, with a crustlike rind...***Maclura***
1'. Leaves serrate or dentate, undivided or lobed; branches not spiny; staminate inflorescence an ament; pistillate inflorescence a head or cluster.....***Morus***

Maclura Nutt. Osage Orange, Bois d'Arc, Bow-wood, Naranjo Chino

(for William Maclure, 1763–1840) Dioecious trees with hard wood. **LEAVES** with stipules small or minute; blade entire. **INFL** staminate, a peduncled head or cyme; pistillate, a dense, globose, axillary head. **FLOWERS** imperfect; perianth 4-merous. **FRUIT** multiple, globose. $x = 14$. About 15 species in temperate and tropical North America, Africa, and Asia.

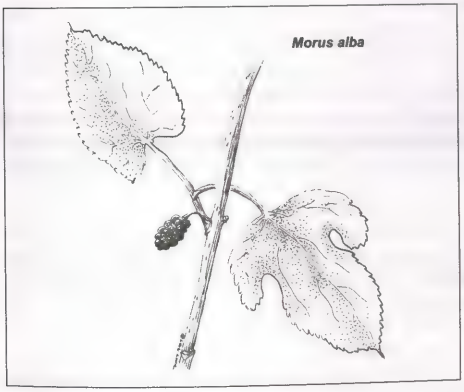


Maclura pomifera (Raf.) C. K. Schneid. (fruit-producing) Tree or shrub to 12 m tall, often thicket-forming; spiny, deciduous, dioecious; open-crowned; wood hard, yellow; sap milky; bark furrowed, yellow-brown; thorns to 25 mm long, stout. **LEAVES** alternate or opposite; stipules minute; petioles to 5 cm long; blade entire, ovate to elliptic-lanceolate, turning bright yellow in fall, to 12 cm long; base broadly cuneate to subcordate; apex acuminate. **INFL**: staminate a loose axillary head or umbel; pistillate a head. **FLOWERS** imperfect; 4-merous; pistillate flowers sessile, 2–2.5 cm across, style long, filiform; staminate flowers pedicelled, 25–35 mm long. **FRUIT** a globose multiple of achenelike fruits to 15 cm diameter; rind wrinkled, hard. **SEEDS** about 1 cm long. |*Toxylon pomiferum* Raf.| Escaped along rivers and at old homesteads. NMEX: SJn. 1525 m (5000'). Flowering: Apr–May. Fruit: Aug–Oct. Known in

our area from one riparian location near Shiprock; two large female trees and several shrubby male trees forming a thicket. Eastern Texas, Arkansas, and Oklahoma but widely escaped and cultivated as a thorny hedge throughout the southern United States. The wood was widely used for bows by many tribes, including Apaches. Sometimes the roots were used by several tribes as a yellow dye.

Morus L. Mulberry, Moral

(Latin for mulberry) Winter-deciduous, dioecious or monoecious trees or shrubs; bark scaly and/or thick. **LEAVES** with stipules lanceolate, deciduous; blade undivided or lobed; serrate or dentate; basal nerves 3–5. **INFL** a stalked, axillary, pendent, catkinlike spike or ament, both sexes often present. **FLOWERS** imperfect; calyx 4-parted, sepals involute, partially enclosing filaments; stamens 4; stigmas 2. **FRUIT** an ovoid compressed achene, enclosed by the fleshy white, black, or dark purple calyx, aggregating into a multiple accessory structure, similar in outward appearance to the aggregate fruits of *Rubus*, but with a multiple floral origin. About 12 species in temperate and subtropical Northern Hemisphere regions. Trees often grown for edible fruit, as ornamentals, or as food for silkworm larvae.



Morus alba L. (white) White mulberry, Russian mulberry, silkworm mulberry, moral blanco. Small tree to 15 m high with spreading branches which eventually form a rounded crown; young branches slightly pubescent, becoming glabrous. **LEAVES** with petioles 1–3 cm long; ovate to subcordate; to 20 cm long; apex subobtuse to acuminate; dentate, sometimes lobed; light green and usually glabrous above, hairy in tufts at axils of major veins on underside or glabrous. **INFL** a pendent catkinlike spike; pistillate spikes 5–15 mm long; staminate spikes about twice as long. **FLOWERS** small, greenish or whitish. **FRUIT** a fleshy multiple, ovoid to oblong-elliptic; 1–2.5 cm long; white, pink, violet, or reddish; edible, sweet and/or tart. $2n = 28, 30$. Along rivers and acequias or escaped from cultivation near habitations. Attracting and spread by migrating fruit-eating birds, such as scrub jays, cedar waxwings, or orioles. ARIZ: Apa; COLO: Mon; NMEX: SJn; UTAH. 1300–2000 m (4300–6500'). Flowering: Mar–May. Fruit: May–Jul. Native of China, but naturalized and invasive in much of Europe and North America.

NYCTAGINACEAE Juss. FOUR-O'CLOCK FAMILY

John R. Spence

Annual or perennial herbs, subshrubs, or shrubs. **STEMS** unarmed (ours), prostrate, procumbent, ascending to erect, often clambering on other plants, sometimes swollen at the nodes, with or without sticky bands in the internodes, variously glabrous or pubescent, sometimes white-pubescent or reddish in color. **LEAVES** deciduous, sessile to petiolate, opposite or rarely alternate, pairs often unequal in size, simple, bases symmetric to strongly unequal, blades variably glabrous or pubescent, often somewhat thick and fleshy, sometimes viscid, stipules lacking. **INFL** terminal or lateral bracteate cymes or racemes, or flowers solitary, bracts sometimes sepaloid, often accrescent in fruit, peduncles sometimes with sticky bands in internodes. **FLOWERS** actinomorphic to sometimes zygomorphic, perigynous, perfect or unisexual, showy to inconspicuous, chasmogamous to cleistogamous; calyx 5-merous, inconspicuous to showy, connate, salverform, funnelform to campanulate, constricted beyond ovary; corolla absent; stamens typically 5, sometimes more, alternate with calyx, filaments free or connate at base, dehiscing longitudinally; nectary disc sometimes present at base of pistil, ovary of 1 1 carpels, styles fusiform-linear, capitate, or hemispherical, ovules solitary, placentation basal. **FRUIT** an anthocarp consisting of an achene, or utricle enclosed in persistent base of calyx, woody to fleshy, often sticky-glandular, smooth or ribbed to winged. **SEEDS** 1. A family of 35 genera and about 350 species, distributed primarily in the New World, but extending to Africa, Australia, and Eurasia. The four-o'clock family includes the well-known *Bougainvillaea* vine, native to South America, as well as other ornamentals. The family appears to be closest to the Phytolaccaceae. Generic and species limits are controversial, especially in *Mirabilis* (Levin 2000; Flora of North America Editorial Committee 2003).

1. Flowers numerous in capitate umbels, subtended by 5–10 broad bracts; stigmas linear ..... (2)
1' Flowers single or in few-flowered, cymose to umbellate clusters, subtended by 1–5 narrow to broad bracts; stigmas capitate to hemispheric ..... (3)

2. Plants annual; fruits large, greater than 1 cm long and wide, with large, conspicuous, papery-translucent wings extending above and below body of fruit ..... ***Tripterocalyx***
2' Plants perennial or rarely annual; fruits small, less than 1 cm, with smaller, less conspicuous, opaque wings that do not extend above or below the fruit ..... ***Abronia***

3. Flowers subtended by large, foliaceous, often connate bracts that form an involucre, sometimes enlarging in fruit ..... (4)
3' Flowers ebracteate or subtended by small bracts that are not connate or forming an involucre, not enlarging in fruit ..... (5)

4. Prostrate, strongly sticky-glandular herbs; flowers bilaterally symmetrical, in clusters of 3 appearing to be 1 flower, subtended by 3 free papery-translucent bracts ..... ***Allionia***
4' Prostrate to erect, glabrous to glandular herbs; flowers mostly radially symmetric, in clusters of 4 or more or sometimes single, bracts 4–6, free to distinctly connate, green or papery ..... ***Mirabilis***

5. Plants perennial; fruits with 3–5 thin, papery-translucent wings; inflorescence stem lacking sticky internodal bands, flowers dull green-white, long-funnelform, 30–50 mm long ..... ***Acleisanthes***
5' Plants annual; fruits lacking distinct wings; inflorescence stems with sticky internodal bands, flowers white to pink, campanulate, small, 1–1.5 mm long ..... ***Boerhavia***

Abronia Juss. Sand-verbena, K'íneetlíciit–a'–ipáih

(Greek *abros*, for the delicate and graceful plants) Annual or perennial herbs from taproots or rhizomes. **STEMS** prostrate, ascending to erect, or plants sometimes acaulescent, lacking sticky bands on internodes, glabrous, glandular, or pubescent. **LEAVES** commonly basal with fewer cauline leaves, opposite pairs usually distinctly unequal, petiolate, blades thick and fleshy, bases mostly asymmetric, glabrous or pubescent. **INFL** axillary or scapose, pedunculate, in capitate, cymose to umbellate heads, involucre of 5–10 bracts, persistent, not accrescent, connate, papery or translucent, sometimes green. **FLOWERS** chasmogamous, actinomorphic, perfect, funnelform to salverform, tube often constricted above ovary, abruptly 5-limbed; stamens 5–9, included in tube, styles included, stigmas linear. **FRUIT** a symmetric anthocarp, not distinctly ribbed, turbinate or obovate, usually winged, wings expanded at distal end or not, wall smooth to slightly rugose, not tuberculate, glabrous to pubescent. A North American genus of 20 species, primarily in arid to semiarid habitats in the West and Southwest, and extending into northern Mexico. Many species require mature fruits to identify and are highly variable morphologically, suggesting hybridization. Some species have fragrant flowers. The Navajo name is obscure, usually translated as either stinkbug food or gray.

1. Plants usually acaulescent, most or all leaves basal ..... ***A. nana***
1' Plants usually caulescent, peduncles arising from axils of stem leaves ..... (2)

2. Plants with long, slender rhizomes; flowers typically 10–25 per head; fruit wings expanded distally ..... ***A. bolackii***
2' Plants typically arising from a taproot; flowers typically more than 25 per head; fruit wings expanded distally or not, or fruits wingless ..... (3)

3. Fruits wingless, or if winged, then wings not dilated distally ..... ***A. fragrans***
3' Fruit wings conspicuous, dilated distally ..... ***A. elliptica***

Abronia bolackii N. D. Atwood, S. L. Welsh & K. D. Heil (named in honor of Tommy Bolack, on whose ranch the type specimen was collected) Bolack's sand-verbena. Perennial herb from rhizomes. **STEMS** short, erect to decumbent, or plants sometimes appearing acaulescent, glandular-pubescent to glabrous. **LEAVES** numerous, mostly basal; petiole 1–4 cm; blade ovate or elliptic, 1–3 cm long, 0.4–1.5 cm wide, margins sometimes weakly sinuate to undulate, glabrous or finely puberulent. **INFL** peduncle 1.6–5.5 cm long, glandular-pubescent, bracts 5, green, becoming paler whitish with age, ovate, 6–10 mm long, 4–10 mm wide, apex broadly acute to rounded. **FLOWERS** 10–25 per head, perianth greenish white, tube 7–11 mm long, limb white, 2–3 mm long. **FRUIT** obovate to obconic, 4.5–7 mm long, puberulent, thin-walled, wings (3) 5, not expanded at distal end or folded together. Rare on gypsiferous clay badlands; saltbush and shadscale shrubland communities. NMEX: SJn. 1660–1730 m (5400–5700'). Flowering: Apr–May. Fruit: May–Jul. *Abronia bolackii* is the only rhizomatous species in the study area and is restricted to the Ojo Alamo Formation, which

weathers into a gypsiferous clay soil. It is closest to *A. elliptica*, which is overall a much larger plant that develops from a distinct taproot.

Abronia elliptica A. Nelson (for the elliptical shape of the leaves) Sand-verbena. Perennial herb from stout taproot. **STEMS** erect to decumbent, rarely nearly acaulescent, glandular-pubescent to rarely glabrous. **LEAVES** numerous, basal and cauline; petiole 1–8 cm; blade ovate-elliptic, 1.5–5.5 cm long, 0.6–3 cm wide, glaucous, margins often sinuate to undulate, abaxial surface usually glabrous, adaxial surface glandular-puberulent. **INFL** peduncle 3–8 cm long, glandular-pubescent, bracts 5, scarious, obovate to ovate, 6–20 mm long, 4–8 mm wide, puberulent to villous, apex acute to rounded. **FLOWERS** numerous, (20) 25–70 (75) per head; perianth tube pink or greenish, 12–20 mm long, limb white, 6–8 mm long. **FRUIT** turbinate, 5–12 mm long, glabrous to puberulent, thin-walled, wings (2) 3–5, thin, expanded at distal end, 2 folded together to form a groove. [*A. fragrans* Nutt. ex Hook. var. *elliptica* (A. Nelson) M. E. Jones]. Sandy to rocky soils in open shrublands and barrens, and sand dunes. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1125–2285 m (3700–7500'). Flowering: Apr–Sep. Fruit: May–Oct. Although closely related to *A. fragrans*, it is distinct in fruit morphology. The Hopi claim that putting a plant of *A. elliptica* on the head of a child will induce sleepiness.

Abronia fragrans Nutt. ex Hook. (for the fragrant flowers) Fragrant sand-verbena. Perennial herb from stout taproot. **STEMS** erect to decumbent, rarely nearly acaulescent, glandular-pubescent to rarely glabrous. **LEAVES** numerous, basal and cauline; petiole 1–7 cm; blade ovate, triangular, or broadly lanceolate, 3–11 cm long, 1–7 cm wide, green, not glaucous, margins often sinuate to undulate, adaxial and abaxial surfaces glandular-puberulent to densely pubescent, sometimes villous. **INFL** with peduncle 3–8 cm long, glandular-pubescent, bracts 5, scarious, lanceolate to ovate, 8–22 mm long, 3–10 mm wide, puberulent to villous, apex acute to rounded. **FLOWERS** numerous, (25) 30–75 (80) per head; perianth tube green, pink, red, or purple, 12–24 mm long, limb white, 7–10 mm long. **FRUIT** turbinate, 5–12 mm long, glabrous to puberulent, thick-walled, wings absent and fruit grooved, or present and (2) 3–5, thick, stiff, not expanded at distal end, not folded together. Uncommon to locally common on sandy soils in open shrublands and barrens, open piñon-juniper woodlands, and sand dunes. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1525–2285 m (5000–7500'). Flowering: Apr–May. Fruit: May–Jul. One of the Navajo names translates as spider medicine. Supposedly the effects of swallowing a spider can be eliminated by taking a medicine prepared from the plant. Many American Indian tribes used the plant as a cathartic and a diaphoretic, as well as for a variety of ailments, including dermatitis, stomach cramps, and cold sores. The roots were sometimes used as food by the Acoma and Laguna Pueblos.

Abronia nana S. Watson (for its low-growing stature) Dwarf sand-verbena. Perennial herb from rhizomes. **STEMS** absent, plants typically acaulescent and caespitose, rarely very short stems present, glandular-pubescent to glabrous, not whitish. **LEAVES** numerous, basal; petiole 1–5 cm; blade lanceolate to elliptic or ovate, 0.5–2.5 cm long, 0.7–1 cm wide, margins entire to undulate, glabrous or finely puberulent. **INFL** with peduncle 3–10 cm long, glandular-puberulent, bracts 5, scarious, lanceolate to narrowly ovate, 5–10 cm long, 3–6 mm wide, apex broadly acute to rounded, glandular-puberulent. **FLOWERS** 12–25 per head; perianth tube pink or rarely white, 10–28 mm long, limb white, 7–10 mm long. **FRUIT** obovate to cordate, 5–10 mm long, wings 5, not expanded distally or folded together. Clayey, gypsiferous soils; desert grassland, rabbitbrush, saltbush, sagebrush, and piñon-juniper woodland communities. ARIZ: Apa; NMEX: SJn. 1615–2135 m (5300–7000'). Flowering: Apr–May. Fruit: May–Jul.

Acleisanthes A. Gray Trumpets, Moonpod

(Greek *acleis*, a lack, + *anthos*, flower, for flowers lacking an involucre) Perennial herbs, sometimes becoming woody, from taproots. **STEMS** procumbent to erect, often clambering on other plants, sometimes swollen at the nodes, lacking sticky bands on internodes, glabrous or pubescent, often whitish. **LEAVES** sessile to petiolate, opposite pairs usually unequal, often strongly so, blades mostly thick and fleshy, ovate, bases symmetric to asymmetric, glabrous or pubescent. **INFL** terminal or axillary, solitary flowers or few-flowered cymes; bracteate or not, if present, involucres subtending 1–25 flowers, bracts 1–3, persistent, connate, not accrescent, remaining green. **FLOWERS** actinomorphic, perfect, sometimes cleistogamous and rounded-closed, chasmogamous flowers showy, funnelform; stamens 2–6, exserted; styles exserted beyond stamens, stigmas peltate. **FRUIT** symmetric, 4–5-ribbed, ellipsoid to oblong, leathery, smooth to finely pubescent, ribbed, wings often present, 3–5, sometimes hyaline, not distinctly tuberculate, glandular at one end. A genus of 17 species distributed primarily in the deserts of the Southwest and northern Mexico, but extending to arid northeast Africa. Our single species was originally placed in *Selinocarpus*, but Levin (2000) showed that it is probably embedded within *Acleisanthes*, which is also supported by morphology.

Acleisanthes diffusa (A. Gray) R. A. Levin (apart, for open branching of plants) Spreading moonpod. Perennial herb to subshrub. **STEMS** prostrate to erect, sometimes clambering on other plants, dichotomously to irregularly branched, densely brown to white-pubescent, sometimes appearing whitish. **LEAVES** numerous, spreading, green, petiolate, opposite pairs usually slightly unequal, blades mostly thick and fleshy, ovate, 12–28 mm long, 5–15 mm wide, with undulate margins, glabrous or pubescent, apex rounded to acute, leaf bases more or less symmetric. **INFL** terminal or axillary, bracteate, involucres subtending 1 (2–3) flowers, bracts 2–3, small, linear, 2–3 mm long. **FLOWERS** actinomorphic, perfect, mostly cleistogamous, small and rounded-closed, occasional chasmogamous flowers present, perianth 30–45 mm long, dull to pale green or yellow-green, sometimes with green stripes, funnelform; stamens 4–5. **FRUIT** symmetric, ellipsoid, pubescent with white hairs, smooth, wings present, 1–2 mm wide, not tuberculate. [*Selinocaprus diffusus* A. Gray]. Rare in arid to semiarid shadscale, saltbush, and blackbrush shrublands; usually on clay soils. UTAH. 1125–1220 m (3700–4000'). Flowering: May–Aug. Fruit: Jun–Oct.

Allionia L. Windmills

(for C. Allioni, Italian botanist) Annual or perennial herbs from slender to stout taproot. **STEMS** prostrate to clambering on other plants, sometimes swollen at the nodes, lacking sticky bands on internodes, glabrous or pubescent, somewhat reddish. **LEAVES** petiolate, opposite pairs unequal, blades thin, broadly lanceolate to ovate or triangular, bases more or less asymmtetric, glabrous or pubescent. **INFL** axillary, pedunculate, a cluster of 3 flowers; involucres distinct, of 3 bracts, persistent, connate, not accrescent, thin and papery or translucent. **FLOWERS** strongly bilaterally symmetrical, chasmogamous, perfect, showy, funnelform, limb short to almost absent; stamens 4–7, exserted; styles exserted beyond stamens, stigmas capitate. **FRUIT** compressed dorsiventrally, with concave and convex faces, obovoid, 5-ribbed, 2 lateral ribs enlarged and curved inward on convex face, ribs on convex face with 1–8 glandular teeth or teeth and glands sometimes lacking, fruit wall smooth or weakly rugose adaxially, not tuberculate, glandular on the concave face. A small genus of two species, widespread from southern North America through South and Central America and the West Indies. The fruit morphology is very complex, and mature fruits are usually necessary for proper identification. The three bilaterally symmetric flowers are closely clustered, giving the appearance of a single radially symmetric flower.

1. Annual; fruit lateral ribs with 4–8 regular teeth; fruit weakly convex adaxially ..... ***A. choisyi***
1' Perennial or rarely annual; fruit lateral ribs with 0–4 short, irregular teeth; fruit strongly convex adaxially ..... ***A. incarnata***

Allionia choisyi Standl. (for Jacques Denys Choisy, botanist, clergyman, and philosopher, 1799–1859) Trailing four-o'clock, garapatilla. Annual herbs from slender taproot. **STEMS** sprawling-prostrate, to 2 m, somewhat sticky-pubescent, often with adherent sand grains. **LEAVES** green to glaucous-green, paler below, becoming smaller distally; petiole 4–20 mm, same length or shorter than blade; larger leaf blades 12–26 mm long, 8–20 mm wide, margins undulate or somewhat plane, glabrous or pubescent, sometimes viscid, base asymmetric. **INFL** peduncle 2–10 mm, pubescent, involucres broadly ovate to rounded at maturity, 5–7 mm, margins not ciliate. **FLOWERS** pink, magenta, or rarely white, small, 2–6 mm. **FRUIT** brown at maturity, 3–4 mm long, 2–3.2 mm wide, weakly convex, teeth of lateral wings regularly shaped, 4–8 in number, slender, attenuate, glandular or not, concave side glandular, stalks of glands the same length or longer than head. Disturbed and open sandy or gravelly to rocky sites in desert scrub, black sagebrush, piñon-juniper woodland, and riparian communities. ARIZ: Apa, Nav; NMEX: McK, SJn; UTAH. 1650–1830 m (5420–6000'). Flowering: May–Sep. Fruit: Jun–Oct. The small fruits resemble ticks, thus the Spanish name garapatilla. The fruits of this species are variable and sometimes are more strongly convex with regularly shaped teeth, resembling fruits of *A. incarnata*.

Allionia incarnata L. (flesh-colored, in reference to the flowers) Trailing four-o'clock, allionia, windmills. Annual to more commonly perennial herbs from slender to stout and sometimes woody taproot. **STEMS** sprawling-prostrate, to 1.2 m, somewhat sticky-pubescent to villous, often with adherent sand grains. **LEAVES** green to glaucous-green, paler below, becoming smaller distally, petiole 3–20 mm long, usually shorter than blade, larger leaf blades 22–60 mm long, 12–32 mm wide, margins flat to sometimes undulate, glabrous or pubescent, sometimes viscid, base asymmetric. **INFL** with peduncle 4–26 mm long, pubescent, involucres ovate at maturity, 5–8 mm, margins not ciliate. **FLOWERS** pink to magenta, small, 6–14 mm. **FRUIT** brown at maturity, 3–4.5 mm long, 1.8–2.5 mm wide, strongly and deeply convex, teeth of lateral wings absent, or up to 4 present, broadly triangular to blunt, lacking glands, concave side glandular, stalks of glands the same length or shorter than head. Common in sandy to rocky sites in open desert scrub, blackbrush, shadscale, snakeweed, and piñon-juniper woodland communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, SJn; UTAH. 1430–1830 m (4700–6000') Flowering: Apr–Oct. Fruit: May–Nov. The plants in the study area are referred to **var. *incarnata***, while a second variety, var. *villosa* (Standl.) Munz, occurs in the Mojave and Sonoran deserts.

Boerhavia L. Spiderling

(for botanist Herman Boerhaave) Annual or perennial herbs or subshrubs from slender to swollen and tuberous taproots. **STEMS** procumbent, ascending to erect, sometimes swollen at the nodes, with or without sticky bands on internodes, glabrous to glandular-pubescent or villous, not whitish. **LEAVES** petiolate, opposite pairs distinctly unequal, blades thin to sometimes weakly fleshy, margins plane to undulate, narrowly lanceolate to broadly ovate, bases symmetric to asymmetric, glabrous or pubescent. **INFL** terminal or axillary, peduncle short or long, often obscure, highly branched, of a diffuse cyme, raceme, spike, or umbel, rarely borne singly; bracts 1–3, subtending 1 few flowers, persistent or deciduous, weakly connate to distinct, not accrescent in fruit, papery or translucent. **FLOWERS** more or less actinomorphic to sometimes bilaterally symmetric, perfect, chasmogamous flowers funnelform to campanulate, limbs abruptly flared above tube, cleistogamous flowers absent; stamens 2–8, included; styles at same level as stamens or somewhat exserted, stigmas peltate. **FRUIT** symmetric, 4–5-ribbed, fusiform, elliptic, obovoid, or pyramidal, ribs 3–5, angular to smooth or sometimes weakly winged, wall glabrous or puberulent, smooth to rugose, not tuberculate, glabrous to pubescent. A genus of 40 species, distributed in warm regions of the world, including North, Central, and South America, Africa, and Australia. The genus is taxonomically difficult, and mature fruits are usually needed for correct identification.

Boerhavia torreyana (S. Watson) Standl. (for John Torrey, 1796–1873, botanist and colleague of A. Gray) Spiderling. Annual herbs. **STEMS** ascending to erect, to 50 cm, irregularly branched, densely glandular-villous and viscid, at least at base, not whitish. **LEAVES** numerous, mostly basal; petiole 12–25 mm; blades oval to ovate or triangular, 20–40 mm long, 15–25 mm wide, becoming smaller distally, variably glabrous to glandular-pubescent or brown-punctate, paler below, margins smooth to undulate, apex rounded to obtuse. **INFL** terminal and axillary, irregularly branched, sticky internodes present, spicate to racemose; bracts 2, deciduous, lanceolate, 1–2 mm long, apex acute to acuminate. **FLOWERS** actinomorphic, small; perianth 1–1.5 mm, white to pink, campanulate; stamens 2–3. **FRUIT** obovoid, gray to red-brown or tan, 2–3 mm long, ribs 5, rounded, sometimes slightly winged, wall smooth to weakly rugose. Talus slopes of the De Chelly Sandstone. Known from Canyon de Chelly. ARIZ: Apa. 1730 m (5675'). Flowering Jul–Aug. Fruit Sep–Oct.

Mirabilis L. Four-o'clock, Umbrellawort, Tshétitéeh

(Latin *mirabilis*, wonderful) Perennial herbs or subshrubs from slender to swollen and tuberous taproots. **STEMS** procumbent, ascending to erect, often clambering on other plants, sometimes swollen at the nodes, lacking sticky bands on internodes, glabrous or pubescent, sometimes whitish. **LEAVES** sessile to petiolate, opposite pairs usually equal, blades thin to distinctly thick and fleshy, narrowly lanceolate to broadly orbicular, glabrous or pubescent, bases more or less equal. **INFL** terminal or axillary, bracteate, involucres subtending 1–15 flowers, persistent, connate, accrescent, remaining green or often becoming papery or translucent. **FLOWERS** more or less actinomorphic, perfect, sometimes cleistogamous and rounded-closed, chasmogamous flowers showy, funnelform to campanulate; stamens 3–6, exserted; styles exserted beyond stamens, stigmas capitate. **FRUIT** symmetric, 4–5-ribbed, obovoid to elliptic or globose, ribs smooth to tuberculate, wall between ribs smooth to often strongly tuberculate, glabrous to pubescent, not distinctly glandular at one end. A genus of about 60 species, primarily New World with a large concentration in the Southwest, Mexico, and into South America. Our species are easily separated into two well-marked groups, section *Quamoclidion* (*M. glandulosa*, *M. multiflora*, *M. oxybaphoides*) and section *Oxybaphus* (*M. albida*, *M. glabra*, *M. linearis*). Although *Oxybaphus* has often been segregated from *Mirabilis* and treated at the generic level, it has been reluctantly decided to not recognize it. In some preliminary phylogenetic DNA work, Levin (2000) showed that *Oxybaphus* may be derived from within section *Quamoclidion*, and both were shown to be distinct from section *Mirabilis*. However, *Quamoclidion* has generally not been recognized as a genus in North America. Clearly more work needs to be done on sectional relationships, but it is likely that the three principal sections may eventually be recognized as distinct genera. The species in *Oxybaphus* are notoriously variable and apparently hybridize where their ranges overlap; thus this treatment is very preliminary, largely following Spellenberg (2003). Fruits are generally needed to distinguish the species. Some species of *Mirabilis* were widely used by American Indian tribes as medicine, usually from concoctions of the root. The generic name used by the Navajo refers to a tendency for plants to force their roots into rocky sites and outcrops. The showy species *M. multiflora* and *M. glandulosa* are easily transplanted from pieces of the root and make outstanding xeric ornamentals.

1. Involucre becoming enlarged, tan and somewhat translucent with conspicuous veins; fruit distinctly 5-ribbed; leaf blades linear to narrowly ovate (*Oxybaphus*) ..... (2)
1' Involucre not enlarging in fruit, remaining green with veins obscure; fruit smooth to weakly 5-ribbed or somewhat 5-angled; leaf blades broadly ovate, deltate, or cordate (*Quamoclidion*) ..... (4)

2. Fruit glabrous, grayish brown to green-brown ..... ***M. glabra***
2' Fruit pubescent, dark brown to dark olive-brown ..... (3)

3. Leaf blades narrowly linear-lanceolate, mostly less than 1 cm wide; fruit ribs with smooth, low tubercles barely raised above fruit surface; stems whitish-pubescent ..... ***M. linearis***
3' Leaf blades lanceolate to ovate, at least some greater than 2 cm wide; fruit ribs with distinctly raised tubercles; stems green ..... ***M. albida***

4. Leaves relatively thin, cordate; flowers 1–3 per involucre; perianth mostly less than 1 cm long ..... ***M. oxybaphoides***
4' Leaves thick, fleshy, orbicular to triangular-cordate; flowers typically 6 or more per involucre; perianth large, showy, 2–6 cm long ..... (5)

5. Plants generally irregularly sprawling and branched, leaves rounded-cordate to orbicular; bracts with rounded-obtuse tips; inflorescence sticky-glandular; fruit strongly tuberculate, sticky when wet ..... ***M. glandulosa***
5' Plants sprawling to erect, branched from base, forming mounds; leaves triangular-cordate; bracts with acute tips; inflorescence weakly glandular; fruit smooth or weakly tuberculate, not or slightly sticky when wet ..... ***M. multiflora***

Mirabilis albida (Walter) Heimerl (for the white flowers) Umbrellawort. Perennial herbs. **STEMS** erect or procumbent, glabrous or puberulent, sometimes viscid or hirsute and spreading, not whitish. **LEAVES** ascending or spreading, green to glaucous-green or grayish green; petiolate; ovate-lanceolate to mostly ovate or cordate, variable in shape, lanceolate leaves 1–10 cm long, 0.5–2.5 cm wide, ovate leaves to 5 cm wide, blades thin to distinctly thick and fleshy, glabrous or pubescent, sometimes viscid, apex variable, rounded to acute, base symmetric to somewhat asymmetric. **INFL** terminal or axillary, peduncle short, to 2 cm, pubescent, involucres campanulate, 5–7 mm, lobes ovate to triangular, pubescent, margins often ciliate with dark hairs, involucre enlarging and becoming pale tan and translucent in fruit, 6–14 mm long. **FLOWERS** (1) 2–3 per involucre; perianth small, 1–2 cm, white or sometimes pink, short-funnelform, small cleistogamous flowers sometimes present, typically single. **FRUIT** brown, distinctly ribbed, ovoid to obovate, 4–6 mm long, pubescent, sometimes weakly viscid, ribs with tubercles, wall rugose, with low distinct tubercles or rarely almost smooth [*M. comata* (Small) Standl.; *Oxybaphus comatus* (Small) Weath.]. Rocky slopes, fields, and sandy sites. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, SJn; NMEX: McK. 1950–2530 m (6400–8300'). Flowering: Jul–Aug. Fruit: Sep–Oct.

Mirabilis glabra (S. Watson) Standl. (smooth, in reference to fruit) Umbrellawort. Perennial herbs. **STEMS** erect to ascending, glabrous, glandular, puberulent, or pubescent, not whitish. **LEAVES** ascending to erect, glaucous-green or grayish green; sessile or short-petiolate; blade linear to narrowly ovate, 5–9 cm long, 0.5–7 cm wide, somewhat lanceolate to mostly ovate or cordate, variable in shape, lanceolate leaves 1–10 cm long, 0.5–2.5 cm wide, ovate leaves to 5 cm wide, somewhat thick but not fleshy, glabrous or pubescent, apex variable, rounded to acute, base symmetric to somewhat asymmetric. **INFL** terminal or rarely axillary, peduncle short, to 1 cm, pubescent, involucres campanulate, 5–7 mm long, lobes ovate to triangular, glabrous, margins sometimes sparsely ciliate or margins with pale hairs, involucre enlarging and becoming pale tan and translucent in fruit, 8–12 mm long. **FLOWERS** 1–3 per involucre; perianth small, less than 1 cm long, white or sometimes pink, short-funnelform, typically lacking cleistogamous flowers. **FRUIT** pale grayish green to greenish brown, distinctly ribbed, obovate, 4–5 mm long, glabrous or rarely somewhat puberulent, ribs with tubercles, wall not distinctly rugose, with low to often distinct tubercles present [*Oxybaphus glaber* S. Watson]. Rocky slopes, fields, and sandy sites. NMEX: SJn. 1890–2050 m (6200–6725'). Flowering: May–Sep. Fruit: Jun–Oct.

Mirabilis glandulosa (Standl.) W. A. Weber (for the sticky fruit and inflorescence) Showy four-o'clock. Perennial herbs. **STEMS** sprawling to ascending, forming straggling mats, glabrous to pubescent, not whitish. **LEAVES** spreading to erect, green, sometimes glaucous, petiolate at least proximally; blade broadly cordate to nearly orbicular, 4–10 cm wide × 5–8 cm long, thick and somewhat fleshy, glabrous, apex variable, rounded to acute, base asymmetric. **INFL** terminal or axillary, peduncle short or long, 0.5–6.5 cm, strongly glandular-pubescent and viscid, involucres broadly tubular to campanulate, 25–40 mm, lobes ovate, rounded-obtuse, glabrous to pubescent, margins not ciliate, involucre not enlarging in fruit, remaining green. **FLOWERS** 6 per involucre; perianth large, showy, 2–6 cm long, pink to magenta, long-funnelform, typically lacking cleistogamous flowers. **FRUIT** brown to brown-black, ribs present or nearly absent, ovoid, 5–10 mm long, distinctly sticky-mucilaginous when wet, wall distinctly and strongly tuberculate. [*M. multiflora* (Torr.) A. Gray var. *glandulosa* (Standl.) J. F. Macbr.]. (Ours) mostly on clay slopes derived from the Morrison Formation; shadscale, sagebrush, and piñon-juniper woodland communities. ARIZ: Apa, Nav; COLO: Dol, Mon; NMEX: SJn; UTAH. 1525–1980 m (5000–6500'). Flowering: Apr–Jun. Fruit: Jun–Jul. *Mirabilis glandulosa* in its typical phase is quite distinct from *M. multiflora*, although there are intermediates. The very broad, rounded leaves, rounded involucre tips, and

sticky inflorescence and fruit generally distinguish it from *M. multiflora*. It also tends to flower earlier and is less likely to flower after the summer monsoons, which *M. multiflora* commonly does.

Mirabilis linearis (Pursh) Heimerl (line, for the slender, linear leaves) Narrowleaf umbrellawort. Perennial herbs. **STEMS** decumbent, ascending to erect, variably glabrous, pubescent, or puberulent, sometimes glandular-pubescent and viscid or densely hirsute, whitish. **LEAVES** ascending to spreading, green to glaucous-green or blue-green or gray, petiolate; blade linear-lanceolate to narrowly lanceolate, variable in shape, 4–12 cm long, 0.1–2 cm wide, thin to somewhat thick and fleshy, glabrous, glandular, or hirsute, apex variable, rounded to acute, base symmetric to somewhat asymmetric. **INFL** terminal and axillary, peduncle short, 4–10 mm, glandular-pubescent to pilose or hirsute; involucres green, campanulate, 4–6 mm, lobes ovate, short, ciliate-pubescent in fruit, involucre enlarging and becoming pale tan and translucent in fruit, 5–12 mm long. **FLOWERS** typically 3 per involucre; perianth small, 0.7–1 cm, white to pink or purple, cleistogamous flowers lacking. **FRUIT** olive to brown, weakly ribbed, obovate, 3–5 mm long, pubescent to hirsute, not viscid, wings not or weakly tuberculate, wall smooth to somewhat rugose, with low or distinct tubercles. [*Oxybaphus linearis* (Pursh) B. L. Rob.]. A variable species with two varieties in the study area. Medicines from the roots of this species were widely used for stomach ailments by the Navajo and Zuni, who also ate the seeds and fruits on occasion. More work is needed to clarify the relationships and distributions of the two varieties, and also to determine whether var. *decipiens* is distinctive enough to be considered a separate species.

1. Leaf blades lanceolate, 0.5–2 cm wide, green; perianth pink to purple ..... **var. *decipiens***
1′ Leaf blades linear, 0.1–1 cm wide, glaucous-gray or blue-green; perianth white to pink ..... **var. *linearis***

var. *decipiens* (Standl.) S. L. Welsh (deceiving) Uncommon in ponderosa pine, Gambel's oak, piñon-juniper woodland, aspen, spruce-fir, and riparian communities. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn, UTAH. 1900–3050 m (6235–10005′). Flowering: June–Aug. Fruit: Jul–Sep. Generally at higher elevations than var. *linearis*.

var. *linearis* Shadscale, sagebrush, rabbitbrush, piñon-juniper woodland, mountain brush, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1125–2715 m (3700–8905′). Flowering: May–Sep. Fruit: Jun–Oct.

Mirabilis multiflora (Torr.) A. Gray **CP** (for the numerous flowers) Showy four-o'clock. Perennial herbs. **STEMS** sprawling to ascending, forming hemispherical mounds, glabrous to pubescent, not whitish. **LEAVES** spreading to erect, green, sometimes glaucous; petiolate at least proximally, blade broadly triangular-cordate or ovate, 4–9 cm wide × 4–7 cm long, thick and somewhat fleshy, glabrous, apex variable, rounded to acute, base asymmetric. **INFL** terminal or axillary, peduncle short or long, 0.5–6.5 cm, glabrous or weakly glandular-pubescent, not distinctly viscid; involucres broadly tubular to campanulate, 25–40 mm, lobes triangular-ovate, acute, glabrous to pubescent, margins not ciliate, involucre not enlarging in fruit, remaining green. **FLOWERS** 6 per involucre; perianth large, showy, 2–6 cm long, pink to magenta, long-funnelform, typically lacking cleistogamous flowers. **FRUIT** brown to brown-black, ribs present or nearly absent, ovoid, 5–10 mm, not or only slightly sticky-mucilaginous when wet, wall smooth to weakly tuberculate. Sagebrush, blackbrush, piñon-juniper woodlands, other wooded slopes, canyons, and riparian communities. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1220–2560 m (4000–7800′). Flowering: May–Sep. Fruit: Jun–Oct. This species was widely used in the region as a drug to induce hallucinations (Hopi), to aid digestion (Zuni), for rheumatism (Navajo), as a dermatological aid and cleanser (many tribes), taken internally to decrease appetite (Zuni), and to make a tea (Navajo).

Mirabilis oxybaphoides (A. Gray) A. Gray (for similarity to *Oxybaphus*) Spreading four-o'clock, t–'iicnát'ooh. Perennial herbs. **STEMS** prostrate, ascending, sometimes climbing on and tangled in other plants, glandular-pubsecent to puberulent, not whitish. **LEAVES** sparse, spreading; petiolate; blade broadly ovate to deltate, 2–8 cm long, 1–7 cm wide, thin or sometimes weakly fleshy, glabrous to glandular-pubescent, apex mostly acuminate or rarely rounded. **INFL** a terminal or axillary cyme, involucres clustered at ends of branches, sometimes solitary, peduncle variable in length, pubescent, involucres bell-shaped, 6–8 mm, lobes ovate to triangular, pubescent, margins not distinctly ciliate with dark hairs, not enlarging or becoming pale tan and translucent in fruit. **FLOWERS** 3 per involucre; perianth small, 0.5–1 cm, pale pink to purplish, rarely white, typically lacking cleistogamous flowers. **FRUIT** olive-green or green-brown to dark brown or black, not ribbed although faint grooves sometimes present, obovoid to subspherical, 2–3 mm, not pubescent, wall smooth or only slightly rugose, lacking distinct tubercles. Piñon-juniper and oak woodlands, riparian woodlands, and other shaded sites. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon; NMEX: McK, RAr, San, SJn. 1645–2565 m (5400–8415′). Flowering: May–Jul. Fruit: Jun–Sep. The Navajo name is usually translated as snake

tobacco. They used the powdered leaves and roots to reduce swelling from spider bites, to control dandruff, to aid healing of fractures, and sometimes as food or tea.

Tripterocalyx (Torr.) Hook. Sand-puffs

(Greek *tri*, three, + *pteron*, wing, + *calyx*) Annual herbs from slender, fibrous to somewhat woody taproots. **STEMS** green to often reddish throughout or at nodes, decumbent to erect, viscid-glandular to pubescent, lacking sticky bands on internodes, glabrous or pubescent. **LEAVES** petiolate, opposite pairs unequal; blades thick and fleshy, broadly lanceolate, elliptic, ovate, or obovate, glabrous or pubescent, bases mostly asymmetric. **INFL** axillary, pedunculate, of capitate heads or umbels, bracteate, bracts 5, subtending 5–25 (30) flowers, persistent, weakly connate to nearly distinct, not accrescent, thin, translucent to papery. **FLOWERS** actinomorphic, perfect, chasmogamous, perianth funnelform to salverform, 4–5-lobed, caudoucous above the ovary; stamens 3–5, included in tube, styles included, stigmas linear. **FRUIT** symmetric, slender-elliptic to fusiform, sometimes somewhat spongy, ribs extending into 2–4 wings, translucent, large, wall smooth to rugose, not tuberculate, glabrous to pubescent, not distinctly glandular at one end. A small genus of four species endemic to western North America and Mexico.

1. Floral tube relatively short, 6–16 mm, limb 3–5 mm, greenish pink, lobes inconspicuous ..... ***T. micranthus***
1′ Floral tube longer, 13–28 mm, limb 9–12 mm, pink, magenta, or white, lobes distinct ..... (2)

2. Limb of perianth white, at least adaxially; fruits less than 20 mm long ..... ***T. wootonii***
2′ Limb of perianth pink to purple on both sides; fruits mostly greater than 20 mm long ..... ***T. carneus***

Tripterocalyx carneus (Greene) L. A. Galloway (flesh-colored, for the showy flowers) Pink sand-puffs. Annual herbs. **STEMS** decumbent, ascending to erect, 10–60 cm, glandular-pubescent to puberulent, often reddish. **LEAVES** spreading, petiole 1.5–7 cm, blades oblong to ovate or broadly lanceolate, 3–9 cm long, 1.2–4 cm wide, somewhat glaucous abaxially, glabrous to glandular-pubescent, margins entire to undulate and ciliate, apex acute to obtuse. **INFL** short- to long-pedunculate, 1.5–10 cm, 10–25-flowered, bracts lanceolate, 6–15 mm long, 3–6 mm wide, margins glandular-ciliate. **FLOWER** perianth tube 13–25 mm, pale pink to magenta, limb 9–12 mm, pale pink, showy. **FRUIT** ovate, 16–30 mm long, lateral ribs weakly developed or lacking; wings 2–4. Blackbrush, *Ephedra*-resinbush, purple sage, and sand sagebrush communities. COLO: Mon; NMEX: McK, SJn. 1615–1890 m (5300–6200′). Flowering: Apr–Sep. Fruit: Jun–Oct. This showy species reaches its northern limits within the study area and is one of the few elements of the Chihuahuan Desert flora in the Four Corners region.

Tripterocalyx micranthus (Torr.) Hook. (for the small flowers) Small-flowered sand-puffs. Annual herbs. **STEMS** decumbent, ascending to erect, 10–50 cm, glandular-pubsecent and viscid, reddish. **LEAVES** spreading, petiole 1.2–3.5 cm, blades broadly lanceolate to elliptic, 1.5–5 cm long, 0.6–2.2 cm wide, green or glaucous abaxially, mostly glandular-pubescent, margins entire to undulate, ciliate, apex acute to obtuse. **INFL** short- to long-pedunculate, 1.5–9 cm, 5–15-flowered, bracts lanceolate to ovate, 3.5–8 mm long, 1–2.5 mm wide, margins glabrous to glandular-pubescent. **FLOWER** perianth tube short, 5–16 mm, greenish pink, limbs short, 3–5 mm, greenish white or pink. **FRUIT** rounded-oval, 11–20 mm long, lateral ribs weakly developed or with poorly developed wings, wings typically 3 (2–4). Sandy sites in desert grasslands and desert shrub communities. ARIZ: Apa, Nav; COLO: LPl; NMEX: McK, RAr, SJn; UTAH. 1125–1860 m (3700–6100′). Flowering: Apr–Sep. Fruit: Jun–Oct. This showy species is most common to the north, reaching its southern limit in the Four Corners region.

Tripterocalyx wootonii Standl. (for Elmer Ottis Wooton, 1865–1945, New Mexico botanist) Wooton's sand-puffs. Annual herbs. **STEMS** decumbent, ascending to erect, 10–70 cm, glandular-pubescent and viscid, green to often reddish at nodes. **LEAVES** spreading; petiole 1–6 cm, blades broadly ovate to oblong, 1.8–7.6 cm long, 0.6–4.5 cm wide, more or less glaucous abaxially, glabrous or glandular-pubescent, margins entire to weakly undulate, scabrid to short-ciliate, apex acute to obtuse. **INFL** short- to long-pedunculate, 1.7–9.5 cm, 10–25-flowered, bracts narrowly lanceolate to ovate, 4.5–13 mm long, 0.5–4.7 mm wide, margins glandular-ciliate or sometimes glabrous. **FLOWER** perianth tube 13–25 mm, pink, limbs distinct, 9–11 mm, white adaxially. **FRUIT** oval, 14–24 mm, lateral ribs present, 1–3 or sometimes absent, if present, lacking wings or wings poorly developed, wings typically (2–) 3 (–4). [*T. carneus* (Greene) L. A. Galloway var. *wootonii* (Standl.) L. A. Galloway]. Sandy soils in desert grasslands, desert scrub, sagebrush, and juniper savanna communities. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: McK, RAr, San, SJn; UTAH. 1125–2200 m (3700–7215′). Flowering: Apr–Sep. Fruit: Jun–Oct. *Tripterocalyx wootonii* largely replaces *T. carneus* in the southern portions of the study area and further south.

NYMPHAEACEAE Salisb. WATER-LILY FAMILY

C. Barre Hellquist

Perennial, aquatic, rhizomatous herbs. **STEMS**: rhizomes branched or unbranched, erect or horizontal, some tuberous, some stoloniferous. **LEAVES** arising from rhizomes, alternate, floating, submersed, and emersed, stipules present or absent; petioles long; blades lanceolate to ovate, or orbicular with basal sinus, margins entire, spinose, or dentate. **INFL** axillary or extra-axillary, flowers solitary. **FLOWERS** bisexual, diurnal or nocturnal, floating, emergent, occasionally submersed with long peduncle; involucre absent; perianth often persistent; hypogynous, perigynous, or epigynous; sepals usually 4–9 (–12); petals numerous (rarely absent), often transitional to stamens; stamens numerous; pistil 1, 3–35-carpellate and -locular; ovules numerous; stigma sessile, radiate on stigmatic disc. **FRUIT** berrylike, indehiscent or irregularly dehiscent. **SEEDS** several to numerous; aril present or absent, fleshy (Wood 1959). Six genera, about 50 species worldwide.

Nuphar Sm. Spatterdock, Cow-lily, Yellow Pond-lily

(ancient Arabic or Persian) Rhizomes horizontal, branched. **LEAVES** floating, submersed, and emersed; blades orbicular to linear, basal lobes divergent or overlapping, margins entire; primary venation mostly pinnate, basal section of midrib with parallel veins, light green, some reddish when young. **FLOWERS** floating or emersed, opening diurnally; perianth hypogynous, nearly globose at anthesis; sepals 5–9 (–12), green to yellow on outer surface, yellow, often red-tinged on inner surface, oblong to obovate or orbicular; petals numerous, smaller than sepals, spirally arranged, stamenlike; stamens yellow or red-tinged, inserted below ovary; ovary longer than petals and stamens; stigmatic disc with margin entire, crenate, or dentate. **FRUIT** borne on peduncles. **SEEDS** ovoid, to 6 mm; aril absent. $x = 17$ (Beal 1956; Padgett 1997). Ten to 12 species. North America, Mexico, Europe, Asia.

Nuphar polysepala Engelm. (many-sepaled) Yellow cow-lily, spatterdock. Rhizomes 3–8 cm in diameter or larger. **LEAVES** floating, submersed, and emergent; petioles terete; blades green, widely ovate, 10–40 (–45) × 7–30 cm, sinus 1/3–2/3 length of midrib, lobes divergent to overlapping. **FLOWERS** 5–10 cm in diameter; sepals (6–) 9 (–12), green on undersurface, yellow above, sometimes red-tinged toward base; petals oblong, thick; anthers 3.5–9 mm, shorter than the filaments. **FRUIT** green to yellow, cylindric to ovoid, 4–6 (–9) × 3.5–6 cm, strongly ribbed, slightly constricted below the stigmatic disc; disc green, 20–35 mm diameter. **SEEDS** 3.5–5 mm long. $2n = 34$. [*N. lutea* (L.) Sm. subsp. *polysepala* (Engelm.) E. O. Beal; *Nymphaea polysepala* (Engelm.) Greene]. Ponds, lakes, and streams. COLO: LPl, SJn. 2950–3275 m (9400–10800'). Flowering and fruiting: Jun–Aug. Alaska, Yukon, and Northwest Territories south to California, Arizona, Colorado, and New Mexico. This species has been used by various Native Americans as an antirheumatic medicine, blood medicine, and for various other maladies. The roots may be boiled or roasted and eaten as a vegetable. Ground seeds have been used as flour and for porridge. Dried roasted seeds are similar to popcorn.

OLEACEAE Hoffmanns. & Link OLIVE FAMILY

Kenneth D. Heil

Trees, shrubs, or subshrubs. **LEAVES** opposite (rarely alternate in *Menodora*), simple or pinnately compound, stipulate. **INFL** racemose, paniculate, or thyrsoid. **FLOWERS** perfect or imperfect; calyx mostly 4-lobed or absent; corolla usually united or with distinct petals, or lacking; stamens 2, distinct; pistil 1, the ovary superior, 2-carpelled and 2-loculed; style 1 or lacking, stigmas 1 or 2. **FRUIT** a berry, drupe, loculicidal capsule, circumscissile capsule, or samara. $x = 10$, 11, 13, 14, 23, 24. Approximately 30 genera and about 600 species worldwide, mostly in warmer temperate and subtropical regions. Numerous ornamentals, which include *Chionanthus virginicus* L. (fringe tree), *Forsythia* (golden bells), *Ligustrum* (privet), and *Syringa* (lilac). Several species are used for timber including species in *Olea*, *Fraxinus*, *Nestegis*, and *Notelaea* (Welsh et al. 2003).

1. Fruit a samara; leaves mostly compound (except in *Fraxinus anomala*); large shrubs or trees ..... ***Fraxinus***
1' Fruit a drupe or capsule; leaves simple; spiny shrubs or subshrubs ..... (2)

2. Fruit a drupe; corolla lacking; indigenous shrub of river valleys ..... ***Forestiera***
2' Fruit a capsule; corolla well developed; piñon-juniper woodland communities or cultivated shrubs ..... (3)

3. Corolla yellow; fruit a membranous circumscissile capsule; indigenous subshrub ..... ***Menodora***
3' Corolla lavender to red, purple, lilac, or white, never yellow; fruit a loculicidal capsule; cultivated shrub ..... ***Syringa***

Forestiera Poir. Desert Olive, New Mexico Privet

(for Charles Le Forestier, French physician and botany teacher of Poiret, the describer) Sprawling shrubs. **LEAVES** opposite, often appearing fascicled at the ends of the branches, serrate or entire. **FLOWERS** very small, polygamo-dioecious, appearing before the leaves; calyx none or minute, unequally 5–6-cleft; corolla none or 1 or 2 small petals; stamens 2 or 4; ovary 2-loculed, with 2 ovules. **FRUIT** a thin-fleshed drupe. **SEEDS** bony, 1. About 15 species, mostly in southwest North America.

Forestiera pubescens Nutt. (becoming hairy) New Mexico privet, New Mexico olive. Shrubs up to 3 m tall, bark gray with spiny branches. **LEAVES** (0.8) 1.5–5.5 cm long, (0.3) 0.5–2 cm wide, oblanceolate to elliptic, entire to serrulate. **INFL** with flowers in fascicles. **FLOWERS**: staminate sessile; pistillate pedicellate. **DRUPES** 5–8 mm long, ellipsoid, blue-black. [*F. neomexicana* A. Gray]. River terraces with Russian olive, saltcedar, skunkbush, and cottonwood. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1360–1905 m (4460–6260'). Flowering: Apr–Jun. Fruit: Jun–Sep. California east to Oklahoma and Texas; Chihuahua, Mexico. Leaves used by the Ramah Navajo as a ceremonial emetic; stem used to make Evilway big hoop. Used to make prayer sticks and as a dye plant for wool by the Navajo. The large shrubs were considered water indicators by the Isleta. The fruit is eaten by numerous birds and mammals, especially foxes and coyotes.

Fraxinus L. Ash

Deciduous trees or shrubs. **LEAVES** opposite, pinnately compound (simple in *F. anomala*). **INFL** a panicle. **FLOWERS** perfect or unisexual, inconspicuous; calyx lacking or 4-cleft; corolla lacking or of 2 or more distinct petals; stamens mostly 2; ovary 2-loculed; style 1; stigmas 1 or 2. **FRUIT** a samara. About 65 species, mostly north-temperate, with a few extending to the tropics. An important timber tree and used for tool handles and sporting goods.

1. Flower with a corolla, in terminal branches on lateral leafy branchlets of the current year; McKinley County, New Mexico ..... ***F. cuspidata***

1' Flower without a corolla, in axillary panicles from separate buds in the axils of leaves of the previous year; widespread ..... (2)

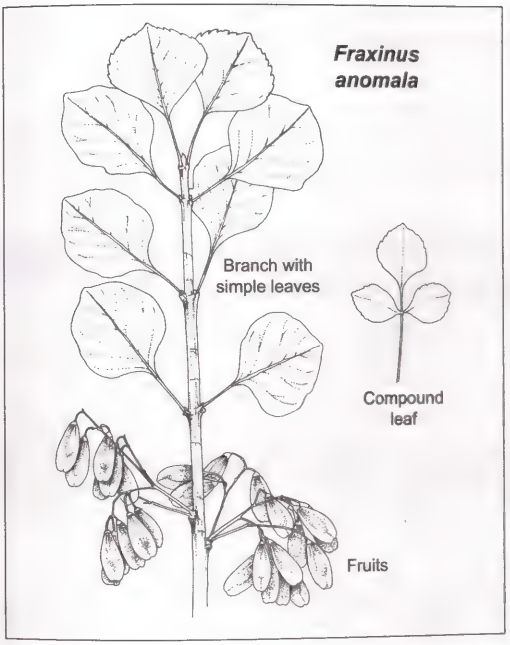
2. Leaves mostly simple, sometimes 3–7-foliate; twigs quadrangular; wings of the samaras not or seldom continuing to the base of the fruit; blackbrush, shadscale, piñon-juniper, and ponderosa pine communities ..... ***F. anomala***

2' Leaflets 3–7; twigs terete or nearly so; wings of the samaras continuing to the base of the fruit; stream courses and flood plains ..... ***F. velutina***

Fraxinus anomala Torr. ex S. Watson (abnormal, referring to the single leaf) Singleleaf ash. Shrub or small tree, mostly 2–5 m tall; twigs 4-sided. **LEAVES** glabrous, mostly simple, occasionally 3- to 7-foliolate; the blade ovate to oval, entire or crenulate; 1–5 cm long, 1–7.5 cm wide, acute or subcordate basally, acute to rounded apically. **INFL** a 3–12 cm many-flowered panicle. **FLOWERS** mostly perfect; calyx 1–2 mm long; petals none. **SAMARAS** 12–27 mm long, 5–12 mm wide, obovate-oblanceolate, winged almost to the base. [*Fraxinus anomala* var. *triphylla* M. E. Jones]. Often on slickrock in blackbrush, ephedra, shadscale, Gambel's oak, piñon-juniper, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Dol, Mon; NMEX: SJn; UTAH. 1360–2135 m (4460–7000'). Flowering: Apr–May. Fruit: May–Jun. New Mexico, Colorado to California; Mexico. Seeds used in prayer for rain by the Kayenta Navajo. Used for prayer sticks by the Hopi.

Fraxinus cuspidata Torr. (with a stiff point, referring to the leaves that are occasionally cuspidate) Fragrant ash. Shrub or small tree up to 6 m high; trunk up to 2 dm in diameter; bark gray, smooth, becoming fissured into ridges. **LEAVES** petioled with (3) 4–7 (–9) leaflets, leaflets lanceolate to broadly ovate, long-pointed and sometimes cuspidate, 3.5–7 cm long, entire to coarsely toothed, dark green above, paler and pubescent beneath when young. **INFL** a panicle, 7–10 cm long, loose. **FLOWERS** appearing with the leaves; petals 4, about 10 mm long, 1 mm wide, white; stamens shorter than the petals. **SAMARAS** including the wing about 1.2 cm long, oblong-obovate to lanceolate; wing 6 mm wide in upper 1/2 and extending nearly to base of flattened fruit body. Local on rocky slope of canyons. Willow, Gambel's oak, and piñon-juniper communities. NMEX: McK. 2000–2135 m (6560–7000'). Flowering: May–Jun. Fruit: Jun–Jul. Nevada, Arizona, New Mexico, and Texas. The Navajo used the stems to make arrows and bows. The wood is used to make weaving tools.

Fraxinus velutina Torr. (velvety) Velvet ash, Arizona ash. Moderate-size trees; branchlets terete, spreading-hairy to sparingly or nearly glabrous. **LEAVES** with 3–5 leaflets (rarely simple), petiolulate, lanceolate to ovate, elliptic, or orbicular, cuneate to acute basally, acuminate to rounded apically, nearly entire to serrate, hairy or glabrous on the



lower surface. **FLOWERS** imperfect; calyx persistent, campanulate; corolla none; anthers apiculate, oblong. **SAMARAS** 16–34 mm long, 4–6 mm wide, the blade decurrent about halfway along the terete body. [*F. pennsylvanica* Marshall subsp. *velutina* (Torr.) G. N. Mill.]. Stream courses and flood plains. A single collection along the Animas River in Farmington. NMEX: SJn. 1645 m (5400'). Flowering: May–Jun. Fruit: Jun–Jul. California, Nevada, Utah, east to Texas.

Menodora Bonpl. Menodora

(Greek *menos*, force, + *doron*, gift) Menodora. Subshrubs. **LEAVES** alternate, lowermost opposite, simple, sessile or subsessile, entire. **INFL** solitary, corymbose, or paniculate. **FLOWERS** showy; calyx 5–15-lobed; corolla yellow, subrotate, 5–6-lobed; stamens 2, inserted on the corolla tube; ovary superior, 2-loculed, 2–4 ovules per locule; style slender, stigma capitate. **FRUIT** a circumscissile capsule.

Menodora scabra A. Gray (rough) Rough menodora. Erect or ascending subshrub, mostly 2–3.5 dm tall, woody at the base only. **LEAVES** 0.5–3 cm long, 2–5 mm wide, narrowly elliptic to oblong or lanceolate, glabrous or scaberulous. **FLOWER** calyx glabrous to scabrous, 7–11 linear lobes, 4–5 mm long; corolla bright yellow, subrotate, lobes 5–9 mm long. **CAPSULE** 5–7 mm long, 8–12 mm thick. **SEEDS** 4–5 mm long, about 3 mm wide. $2n = 22$. Rocky soils. Ponderosa pine, Rocky Mountain juniper, piñon pine, and Gambel's oak communities. NMEX: McK. California, Utah south to Arizona, New Mexico, and Texas; Mexico. Used by the Ramah Navajo in the following ways: decoction of root used for back pain, infusion taken for heartburn, decoction of plant taken to facilitate labor, and plant used as a "life medicine."

Syringa L. Lilac

(Greek *syrinx*, a hollow tube or pipe, referring to the hollow state of the younger shoots in certain species) Shrubs. **LEAVES** petiolate, opposite, simple. **INFL** a terminal or lateral panicle. **FLOWERS** perfect, campanulate, 4-toothed, persistent; corolla tubular, limb 4-lobed and rotate; stamens 2, inserted on the corolla tube; ovary 2-loculed, each locule with usually 2 ovules; style with a 2-lobed stigma. **FRUIT** a loculicidal capsule. About 25 species, mostly Asiatic. Commonly cultivated and with strongly fragrant flowers.

Syringa vulgaris L. (common) Common lilac. Shrubs up to 4 m tall or more, branches mostly erect. **LEAVES** 3–12 cm long, 1.5–8 cm wide, ovate to cordate to rounded, truncate or obtuse basally, acute to acuminate apically, glabrous. **INFL** a panicle, 10–20 cm long. **FLOWERS** purple, lilac, or white; stamens included. $2n = 44, 46$. An ornamental that persists around homesites. Introduced from Europe. COLO: Mon, SMg; NMEX: SJn; UTAH. 1325–2225 m (4350–7300'). Flowering: Apr–Jun. Fruit: Jun–Jul. Widespread throughout the United States.

ONAGRACEAE Juss. EVENING PRIMROSE FAMILY

Warren L. Wagner and Peter C. Hoch

Annual or perennial herbs and shrubs, rarely trees. **LEAVES** usually cauline, often with a basal rosette, rarely basal only, simple, alternate or opposite, occasionally whorled or spirally arranged, entire or toothed to pinnatifid; stipules present, usually small and caducous, or absent in tribes Epilobieae and Onagreae. **FLOWERS** perfect and hermaphroditic or rarely unisexual, actinomorphic or zygomorphic, (2–) 4 (–7)-merous; axillary, in leafy spikes or racemes or solitary, or occasionally in panicles, flower parts distal to the ovary deciduous after anthesis (in ours); floral tube present or occasionally absent, nectariferous within; sepals green or colored; petals as many as sepals or rarely absent, variously

colored, occasionally clawed; stamens twice as many as sepals and in 2 series, the antisepalous set usually longer, rarely all equal, or as many as sepals, anthers versatile or sometimes basifixed, dithecal, polysporangiate, opening by longitudinal slits, pollen grains united by viscin threads, (2–) 3 (–5)-aperturate, shed singly or in tetrads or polyads; ovary inferior, consisting of as many carpels and locules as sepals, the septa sometimes thin or absent at maturity, placentation axile or parietal, ovules 1 to numerous per locule, in 1 or several rows or clustered, style 1, stigma with as many lobes as sepals or clavate to globose. **FRUIT** a loculicidal capsule or indehiscent berry or nutlike. **SEEDS** usually small, sometimes with a coma or wings. $x = 7, 8, 10, 11, 15, 18$. (Wagner, Hoch, and Raven 2007; Munz 1965; Raven 1979; Levin et al. 2004.) Twenty-two genera and 657 species (806 taxa) distributed nearly worldwide, but especially rich in the New World.

1. Stipules present, sometimes deciduous; fruit indehiscent, burlike with hooked hairs; flowers 2-merous [tribe Circaeae] ..... ***Circaea***
1′ Stipules absent; fruit a dehiscent capsule or sometimes indehiscent, but not burlike; flowers 4-merous ..... (2)

2. Seeds comose (rarely secondarily lost); sepals erect or spreading; stigmas commissural with dry multicellular papillae [tribe Epilobieae] ..... (3)
2′ Seeds not comose; sepals reflexed; stigmas not commissural [tribe Onagreae] ..... (4)

3. Floral tube absent; petals entire; leaves spirally arranged or rarely subopposite or verticillate; stamens subequal; style and stamens reflexed at maturity ..... ***Chamerion***
3′ Floral tube present; petals with apical notch; leaves opposite, at least near base of the stem; stamens in 2 unequal whorls; style and stamens erect ..... ***Epilobium***

4. Capsule 2-loculed; stems very slender, hairlike; petals white with 1 or 2 yellow areas at base ..... ***Gayophytum***
4′ Capsule 4-loculed; stems usually not very slender; petals yellow or white but not white with yellow areas ..... (5)

5. Style with a peltate indusium at base of stigma, at least at younger stages prior to anthesis; stigma 4-lobed, receptive all around (or peltate to discoid or nearly square in sect. *Calylophus*) ..... ***Oenothera***
5′ Style without an indusium; stigma hemispherical ..... (6)

6. Seeds in 2 rows per locule; capsule pedicellate; leaves ± basal, pinnatifid with a large terminal lobe, in some species either lateral lobes ± reduced or leaf ovate-cordate on a long petiole; lower surface of leaves or leaf margins with conspicuous (brown) oil cells ..... ***Chylismia***
6′ Seeds in 1 row per locule; capsule sessile; leaves entire to toothed, not predominantly basal or with oil cells ..... ***Camissonia***

Camissonia Link Camissonia, Sun Cup

(named in honor of Adelbert von Chamisso, 1781–1838, German poet, and botanist on the Russian ship *Rurik*, which sailed around the world from 1815 to 1818, including collecting in California in 1816) Annual, usually erect, sometimes prostrate, caulescent herbs, with or usually without a well-defined basal rosette, white or reddish brown epidermis conspicuously exfoliating. **LEAVES** alternate to subfasciculate, subsessile or petiolate, blades linear to narrowly elliptic, margins entire to weakly denticulate; stipules absent. **INFL** a spike, nodding initially and becoming erect in fruit. **FLOWERS** actinomorphic; sepals 4, reflexed singly or in pairs; petals 4, yellow, sometimes with 1 to several red dots near base and fading red; stamens 8 in 2 unequal series, anthers versatile, pollen shed singly; ovary with 4 locules, stigma subentire, subcapitate to subglobose. **FRUIT** a sessile capsule, regularly but sometimes tardily loculicidal, straight to somewhat flexuous, subterete. **SEEDS** many, in 1 row per locule, narrowly obovoid to narrowly oblanceoloid, with the surface smooth, glossy. $2n = 14, 28, 42$; $x = 7$. Reproductive features: flowers diurnal; self-compatible or self-incompatible; autogamous (rarely cleistogamous) or outcrossing; pollinated by bees. As now reconfigured, *Camissonia* consists of 12 species (16 taxa). Endemic to western North America, with one species in South America from Peru to Chile and Argentina. This treatment departs significantly from the most recent monograph of *Camissonia* by Raven (1969), in that we have segregated from it the genera *Camissoniopsis*, *Chylismia*, *Chylismiella*, *Eremothera*, *Eulobus*, *Neoholmgrenia*, *Taraxia*, and *Tetrapteron*, based on molecular and morphological analysis (Levin et al. 2004; Wagner, Hoch, and Raven 2007). The more narrowly delimited *Camissonia* is morphologically defined by having capsules subterete; seeds in one row per locule, glossy, triangular in cross section; and plants flowering from the upper nodes only.

Camissonia parvula (Nutt. ex Torr. & A. Gray) P. H. Raven (Latin *parvus*, small or little) Slender annuals, ± strigillose, rarely with scattered spreading hairs, also usually sparsely glandular-puberulent, especially in the inflorescence. **STEMS**

1 or more, wiry, arising from the base, usually (3–) 15–30 cm long, with basal rosette absent. **LEAVES** 10–30 mm, linear, margin subentire. **INFL** nodding. **FLOWERS** with floral tube 1.3–2 mm long; sepals 1.5–2.5 mm long, petals 1.5–3.6 mm long, yellow, fading reddish orange. **FRUIT** 1.5–3 cm long, cylindrical, straight, usually swollen by seeds. **SEEDS** 0.7–0.8 mm, shiny, minutely pitted. $2n = 28$. [*Oenothera parvula* Nutt. ex Torr. & A. Gray] Sandy soils or dunes, usually in sagebrush shrubland to sagebrush-juniper woodland. ARIZ: Coc, Nav; NMEX: SJn; UTAH. 1130–2100 m (3600–6900'). Flowering: May–Jul. Widespread in the western United States from eastern Washington, Oregon, and California to Montana and Wyoming, western Colorado to northern Arizona, and San Juan County, New Mexico. Self-pollinating.

Chamerion (Raf.) Raf. ex Holub Fireweed, Willow Herb

(probably a contraction of *Chamaenerion*, a pre-Linnaean epithet for *Epilobium angustifolium* meaning dwarf oleander) Erect perennial herbs, pubescent (eglandular) to subglabrous, with shoots from woody caudex or spreading lateral roots. **STEMS** often clumped, simple or rarely branched. **LEAVES** spirally arranged, very rarely subopposite or subverticillate, often subcoriaceous; cauline blades linear to lanceolate, elliptic, or ovate; stipules absent. **INFL** a simple raceme or spike, rarely branched. **FLOWERS** 4-merous, slightly zygomorphic, the lower petals somewhat narrower than upper ones, strongly protandrous, opening on axis nearly perpendicular to stem axis; floral tube absent, producing nectar from raised disc at base of style and stamens; sepals green or reddish green, spreading; petals pink to rose-purple, rarely white, obcordate or obtrullate, entire; stamens 8 in 1 whorl, subequal, erect at onset of anthesis, later deflexed; filament bases slightly bulged to form chamber around nectary disc; anthers versatile; pollen blue or yellow, shed singly; ovary with 4 locules; style deflexed with unopened stigma during anther dehiscence, later straightening and stigma lobes opening, stigma deeply 4-lobed and revolute, receptive only on inner surfaces. **FRUIT** an elongate, slender, loculicidal capsule, terete to quadrangular, splitting to base with intact central column. **SEEDS** numerous, in 1 row per locule, narrowly clavate, with coma of silky hairs at chalazal end. $2n = 36, 72, 108$; $x = 18$. Flowers diurnal, hermaphroditic, protandrous, generally remaining open for 3–5+ days; self-compatible or rarely some populations of *C. angustifolium* self-incompatible; outcrossing and pollinated mainly by bees. This genus of eight species is divided into two sections, section *Rosmarinifolium*, found in Europe and the Caucasus region, and section *Chamerion*, found in eastern Asia, with two species widespread in the Northern Hemisphere. Although sometimes included within *Epilobium*, *Chamerion* forms a well-differentiated sister group to that genus, based on both morphological characters (lack of a floral tube; subequal stamens; zygomorphy involving the petals, stamens, and stigma; and leaves nearly always spirally arranged, rarely subopposite or verticillate) and molecular data. Two species are native to North America, and both are in our flora (Mosquin 1966; Small 1968; Baum, Sytsma, and Hoch 1994).

1. Bracts much smaller than cauline leaves, sublinear; leaves linear to lanceolate, with distinct submarginal vein; petioles 2–7 mm long; sepals 9–19 mm long; petals 14–25 mm long; seeds 1–1.3 mm long. ..... ***C. angustifolium***
1' Bracts not much smaller than cauline leaves, lanceolate; leaves narrowly ovate, elliptic to lance-elliptic, lacking submarginal vein; petioles 0–3 mm long; sepals 10–16 mm long; petals 10–32 mm long; seeds 1.2–2.1 mm long ..... ***C. latifolium***

Chamerion angustifolium (L.) Holub (Latin *angustus*, narrow, + *folius*, leaf; narrow-leaved) Fireweed. Perennial herbs, forming large clones by vigorous shoots from a woody caudex or from long lateral roots, glabrous to densely strigillose, especially on inflorescence. **STEMS** 30–200 cm tall. **LEAVES** on petioles 2–7 mm long; cauline blades (6–) 9–23 × (0.7–) 1.5–3.4 cm, linear to oblong- or elliptic-lanceolate, green, subglabrous to strigillose, on abaxial side and on abaxial midrib, margins ± denticulate, with prominent submarginal vein. **INFL** bracts much smaller than cauline leaves. **FLOWERS** nodding in bud, suberect at anthesis; sepals 9–19 mm long; petals 14–25 mm long, pale pink to purple or rarely white. **FRUIT** 5–9.5 cm long, densely appressed-canescent, pedicel 1–3 cm long. **SEEDS** 1–1.3 mm long, irregularly reticulate, with indistinct chalazal collar; coma dingy or white, 10–17 mm long, not easily detached. $2n = 72, 108$. Widespread, in open (often disturbed) habitats; common in our area. ARIZ: Apa. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr, SJn; UTAH. 1130–4200 m (3700–13700'). Flowering: Jul–Sep. Circumboreal, in North America from Greenland, Canada, and Alaska to North Carolina, Ohio, New Mexico, California, and Mexico. Four Corners material belongs to **subsp. *circumvagum*** (Mosquin) Hoch (wandering around). An extremely widespread species in boreal regions worldwide, this species survives and spreads quickly following fires, hence its common name. Used by many cultures as a potherb, and the young leaves are eaten as salads. The flowers are favored by bees, and fireweed honey is highly valued.

Chamerion latifolium (L.) Holub (Latin *latus*, broad, + *folius*, leaf; broad-leaved) Arctic fireweed. Perennial herbs, with thick, woody rhizomes and wiry mass of roots. **STEMS** 12–35 cm tall, glabrous below to sparsely or rarely densely

strigillose on upper stem and inflorescence. **LEAVES** on petioles 0–2 mm long; cauline blades 2–5 (–8) × 0.6–1.7 (–2.6) cm, narrowly ovate or elliptic to lance-elliptic, green or pale green, subglabrous or strigillose, especially on veins, margins subentire to remotely punctate-denticulate with 4 to 7 teeth, lacking submarginal vein. **INFL** bracts about 1/2 as long as cauline leaves, foliaceous. **FLOWERS** erect in bud, nodding at early anthesis; sepals 10–16 mm long; petals 10–24 (–32) mm long, rose-purple or pink. **FRUIT** 2.5–8 cm long, strigillose, pedicel 1.2–2.5 cm long. **SEEDS** 1.2–2.1 mm long, surface irregularly low-reticulate, with distinct chalazal collar; coma tawny or dingy, 9–15 mm, not easily detached. $2n = 36, 72$. Widely distributed but uncommon, usually on river gravel and talus slopes. Not common in our area. COLO: Hin, LPl, Min, RGr, SJn. 1130–3700 m (3700–12000'). Flowering: Jun–Aug. Circumpolar, circumboreal, in North America from Greenland and eastern Canada to Alaska and along mountain ranges south to Colorado and California.

Chylismia (Nutt. ex Torr. & A. Gray) Raim. Sun cup

(Greek *chul*, juicy, + *-ism*, suffix to form an adjective, in reference to the succulence of many species in this genus) Robust annual herbs, or sometimes perennial herbs with woody base, stems often slightly succulent, usually branched, usually with well-developed basal rosette. **LEAVES** alternate, long-petiolate, blades usually deeply pinnately divided or rarely simple, veins on lower surface usually with conspicuous brown oil cells, margins sharply dentate to entire; stipules absent. **INFL** an erect or nodding raceme. **FLOWERS** actinomorphic, subsessile to long-pedicellate; floral tube short (in ours) or long, funnelform; sepals 4, reflexed separately; petals 4, yellow or white (often fading orange-red) or lavender, if yellow usually strongly ultraviolet reflective, often with 1 or more red dots near base; stamens 8 in 2 subequal series (in ours) or rarely 4 in 1 series, anthers versatile, long-ciliate or glabrous, pollen shed singly (in ours) or occasionally in tetrads; ovary with 4 locules; stigma entire and capitate or rarely conical-peltate and ± 4-lobed. **FRUIT** a loculicidal capsule, long-pedicellate to subsessile, straight, subterete and clavate or linear, often spreading or deflexed. **SEEDS** numerous, in 2 rows per locule, lenticular to narrowly ovoid, with a more or less pronounced membranous margin when immature, narrowly ovoid when mature, finely lacunose. $2n = 14, 28$; $x = 7$. Flowers diurnal (in ours) or vespertine; self-incompatible or self-compatible; outcrossing diurnal species pollinated by bees, outcrossing vespertine species pollinated by small moths or hawkmoths, or autogamous. *Chylismia* is a genus of 16 species in two sections (ours all sect. *Chylismia*), distributed in desert regions of western North America (Raven 1969). This genus is clearly distinguished from other species formerly and currently included in *Camissonia* by having straight to arcuate (never twisted or coiled) capsules on distinct pedicels and seeds in 2 rows per locule. Molecular analyses (Levin et al. 2004) showed that *Chylismia* is not in a clade with other *Camissonia* species but rather is a separate clade sister to the strongly supported and realigned genus *Oenothera* (Wagner, Hoch, and Raven 2007).

1. Capsule 0.4–1.2 cm long; inflorescence with intricate, filiform branches, corymbiform ..... ***C. parryi***
1' Capsule 1–5 cm long; inflorescence not with filiform branches, usually unbranched or widely branching, but not forming an intricate corymbiform inflorescence ..... (2)

2. Inflorescence erect, elongating in flower and fruit; capsule 1.2–1.8 mm thick ..... ***C. walkeri***
2' Inflorescence nodding, elongating after anthesis; capsule 1.5–2.6 mm thick ..... (3)

3. Flowers outcrossing, petals 5.5–9 mm long, stigma exserted beyond anthers at anthesis ..... ***C. eastwoodiae***
3' Flowers self-pollinating, petals 1.5–5.5 mm long, stigma not exserted beyond anthers ..... ***C. scapoidea***

Chylismia eastwoodiae (Munz) W. L. Wagner & Hoch (for Alice Eastwood, 1859–1953, who worked on the flora of western North America, especially in California) Succulent annual, glabrous, glandular-puberulent, or villous below. **STEMS** 3–30 cm tall. **LEAVES** in a basal rosette, sometimes cauline, simple, blades oblanceolate to cordate, 0.8–7.5 cm × 0.4–3 cm, margins entire or denticulate. **INFL** nodding, elongating after anthesis. **FLOWERS** with floral tube 2–4.5 mm long, glandular-puberulent or strigose externally, villous near base within; sepals 3–8 mm long, without free tips in bud; petals 5.5–9 mm long, bright yellow with red dots near the base; stigma exserted beyond stamens at anthesis. **FRUIT** 1.8–4 cm long, 1.5–1.9 mm thick, curved, erect, pedicel spreading or slightly deflexed, 0.4–2.8 cm long. **SEEDS** 1.2–1.7 mm long. $2n = 14$. [*Camissonia eastwoodiae* (Munz) P. H. Raven; *Oenothera eastwoodiae* (Munz) P. H. Raven]. Barren clay flats or slopes, especially Mancos clay. ARIZ: Apa; COLO: Mon; UTAH. 1200–1800 m (3900–5900'). Flowering: Apr–Jun. Colorado Plateau endemic from Grand and Emery counties, Utah, to Mesa County, Colorado, south to San Juan County, Utah, east to Montrose County, Colorado. Outcrossing.

Chylismia parryi (S. Watson) Small (for Charles C. Parry, 1823–1890, English-born American botanist and explorer of western North America) Erect and often intricately branched annual herb 5–40 (–80) cm tall, densely villous with white hairs about 2 mm long. **LEAVES** in poorly defined basal rosette, mostly cauline, simple or very rarely with a few small

lateral segments, the blade or terminal segment ovate or cordate, 1.4–4 cm × 0.5–2.2 cm, margin weakly dentate, reduced upward. **INFL** nodding, mostly glabrous, with intricate, filiform branches, corymbiform. **FLOWERS** with floral tube 0.5–2 mm long, glabrous or villous externally and within; sepals 1.5–4 mm long, with clusters of light brown oil cells at tip, without free tips in bud; petals 2–7 mm long, bright yellow, often with red dots near base, sometimes fading rose; stigma well exserted beyond anthers at anthesis. **FRUIT** 0.4–1 (–1.2) cm long, 1.2–1.5 mm thick, pedicel 4–20 mm long, filiform, widely spreading or reflexed but capsule held erect. **SEEDS** 0.7–1.2 mm long, lenticular, with narrow cellular rim, few and crowded in 4-septate capsule so as to appear 1-rowed. $2n = 14$. [*Camissonia parryi* (S. Watson) P. H. Raven; *Oenothera parryi* S. Watson] Dry, open sites in clay, gypsiferous, or gravelly soils, slopes or flats, desert shrublands to juniper woodland. UTAH (only Road Canyon). 1800–1900 m (5900–6200'). Flowering May–Sep. Washington to Beaver counties, Utah; Clark County, Nevada; and Mohave to Coconino counties, Arizona; apparently disjunct to San Juan County, Utah. Outcrossing.

Chylismia scapoidea (Torr. & A. Gray) Small (Latin *scapus*, scape, in reference to the nearly leafless flowers and stems) Annual herb 3–45 cm tall. **STEMS** strigose, villous, or glandular-puberulent below. **LEAVES** mostly in a basal rosette, greatly reduced upward, the blade or terminal segment ovate, narrowly ovate, or elliptic, 1.7–6 × 1–3 cm, ± with several lateral smaller segments. **INFL** nodding, elongating after anthesis, glandular-puberulent, strigose, or subglabrous. **FLOWERS** with floral tube 1–4.5 mm long, glandular-puberulent, strigose, or glabrous externally, sparsely villous to glabrous within; sepals 1.2–5 mm long, ± free tip in bud; petals 1.5–5.5 mm long, bright yellow with fine red dots toward the base; stigma surrounded by 8 dimorphic stamens, the longer usually surpassing the shorter by 1–2 mm. **FRUIT** ascending, weakly clavate, curved to nearly straight, 1–5 cm long, 1.8–2.6 mm thick, the valves sometimes twisted at maturity; pedicel ascending or spreading, 4–20 mm long. **SEEDS** 1–2 mm long. $2n = 14, 28$. [*Camissonia scapoidea* (Torr. & A. Gray) P. H. Raven; *Oenothera scapoidea* Torr. & A. Gray] Dry, open sites in clay or sandy soils, slopes or flats, desert shrublands to juniper woodland. Flowering: May–Jun. Widespread in the western United States from eastern Oregon to western and central Wyoming and western Montana, south to northern Arizona and northwestern New Mexico. Self-pollinating.

1. Capsule 2.5–5 cm long; petals 1.5–2 mm long ..... **subsp. *macrocarpa***
1' Capsule (1–) 1.5–3 cm long; petals 1.7–5 mm long ..... **subsp. *scapoidea***

subsp. *macrocarpa* (P. H. Raven) W. L. Wagner & Hoch (large-fruited) **LEAVES** with ovate blades, often with cordate bases, 1.7–3.5 × 1–1.5 cm. **FLOWERS** with petals 1.5–2 mm long. **FRUIT** 2.5–5 cm long, stout, very large for size of plant, pedicel 2–8 (–14) mm long. [*Camissonia scapoidea* (Torr. & A. Gray) P. H. Raven subsp. *macrocarpa* (P. H. Raven) P. H. Raven] ARIZ: Apa, Nav. 1860–1955 m (6100–6415'). Northeastern Arizona.

subsp. *scapoidea* **LEAVES** with narrowly ovate to ovate blades, often with cordate bases, 2–5.5 × 1–3 cm. **FLOWERS** with petals 1.7–5 mm long. **FRUIT** (1–) 1.5–3 cm long; pedicel 5–20 mm long. $2n = 14, 28$. [*Camissonia scapoidea* (Torr. & A. Gray) P. H. Raven subsp. *scapoidea*]. COLO: Mon; NMEX: SJn; UTAH. 1485–1900 m (4880–6230'). Eastern Oregon to southwestern Montana and western Wyoming, south through Nevada to northern Arizona and northwestern New Mexico.

Chylismia walkeri A. Nelson (after zoologist Ernest Pillsbury Walker, 1891–1969) Slender annual herb 10–70 cm tall. **STEMS** villous below. **LEAVES** in a basal rosette, the cauline blades well developed or absent, the rosette leaves oblong, 3–22 cm long, terminal segment 1–5 × 0.5–3 cm, lateral segments ± developed, villous, often densely so on lower surface, with brown oil cells prominently lining veins below, often purple-dotted, margin doubly serrate. **INFL** erect, branching, elongating in flower and fruit, the buds individually drooping. **FLOWERS** with floral tube 0.5–1.3 mm long, glandular-puberulent or hispid externally, glabrous to sparsely villous within; sepals 1.2–2 mm long, often purple-dotted, with short free tips in bud; petals 1.2–3 mm long, bright yellow; stigma surrounded by anthers at anthesis. **FRUIT** 1.2–4.5 cm long, 1.2–1.8 mm thick, spreading or ascending, the valves often twisted at maturity, straight or slightly curved, pedicel 5–15 mm long. **SEEDS** 0.6–1.2 mm long. $2n = 14, 28$. [*Camissonia walkeri* (A. Nelson) P. H. Raven subsp. *walkeri*] Dry, open places in sandy, talus, or clay sites, in desert shrublands. ARIZ: Apa, Nav; COLO: Mon; NMEX: SJn; UTAH. 1100–1800 m (3600–5900'). Flowering: Apr–Jun. Nearly confined to the Colorado Plateau, from southeastern Utah, adjacent Colorado, and northern Arizona. Our material belongs to **subsp. *walkeri***. Self-pollinating.

Circaea L. Enchanter's Nightshade

(named for Circe, the enchantress of Greek mythology) Perennial herbs, producing rhizomes, often forming large colonies, sometimes terminated by tubers or with stolons. **LEAVES** opposite and decussate, becoming alternate

toward the inflorescence, petiolate; stipules setaceous or glandlike, deciduous or rarely persistent. **INFL** a simple or branched raceme. **FLOWERS** hermaphroditic (protogynous, one anther shedding pollen at anthesis, the other one with delayed dehiscence), bilaterally symmetrical, axillary, pedicellate, erect in bud, spreading to strongly reflexed in fruit; floral tube a mere constriction to very short, subcylindrical to funnelform, with a nectary wholly within and filling lower portion of floral tube or elongated and projecting above the opening of the floral tube as a fleshy, cylindrical or ringlike disc; sepals 2, usually white or pink, spreading or reflexed; petals 2, white or pink, notched at the apex or subentire; stamens 2, anthers versatile, pollen shed in monads; ovary with 2 locules, style filiform, stigma shortly bilobed. **FRUIT** an indehiscent capsule, deciduous with the pedicel at maturity, covered with stiff uncinate hairs. **SEEDS** 1 per locule, smooth, fusiform, or, more commonly, broadly clavoid to slenderly ovoid, adhering ± firmly to the inner ovary wall. $2n = 22$. Flowers diurnal; self-compatible; outcrossing, and pollinated by syrphid flies and small bees, or sometimes autogamous. *Circaea* consists of eight species (14 taxa) and a number of common hybrids, which occur throughout the Northern Hemisphere in moist, temperate, broad-leaved evergreen, deciduous, coniferous, or cool boreal forests at elevations from sea level to 5000 m. Unlike most genera of the Onagraceae, which are restricted to or are most diverse in the New World, *Circaea* is most diverse in eastern Asia, where 12 of the 14 taxa occur. The genus is strikingly distinct within Onagraceae by having 2-merous flowers and indehiscent fruits covered with hooked hairs (Boufford 1982; Boufford et al. 1990).

Circaea pacifica Asch. & Magnus (named for its distribution in western North America) Erect perennial herb, overwintering by small tubers at the end of slender rhizomes, lower parts retrorsely puberulent, the upper part and inflorescence glandular-puberulent. **STEMS** 1–4 dm tall. **LEAVES** thin, ovate to ovate-cordate, the lowermost smaller, 1.5–7 (–10) × 1–6 (–8) cm, margin subentire to sharply serrate, petioles 0.3–4 cm long. **INFL** a terminal raceme to 17 cm, and also with smaller lateral racemes 0.8–3 cm long, elongating after anthesis. **FLOWERS** with pedicel 0.7–3.5 mm long, elongating to 1.8–5 mm in fruit; floral tube 0.3–0.6 mm long; sepals 1–2.1 mm long; petals white or pink, 0.8–1.6 mm long, deeply notched up to 1/4 to 1/3 their length; stigma capitate to weakly 2-lobed. **FRUIT** 1.5–2.5 mm, clavate, 1-locular by abortion of other carpel. **SEEDS** 1. $2n = 22$. [*C. alpina* L. subsp. *pacifica* (Asch. & Magnus) P. H. Raven]. In forest and shrubland, usually in moist to wet areas along streams and marshy sites, often in partial shade. COLO: LPl, Min. 1500–2900 m (4900–9500′). Flowering: May–Sep. The species occurs in western North America from British Columbia southward and is increasingly disjunct to Arizona and New Mexico. Usually self-pollinating.

Epilobium L. Willow Herb

(Latin *epi*, upon, + *lobium*, pod; probably referring to the inferior ovary of the flower) Perennial herbs with rosettes, fleshy decussate turions, soboles, or stolons, rarely woody at base, or annual herbs with taproot. **STEMS** erect to ascending or decumbent, simple to well branched, strigillose, glandular, villous, or glabrous, often with raised strigillose lines descending from leaf axils. **LEAVES** opposite below inflorescence or only at base, alternate distally, subsessile to petiolate; cauline blades sublinear to lanceolate, oblong, or ovate, lower ones often obovate; stipules absent; bracteoles absent. **INFL** a spike, raceme, or panicle, or flowers solitary in leaf axils. **FLOWERS** actinomorphic or (*E. canum* only) zygomorphic, pedicellate to sessile; floral tube short or elongate, usually with ring of hairs or scales at mouth within, nectary at base of tube, parts distal to ovary deciduous after anthesis; sepals 4, green or rarely colored, erect or rarely spreading; petals 4, rose-purple to white, rarely cream-yellow, or rarely orange-red (then sepals and floral tube also colored), obcordate to obtrullate, apically notched; stamens 8 in 2 unequal series; anthers versatile, rarely basifixed, pollen shed in tetrads or rarely singly; ovary with 4 locules, stigma entire and clavate or capitate to deeply 4-lobed, the lobes commissural, receptive only on inner surfaces. **FRUIT** a loculicidal capsule, usually narrowly cylindrical, terete to sharply quadrangular, splitting to base with intact central column or rarely splitting only on upper 1/3 with central column disintegrating. **SEEDS** numerous or rarely 1–8 per locule, in 1 (2) rows per locule, with ± persistent coma of hairs, or some species (not in our area) lacking coma. $2n = 18, 20, 24, 26, 30, 32, 36, 38, 60$; $x = 18$. Reproductive features: Flowers diurnal, sometimes weakly protandrous, usually self-compatible, and remaining open for more than one day; primarily autogamous, but about 20 species modally outcrossing, pollinated by bees, flower flies, butterflies, or rarely (sect. *Zauschneria)* hummingbirds. *Epilobium* is the largest genus in the Onagraceae, with 165 species distributed on all continents except Antarctica. The genus currently is divided into seven sections, one of which has two subsections. *Epilobium* now includes the former segregate genera *Zauschneria* and *Boisduvalia*. The monophyly of this redefined genus *Epilobium* is very strongly supported by both molecular and morphological characters and forms a sister relationship with *Chamerion*.

1. Floral tube 19–24 mm long; calyx and corolla red-orange, slightly zygomorphic ..... ***E. canum***
1′ Floral tube 0.5–12 (–16) mm long; calyx ± green, corolla white to rose-purple, actinomorphic ..... (2)

2. Annual with taproot; lower stem peeling; leaves often folded on midrib and clustered at upper nodes ..... ***E. brachycarpum***
2' Perennials from caudex; lower stem not peeling; leaves flat, not clustered at nodes ..... (3)

3. Stems erect, with basal rosettes or fleshy turions ..... (4)
3' Stems ascending, clumped, or matted, with soboles or stolons from caudex ..... (6)

4. Leaf veins conspicuous; stems (3–) 10–120 (–190) cm tall, with leafy basal rosettes or fleshy turions; seed surface conspicuously ridged ..... ***E. ciliatum***
4' Leaf veins inconspicuous; stems 2–60 cm tall, with basal fleshy turions; seed surface rugose to papillose ..... (5)

5. Pedicel in fruit 0.8–3.8 cm long; inflorescence nodding in bud; leaves 0.5–4.7 cm long ..... ***E. halleanum***
5' Pedicel in fruit 0–0.5 cm long; inflorescence suberect; leaves 1–5.5 (–6) cm long ..... ***E. saximontanum***

6. Plants caespitose, 3–20 (–25) cm tall; leaves (5.5–) 8–25 mm long; fruit 1.7–4 (–5.6) cm long ..... ***E. anagallidifolium***
6' Plants loosely clumped, 10–50 cm tall; leaves 15–55 mm long; fruit 4–10 cm long ..... (7)

7. Pedicel in fruit 0.5–2 cm long; fruit 4–6.5 cm long; petals pink to rose-purple or rarely white; seeds 0.9–1.2 mm long, papillose ..... ***E. hornemannii***
7' Pedicel in fruit 2–4.5 cm long; fruit 5–10 cm long; petals white or rarely flushed pink; seeds 1.1–1.6 mm long, reticulate ..... ***E. lactiflorum***

Epilobium anagallidifolium Lam. (with leaves like the genus *Anagallis* [Myrsinaceae]) Alpine willow herb. Low, mat-forming, perennial herb, spreading by thin soboles up to 5 cm long with scattered small leaves. **STEMS** 3–20 (–25) cm tall, ascending basally, often sigmoidally bent or nodding, unbranched, subglabrous or with strigillose lines decurrent from margins of the petioles, rarely strigillose on upper stem with scattered glandular hairs. **LEAVES** often less than length of internodes, attenuate to petioles 1–6 mm long, or subsessile on inflorescence; cauline blades (5.5–) 8–25 × 2.5–10 mm wide, spatulate to oblong basally to elliptic at midstem to lanceolate or sublinear above, subglabrous, margins subentire above to scarcely denticulate below, lateral veins obscure. **INFL** few-flowered, nodding in bud to suberect later. **FLOWERS** erect or nodding; floral tube 0.6–1.2 mm long, glabrous within; sepals 1.5–5 mm long; petals (1.7–) 2.5–6.5 (–8) mm long, pink to rose-purple, rarely white, the notch 0.5–1.2 mm; stigma broadly clavate or subcapitate, at least the longer stamens shedding pollen directly onto stigma at anthesis. **FRUIT** 1.7–4 (–5.6) cm long, slender, often reddish purple, pedicel 0.5–3.5 (–6.8) cm long. **SEEDS** 0.7–1.4 mm long, narrowly obovoid, surface reticulate, sometimes smooth, with inconspicuous chalazal collar; coma dull white, persistent. $2n = 36$. [*E. alpinum* L., nom. rej.] Moist rockslides, talus slopes, and gravelly areas near streams or seeps in alpine and upper montane communities. COLO: Con, Hin, LPl, Min, Mon, RGr, SJn. (1300–) 2100–4100 m ([4300–] 6900–13500') Flowering: Jun–Sep. Circumboreal. Similar and related to *E. hornemannii* and *E. lactiflorum*, this differs from those species by consistently smaller stature, subentire leaves, and shorter capsules. Also similar to and confused with *E. clavatum* Trel., which occurs in high mountains north of our region and has a more robust habit, more pubescence, wider leaves, and larger seeds.

Epilobium brachycarpum C. Presl (Latin *brachy-*, short, + *-carpus*, fruit; short-fruited) Annual willow herb. Erect annual with taproot. **STEMS** single, 15–200 cm tall, terete, with exfoliating epidermis near base, often paniculate-branched, glabrous below, often strigillose and glandular above. **LEAVES** sparse, often much shorter than internodes, the lower ones often deciduous, opposite below, alternate and gradually reduced in size above, sometimes fascicled, with short axillary shoots of crowded leaves; cauline blades 1–5.5 × 0.1–0.8 cm, linear to linear-lanceolate or narrowly elliptic, often folded along midrib, subglabrous to sparsely strigillose, margins remotely denticulate, lateral veins very obscure, 2–4 on each side of midrib. **INFL** usually an open, indeterminate panicle, subglabrous to strigillose and often glandular. **FLOWERS** erect, the subtending bract sometimes partially fused to the pedicel; floral tube 1–12 (–16) mm long, with ring of hairs near mouth within; sepals 1.2–8 mm long; petals 1.5–15 (–20) mm long, white to deep rose-purple, the notch 0.5–6.5 mm; pollen shed singly or rarely as tetrads; stigma clavate or deeply 4-lobed. **FRUIT** 1.5–3.2 cm long, glabrous to usually slightly glandular-strigillose, pedicels 0.1–1.7 cm long. **SEEDS** 1.5–2.7 mm long, obovoid, surface low-papillose, with a constriction 0.5–0.7 mm from micropylar end, chalazal collar inconspicuous; coma white, easily detached. $2n = 24$. [*E. paniculatum* Nutt. ex Torr. & A. Gray and varieties] Dry woods, grasslands, roadsides. Relatively uncommon in our area. COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: RAr; UTAH. 2165–2745 m (7100–9000'). Flowering: Jun–Sep. Fruit: Jul–Oct. Widespread in western North America from northern Canada to Minnesota, south to California, Arizona, and New Mexico. Naturalized in South America and Europe.

Epilobium canum (Greene) P. H. Raven (Latin *canus*, grayish white, in reference to whitish hairs common on this plant) Perennial herbs or subshrubs, often clumped, with basal shoots from ± woody caudex. **STEMS** 15–40 cm tall, terete, well branched throughout to nearly simple, often scaly basally, grayish to green, generally moderately pubescent, with whitish, spreading-villous hairs and shorter, erect, glandular hairs. **LEAVES** mostly longer than internodes, often with a short axillary shoot and appearing fascicled, subsessile; cauline leaves 20–45 × 5–21 mm wide, ovate to broadly elliptic, moderately pubescent, margins prominently denticulate, veins prominent, 3–7 on each side of the midrib. **INFL** an erect raceme, mainly glandular-pubescent. **FLOWERS** erect to horizontal; zygomorphic, with upper petals slightly flared to right angle with calyx tube, lower ones parallel with it, red-orange or very rarely white; floral tube 19–24 mm long, the base slightly expanded, a ring of 8 irregular scales near base; sepals 4–8 mm long; petals 8–13 mm long, obcordate, the notch 2.2–3.2 mm; stigma 4-lobed, exserted beyond the stamens. **FRUIT** 1.5–2 cm long, glandular-pubescent, sometimes beaked, subsessile or on pedicels to 0.5 cm long. **SEEDS** 1.5–2.6 mm long, narrowly ovoid with constriction 0.6–0.8 mm from micropylar end, surface low-papillose, chalazal collar inconspicuous, coma white, easily detached. $2n = 30$. [*Zauschneria latifolia* (Hook.) Greene var. *garrettii* (A. Nelson) Hilend]. Sandy or rocky soils on steep slopes, rocky hillsides, roadsides, and dry streambeds. Uncommon in our area. UTAH. 1200–2900 (–3400) m (3900–9500′ [11200′]). Flowering: Jun–Oct. Endemic in the western United States, from northwestern Wyoming and southeastern Idaho to northern Nevada and montane areas of north-central to southwestern Utah, disjunct to the Abajo Mountains of San Juan County in southeastern Utah, and to southeastern California. Our material belongs to **subsp. *garrettii*** (A. Nelson) P. H. Raven (for A. O. Garrett, 1870–1948, botanist and teacher in Salt Lake City, Utah).

Epilobium ciliatum Raf. (Latin *ciliatus*, ciliate or hairy) Erect perennial herb perennating from leafy basal rosettes or fleshy underground shoots. **STEMS** (3–) 10–120 (–190) cm tall, well branched or simple, terete, lower stem subglabrous with raised lines of strigillose hairs decurrent from margins of the petioles, the upper stem strigillose and usually glandular, or very rarely sericeous. **LEAVES** subglabrous with strigillose margins, or sometimes strigillose throughout, sessile or on petiole 0.1–1 cm long; cauline blades (0.5–) 3–12 × (0.2–) 0.6–5.5 cm, mostly longer than internodes, very narrowly lanceolate to ovate or elliptic, the basal ones often obovate, margins densely serrulate, lateral veins conspicuous, 4–10 on each side of the midrib. **INFL** open or condensed, bracts very reduced or leafy. **FLOWERS** erect; floral tube 0.5–2.6 mm long, with ring of hairs at the mouth within; sepals 2–7.5 mm long, sometimes keeled; petals 2–14 mm long, white to pink or rose-purple, the notch 0.4–2.5 mm; stigma clavate or subcapitate, as long as or rarely exserted beyond anthers. **FRUIT** (1.5–) 3–10 cm long, strigillose and glandular, on pedicel (0–) 0.5–1.5 (–4) cm long. **SEEDS** (0.6–) 0.8–1.6 (–1.9) mm long, narrowly obovoid, surface with conspicuous longitudinal ridges of flattened papillae, rarely reticulate, chalazal collar sometimes conspicuous, coma white or dingy, easily detached, very rarely lacking. $2n = 36$.

1. Petals 2–6 (–9) mm long, white or pink; stem with basal rosettes; leaves generally lanceolate, reduced in open inflorescence ..... **subsp. *ciliatum***
1′ Petals 4.5–12 (–14) mm long, deep rose-purple to pink or rarely white; stem with fleshy turions; leaves generally ovate, not much reduced in condensed inflorescence ..... **subsp. *glandulosum***

subsp. *ciliatum* Variable, weedy, perennial herb, with basal rosettes of subobovate obtuse leaves 10–35 mm long, or rarely with fleshy turions. **STEMS** (3–) 5–120 (–190) cm tall, often well branched. **LEAVES** (0.5–) 3–12 × (0.2–) 0.6–3.7 cm, very narrowly lanceolate to narrowly ovate, or obovate near base, those on the inflorescence narrower. **INFL** open, bracts very reduced. **FLOWERS** with floral tube 0.5–1.8 × 0.9–3 mm long; sepals 2–6 × 0.7–1.6 mm long; petals 2–6 (–9) × 1.3–4 mm, white or sometimes pink; stigma rarely exserted beyond stamens. **FRUIT** (1.5–) 4–10 cm long, pedicel 0.2–1.5 (–4) cm long; frequently 200–500 capsules per plant. **SEEDS** (0.6–) 0.8–1.2 (–1.5) mm long, surface distinctly ridged, coma present or very rarely lacking. $2n = 36$. [*E. adenocaulon* Hausskn. and varieties]. Meadows, stream banks, roadsides, and other moist, often disturbed habitats in full sun to moderate shade. Very common in our area. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1125–4100 m (3700–13500′). Flowering: May–Nov. Very widespread in North America from northern Canada and Alaska to North Carolina, Ohio, Missouri, Texas, New Mexico, California, southern Mexico, and Guatemala; also widespread in South America, Australasia, Europe, and East Asia. This species was used as an analgesic for leg pains by Hopi and as a lotion or poultice of roots for muscular cramps by Navajo. *Epilobium ciliatum* is the most common species in the genus in North America and in our area.

subsp. *glandulosum* (Lehm.) Hoch & P. H. Raven (glandular) Perennial herb with basal turion of fleshy scales or leaves just below ground level, or rarely with leafy rosette. **STEMS** 20–110 (–170) cm tall, simple or sparsely branched.

LEAVES 3–10.5 (–15.5) × 1–4.5 (–5.5) cm, typically not much reduced in size onto a crowded inflorescence, narrowly ovate to ovate, rarely lanceolate, often clasping. **INFL** leafy, condensed. **FLOWERS** with floral tube 1–2.6 × 1.4–3.5 mm long; sepals 4.5–7.5 × 1.2–2 mm, sometimes keeled; petals 4.5–12 (–14) × 2.5–6.5 mm, deep rose-purple to pink or rarely white; stigma often exserted beyond stamens. **FRUIT** 4–8.5 cm long, pedicel 0.5–2.5 cm long, or rarely subsessile. **SEEDS** 1.1–1.6 (–1.9) mm long, surface distinctly ridged or rarely reticulate; coma present. $2n = 36$. [*E. brevistylum* Barbey]. Montane, subalpine, and maritime meadows, stream banks, roadsides, and other moist habitats. Uncommon in our area. COLO: Hin; NMEX: SJn. 1500–3400 m (5000–11200'). Flowering: Jun–Sep. Boreal North America from eastern Canada and Alaska to New England, Wisconsin, and south along the mountain ranges to New Mexico, northern Arizona, and California.

Epilobium halleanum Hausskn. (for Elihu Hall, 1820–1882, Colorado collector and farmer) Hall's willow herb. Slender perennial herbs with compact, underground, fleshy turions. **STEMS** 2–60 cm tall, rarely branched, subglabrous below inflorescence with raised lines of strigillose hairs decurrent from margins of the petioles, the upper stem strigillose and glandular, or subglabrous throughout. **LEAVES** subglabrous, with strigillose margins, petioles 0–0.2 cm; cauline blades 0.5–4.7 × 0.25–1.4 cm, mostly subequal to internodes but much reduced in upper pairs, ovate and obtuse basally to lanceolate or narrowly elliptic above, margins subentire below, often denticulate above, lateral veins inconspicuous, 3–6 on each side of midrib. **INFL** nodding in bud, erect later, often bracts very reduced in size. **FLOWERS** erect; floral tube 0.5–1.7 mm long, with a ring of hairs at the mouth within; sepals 1.2–2.8 mm long; petals 1.6–5.5 mm long, white, often fading pink, with apical notch 0.3–1.2 mm; stigma entire, clavate, rarely exserted beyond the anthers. **FRUIT** 2.4–6 cm long, slender, subglabrous to quite pubescent, on pedicel 0.8–3.8 cm long. **SEEDS** 1.1–1.6 mm long, attenuate, narrowly obovoid, surface papillose; coma white, easily detached. $2n = 36$. [*E. pringleanum* Hausskn.]. Shaded or open meadows, stream banks, and seasonally moist roadside areas. Uncommon in our area. COLO: Arc, Hin, LPl, Min, Mon; UTAH. 1200–3950 m (4000–13000'). Flowering: Jun–Sep. Western North America, from British Columbia to Saskatchewan in Canada south through the mountain ranges to California, Arizona, and New Mexico.

Epilobium hornemannii Rchb. (for Jens Hornemann, 1770–1841, Danish botanist) Hornemann's willow herb. Ascending perennial herb, often clumped, with short leafy soboles. **STEMS** 10–45 cm tall, simple or branched from base, subglabrous below inflorescence, except for raised strigillose lines decurrent from the margins of the petioles, inflorescence often ± densely strigillose and glandular. **LEAVES** glabrous except for strigillose hairs on margins, inflorescence often ± densely strigillose and glandular. **LEAVES** glabrous except for strigillose hairs on margins, reduced in size on inflorescence, on petioles 0.2–0.8 cm; cauline blades 1.5–5.5 × 0.7–2.9 cm, obovate below to broadly elliptic or narrowly ovate above, often lanceolate on inflorescence, margins denticulate, lateral veins inconspicuous, 3–5 on each side of midrib. **INFL** erect or sometimes nodding. **FLOWERS** erect; floral tube 1–2.2 mm long, glabrous within; sepals 3–6.6 mm long; petals 4–11 mm long, pink to rose-purple or rarely white, the notch 0.7–2.4 mm; stigma clavate to cylindrical, rarely exserted beyond anthers. **FRUIT** 4–6.5 cm long, slender, on pedicel 0.5–2 cm long. **SEEDS** 0.9–1.2 mm long, very narrowly obovoid, surface papillose, coma white to tawny, easily detached. $2n = 36$. Moist alpine and montane meadows, stream banks, and fine scree slopes. Proper habitat restricted in our area, but not uncommon. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 1500–3900 m (5000–12000'). Flowering: Jun–Aug. Nearly circumboreal, in North America from Greenland and northeastern Canada to Alaska, south to New England, Quebec, South Dakota, and along mountain ranges to New Mexico, Arizona, and California. Our material belongs to **subsp.** ***hornemannii***.

Epilobium lactiflorum Hausskn. (white- or milky-flowered) Suberect to ascending perennial herb, often clumped, with leafy soboles. **STEMS** 15–50 cm tall, simple or rarely branched from the base, subglabrous below the inflorescence except for densely strigillose lines decurrent from the margins of the petioles, more generally strigillose and glandular on the inflorescence. **LEAVES** glabrous except for strigillose hairs on margins, on petioles 0.3–1.2 cm; cauline blades 2–5.5 × 0.8–2.4 cm, elliptic or narrowly ovate to narrowly lanceolate, basal ones often spatulate or obovate, denticulate, lateral veins inconspicuous. **INFL** nodding in bud, then erect. **FLOWERS** erect, floral tube 1–2.2 mm long, glabrous within; sepals 3–5.5 mm long, frequently keeled; petals 4–8.8 mm long, white, rarely with red veins or flushed light pink after pollination, the notch 0.7–1.4 mm; stigma clavate, rarely subcapitate and indented at the top, rarely exserted beyond anthers. **FRUIT** 5–10 cm long, slender, pedicel 2–4.5 cm long. **SEEDS** 1.1–1.6 mm long, narrowly obovoid, surface reticulate (smooth) or rarely low-rugose, chalazal neck often conspicuous, coma white, easily detached. $2n = 36$. Montane to subalpine meadows, stream banks, moist ledges, gravel bars, and sometimes roadside ditches. Not uncommon in the proper habitats in our region. COLO: Arc, Hin, LPl, RGr, SJn; NMEX: RAr, SJn. 2590–3595 m (8500–11800'). Flowering: Jun–Sep. Nearly circumboreal; in North America, from eastern Canada to Alaska, south to New England and along the western mountain ranges to New Mexico, Arizona, and California.

Epilobium saximontanum Hausskn. (Latin *saxi-*, rocky, + *montanum*, mountain; Rocky Mountains) Erect perennial herbs, with fleshy underground turions. **STEMS** 4–55 cm tall, simple or well branched, terete, lower stem subglabrous, with raised lines of strigillose hairs decurrent from margins of the petioles, the upper part strigillose and usually glandular. **LEAVES** subglabrous, with strigillose margins, subsessile; cauline blades 10–55 (–60) × 4–20 (–25) mm, lanceolate or narrowly elliptic to ovate, the lower leaves often subobovate, margins faintly denticulate, lateral veins often inconspicuous, 3–6 on each side of the midrib. **INFL** erect. **FLOWERS** erect; floral tube 0.8–1.4 mm, with a ring of hairs at the mouth within; sepals 1.2–3.5 mm long; petals 2.2–5 (–7) mm long, white, infrequently pink to rose-purple, the notch 0.4–1.5 mm; stigma narrowly to broadly clavate or rarely subcapitate, the longer stamens shedding pollen onto stigma. **FRUIT** 2–5.5 (–7) cm long, subsessile or rarely on pedicels 0.1–0.5 cm long, held close to stem. **SEEDS** 1.1–1.6 (–1.8) mm long, very narrowly obovoid, surface rugose to papillose, chalazal collar conspicuous, coma white, easily detached. $2n = 36$. Meadows and stream banks, wet slaty cliffs, often seasonally moist, sometimes disturbed habitats. Relatively uncommon in our area. ARIZ: Apa; COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 1400–3500 m (4600–11500′) Flowering: Jul–Sep. Western and northern North America, from eastern Canada (sparse) to western Canada, south mainly in the southern and central Rocky Mountains from Idaho and Montana to Arizona and New Mexico, also barely reaching eastern California (White Mountains and east slope of the Sierra Nevada).

Gayophytum A. Juss. Ground Smoke

(named for Claude Gay, 1800–1873, a French botanist, author of flora of Chile, and the Greek word for plant, *phyton*). Annual herbs, glabrous to strigillose, sometimes villous. **STEMS** very slender, hairlike, usually erect, densely branched or simple, the epidermis usually exfoliating near the base. **LEAVES** alternate or the lowest subopposite, sessile or petiolate, blades narrowly lanceolate, margins entire; stipules absent. **INFL** a panicle or raceme. **FLOWERS** actinomorphic, pedicellate or sessile; floral tube very short, with nectary at base; sepals 4, green, reflexed individually or in pairs; petals 4, oblong, entire, white with 1 or 2 yellow areas at base, fading pink or red; stamens 8, in 2 unequal series, anthers ± basifixed, often adhering to stigma and shedding pollen directly on it; pollen shed singly; ovary 2-locular; stigma entire, globose to hemispheric, the surface wet and nonpapillate. **FRUIT** a loculicidal capsule, flattened or subterete and often constricted between seeds, with 4 valves, all becoming free or 2 remaining attached to septum. **SEEDS** many or 2–5 per locule, 1 row per locule, ovoid, glabrous or puberulent, without appendages. $2n = 14, 28$; $x = 7$. Flowers diurnal; self-compatible; one species (*G. heterozygum*) is a permanent translocation heterozygote (PTH); autogamous and sometimes cleistogamous, or some species outcrossing and pollinated by syrphid flies or bees. *Gayophytum* consists of nine species (10 taxa), most in western North America, with one species (*G. micranthum*) endemic to southern South America in Chile and Argentina, and one species (*G. humile*) on both continents (Lewis and Szweykowski 1964).

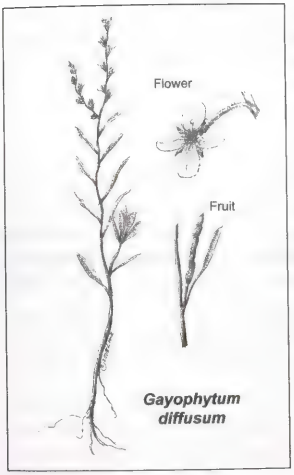
1. Seeds in each chamber crowded and overlapping ..... (2)
1′ Seeds in each chamber not crowded and overlapping ..... (3)

2. Petals 0.7–1.5 mm long; pedicel longer than capsule ..... ***G. ramosissimum***
2′ Petals 1.5–3 mm long; pedicel shorter than capsule ..... ***G. diffusum***

3. Plant branched throughout, usually with 2–8 nodes between branches; capsules usually not much constricted between seeds ..... ***G. decipiens***
3′ Plant branched ± at the base, always branched above at every node or with 1–2 nodes between branches; capsules constricted between the seeds ..... ***G. diffusum***

Gayophytum decipiens H. Lewis & Szweyk. (Latin for deceiving, used when a species closely resembles another) **STEMS** to 50 cm, glabrous or pubescent; branched throughout, usually with 2–8 nodes between branches; branching usually not dichotomous. **LEAVES** 1–3 cm long, somewhat smaller above; petiole 0–5 mm long. **FLOWERS** appearing 1–5 nodes from base and above; petals 1.1–1.8 mm long; stigma spherical, not exserted beyond stamens. **FRUIT** 6–15 mm long, ascending, longer than pedicel, not conspicuously flattened, somewhat constricted between seeds; pedicels 1–2 (–5) mm long. **SEEDS** all developing, 10–25, subopposite, glabrous or densely puberulent. $2n = 14$. Edges of meadows, moist sites along streams, occasionally on slopes. ARIZ: Apa; COLO: Arc, Hin, Min, SMg; NMEX: SJn; UTAH. 1200–2900 m (3900–9500′). Flowering: Jun–Aug. Widespread in the western United States from Washington to Montana, south to southern California, Arizona, and Colorado. Self-pollinating.

Gayophytum diffusum Torr. & A. Gray (Latin *diffusus*, diffuse, loosely spreading) **STEMS** to 60 cm, glabrous or pubescent; branched or unbranched near base, branched above, usually with 1 or 2 nodes between branches; upper branch-



ing dichotomous. **LEAVES** 1–6 cm long; petiole 0–10 mm long. **FLOWERS** appearing 1–20 nodes from base and above; petals 1.2–3 mm long; stigma spherical, not exserted beyond stamens. **FRUIT** 3–15 mm long, ascending, spreading, or reflexed, usually longer than pedicel, constricted between seeds; pedicels 2–11 (–15) mm long. **SEEDS** generally all maturing, 3–18, staggered, opposite or crowded and overlapping, glabrous or pubescent. $2n=28$. Occurring on slopes and flats, in dry to moist sites, in open pine forests, meadow margins, or sagebrush shrublands, occasionally in disturbed sites. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1130–3000 m (3600–9800'). Flowering: May–August. Extremely variable species widespread in western North America from British Columbia to western South Dakota, south to northern Baja California, Arizona, and New Mexico. Usually self-pollinating. Four Corners material belongs to **subsp. *parviflorum*** F. H. Lewis & Szweyk. (small-flowered).

Gayophytum ramosissimum Torr. & A. Gray (Latin for very much branched) **STEMS** to 50 cm, glabrous or nearly so; branched throughout, usually at every other node; branching dichotomous except near base. **LEAVES** 1–4 cm long, much reduced above; petiole 0–10 mm long. **FLOWERS** appearing 5–15 nodes from base and above; petals 0.7–1.5 mm long; stigma spherical, not exserted beyond stamens. **FRUIT** 3–9 mm long, shorter than pedicel, cylindrical; pedicels (3–) 5–12 mm long. **SEEDS** all developing, 10–30, crowded, overlapping, glabrous. $2n=14$. Occurring in open areas, often in sandy soils, usually in piñon-juniper woodland or sagebrush shrubland. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: RAr, SJn; UTAH. 1130–2500 m (3600–8200'). Flowering: May–Aug. Widespread in the western United States from Washington to Montana, south to eastern California, Arizona, and New Mexico. Self-pollinating. The Navajo used the plant in a lotion or poultice for cuts and abrasions. The whole plant was used to create the effect of a dream of a spider bite.

Oenothera L. Evening Primrose

Annual, biennial, or perennial herbs, caulescent or acaulescent; stems erect, ascending, or occasionally decumbent, epidermis green or whitish and exfoliating, with a taproot or fibrous roots, occasionally with shoots arising from spreading lateral roots, or with rhizomes. **LEAVES** alternate, usually with a basal rosette present before flowering but often absent later; stipules absent. **INFL** of solitary flowers in leaf axils, or when numerous forming spikes, racemes, or corymbs. **FLOWERS** actinomorphic or (in sect. *Gaura*) zygomorphic and all petals held in the upper 1/2 of the flower, buds erect or recurved; floral tube well developed; sepals (3) 4, reflexed individually, in pairs, or as a unit and reflexed to one side at anthesis, green to tinged or striped red or purple; petals (3) 4, yellow, purple, or white, rarely pink or red, sometimes with a red basal spot, or the base pale green to yellow, usually aging orange, purple, pale yellow, red, or white, usually obcordate or obovate, sometimes (sect. *Gaura*) clawed; stamens (6) 8, subequal or in 2 unequal series, anthers versatile; pollen shed singly; ovary with (3) 4 locules or septa incomplete (sect. *Gaura*) and 1-locular, ovules numerous or (sect. *Gaura*) reduced to 1–8; style glabrous or pubescent, stigma deeply divided into (3) 4 linear lobes or sometimes (sect. *Calylophus*) peltate, discoid to nearly square or obscurely and shallowly 4-lobed, entire surface of lobes receptive, subtended by a more or less conspicuous peltate indusium in early development, persisting to anthesis but often obscured by developing stigma. **FRUIT** a capsule, usually loculicidally dehiscent, sometimes tardily so, or rarely an indehiscent, nutlike capsule with hard, woody walls (sects. *Gauropsis*, *Gaura*), straight or curved, terete to angled or winged, ellipsoid to clavate, sometimes tapering to a sterile basal stipe, with (3) 4 locules or sometimes unilocular and the septa incomplete and fragile, not evident at maturity (sect. *Gaura*), sessile or sometimes with sterile basal stipe. **SEEDS** usually numerous, in 1 or 2 (3) rows or in clusters in each locule, or reduced to 1–4 per capsule (sect. *Gaura*). $2n = 14, 28, 42, 56$; $x = 7$. Flowers vespertine or diurnal, usually lasting less than one day; self-incompatible or self-compatible; outcrossing diurnal flowers pollinated by bees, small moths, butterflies, syrphid flies, or hummingbirds (two species), and vespertine flowers pollinated by hawkmoths or sometimes other small moths, rarely wasps or ant lions (sect. *Gaura*), or flowers autogamous and occasionally cleistogamous. As delimited here *Oenothera* is the second largest genus in the Onagraceae, with 145 species divided into 18 sections. The genus is widely distributed in temperate to subtropical areas of North and South America, with a few species in Central America, usually of open, often disturbed habitats, from sea level to nearly 5000 m; several species are widely naturalized. Based on convincing molecular analyses (Levin et al. 2003, 2004; Hoggard et al. 2004; Wagner, Hoch, and Raven 2007) and the consistent

synapomorphy of an indusiate style, *Oenothera* has been broadened by including in it *Gaura* (Raven and Gregory 1972) and *Stenosiphon* for the first time, and returning *Calylophus*, which Munz (1965) and others had included in *Oenothera*, but which Raven (1964) and Towner (1977) had excluded. *Gaura*, *Stenosiphon*, and to some degree *Calylophus* each have similar but slightly different variations on the basic lobed stigma. Several of our species have been recently revised (Dietrich and Wagner 1987; Dietrich, Wagner, and Raven 1997; Wagner, Stockhouse, and Klein 1985).

1. Stigma peltate (sect. *Calylophus*) ..... (2)
1' Stigma divided into 4 linear lobes, the lobes very short to long ..... (4)

2. Sepals with keeled midrib; stamens biseriate, the antisepalous set conspicuously longer; capsule tardily dehiscent, often slightly recurved (subsect. *Calylophus*) ..... ***O. berlandieri***
2' Sepals flat, without keeled midrib; stamens subequal; capsule promptly dehiscent, usually straight (subsect. *Salpingia*) ..... (3)

3. Plants subglabrous; stems sparingly to moderately branched, ascending to suberect ..... ***O. hartwegii***
3' Plants densely strigillose throughout, becoming ± silky-strigose, also sometimes glandular-puberulent on flower parts; stems caespitose, moderately branched, spreading-decumbent to ascending ..... ***O. lavandulifolia***

4. Capsule indehiscent; flowers zygomorphic, with all petals held in the upper 1/2 of the flower, or if nearly actinomorphic, then petals very short (0.15–0.3 cm long); floral tube 0.15–1 (–1.3) cm long; seeds 1–4 (sect. *Gaura*) ..... (5)
4' Capsule dehiscent, sometimes tardily so; flowers actinomorphic, petals usually longer than 1 cm |(0.5–)1–6.5 cm long|; floral tube (1–) 1.5–13.5 cm long; seeds numerous ..... (7)

5. Flowers nearly actinomorphic; petals 0.15–0.3 cm long; sepals 0.2–0.4 cm long; stigma surrounded by anthers at anthesis (self-pollinating) (subsect. *Schizocarya*) ..... ***O. curtiflora***
5' Flowers zygomorphic; petals 0.3–1.4 cm long; sepals 0.5–1.5 cm long; stigma exserted beyond anthers at anthesis (outcrossing) ..... (6)

6. Clumped perennial herbs from a thick taproot, often branching belowground with underground stems, or branching only at surface or not at all; underground stems often becoming horizontal or nearly so and giving rise to new plants; sepals 0.5–1 cm long; capsule pyramidal in upper 1/2, constricted sharply to a terete base (subsect. *Campogaura*) ..... ***O. suffrutescens***
6' Biennial herb from a fleshy taproot, stems several from the base; sepals 1.1–1.5 cm long; capsule ellipsoid, 4-angled (subsect. *Gaura*) ..... ***O. coloradensis***

7. Capsule winged; plants subacaulescent; petals yellow (sect. *Lavauxia* subsect. *Lavauxia*) ..... ***O. flava***
7' Capsule not winged, but sometimes valves tuberculate or ridged; plants caulescent, or if acaulescent, then petals white; petals yellow or white ..... (8)

8. Capsule valves tuberculate or with a nearly smooth to irregular undulate ridge; petals white (sect. *Pachylophus*) ..... ***O. cespitosa***
8' Capsule valves not tuberculate or ridged; petals yellow or white ..... (9)

9. Petals white, fading pink or lavender ..... (10)
9' Petals yellow, fading yellow to orange or red (sect. *Oenothera*) ..... (12)

10. Seeds in 1 row per locule; capsule 1.5–2.5 mm in diameter, straight or contorted, tapering to the apex (sect. *Anogra*) ..... ***O. pallida***
10' Seeds in 2 rows per locule; capsule 3–5 mm in diameter, straight or sometimes curved, not tapering throughout to the apex (sect. *Kleinia*) ..... (11)

11. Annual herb from a taproot; mouth of floral tube glabrous; leaves subentire or coarsely dentate or pinnatifid ..... ***O. albicaulis***
11' Perennial herb from a taproot and spreading lateral roots; mouth of floral tube densely pubescent with straight white hairs 1–2 mm long; leaves pinnatifid ..... ***O. coronopifolia***

12. Flower nodding; capsule cylindrical, 3–4 mm in diameter (subsect. *Nutantigemma*) ..... ***O. pubescens***
12' Flower erect; capsule lanceoloid, 4–9 mm in diameter (subsect. *Oenothera*) ..... (13)

13. Petals 0.7–2 cm long; sepals 0.9–1.8 cm long; stigma surrounded by anthers at anthesis; pollen about 50% fertile (2 sizes under 10× magnification, with abortive grains smaller) ..... ***O. villosa***
13′ Petals 2.5–6.5 cm long; sepals 2.5–5.5 cm long; stigma exserted beyond anthers at anthesis; pollen nearly all fertile (1 size under 10× magnification) ..... (14)

14. Floral tube 6–13.5 cm long ..... ***O. longissima***
14′ Floral tube 2.5–5 (–5.5) cm long ..... ***O. elata***

Oenothera albicaulis Pursh (Latin *albus*, white, + *caulis*, stem, in reference to the white stems) Annual herb with taproot and a ± persistent basal rosette, 0.5–3 dm tall, stems usually several from the base, the central one erect, others ascending, strigillose, and also sparsely hirtellous, at least in the upper parts, epidermis white to pink, not exfoliating. **LEAVES** 5–10 × 0.3–2.5 cm, the cauline blades smaller, margin subentire or coarsely dentate or pinnatifid. **INFL** of solitary flowers in leaf axils. **FLOWERS** nodding, actinomorphic; floral tube 1.5–3 cm, cylindrical; sepals 1.5–2.7 cm, without free tips in bud; petals (1.5–) 2–3.5 (–4) cm, white, fading pink; stigma with 4 linear lobes, exserted beyond anthers at anthesis. **FRUIT** 2–4 cm long, 3–4 mm in diameter, straight or sometimes curved, cylindrical, weakly 4-angled, dehiscent nearly to the base. **SEEDS** numerous in 2 rows per locule, about 1 mm long, ellipsoid, pitted-reticulate in rows. $2n = 14$. Dry, open sites, usually sandy flats and slopes. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1125–2000 m (3700–6600′). Flowering: Mar–Jun. Widespread in western North America from western North Dakota and eastern Montana, southward through the plains and Rocky Mountain region to Arizona, New Mexico, western Texas, and northern Sonora and Chihuahua, Mexico. Probably self-incompatible, outcrossing.

Oenothera berlandieri Walp. (for Jean Louis Berlandier, 1805–1851, Belgian explorer in North America) Sundrops, Texas primrose, Berlandier's sundrops. Perennial from a woody caudex, basal rosette usually not present at anthesis, stems usually several from the base, simple to moderately branched, erect to sprawling, 1–4 dm tall, glabrous to strigillose, especially in upper parts. **LEAVES** 1–4 cm × 0.1–0.6 cm wide, usually not much reduced on upper stem, margin subentire to serrate; fascicles of small leaves often present in nonflowering axils. **INFL** of solitary flowers in axils, but crowded at the stem apex. **FLOWERS** erect, actinomorphic; floral tube 0.5–2 cm long, funnelform; sepals 0.4–1.2, midrib raised or keeled, with free tips 0–2 mm long in bud; petals (0.6–) 1–2.5 cm long, yellow, fading yellow to orange or purple; stigma discoid to nearly square, exserted beyond anthers at anthesis. **FRUIT** 1–3.5 cm long, 1–2 mm in diameter, often slightly recurved, cylindrical, bluntly 4-angled, dehiscent nearly to the base, often tardily so. **SEEDS** numerous in 2 rows per locule, 1–1.8 mm long, sharply angled, truncate at apex. $2n = 14$. [*Calylophus berlandieri* Spach]. Occurring on sandy, gravelly, or limestone soils in dry areas. NMEX: SJn (near Bloomfield). 1650–1700 m (5400–5600′). Flowering: Apr–Jun. Occurs in the high plains from south-central Kansas, Texas panhandle, and scattered localities in eastern to central New Mexico and adjacent southeastern Colorado; with recently discovered disjunct populations near Bloomfield, San Juan County, New Mexico. Four Corners material belongs to **subsp.** ***berlandieri***. Self-incompatible, outcrossing.

Oenothera cespitosa Nutt. **CP** (growing in a tuft) Sand-lily, fragrant, gumbo, white, or tufted evening primrose. Acaulescent or caulescent perennial herbs with definite basal rosette, loosely caespitose to pulvinate from stout taproot, adventitious shoots sometimes produced from slender, spreading, lateral roots. **STEMS** 1 to many, branching from near the base, ascending or rarely nearly erect, 1–4 dm long, epidermis not exfoliating. **LEAVES** in a rosette, 2–25 (–33) × (0.3–) 1–4 (–6.5) cm, margin irregularly sinuate-dentate, pinnatifid, or subentire. **INFL** solitary in leaf axils. **FLOWERS** erect or sometimes nodding, actinomorphic; floral tube (2.8–) 4–14 (–16.5) cm long, cylindrical; sepals (1.5–) 2–4.5 (–5.4) cm long, without free tips in bud; petals (1.6–) 2–4.5 (–5.6) cm long; stigma with 4 linear lobes, exserted beyond stamens. **FRUIT** (1–) 1.5–5 (–6.8) cm long, 5–9 mm in diameter, cylindrical to lanceoloid or ellipsoid, straight to falcate or sigmoid, nearly symmetrical or strongly asymmetrical at base, tapering to a sterile beak 6–8 mm long, the free tips 0.2–4 mm long, erect to recurved, the valves with rows of distinct tubercles to sinuate or nearly smooth ridges along the margin, dehiscing 1/3–7/8 of their length, sessile to long-pedicellate. **SEEDS** numerous, in (1) 2 rows per locule, obovoid, with a seed collar sealed by a thin membrane, this flat or depressed into the raphial cavity, when depressed often splitting and becoming separated from the seed collar. $2n = 14, 28$. [*Oenothera caespitosa* Sims, orth. var.]. Local and colonial in open sites, slopes, and flats, rocky to sandy or clay soils, from grasslands, desert scrub, and piñon-juniper woodland to montane conifer forests. Widespread in western North America, from southeastern Washington and Oregon, to southern Alberta and Saskatchewan, south to southern California and east to North and South Dakota, west of the Missouri River, through much of Colorado, western two-thirds of New Mexico to west Texas and northern Chihuahua and Sonora, Mexico. Self-incompatible, outcrossing. Used by Navajos in various ceremonies,

as a dusting powder for chafing, and as a gynecological aid in a poultice of ground-up plants applied for prolapse of the uterus. Used by Hopi for sore eyes, toothache, and in a poultice of the root for swellings. The flowers were used by Hopi ceremonially as "white flower," and the ground plant used as a tobacco substitute. Often cultivated.

1. Capsule oblong-lanceoloid, abruptly contracted to a sterile beak, the dehiscing valves erect or incurved; floral tube 3.5–6 (–7) cm long, often recurved when young; plants shaggy-villous, sometimes densely so.... ....**subsp. *navajoensis***
1′ Capsule cylindrical to lance-cylindrical, tapering gradually to a sterile beak, the dehiscing valves spreading; floral tube (5–) 7–16 cm long, erect; plants hirsute or glabrous ....(2)

2. Capsule somewhat curved, the valves with smooth to irregular ridges; leaves mostly oblanceolate to spatulate, the margins dentate....**subsp. *macroglottis***
2′ Capsule straight, the valves with tuberculate ridges or rows of nearly distinct tubercles; leaves oblanceolate to lanceolate or elliptic; typically pinnately lobed ....**subsp. *marginata***

subsp. *macroglottis* (Rydb.) W. L. Wagner, Stockh. & W. M. Klein (large glottis, possibly referring to the hypanthium) Acaulescent or rarely with a short congested stem 0.4–0.8 dm tall, hirsute and glandular-puberulent, sometimes glabrous. **LEAVES** (6.8–) 9.5–23 (–32) × (1.3–) 2.4–4.5 (–6.5) cm, oblanceolate to spatulate, margin regularly to irregularly dentate, usually 1–3 small teeth 1–2 mm high between each pair of larger teeth 3–4 mm high, sometimes with a few larger lobes toward the base, rarely the blade coarsely and irregularly pinnately lobed. **FLOWERS** erect; floral tube (4.5–) 7.5–11 (–15.3) cm long; sepals (2.2–) 3–4.5 (–5) cm long; petals (2.1–) 3.5–4.3 (–5) cm long, fading pink to pale rose. **FRUIT** (1.7–) 2.5–4.5 (–5.6) cm long, lance-cylindrical to cylindrical, somewhat curved, terete, symmetrical throughout or occasionally asymmetrical at the base by being slightly flattened on one side, margins of valves with a conspicuous, nearly smooth to irregular undulate ridge about 1.5 mm high, the cross veins visible but not conspicuous, the valves spreading, pedicel 2–7 mm long. **SEEDS** 2.5–3 mm long. $2n = 14, 28$. [*O. cespitosa* Nutt. var. *macroglottis* (Rydb.) Cronquist]. Igneous soils, piñon-juniper to spruce-fir. COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; NMEX: RAr, SJn; UTAH. 1850–3000 m (6100–9800′). Flowering: late May–Sep. Endemic to the southern Rocky Mountains, from southern Wyoming through Colorado to southeastern Utah and central New Mexico.

subsp. *marginata* (Nutt. ex Hook. & Arn.) Munz (margined) Acaulescent or with congested stems 1–4 dm long, hirsute and glandular-puberulent. **LEAVES** (2.8–) 10–26 (–36) × (0.6–) 1–3 (–4.5) cm, oblanceolate to narrowly elliptic, rarely lanceolate, coarsely and irregularly pinnately lobed to dentate or rarely serrate, the lobes rarely cut more than halfway to the midrib, sometimes only coarsely erose. **FLOWERS** erect; floral tube (4.1–) 8–14 (–16.5) cm long; sepals (2.2–) 3.4–4.5 (–5.4) cm long; petals (2.4–) 3.5–5 (–6) cm long, fading pink to lavender. **FRUIT** (2.1–) 2.5–5 (–6.8) cm long, cylindrical to sometimes lance-cylindrical, rounded to obtusely quadrangular in cross section, straight and nearly symmetrical and obtuse to cuneate at the base, the margins of the valves with minute to conspicuous tubercles, these sometimes coalesced into a sinuate ridge, the tubercles 0.3–2 mm high, 1–4.5 mm apart, the cross veins prominent to obscure, the valves spreading, pedicel 0–40 (–55) mm long. **SEEDS** 2.2–3.4 mm long. $2n = 14$. Soils derived from igneous rock, sandstone, or limestone, rarely shale. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1200–2300 m (3900–7500′). Flowering: Apr–Jul. Widespread in western North America, from southeastern Washington and Idaho, south to southern California and western Colorado, western two-thirds of New Mexico to west Texas and northern Chihuahua and Sonora, Mexico.

subsp. *navajoensis* W. L. Wagner, Stockh. & W. M. Klein (of the Navajo) Caulescent and loosely caespitose or with stems 1–2.5 dm, crinkly villous, the hairs usually somewhat tangled and glandular-puberulent. **LEAVES** (3.5–) 4–13 (–16) × (0.7–) 1–3.2 cm, oblanceolate to rhombic-obovate, coarsely and irregularly dentate or serrate, sometimes pinnately lobed, often with several larger lobes toward the base of the blade. **FLOWERS** recurved or erect; floral tube (3.5–) 4–7 (–8) cm long; sepals 2.2–2.7 (–3.2) cm long; petals (2.5–) 2.8–3.2 (–3.4) cm long, fading pink to light rose. **FRUIT** 1.3–3.5 (–4) cm long, oblong-lanceoloid, quadrangular or sometimes only obscurely angled in cross section, straight, asymmetrical at the base, usually truncate to rarely obtuse, the margins of the valves with a low, sinuate ridge to 8–15 small, nearly distinct tubercles 0.4–1 mm high, 2–3 mm apart, the cross veins prominent, the valves remaining erect or incurved, pedicel flattened to rounded, 1–3 mm long. **SEEDS** 2.1–2.6 mm long. $2n = 14, 28$. [*O. cespitosa* Nutt. var. *navajoensis* (W. L. Wagner, Stockh. & W. M. Klein) Cronquist]. Clay and fine sand, desert shrubland to piñon-juniper. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: SJn; UTAH. 1130–1800 m (3600–5900′). Flowering: Apr–Jun. Nearly endemic to and widespread in the Colorado Plateau, from eastern Utah, western Colorado, northeastern Arizona, and northwestern New Mexico.

Oenothera coloradensis (Rydb.) W. L. Wagner & Hoch (origin in Colorado) Biennial herb with fleshy taproot and ± persistent basal rosette. **STEMS** several from the base, erect, 5–12.5 dm tall, unbranched to moderately branched, villous and strigillose, epidermis not exfoliating. **LEAVES** 2–13 × 1–4 cm, those in rosette larger, margin subentire to repand-denticulate. **INFL** a spike. **FLOWERS** erect, zygomorphic, with petals in the upper 1/2 and the style and stamens usually in the lower 1/2; floral tube 0.8–1.2 cm long, cylindrical; sepals 1.1–1.5 cm long, without free tips in bud; petals 1.1–1.4 cm long; stigma with 4 short linear lobes, exserted beyond anthers at anthesis. **FRUIT** 0.8–1.1 cm long, 2–5 mm in diameter, narrowly ellipsoid, sharply 4-angled, indehiscent. **SEEDS** 2–4, 2–3 mm long, yellowish to light brown. $2n = 14$. [*Gaura neomexicana* Wooton subsp. *neomexicana*]. Mountain meadows in openings in coniferous forest, growing in heavy soils. COLO: Arc, LPl; NMEX: RAr, SJn. 1800–2800 m (5900–9200'). Flowering: July–Sep. Occurs in two disjunct areas: Sacramento Mountains and Sierra Blanca, Lincoln, and Otero counties (south-central), New Mexico, and San Juan Mountains, near Pagosa Springs, and adjacent areas of New Mexico. Our material belongs to subsp. ***neomexicana*** (Wooton) W. L. Wagner & Hoch (of New Mexico). Self-compatible, outcrossing.

Oenothera coronopifolia Torr. & A. Gray (Latin *corona*, crown, + Greek *opi*, vision or looking like, + Latin *folia*, leaves, in reference to the pinnatifid leaves looking like the top margin of a crown) Perennial herb with a taproot and basal rosette not present by anthesis, forming spreading lateral roots. **STEMS** 1–6 dm tall, usually several, erect, usually branched, strigose and also hirsute, epidermis not exfoliating. **LEAVES** 2–7 × 0.5–1.5 cm, pinnatifid, sometimes the lower ones not as dissected. **INFL** of solitary flowers in leaf axils. **FLOWERS** nodding, actinomorphic; floral tube 1–2.5 cm, cylindrical, densely pubescent at the mouth with straight white hairs 1–2 mm long; sepals 1–2 cm, without free tips in bud; petals 1–1.5 (–2) cm, white, fading pink; stigma with 4 linear lobes, exserted beyond anthers at anthesis. **FRUIT** 1–2 cm long, 3–5 mm in diameter, straight, cylindrical, ± weakly 4-angled, dehiscent nearly to the base. **SEEDS** numerous in 2 rows per locule, about 2 mm long, ellipsoid, minutely tuberculate in rows. $2n = 14, 28$. Dry, open sites, grassy meadows, slopes, along drainages, in foothills and mountains. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1500–2800 m (4900–9200'). Flowering: Jun–Sep. Widespread in western North America from western North and South Dakota, eastern Wyoming, southward through the plains and Rocky Mountain region to northern Arizona, New Mexico, and eastern Kansas. Probably self-incompatible, outcrossing. Used by Navajo to improve the taste of tobacco, in a cold infusion of leaves for stomachache, and in a poultice of the plant or root for swellings.

Oenothera curtiflora W. L. Wagner & Hoch (Latin *curtus*, short, in reference to the short flower parts) Rank annual herb with heavy taproot and basal rosette, usually not present at anthesis. **STEMS** 3–20 (–30) dm tall, erect, usually unbranched or branching just below the inflorescence, densely glandular-puberulent and moderately long-villous, sometimes glabrate above. **LEAVES** 2–12.5 × 0.5–4 cm, those in rosette larger, narrowly elliptic to narrowly ovate, margin subentire to sinuate-dentate. **INFL** a dense spike, nodding toward apex. **FLOWERS** erect, nearly actinomorphic; floral tube 0.15–0.5 cm long, cylindrical; sepals 0.2–0.4 cm long, without free tips in bud; petals 0.15–0.3 cm, white, quickly fading pink; stigma with 4 very short, linear lobes, surrounded by anthers at anthesis. **FRUIT** 0.5–1.1 cm long, 1.5–3 mm in diameter, fusiform, reflexed at maturity, tapering ± abruptly toward the base, terete, weakly 4-angled in the upper 1/3, the angles becoming broad and rounded in lower part, indehiscent. **SEEDS** 3 or 4, 2–3 mm long. $2n = 14$. Occurring in disturbed places and along streams. [*G. parviflora* Douglas ex Lehm.; *Gaura mollis* James, nom. rej.]. Oregon south through Idaho, Nevada to Arizona, east to Indiana, and south to Sinaloa and Zacatecas, Mexico; naturalized in Australia, China, Japan, and southern South America. Self-compatible, self-pollinating. The root used by Hopi in a concoction for snakebite. Fresh leaves were used in a headband for cooling in hot weather. The Navajo used the leaves in an infusion for burns or inflammation, as a fumigant, and in a poultice applied postpartum to sore breasts. Sometimes the roots were added to meat stew, and the plant was also used to protect dancers during the fire dance of the Mountain Chant. Widely distributed throughout the western and central United States, from southern Washington and northeastern ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1125–2000 m (3700–6600'). Flowering: May–Aug.

Oenothera elata Kunth (Latin *elatus*, tall, in reference to the tall habit) Biennial to short-lived perennial herbs with a heavy taproot and ± persistent basal rosette. **STEMS** 3–25 dm tall, erect, 1 to several, ± branching above, exclusively densely strigillose with some longer appressed hairs or with spreading to erect hairs, some with red-pustulate bases, sometimes also sparsely to densely glandular-puberulent, especially in inflorescence. **LEAVES** 4–25 × 1–2.5 (–4) cm, rosette leaves often much larger, oblanceolate to narrowly lanceolate or very narrowly to narrowly elliptic, margins bluntly dentate or subentire, the teeth sometimes widely spaced, the lower ones sometimes sinuate-dentate toward the base. **INFL** a dense spike, erect. **FLOWERS** erect, actinomorphic; floral tube 2.5–5 (–5.5) cm long, cylindrical; sepals 2.7–5 cm long, with free sepal tips 2–7 mm long; petals 3–5.5 cm long, yellow, fading orange to yellow; stigma

with 4 linear lobes, exserted beyond anthers at anthesis. **FRUIT** 2–6.5 cm long, 4–7 mm in diameter, narrowly lanceoloid, bluntly 4-angled, dehiscent nearly to the base. **SEEDS** numerous, in 2 rows per locule, 1–1.9 mm long, angled, reticulate-pitted. $2n = 14$. [*O. hookeri* Torr. & A. Gray; *O. hookeri* Torr. & A. Gray var. *angustifolia* R. R. Gates; *O. venusta* Bartlett; *O. hewetti* Cockerell]. Occurring along streams, in meadows, or in disturbed sites. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1130–3000 m (3600–9800'). Flowering: Jun–Sep. Widespread in the western United States, from southern Washington south to California, east and south to Oklahoma, central and western Texas, and Durango, Coahuila, and Baja California in Mexico. Four Corners material belongs to **subsp**. ***hirsutissima*** (A. Gray ex S. Watson) W. Dietr. (shaggy or bristly). Self-compatible, mostly outcrossing. This species has an AA genomic constitution with plastome I (Dietrich, Wagner, and Raven 1997). Used by Navajo as a Plumeway emetic, as a cold remedy, and in a poultice of the root for swellings.

Oenothera flava (A. Nelson) Garrett (Latin *flavus*, yellow, in reference to the yellow petals) Subacaulescent, short-lived perennial or rarely annual herb, with a fleshy taproot and 1 to several densely leafy rosettes. **LEAVES** (3.4–) 6–30 (–36) × (0.5–) 1.5–5 (–7) cm, oblanceolate to linear-oblong in outline, often somewhat fleshy, appearing glabrous but sparsely to moderately strigillose mostly along the margins and sometimes the veins, often mixed with more evenly distributed glandular hairs, margin irregularly and coarsely pinnately lobed, the lobes variable in size and shape from linear to deltoid to coarsely dentate or subentire, sometimes with a large, terminal, lanceolate lobe. **INFL** of solitary flowers from the rosette. **FLOWERS** erect, actinomorphic; floral tube (2.4–) 4–20 (–26.5) cm long, cylindrical; sepals (0.8–) 1.1–4 (–4.2) cm long, with free tips 1–5 (–12) mm long in bud; petals (0.7–) 1–4.5 (–5) cm long, bright yellow, sometimes paler in smaller-flowered plants, fading orange, drying purple; stigma with 4 linear lobes, exserted beyond or surrounded by anthers at anthesis. **FRUIT** (1–) 2–3.5 (–4.3) cm long, 4–8 mm in diameter, narrowly ovoid or ellipsoid, sometimes lanceoloid, becoming hard and leathery in age, the surface usually conspicuously reticulate-veined, gradually constricted to a short beak, the valves with a narrowly oblong wing (2–) 3–5 (–6) mm wide, confined to the upper 2/3 of the capsule, dehiscing 1/4–1/2 the length of the capsule. **SEEDS** numerous in 2 rows per locule, 1.8–2.2 (–2.6) mm long, asymmetrically cuneiform, the surface minutely beaded, narrowly winged at the distal end and along 1 adaxial margin, the raphe raised and conspicuous. $2n = 14$. [*O. taraxacoides* (Wooton & Standl.) Munz]. Local and colonial, sometimes common in wettish (at least seasonally moist) clay to gravelly sand of swales, desiccating flats and ponds, montane meadows, margins of permanent or seasonal watercourses, and disturbed sites. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1130–3000 m (3600–9800'). Flowering: May–Sep. Widespread in western North America from southern Alberta and southwestern Saskatchewan, across the plains of Montana and North Dakota, south to northern Nebraska, throughout the Rocky Mountain region to the Sierra Madre Occidental and adjacent lowlands to Durango, Mexico, and also from disjunct areas: 1) Yakima County, Washington, 2) eastern Oregon and northeastern California, 3) mountains of Nevada, and 4) Jalisco, Guanajuato, and Hidalgo, Mexico. Wagner (1986) recognized two subspecies within the self-compatible *O. flava*. Subsequent study of the complex variation pattern suggests that larger-flowered plants in the southern part of the range evolved on numerous occasions in areas where longer-tongued hawkmoths occur; therefore this species is no longer subdivided. Our plants are the small-flowered (petals 0.7–2.5 cm long), mostly self-pollinating type. The ashes of capsules are used by Navajo for burns, and a poultice of the root for swellings, internal injuries, and throat trouble.

Oenothera hartwegii Benth. (for Karl T. Hartweg, 1812–1871, a German botanist who collected plants in Colombia, Ecuador, Guatemala, Mexico, and California in the United States for the London Horticultural Society) Perennial from a usually stout, woody caudex, basal rosette not present. **STEMS** several to many, sparingly to moderately branched, ascending to suberect, 1.4–4 dm tall, glabrous to sparsely glandular-puberulent. **LEAVES** 1–5 × 0.1–1 cm, linear to oblanceolate to lanceolate, margin subentire, occasionally slightly undulate, rarely with small axillary leaves present. **INFL** of solitary flowers in the upper axils. **FLOWERS** erect, actinomorphic; floral tube 3–5 cm long, narrowly funnelform; sepals 0.9–2.8 cm long, midrib not keeled, with free tips 0.5–3 mm long; petals 1–3 cm long, yellow, usually fading red to purple; stigma peltate, exserted beyond anthers at anthesis. **FRUIT** 1–4 cm long, 2–3 mm in diameter, cylindrical and often narrowed at each end, obtusely 4-angled, dehiscent nearly to the base. **SEEDS** numerous, in 2 rows per locule, 1–1.5 mm long, narrowly obovoid and somewhat angled, surface smooth. $2n = 14$. [*Calylophus hartwegii* (Benth.) P. H. Raven subsp. *fendleri* (A. Gray) Towner & P. H. Raven; *Oenothera fendleri* A. Gray]. Occasional on clay or gravelly soils, sometimes calcareous soils. NMEX: RAr. 1130–2200 m (3600–7215'). Flowering: May–Aug. Occurring from eastern Arizona, on the Mogollon Rim, through much of New Mexico, to western parts of Oklahoma and Texas, and rare in eastern Chihuahua, Mexico. Our material belongs to **subsp**. ***fendleri*** (A. Gray) W. L. Wagner & Hoch (for Augustus Fendler, 1813–1883, botanical collector in New Mexico, Venezuela, Panama, and Trinidad). Self-incompatible, outcrossing. Used as a drug by the Navajo, especially for internal bleeding. Often cultivated.

Oenothera lavandulifolia Torr. & A. Gray (Latin *lavandulus*, lavender, perhaps in reference to the color of the faded petals) Perennial from a stout, woody caudex, basal rosette not present. **STEMS** caespitose, several to many, moderately branched, spreading-decumbent to ascending, 0.4–2 (–3) dm tall, densely strigillose throughout, becoming ± silky-strigose, also sometimes glandular-puberulent on flower parts. **LEAVES** 0.6–5 × 0.1–0.6 cm, linear to narrowly lanceolate or narrowly oblanceolate, margin subentire, occasionally slightly undulate, infrequently revolute, sometimes with small axillary leaves present. **INFL** of solitary flowers in the upper axils. **FLOWERS** erect, actinomorphic, floral tube 2.5–8 cm long, narrowly funnelform; sepals 0.8–2 cm long, midrib not keeled, with free tips 0.3–3 mm long, petals 1.2–2.8 cm long, yellow, usually fading pink to pale purple; stigma peltate, exserted beyond anthers at anthesis. **FRUIT** 0.6–2.5 cm long, 1–3 mm in diameter, cylindrical and often narrowed at each end, obtusely 4-angled, dehiscent nearly to the base. **SEEDS** numerous, in 2 rows per locule, 1.5–2.5 mm long, narrowly obovoid and somewhat angled, surface smooth. $2n = 14$. [*Calylophus lavandulifolius* (Torr. & A. Gray) P. H. Raven]. Dry, open sites, in sandy to clay soils. ARIZ: Apa, Nav; COLO: Dol, Mon; NMEX: RAr, SJn; UTAH. 1300–2500 m (4300–8200'). Flowering: May–Aug. Occurring from eastern Nevada through Arizona north of the Mogollon Rim, Utah to southeastern Wyoming, adjacent Nebraska, south to western Texas. Self-incompatible, outcrossing. The capsules used by the Apache as a cooked food for children (although identification may refer to *O. hartwegii* as well as or instead of this species).

Oenothera longissima Rydb. (Latin *longissimus*, extremely long, in reference to the much longer floral tubes in this species relative to closely related species) Bridges evening primrose. Biennial to short-lived perennial herbs from a heavy taproot, basal rosette present at anthesis. **STEMS** erect, 1 to several, ± branching above, 6–30 dm tall, densely strigillose or also with spreading to erect hairs, some with red-pustulate bases, and sometimes also sparsely to densely glandular-puberulent, especially in inflorescence. **LEAVES** 5–25 × 0.8–2.5 cm, rosette leaves often much larger, oblanceolate to narrowly lanceolate or very narrowly to narrowly elliptic, margins bluntly dentate or subentire, the teeth sometimes widely spaced, the lower ones sometimes sinuate-dentate toward the base. **INFL** an erect, dense spike. **FLOWERS** erect, actinomorphic; floral tube 6–13.5 cm long, cylindrical; sepals 2.5–5.5 cm long, with free sepal tips 2–6 mm long; petals 2.8–6.5 cm long, yellow, fading orange to yellow; stigma with 4 linear lobes, exserted beyond anthers at anthesis. **FRUIT** 2.5–5.5 cm long, 4–9 mm in diameter, narrowly lanceoloid, bluntly 4-angled, dehiscent nearly to the base. **SEEDS** numerous, in 2 rows per locule, 1–1.9 mm long, angled, reticulate-pitted. $2n = 14$. Occurring in at least seasonally moist sites, usually in sandy or sandy loam soils, sometimes alkaline soils. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: SJn; UTAH. 1125–2800 m (3700–9200'). Flowering: Jul–Sep. Ranging from southwestern Colorado, southern Utah, and northwestern New Mexico to eastern Nevada and southern California. Self-compatible, mostly outcrossing.

Oenothera pallida Lindl. (Latin *pallidus*, pale, in reference to often pale leaves) Pale evening primrose. Perennial herbs with taproot and lateral roots, basal rosette ± present at anthesis, or annual herbs from a taproot. **STEMS** 1 to several from the base, 10–50 cm tall, ± branching from near the base, central one erect, subglabrous to sparsely to densely strigillose, also often spreading-villous, at least in the upper parts, epidermis white, exfoliating. **LEAVES** 1–6 × 0.3–1.5 cm, the cauline ones smaller, coarsely dentate or sinuate-dentate. **INFL** of solitary flowers in the upper leaf axils. **FLOWERS** nodding, actinomorphic; floral tube 1.5–3.5 cm long, cylindrical; sepals 1.3–2.5 cm long, with free tips in bud 0.5–2 mm long; petals (1–) 1.5–2.5 (–3) cm long, white, yellow at the base, fading pink or lavender; stigma with 4 linear lobes, exserted beyond anthers at anthesis. **FRUIT** 1.5–6 cm long, 1.5–2.5 mm in diameter, straight or contorted, cylindrical, tapering to the apex, weakly 4-angled, the angles blunt, dehiscent nearly to the base. **SEEDS** in 1 row per locule, 1.5–2.2 mm long, narrowly obovoid, minutely pitted at high magnification. $2n = 14$. Dry, open sites, usually sandy flats and slopes. Widespread in western North America from Washington and northern Oregon to southwestern South Dakota, southward through the plains and Rocky Mountain region to Arizona, New Mexico, western Texas, and northern Chihuahua, Mexico. Self-incompatible, outcrossing. A poorly understood species currently subdivided into four subspecies (Wagner, Hoch, and Raven 2007) that differ largely in aspect, leaf division, capsule configuration, and pubescence. Used by Navajo as a dusting powder for venereal disease sores; a poultice of the plant used for spider bites, and a decoction of roots and leaves for snakebite. It was also used as a Beadway emetic, and as a treatment for livestock with colic. An infusion of the plant was used for kidney disease and for sore throats. Used by the Hopi ceremonially as the white flower associated with the northeast direction.

1. Plants subglabrous, rarely with a few long hairs; leaves often denticulate; capsule usually contorted ....**subsp. *pallida***
1'. Plants sparsely to densely strigillose, also often spreading-villous; leaves usually sinuate-dentate; capsule straight, curved, or contorted ..... (2)

2. Upper part of plant conspicuously villous; capsule usually contorted; plant not branching much above base; short-lived perennial to annual herbs ..... **subsp. *trichocalyx***
2' Upper plant sparsely to densely strigillose or subglabrous; capsule usually straight or curved; plants usually much-branched above the base; perennial, often becoming a subshrub ..... **subsp. *runcinata***

subsp. *pallida* Perennial herbs from taproot and spreading lateral roots, basal rosette not present at anthesis. **STEMS** usually branched throughout, subglabrous, rarely with a few long hairs or sparsely strigillose. **LEAVES** subentire to denticulate, rarely more deeply divided. **FLOWER** sepals 1.2–1.8 cm long, usually red-tinged. **FRUIT** usually contorted. In sandy soils or on dunes, often in disturbed areas, sometimes in alkaline soils. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1125–2000 m (3700–6600′). Flowering: May–Sep. Widespread in the Intermountain region of the western United States, from Washington and northern Oregon, through Idaho to central Wyoming, Utah, southern Nevada, northern Arizona, and northwestern New Mexico.

subsp. *runcinata* (Engelm.) Munz & W. M. Klein (pinnatifid or coarsely serrate, in reference to the leaves) Perennial herbs from a taproot and spreading lateral roots, basal rosette not present at anthesis. **STEMS** usually branched throughout, often becoming a subshrub, usually densely strigillose throughout, rarely sparsely so. **LEAVES** sinuate-dentate, rarely some of them merely dentate. **FLOWER** sepals 1–2.5 cm long, usually gray-green. **FRUIT** usually straight or somewhat curved. In sandy soils or on dunes, often in disturbed areas, sometimes in alkaline soils. COLO: Mon; NMEX: McK, SJn. 1130–2300 m (3600–7500′). Flowering: May–Sep.

subsp. *trichocalyx* (Nutt. ex Torr. & A. Gray) Munz & W. M. Klein (hairy calyx) Annual or short-lived perennial from a taproot and sometimes from spreading lateral roots, basal rosette usually present at anthesis. **STEMS** 1 to several from the base, relatively little-branched above, villous, especially in the upper parts, also usually sparsely to moderately strigillose. **LEAVES** sinuate-dentate, rarely some of them merely dentate. **FLOWER** sepals 1–1.8 cm long, often red-tinged. **FRUIT** usually contorted. In sandy, silty, or rocky soils. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: SJn; UTAH (Glen Canyon area). 1125–2400 m (3700–7900′). Flowering: May–Jun. Occurring from Wyoming to the eastern half of Utah, western half of Colorado, and San Juan County, New Mexico.

Oenothera pubescens Willd. ex Spreng. (becoming hairy) South American evening primrose. Erect, annual or biennial herbs, basal rosette present at anthesis. **STEMS** erect, simple or with a branched main stem and arcuate to procumbent lateral branches arising from rosette, 0.5–5 (–8) dm tall, densely to sparsely strigillose, sometimes in upper part also villous and glandular-puberulent. **LEAVES** 2–8 × 0.5–2.5 cm, rosette leaves often much larger, narrowly oblanceolate, narrowly oblong to lanceolate or narrowly elliptic, pinnately lobed to subentire. **INFL** of solitary flowers in the upper axils, the apex often curved. **FLOWERS** nodding, actinomorphic; floral tube 1.5–5 cm long, cylindrical; sepals 0.5–2.5 cm long, with free tips 0.1–1 mm long; petals 0.5–2.5 (–3.5) cm long, yellow, fading red; pollen about 50% (–70%) fertile; stigma divided into 4 linear lobes, surrounded by anthers at anthesis. **FRUIT** 2–4.5 cm long, 2–3 mm in diameter, cylindrical, dehiscent nearly to the base. **SEEDS** numerous, in 2 rows per locule, 0.9–1.5 mm long, broadly ellipsoid to subglobose, the surface pitted. $2n = 14$ (ring of 14 in meiosis). Scattered to locally common in open sites in montane communities. NMEX: McK. 2600–2800 m (8500–9200′). Flowering: May–Aug. Widespread from Arizona and New Mexico, south to Guatemala, and Andes of South America in Colombia, Ecuador, and Peru. Self-compatible, self-pollinating, permanent structural heterozygote species.

Oenothera suffrutescens (Ser.) W. L. Wagner & Hoch (Latin, slightly woody, in reference to the woody base) Scarlet gaura, scarlet beeblossom, linda tarde wild honeysuckle, butterfly weed. Clumped perennial herb from a thick taproot, often with branching underground stems, or branching only at the surface or not at all; underground stems often becoming horizontal or nearly so and giving rise to new plants, basal rosette not present at anthesis. **STEMS** 1–12 dm tall, varying from densely branched at the base but little above, to strict and scarcely branched at the base but densely so above, densely strigillose, also often with long spreading hairs near the base, to subglabrous. **LEAVES** 0.7–6.5 × 0.1–1.5 cm, linear to narrowly elliptic, margin entire to remotely and coarsely serrate. **INFL** of erect, dense spikes. **FLOWERS** erect, zygomorphic; floral tube 0.4–1.3 cm long, cylindrical; sepals 0.5–1 cm long, without free tips in bud; petals 0.3–0.8 mm long, white, fading to orange-red to deep maroon; stigma with 4 linear lobes, exserted beyond anthers at anthesis. **FRUIT** 0.4–0.9 cm long, 1–3 mm in diameter, pyramidal in upper 1/2, constricted sharply to a terete base, indehiscent. **SEEDS** (1–) 3–4, 1.5–3 mm long, 1–1.5 mm thick, light to reddish brown. $2n = 14, 28, 42, 56$. [*Gaura coccinea* Pursh]. Occurring in sandy to sometimes clay soils, often calcareous, in desert shrublands to piñon-juniper woodland, disturbed areas, meadows, slopes. ARIZ: Apa; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1130–2000 m (3600–6600′). Flowering: May–Aug. Widespread in North America from southern British Columbia to southern Manitoba, south across the plains to western parts of Minnesota, Iowa, and Missouri, and south in the Rocky

Mountain region from Montana, eastern Wyoming, all but northwestern Colorado, northern and eastern Arizona, southern Nevada, southern California, and through much of Mexico in the Sierra Madre Occidental, Sierra Madre Oriental, and the transvolcanic belt. Self-incompatible, outcrossing. The Navajo used a cold infusion of this plant to settle children's upset stomachs after vomiting. Also as a "life medicine," especially for serious internal injuries.

Oenothera villosa Thunb. (Latin *villosus*, villous, in reference to the spreading hairs often present) Biennial evening primrose. Biennial to short-lived perennial herbs from a heavy taproot, basal rosette present at anthesis. **STEMS** erect, 1 to several, ± branching above, 3–20 dm tall, with a mix of 3 hair types, densely strigillose, spreading-villous, some hairs with red-pustulate bases, and sparsely to densely glandular-puberulent, especially in inflorescence. **LEAVES** 5–20 × 1–2.5 (–4) cm, rosette leaves often larger, oblanceolate to narrowly lanceolate or narrowly elliptic, margins bluntly dentate or subentire, the teeth sometimes widely spaced, the lower ones sometimes sinuate-dentate toward the base. **INFL** a dense spike, erect. **FLOWERS** erect, actinomorphic; floral tube 2.3–4.4 cm long; sepals 0.9–1.8 cm long, with free sepal tips 0.5–3 mm long; petals 0.7–2 cm long, yellow, fading orange to yellow; pollen about 50% (–70%) fertile; stigma with 4 linear lobes, surrounded by anthers at anthesis. **FRUIT** 2–4.3 cm long, 4–7 mm in diameter, narrowly lanceoloid, bluntly 4-angled, dehiscent nearly to the base. **SEEDS** numerous, in 2 rows per locule, 1–2 mm long, angled, surface reticulate-pitted. $2n = 14$ (ring of 14 in meiosis). Occurring primarily in open, often wet sites such as streamsides, fields, roadsides. COLO: Arc, Hin, LPl, Min, Mon, Sln; NMEX: McK, RAr, Sln; UTAH. 1130–3150 m (3600–10300'). Flowering: Jun–Aug. Occurring widely in western North America from southern British Columbia eastward to Manitoba, south to northern California, the northern half of Nevada, Utah, Arizona, and New Mexico, and east to Minnesota and Nebraska; possibly naturalized around the Great Lakes. Self-compatible, self-pollinating, permanent structural heterozygote species. Our material is **subsp. *strigosa*** (Rydb.) W. Dietr. & P. H. Raven. Dried leaves were smoked with tobacco for good luck in hunting by the Navajo. Also used in a cold root infusion for "deer infection."

ORCHIDACEAE Juss. ORCHID FAMILY

Linda Mary Reeves

(*orchis*, testis, referring to the underground tubers of some European species) Mostly perennial herbs in ours, vines or shrublike; most epiphytic, but ours terrestrial, sometimes mycotrophic with reduced chlorophyll content and reduced or absent leaves; most completely or partially dependent, at least as seeds and young protocorms, upon mycorrhizal fungi for nutrition. Underground parts rhizomes or tuberous; roots fleshy and few, often with a velamen; sometimes difficult to differentiate histologically from underground stems. **STEMS** commonly erect, sheathed in bracts in most, pendent to prostrate in others, often swollen and succulent, forming a pseudobulb. **LEAVES** if present, often sheathing, cordate, elliptic, ovate, obovate, lanceolate, or linear, occasionally terete, commonly somewhat fleshy and succulent. **INFL** solitary, spicate, corymbose, or racemose. **FLOWERS** complete, mostly perfect, few imperfect (such as *Cycnoches*), minute and inconspicuous to showy, usually zygomorphic and resupinate (twisting 180°), sometimes hypersupinate (twisting more than 180°); perianth of 6 tepals, or more commonly 3 sepals and 3 petals, the lowermost or uppermost often expanded into a lip (labellum) or pouch and often uniquely colored or ornamented with calli, nectar guidelines, or other unusual structures such as dangling wax secretions or pseudostamens, often containing nectaries and a spur or nectar bowl, many without nectaries or food reward for pollinators; stamen(s) completely fused to the style and stigma, or nearly so, to form the column; fertile anthers 3, 2, or 1 (typical in ours); pollen mealy, or more usually agglutinated into 1 or more pollinia, often in derived genera connected to gluelike viscin adherents and/or elastic fibers (the caudicle or stipe) and/or a sticky pad derived from the rostellum (the viscidium), the whole forming the pollinarium or, in some genera, hemipollinaria; pollinia not in pollinaria in some genera, adhering to pollinator by gluelike secretions of the column; stigma forming a sticky concave surface on the lower side of the column tip; ovary inferior, 3-carpellate; ovules numerous, with parietal placentation. **FRUIT** in most a dry, dehiscent capsule, sometimes uncommon. **SEEDS** mostly minute, occasionally substantial as in *Vanilla*, numerous, often as many as a million per fruit, mostly airborne, dry, lacking endosperm or obvious differentiation of the embryo. Seedling initially an undifferentiated callus, later often with poorly differentiated embryonic tissues. Chromosome number various. About 25,000–35,000 species distributed worldwide in almost all habitats with moisture, but most abundant in the tropics. Terrestrial orchids, especially, often inhabiting slightly or infrequently disturbed sites. Pollination systems commonly spectacular and varied; autogamy present in many genera. *Piperia unalascensis* (Spreng.) Rydb. should be searched for in our area as it has been found in Linda Canyon of the Zuni Mountains (McKinley County), New Mexico, as well as in Dolores County, Colorado. Both locations are just outside the study area. *Vanilla planifolia*, source of vanilla "bean" and flavoring; pseudobulbs of some genera (*Ophrys* or *Orchis*) eaten as food in Asia (salepi dondurma, "fox testicle ice cream" in Turkey) or dried and powdered for thickening stews. *Cattleya*, *Laelia*, *Dendrobium*, *Oncidium*, *Cymbidium*, *Phalaenopsis*, *Vanda*, and other genera

important in the cut-flower and horticulture trade with many multigeneric hybrids produced (Luer 1975; Dressler 1981, 1993; Coleman 2002).

1. Leaves present at flowering ..... (2)
1' Leaves absent at flowering ..... (9)

2. Fertile anthers 2; flowers large and showy, yellow and brown or, rarely, yellow and green ..... ***Cypripedium***
2' Fertile anther 1; flowers various ..... (3)

3. Leaf mainly solitary, basal, slightly to somewhat plicate; flowers showy, pink and white with yellow pseudostamens on saccate lip ..... ***Calypso***
3' Leaves various, usually more than 1, flowers various, no pseudostamens, lip not or only slightly saccate ..... (4)

4. Leaves primarily basal, not well distributed along the stem; if present, small, few, and bractlike ..... (5)
4' Leaves distributed along the stem; if more than 2, longer basally, and smaller, more frequent, and leaflike bracts approaching the inflorescence ..... (6)

5. Lip not deeply saccate; inflorescence a congested spiral; leaves entirely green ..... ***Spiranthes***
5' Lip deeply saccate; inflorescence not a spiral, but a 1-sided, spikelike raceme; leaves often marked conspicuously with white or silver-white ..... ***Goodyera***

6. Leaves 2, opposite, borne more or less midstem, ovate or cordate, margins often undulate; flowers small, green, dull purple, or purplish green ..... ***Listera***
6' Leaves more than 2, alternate, often mostly basal, linear, straplike, or tending toward plicate; flowers various ..... (7)

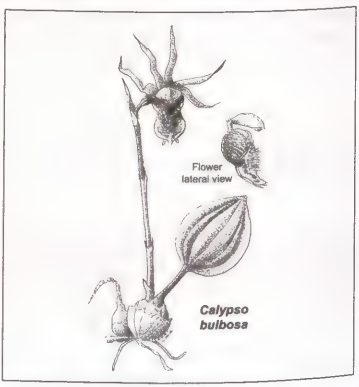
7. Leaves lanceolate, tending toward plicate; flowers solitary or in a loose raceme; slightly showy, spreading, flower color variable but often green, pinkish, and yellow ..... ***Epipactis***
7' Leaves straplike, elliptic or linear, not plicate; inflorescence generally a congested raceme, occasionally loose; flowers not showy, greenish or rarely white ..... (8)

8. Lip apex divided into 2 lobes; flowers green, often with pinkish bases of sepals, petals, lip, and/or column ..... ***Coeloglossum***
8' Lip apex not divided obviously into 2 lobes; flowers green, yellowish green, purplish, or white, often with blue-green markings near base of lip ..... ***Platanthera***

9. Flower solitary, pink, rarely white; lip saccate, with a tuft of yellow hairs, 2-horned ..... ***Calypso***
9' Flower not solitary, brownish purple or dull yellowish, lip not or weakly 3-lobed or auricled toward the base, often many-spotted or -striped ..... ***Corallorhiza***

Calypso Salisb. Fairy Slipper

(Greek *Kalypso*, a secluded sea nymph in Homer's *Odyssey*) Small, low herbs, usually with a single plicate leaf and short flowering stalk with 2–4 small sheathing bracts; small globose corm, coralloid rhizome; roots somewhat fleshy, closely intertwined with fungal mycelia. **LEAF** often absent or fading during flowering; glabrous, petiole often long; blade ovate, plicate. **FLOWERS** solitary, showy, deep pink or pinkish lavender, occasionally white or light pink, fragrant, scent reminiscent of lilac (*Syringa*), often appearing while snow is still on the ground; sepals and lateral petals usually deep pink, linear, erect-spreading; lip saccate, 2-horned, pink, white, mottled and/or striped maroon, bladelike, dilated lamina covering the lip apex, often with prominent tufted yellow hairs (pseudostamens); column suborbicular or ellipsoid, broad, deep pink; pollinaria with 2 pairs of pollinia, flat, waxy, with flat, elliptic, detachable viscidium. **FRUIT** erect when mature, ellipsoid, about 2–3 cm long × 1–2 cm wide, often few and uncommon to rare. Prefers sites of occasional disturbance with downed and well-rotted timber, usually fir, on north-facing banks. Colonies eventually die out as dense conifer shade develops. One circumboreal species.

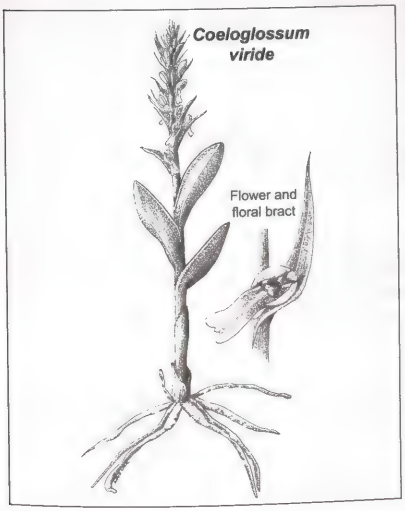


Calypso bulbosa (L.) Oakes (bulblike corm) Fairy slipper, Venus' slipper, calypso, hider-of-the-north, deer head orchid. [*C. americana* R. Br.;

C. borealis (Sw.) Salisb.]. $2n = 28$. Cool, mossy, coniferous forests, usually under fir with considerable wood and bark debris, occasionally under ponderosa pine in logging road ruts or other moist humus soils. Also found at edges of conifer or aspen woods. Populations tend to be large in areas of previous logging, dying out as disturbed forest matures and dense shade develops. Locally common in Chuska and San Juan Mountains. ARIZ: Apa. COLO: Arc, Hin, LPl, Min, RGr, SJn; NMEX: SJn; UTAH. 2405–3200 m (7900–10500'). Flowering: May–Jul. Fruit: Aug–Oct. Northeastern United States; Canada and Alaska south along the higher elevations of the Rockies to Arizona and New Mexico, also northern Europe and Asia. Ours is **var. *americana*** (R. Br.) Luer. The flower attracts pollinators with bright yellow pseudostamens on the lip, mimicking a pollen food source. Pollinators are evidently young, naïve queen bees of *Bombus*, *Pyrobombus*, and *Psithyrus*.

Coeloglossum Hartm. Frog Orchid

(Greek *koilos*, hollow, + *glossa*, tongue) Plant an erect herb, leafy, glabrous, 5–30 cm tall, roots annual, forked, fleshy, tuberoid. **LEAVES** 2–5, elliptic, obtuse, elliptic-obovate to oblanceolate, to 18 cm long, 7 cm wide, clasping, medium green. **INFL** a congested, spicate raceme. **FLOWERS** arising from a leaflike floral bract; sepals and lateral petals green, often with pinkish bases, conniving over a broad column with diverging anther cells; the lip white or whitish green, often with pale pink or peach coloring at the base, apex 2-lobed, a small, central, toothlike prominence between the lobes; pollinia 2, granular, each in 1 hemipollinarium, viscidium with a small, thin membrane. **FRUIT** an elongate, semierect capsule, 1–1.5 cm long, 0.5 cm wide; few to many. $2n = 40$. One circumboreal, polymorphic species with two varieties. Recent DNA evidence indicates that this clade is embedded in the Asian and European genus *Dactylorhiza*, but its morphological features and lack of genetic divergence are coherent enough to warrant keeping it as a separate genus (Pridgeon et al. 1997). It has been placed previously in the genera *Habenaria* and *Platanthera*, possibly due to convergently evolved features (small, green, translucent flowers) as a response to similar pollinators. Pollinators reported to include two wasp species (*Tenthredopsis* sp., *Cryptus* sp.), a mosquito (*Tipula* sp.), and a beetle (*Cantharis* sp.).



Coeloglossum viride (L.) Hartm. (green) American frog orchid, long-bracted orchid, satyr rein orchid. [*Orchis virescens* Muhl.; *Habenaria virescens* (Muhl.) Spreng.; *Platanthera viridis* (L.) Lindl. var. *bracteata* (Muhl. ex Willd.) Rchb. f.]. Rare, but often misidentified. In our area at high elevations in shady, rich, moist, cool woods under conifers, willow and aspen, or forest edge. COLO: Hin, LPl, Mon, SJn. 2470–3505 m (8100–11500'). Flowering: Jun–Jul. Fruit: Aug–Sep. Alaska through Canada and the northeast coast of Asia to the northeastern United States and Canada, south to the southern Appalachians, west to North Dakota and Washington, south to Arizona (White Mountains) and New Mexico. Ours are assigned to **var. *virescens*** (Muhl. ex Willd.) Luer.

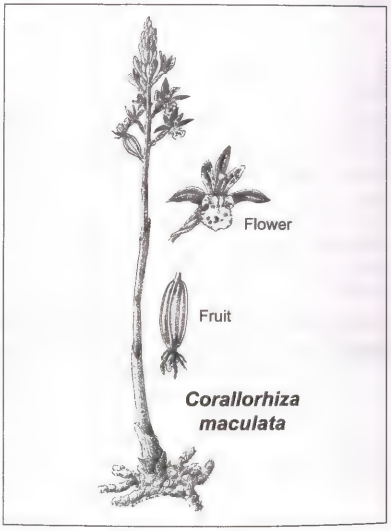
Corallorhiza Gagnebin Coralroot

(Greek *korallion*, coral, + *rhiza*, root) Erect herbs with reduced or absent chlorophyll arising from coralloid rhizomes, mycotrophic, roots absent, usually in association with decaying conifer wood and mycorrhizal fungi. **LEAVES** absent or reduced to small bracts. **INFL** a loose to congested raceme, flowers few to many. **FLOWERS** slightly showy to inconspicuous; perianth parts brownish or yellowish, often cupped, sometimes spreading; lip often, but not always, with brightly colored spots or stripes, margin often undulate, base occasionally auricled; column sometimes with 1 or more spots, compressed; pollinia waxy, 4, connected by a single elastic band to a detachable viscidium in a pollinarium. **FRUIT** ovoid to ellipsoid, pendent, often remaining conspicuously through the winter and following growing season, few to many per flower stalk. About 11 primarily temperate and boreal species of North and Central America, one species circumboreal.

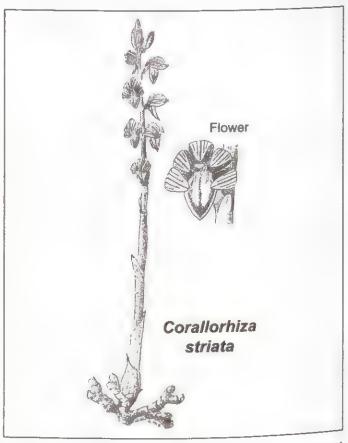
1. Perianth parts with reddish brown, purple, or yellowish brown stripes; lip striped ..... ***C. striata***
1' Perianth parts not prominently striped, lip often spotted ..... (2)

2. Lip with obvious lateral lobes on each side; often robust stalk; common ..... ***C. maculata***
2' Lip without lateral lobes or lobes small and/or shallow; slender stalk; uncommon or rare ..... (3)

3. Lip with shallow lobes, not spotted; flower somewhat spreading; plant pale yellowish green; rare ..... ***C. trifida***
3' Lip without lobes, spotted; flower not spreading, plant bluish to dark reddish brown; uncommon .. ***C. wisteriana***

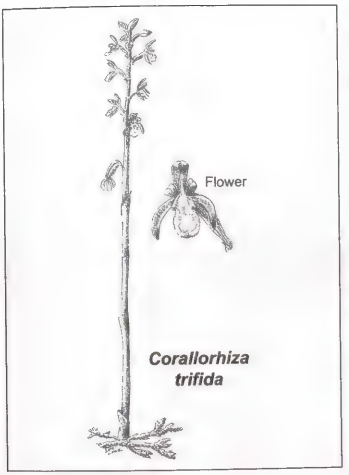


Corallorhiza maculata (Raf.) Raf. (spotted) Spotted coralroot, large coralroot, many-flowered coralroot. Plant reddish or brownish purple, 10–60 cm tall, without leaves, but with many sheathing bracts. **INFL** a bracteate raceme, 5–35 flowers. **FLOWERS** often spreading at anthesis; sepals and petals reddish to brownish purple, linear to oblanceolate, with lateral petals slightly shorter than sepals; lip white or buff, often with dark red, bright pink, or purple spots, 2 prominent, basal, auriculate, lateral lobes, curved, with apex acute, over 1 mm in length, the margin of the main lip lobe often undulate. **FRUIT** sometimes numerous, 2.5 cm long, 1 cm wide. $2n = 42$. [*C. multiflora* Nutt.; *C. hortensis* Suksd.]. Moist and dry, dappled shady to full sun montane locations under conifers or aspens, often at old logging sites. Locally common to abundant. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn; UTAH. 2285–3350 m (7500–11000'). Flowering: late May–Aug. Fruit: Jun–Nov. Alaska to Nova Scotia, south to California and east to Texas, North Carolina; Mexico and Guatemala. The species is reported to be epiparasitic in a relationship with mycorrhizal fungi and adjacent trees. Varied color forms occur in our area, especially forma *flavida*, which lacks the purplish pigments and appears as a striking lemon-yellow, with the lip a pure white. This form is often collected and confused with *C. trifida*, which is much smaller, more delicate, yellowish green, and rare in our area. The species is reported to be pollinated by dance flies (*Empis*) or is self-pollinated.



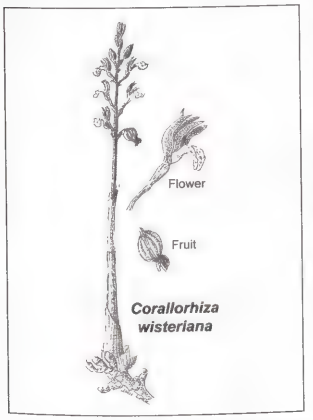
Corallorhiza striata Lindl. (striped) Striped coralroot. Plant reddish, brownish, reddish purple, or yellowish brown, 8–40 cm tall, without leaves, but stem often with sheathing bracts. **INFL** a bracteate raceme of usually 2–25 flowers. **FLOWERS** buff to yellowish, often not conspicuous in ours, perianth parts with 3–5 pinkish or purplish to brownish stripes; sepals lanceolate; lateral petals shorter and ovate to obovate; lip elliptic, entire, white to yellowish, strongly to weakly (in ours) striate, stripes merging at the apex, base with 2 median calli. **FRUIT** less frequent per stalk than *C. maculata*, 2 cm long, 1 cm wide, ellipsoidal, pendent. $2n = 42$. [*C. macraei* A. Gray; *Neottia striata* (Lindl.) Kuntze]. Moist to dry, dappled shade to full sun in montane conifer and aspen woods with decayed wood, often at old logging sites. Uncommon to rare, but often overlooked. ARIZ: Apa; COLO: Hin, LPl, Mon; NMEX: RAr. 2405–2590 m (7900–8500'). Flowering: late May–Jul. Fruit: Jun–Sep. British Columbia to Quebec and Michigan, south throughout the western United States to Texas and northern Mexico. Ours, washed out and dull in color, are **var. *vreelandii*** (Rydb.) L. O. Williams, although var. *striata*, which is more colorful and striped, occurs close to the study area in Colorado and central New Mexico. Most likely pollinated by parasitic wasps, *Coccygonemus pedalis*, although ours more likely pollinated by flies. The species may also be self-pollinating.

Corallorhiza trifida Châtel. (triparted, referring to the lip, which is not, in fact, trifid, but instead weakly trilobed) Yellow coralroot, early coralroot, northern coralroot. Plant yellowish, greenish, slender, to 25 cm tall or smaller in our area, without leaves, but often with sheathing bracts. **INFL** a terminal raceme, lax, with up to 20 flowers, usually fewer



in our area. **FLOWER** sepals and lateral petals lanceolate, oblanceolate to falcate, tan to brownish or greenish; lip white, often with a few purplish spots, with 2 small side lobes, margin undulate. **FRUIT** pendent, ellipsoid, about 1 cm long, 0.5 cm wide. Moist, shady locations under conifers. Rare, known only from Little Sand Creek, Colorado, but probably more frequent in high, moist locations. COLO: Hin. 2710 m (8900'). Flowering: Jun. Fruit: Jun–Jul. Circumboreal, south along the Rocky Mountains to New Mexico; Illinois and Missouri. The only *Corallorhiza* species found in Asia and Europe. Although mycotrophic, may not rely as much on fungi for nutrition due to pale green color of entire plant. Reported to be autogamous or pollinated by syrphid flies.

Corallorhiza wisteriana Conrad (named for Charles J. Wister, who first collected the species) Spring coralroot, early coralroot, Wister's coralroot. Plant similar to and easily confused with *C. maculata*, but smaller (less than 25 cm tall), with thinner stems; dark, dull, inky purple rather than reddish purple flowers; earlier blooming. **INFL** a terminal raceme, loosely flowered with up to 25 flowers per scape. **FLOWERS** not spreading; sepals and lateral petals forming a hood over the lip; lip margin undulate to crenulate, without lateral lobes, white, often with 1 to many pale pink to purple spots. **FRUIT** slightly smaller and more globose than those of *C. maculata*, often low frequency per plant, 1 cm long, 0.6 cm wide. $2n = 42$. [*C. ochroleuca* Rydb.]. Moist to dry, dappled shady montane locations in areas with decaying conifer wood, often in association with *C. maculata* and *C. striata*. Uncommon to locally common. ARIZ: Apa; COLO: Arc, Hin, Min, SJn. 2405–2865 m (7900–9400'). Flowering: early May–Jun. Fruit: Jun–Sep. Montana south to Arizona, New Mexico, and western Mexico, South Dakota and southeastern United States. The author has observed flowers visited by small, black bees, although it has been suggested that some populations are self-pollinating.



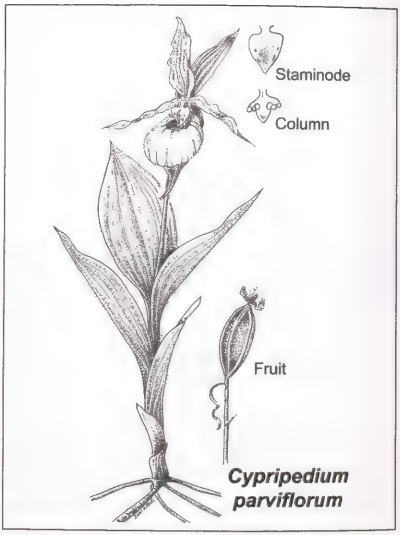
Cypripedium L. Lady's Slipper, Moccasin Flower

[Greek *Kypris*, Cypriot one (Aphrodite), + *podion* or *pedilon*, little foot or slipper] Leafy erect herbs with rhizomes and many fibrous roots. **LEAVES** sheathing, large, ovate, plicate and/or sessile, often glandular-pubescent; apex acute. **INFL** a raceme, flowers 1 to several, with bracts. **FLOWERS** mostly spreading, often showy and brightly colored; sepals 3, the lower 2 often partially to completely united (synsepalous); lateral petals spreading, occasionally twisted, lip inflated, pouchlike, often puckered with a small dorsal opening; column bearing a large, central, flaplike staminode and 2 fertile anthers on each side; pollen mealy, not in pollinia or pollinaria. **FRUIT** a ribbed, 3-locular, ellipsoid capsule. **SEEDS** numerous, minute, with papery seed coat. About 25 species in North America and Eurasia, with one species in Mexico and Guatemala. Some species are grown or collected for horticultural value. Many possess detaching glandular hairs that may cause a skin rash. Most species are trap-pollinated by bees, as the flowers offer no reward but may serve as sleeping locations for late foraging bumblebees. One species pollinated by fungus gnats (Cribb 1997).

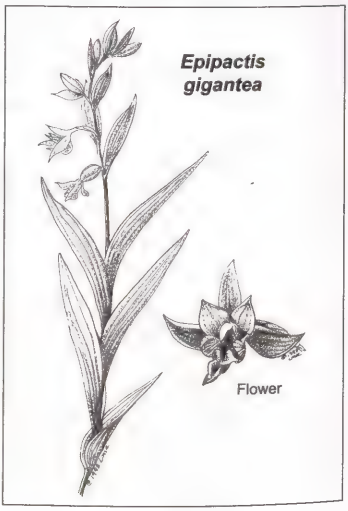
Cypripedium parviflorum Salisb. (small-flowered) Yellow lady's slipper, yellow moccasin flower, whippoorwill shoe. Plant robust, densely pubescent, to 80 cm high. **LEAVES** 3–5, ovate to lanceolate, plicate, bright green. **INFL** with 1 or 2 conspicuous large flowers. **FLOWERS** showy; sepals and lateral petals brown, brownish green, or brownish purple; lip large, inflated, bright yellow. **FRUIT** 2–3 cm long, 1–2 cm wide, often few and rare. $2n = 20$. [*C. calceolus* L. var. *pubescens* (Willd.) Correll; *C. flavescens* DC.; *C. pubescens* Willd.]. Moist, shady locations, often with seeps, sometimes on steep, mossy slopes. Rare and local. COLO: LPl; NMEX: SJn. 2375–2895 m (7800–9500'). Flowering: early Jun–Aug. Fruit: Aug–Oct. Labrador to Alaska, south to all states except Florida, Nevada, and California. Our plants are **var. *pubescens*** (Willd.) O. W. Knight. Originally thought to be a variety of *C. calceolus* L., which is now considered by Cribb (1997) to be a European species that exhibits characters convergent (probably as an adaptation to similar pollinators) with *C. parviflorum*. Pollinator an andrenid bee.

Epipactis Zinn Helleborine

(Greek *epipaktis* or hellebore) Short to tall perennials to 1 m; often forming clumps with several leafy, bracteate, flowering stems from short underground rhizomes with fibrous roots. **LEAVES** alternate, sheathing, often somewhat plicate. **INFL** a loose, bracteate raceme with few flowers. **FLOWERS** somewhat spreading, white, greenish, purplish, or purplish-pink, with open nectaries near the base of the lip; sepals and petals free; lip somewhat saccate near the base, often auricled and somewhat differently colored than the apex of the lip (epichile); column with 1 broad stigma, the central lobe forming a rostellum; stigma lobes often 2 and prominent; pollinia 2 pairs, soft, without caudicles. **FRUIT** a pendent capsule. **SEEDS** numerous, minute. About 25 species in temperate North America, Mexico, North Africa, and Eurasia. One species native to North America, but *E. helleborine* (L.) Crantz has been introduced from Europe and is becoming widely established at moist sites near urban centers, including Albuquerque, New Mexico, where it grows in riparian cottonwood forests. It should be searched for in riparian locations in our area. Most species are pollinated by wasps, bees, or syrphid flies, in some cases female flies attempting to lay eggs on aphidlike warts on the lip.



Epipactis gigantea Douglas ex Hook. (gigantic, referring to flowers and possibly, leaves) Chatterbox, giant helleborine, stream orchid. Plant terrestrial, up to 1 m tall, often much shorter in our area, in clumps, especially where mowed or grazed regularly. **STEMS** rhizomatous, with fibrous roots. **LEAVES** alternate, 4–12, ovate-elliptic to lanceolate, plicate, medium green, somewhat clasping, becoming bracteate ascending the flowering stem, 3–16 cm long, 1–7 cm wide. **INFL** a loose raceme with up to 15 flowers with floral bracts. **FLOWERS** 1.5–3 cm wide, often multicolored, pale to intense green, purple, pink, and yellow, spreading; sepals greenish purple, lip and lateral petals often with purple reticulate stripes and shallow, red, warty protuberances and/or orange calli, anthers green; pollinia in 2 pairs, soft. **FRUIT** ellipsoid, 2–3 cm long, 1–2 cm wide, may be sparsely pubescent, often numerous per stem. $2n = 32, 40$. [*Helleborine gigantea* (Douglas) Druce; *Epipactis americana* Lindl.]. Locally abundant near permanent streams, springs, and hanging gardens or at the base of north-facing cliffs in moist humus; our only "desert" orchid. ARIZ: Apa, Nav; COLO: Arc, Mon; NMEX: SJn; UTAH. 1095–2440 m (3600–8000'). Flowering: Apr–Aug. Fruit: May–Sep. British Columbia south to Baja California and central Mexico, east to Texas and South Dakota; India to China and Japan (often identified as *E. royleana* Lindl., a synonym). Pollinator is a syrphid fly.



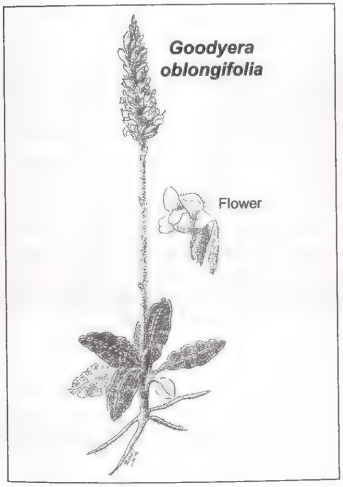
Goodyera R. Br. Rattlesnake Plantain

(named for Hampshire botanist John Goodyear, 1592–1664) Small to medium herbs, often forming matlike colonies; rhizomes horizontal, creeping, thick; roots slightly succulent. **LEAVES** forming a basal rosette, often with silvery, pale green, or whitish netlike markings. **INFL** a bracteate scapose spike with flowers more common on one side or loosely spiraled. **FLOWERS** small, white, fragrant, often with green veins, glandular-pubescent; upper sepal connivent with lateral petals, forming a tubelike structure over the column; lip deeply saccate; column 2-horned; pollinia 2, granular, in clumps maintained by elastic threads, but not in well-defined pollinaria. **FRUIT** an erect capsule, often numerous per flower stalk. **SEEDS** numerous, minute, papery. Hybrids often form, particularly in the Great Lakes area. A genus of worldwide distribution of about 25 species, with four temperate and boreal North American species. Some species

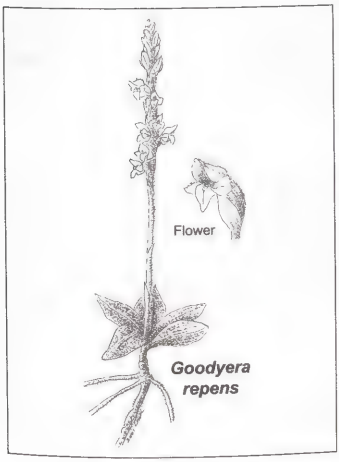
("jewel orchids") grown for the attractively patterned and sometimes velvety leaves rather than the flowers. The leaves were used in the past for medicinal purposes.

1. Leaves pale to dark green, 3–11 cm long, 2–4 cm wide, often prominently reticulated, with a broad central stripe; flowering plant usually more than 20 cm tall; common ..... ***G. oblongifolia***

1′ Leaves often pale green, 1–4 cm long, 0.5–3 cm wide, reticulation not present or prominent in ours, no prominent central stripe; flowering plant usually less than 15 cm tall; rare ..... ***G. repens***



Goodyera oblongifolia Raf. (oblong leaf) Menzies' rattlesnake plantain, rattlesnake plantain. Terrestrial, densely pubescent, mat-forming, sometimes rhizomatous herb, 20–45 cm tall. **LEAVES** 2–many, 2–10 cm long, 1–4 cm wide in a rosette, elliptic, bluish green with prominent broad white or silvery central stripe, often with white, silver, or pale green reticulation. **INFL** a 1-sided, undulate, semisecund, densely flowered spicate raceme with up to 40 flowers. **FLOWERS** white, often with green or pinkish veining, often sweetly fragrant; sepals, ovary, and flowering stalk densely pubescent; lateral petals and dorsal sepal connivent over the column, forming a tube with the lip; lateral sepals spreading; lip bulbous-saccate, white; column short, rostellum pointed; pollinia granular, soft, yellow, viscidium elongate. **FRUIT** ellipsoid, pubescent, about 1 cm × 0.5 cm wide, often many per stem. $2n = 22, 30$. [*G. oblongifolia* var. *reticulata* B. Boivin; *G. decipiens* (Piper) Hubbard]. Common in dry or moist, dark coniferous forests. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: SJn; UTAH. 2315–3260 m (7600–10700′). Flowering: Jul–Sep. Fruit: Aug–Oct. Southern Canada and Alaska, south to Minnesota, Michigan, and Maine, along the Appalachians to North Carolina and Tennessee; Montana, Idaho, South Dakota, New Mexico, Arizona; Sonora and Tamaulipas, Mexico. Pollinated by bumblebees.



Goodyera repens (L.) R. Br. (creeping) Lesser rattlesnake plantain. Small, pubescent, spicate herb up to 25 cm tall. **LEAVES** 2 to many, 1–4 cm long, 0.5–3 cm wide, ovate, in basal rosette, dark to light green, sometimes marked with light green, white or silvery reticulation without broad, light central stripe. **INFL** a loosely flowered, undulate, semisecund, spicate raceme with up to 20 flowers. **FLOWERS** white, often tinged with green or pink, fragrance "soapy"; sepals pubescent, sepals and lateral petals connivent over the short column, tips of lateral sepals not obviously reflexed; lip globose-saccate, white, often with pink; pollinia blunt, yellow, soft, viscidium orbiculate. **FRUIT** ellipsoid, 0.7 cm long, 0.5 cm wide, few to many. $2n = 22, 30$. [*G. ophiodes* (Fernald) Rydb.]. Uncommon and local in mountain ranges of Colorado in moist, dark, coniferous forests among mosses and elfin flowering plants. COLO: Arc, Hin, LPl, Min. 2405–3080 m (7900–10100′). Flowering: Jul–Aug. Fruit: Jul–Sep. Canada and Alaska, northeastern United States, to western North Carolina and eastern Tennesee, Michigan, Wisconsin, Minnesota, Montana, Idaho, Wyoming, South Dakota, Colorado, New Mexico, and Arizona. Pollinator reported to be *Bombus pratorum* or autopollinated, although the scent and flower size suggest a dipteran.

Listera R. Br. Twayblade

(for Martin Lister, 17th-century English naturalist) Small herbs with slender rhizomes, fibrous roots. The adult plant has the appearance of a dicot seedling. **LEAVES** 2 (rarely 3), broad, opposite, borne midstem. **INFL** a terminal raceme. **FLOWERS** small, inconspicuous, widely spreading, often greenish or purplish and/or translucent; most sepals and lateral petals short, often reflexed; the lip mostly cleft, 1-nerved, at least twice as long as the other petals; column possessing a nectary under the stigma; pollinia in pollinaria 2, soft, tear-shaped, without caudicles, viscidium circular.

FRUIT a small, globose to elliptic capsule. **SEEDS** larger than those of most orchids, but thin and papery. A genus of cool regions in the Northern and Southern Hemispheres with about 25 species. Pollinators generally minute flies, fungus gnats, or wasps.

Listera cordata (L.) R. Br. (heart-shaped) Heart-leaved twayblade. Plant erect, slender, to 15 cm tall (taller in more northerly and wetter areas), usually less in our area. Plant appears insignificant and similar to a just-germinated dicot seedling. Underground base of stem swollen, with several thin, stringy roots. **STEM** base surrounded by sheaths, glabrous below, weakly pubescent above. **LEAVES** 2, opposite, cordate, 2 cm wide × 2 cm long or slightly smaller; light green in ours, reticulate-veined, margins undulate or entire. **INFL** a slender raceme, mostly loosely flowered with up to 25 small, but not minute, flowers. **FLOWER** pedicel 3 mm long; green to light green, often translucent with sepals ovate to elliptic, sepals 2 × 1 mm, lateral sepals oblique; petals similar to sepals; lip somewhat linear, about 5–6 mm long, with 2 slender lobes forking from about midway to the apex, a pair of hornlike protuberances at the base; column short, wide. **FRUIT** somewhat erect, globose to ellipsoid, 0.5 cm long × 0.4 cm wide. $2n = 36, 38$. [*Listera nephrophylla* Rydb.; *Ophrys nephrophylla* Rydb.; *L. cordata* (L.) R. Br. var. *chlorantha* P. Beauv.]. Growing sometimes in great masses in shady moist places among a thick mat of mosses under fir and spruce or aspen, often along the edges of streams or springs. Thought to be relatively uncommon in our area, but may be overlooked and locally abundant. COLO: Arc, Hin, LPl, Min, Mon, SJn. 2710–3290 m (8900–10800'). Flowering: Jun–Jul. Fruit: Jun–Aug. Circumboreal in distribution in the Northern Hemisphere, south to the west coast of North America to northern California, along the Rocky Mountains to New Mexico and south to Japan in the Eastern Hemisphere. Our plants belong to **var. *nephrophylla*** (Rydb.) Hultén, with uniformly light green flowers and the leaves significantly larger compared to var. *cordata*. Pollination studies have shown fungus gnats from two families to be the major pollinators through an elaborate mechanism to ensure cross-pollination.

Platanthera Rich. Fringed Orchid, Bog Orchid

(Greek *platys*, wide, broad, + *anthera*, anther) Plants erect, glabrous; roots stoloniferous tuberoids or fusiform. **LEAVES** bright to dark green, 1 or 2 to many, often basal and cauline, becoming reduced toward the inflorescence. **INFL** a loose to extremely congested spike, bracteate spike, or spicate raceme with 5 or 6 to hundreds of flowers. **FLOWERS** large and showy to small and inconspicuous (generally, in ours), often green or white, but yellow, pink, purple, or gold in many fringed species, often fragrant; sepals and lateral petals spreading, reflexed, or hooded; lip pendent, upcurved, entire, crenulate, lobed, or fringed, spur, if present, often short and saccate to several cm in length; column short and broad, anther sacs widely separated, often opening in front; pollinia consisting of mealy grains to tight masses in 2 viscous hemipollinaria, often with elastic caudicles. **FRUIT** semierect to ascending, ellipsoid. A diverse, polymorphic, temperate, terrestrial genus of about 200 species formerly included in *Habenaria*, a genus which now includes only subtropical and tropical species. Most species, especially the fringed orchids, are probably pollinated by butterflies and moths. However, as our species are mostly green, inconspicuous, and oddly fragrant, pollinators are more likely flies and bees. All of our species are included in the *P. dilatata - P. hyperborea* complex of section *Limnorchis*, which includes many closely related, variable, circumboreal species, subspecies, and varieties, endlessly split, lumped, and subsequently resplit. Each species exhibits a few to many geographical races or named varieties. Most of these taxa are capable of hybridization. *Platanthera stricta* Lindl. does not occur in our area, its range extending farther north and west. *Platanthera saccata* (Greene) Hultén is a synonym for this taxon. *Platanthera hyperborea* (L.) Lindl. is now restricted to Iceland and Greenland and is, therefore, not in our area. No definite voucher specimens of the autopollinating *P. aquilonis* Sheviak have been seen from the study area, the main character being the horizontally positioned pollinia, but this species surely occurs here. It is imperative that collectors of this genus note floral scent and flower color as these are not evident in herbarium specimens and are absolutely essential in identification. See notes under Orchidaceae concerning *Piperia unalascensis* (Spreng.) Rydb.

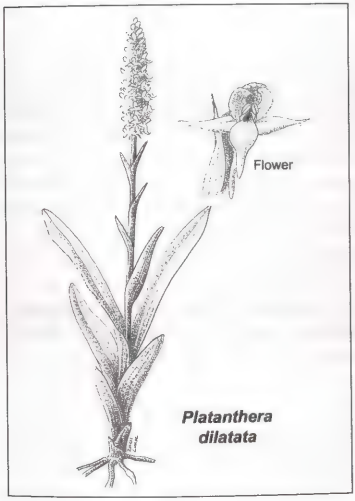
1. Flowers white; lip obviously dilated at the base ..... ***P. dilatata***
1' Flowers green, yellow-green, whitish green, or purplish, lip not obviously dilated ..... (2)

2. Leaves 1–2; scape naked or with 0 or 1 bract (rarely 2) ..... ***P. obtusata***
2' Leaves 1–several; scape with many bracts, gradually reduced distally ..... (3)

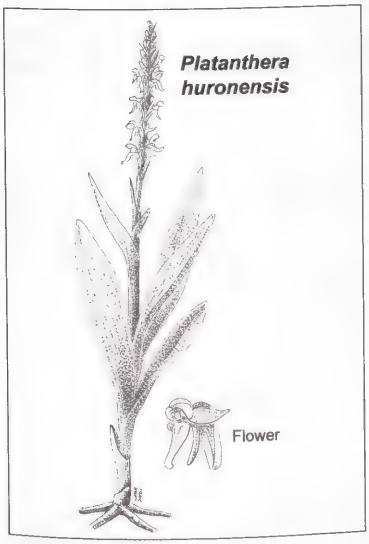
3. Inflorescence sparsely flowered, the column broad, filling more than 1/2 the length of the dorsal sepal; small to medium-sized plants generally inhabiting streamside or hanging garden locales ..... (4)
3' Inflorescence a loose spike to extremely congested, column varied, but not broad, generally moist seepage or damp locales ..... (5)

4. Flowers yellowish green to green, often sparsely flowered, mostly streamside ..... ***P. sparsiflora***
4′ Flowers dark or medium green, slightly congested, few- to many-flowered, populations restricted primarily to hanging gardens and cool cliff bases ..... ***P. zothecina***

5. Spur saccate or scrotiform; lip dull yellowish to bluish, sometimes reddish; musty-scented ..... ***P. purpurascens***
5′ Spur slenderly cylindric; lip whitish or whitish green; sweet or cucumber-scented ..... ***P. huronensis***



Platanthera dilatata (Pursh) Lindl. ex L. C. Beck (broadened or expanded, referring to the base of the lip) Tall white bog orchid, tall white northern orchid, fragrant orchid, bog candle. Plants erect, glabrous, slender or stout, to about 1 m tall, roots fleshy, fusiform, elongated. **LEAVES** few–12, linear to lanceolate or oblong, becoming bractlike above, to about 30 cm long × 7 cm wide. **INFL** a many-flowered spike, congested to lax. **FLOWERS** white; dorsal sepal ovate-elliptic, forming a hood with the lateral petals; lateral sepals elliptic-lanceolate, oblique, usually spreading; petals ovate-lanceolate, oblique, falcate; lip linear-lanceolate, dilated at the base; spur cylindric, equal to lip length. **FRUIT** semierect, ellipsoid, about 1–1.5 cm long × 0.6 cm wide. $2n = 42$. [*Orchis dilatata* Pursh; *Habenaria dilatata* (Pursh) Hook.; *Limnorchis dilatata* (Pursh) Rydb.]. Montane wet meadows, ditches, roadsides, stream banks, damp slopes, and wet roadsides. COLO: LPl; NMEX: RAr. 1830–3230 m (6000–10600′). Flowering: Jun–Aug. Fruit: Jul–Oct. Alaska east to Labrador, south to New York, Illinois, and Colorado. Ours are **var. *dilatata*.** This species has been known to hybridize freely with other green platantheras growing adjacently, often resulting in some plants with greenish flowers. *Platanthera dilatata* often has a strong clove, cinnamon, or cinnamon-vanilla scent, no doubt to attract the many species of small moths and skippers as pollinators.



Platanthera huronensis (Nutt.) Lindl. (of Lake Huron, referring to its northern location) Tall northern green orchid, tall green bog orchid, tall leafy green orchid. Plants erect, to about 40 cm tall. **LEAVES** few to many, gradually reducing to bracts; blade oblong to linear-lanceolate, about 5–25 cm long × 0.8–4 cm wide. **INFL** a spikelike raceme; lax to dense. **FLOWERS** whitish or light green; calyx sometimes darker than corolla; lateral sepals spreading to reflexed, dorsal sepal forming a hood with lateral petals; petals ovate to falcate; lip descending, lanceolate, with no basal thickening; spur slender, cylindric to clavate, often with tapering apex; 5–14 mm; anther cells upright and parallel. **FRUIT** ellipsoidal, erect, 1 cm long × 0.5 cm wide. $2n = 84$. [*Orchis huronensis* Nutt.; *Habenaria hyperborea* (L.) R. Br. var. *huronensis* (Nutt.) Farw.; *Platanthera hyperborea* (L.) Lindl. var. *huronensis* (Nutt.) Luer]. Montane wet meadows, stream banks, marshes, acequias, seeping slopes, roadsides. COLO: Arc, Hin, LPl, Mon, SJn; NMEX: RAr, SJn. 2285–3445 m (7500–11300′). Flowering: Jun–Sep. Fruit: Jul–Oct. Alaska east to Labrador, south to New Jersey, South Dakota, New Mexico, and Oregon. May hybridize with others in the genus. Intensely fragrant with a sweet, pungent, cucumber-like scent, indicating a different pollinator than that of the sometimes sympatric *P. purpurascens*.

Platanthera obtusata (Banks ex Pursh) Lindl. (blunted, referring to the blunt leaves) Small northern bog orchid, blunt leaf orchid. Plants erect, 5–about 20 cm. **LEAVES** 1 or 2, rarely with 1 small bract; blade obovate to oblanceolate, or elliptic-oblong, about 12 cm long × 4 cm wide, clasping the stem. **INFL** a lax spike with about 15 flowers. **FLOWERS** greenish white to yellowish, corolla often lighter than calyx; lateral sepals reflexed, dorsal sepal forming a hood with lateral petals;

petals falcate; lip descending, linear with median basal thickening; spur slender, conic, about 3–10 mm. **FRUIT** erect, elliptic, to 8.5 cm long × 4 cm wide. $2n = 42, 63$. [*Orchis obtusata* Banks ex Pursh; *Habenaria obtusata* (Banks ex Pursh) Richardson; *Habenaria obtusata* var. *collectanea* Fernald]. Mesic to wet coniferous forest, sphagnum bogs, stream banks. Known in our area only from relatively high, spruce-fir forests. COLO: Hin. 2895–3170 m (9500–10400'). Flowering: Jul–Aug. Fruit: Aug–Sep. Circumpolar in distribution, with an arm traveling down the Rocky Mountains: Alaska east to Labrador, south to Massachusetts, Wisconsin, and Colorado; Eurasia. Mosquitoes, particularly males, are the pollinators of this species and the pollinarium is deposited on one of the large eyes while he feeds from the conical entrance to the nectary.

Platanthera purpurascens (Rydb.) Sheviak & W. F. Jenn. (becoming purple, referring to the occasional purplish coloring of the flowers and vegetative parts) Southwestern green bog orchid. Plants 10–50 cm tall. **LEAVES** few to many, larger basally, scattered and becoming smaller along stem; blade oblong to lanceolate, variable size, about 5–20 cm long × 1–5 cm wide. **INFL** a lax to dense spikelike raceme, flowers sometimes in fascicles. **FLOWERS** green to yellowish green, often with a bluish or reddish tint, especially the buds; lateral sepals spreading, dorsal sepal forming a hood with lateral petals; petals falcate; lip descending to reflexed or projecting, lanceolate to ovate, without basal thickening; spur clavate to scrotiform, 2–3 mm long. **FRUIT** ellipsoidal, about 1 cm long × 0.5 cm wide. $2n = 42$. [*Limnorchis purpurascens* Rydb.; *Platanthera hyperborea* (L.) Lindl. var *purpurascens* (Rydb.) Luer; *Habenaria purpurascens* (Rydb.) Tidestr.]. Common in moist montane habitats, such as seeping, mossy slopes, stream banks, acequias, roadsides, conifer woods, and near old buildings. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn. 2345–3655 m (7700–12000'). Flowering: Jun–Sep. Fruit: Jul–Oct. California, southern Wyoming south to New Mexico and eastern Arizona. May grow and hybridize with others of the genus. The flowers are strongly seminiferously scented, sometimes with vanilla overtones, probably indicating a dipteran pollinator, possibly a mosquito.

Platanthera sparsiflora (S. Watson) Schltr. (sparse-flowered) Sparsely flowered bog orchid, canyon habenaria. Plants glabrous, leafy, often slender, sometimes stout and robust, 10–75 cm tall; roots fleshy, elongated, often fusiform. **LEAVES** light to bright green, 10 or fewer, oblong to lanceolate, more frequent basally, clasping the stem and becoming bracteate above, to 30 cm long × 3.5 cm wide, but often much smaller. **INFL** a laxly few- to many-flowered, often elongated spikelike raceme. **FLOWERS** light or yellowish to deep green, often held at a 90° angle to the rachis; dorsal sepal ovate, generally longer and larger than in our other species of *Platanthera*; lateral sepals elliptic-lanceolate, downwardly recurved; lateral petals lanceolate, oblique, forming an acutely pointed hood with the large dorsal sepal; lip linear, the base often with a slightly thickened median ridge, tapering slightly toward the apex, spur cylindrical, as long as or slightly longer than the lip; column large, often filling the entire hood, 2.5–4 mm long × 2–3 mm wide. **FRUIT** semierect, ellipsoid, about 1 cm long × 0.5 cm wide, occasionally heavily produced. [*Habenaria sparsiflora* S. Watson; *Limnorchis ensifolia* Rydb.; *Limnorchis sparsiflora* (S. Watson) Rydb.]. Moist locations, often close to streams and permanent water sources in open or dense woods or enclosed seepages. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, SJn; NMEX: SJn. 1370–3080 m (4500–10100'). Flowering: Jun–Sep. Fruit: Jul–Oct. Southern Washington south through California, northern Utah south to Arizona, east to Lincoln County, New Mexico, south to Baja California, western and south-central Mexico. May be moth-pollinated. A variable species somewhat resembling other green species of *Platanthera* and occupying a similar range in the West, but easily distinguished from them by the very large column, possibly indicating a different pollinator. Similar to *P. zothecina*, which may turn out to be a variety of this taxon, but flowers more delicate, held at a greater angle from the rachis, and generally in moister streamside locations.

Platanthera zothecina (L. C. Higgins & S. L. Welsh) Kartesz & Gandhi. Alcove bog orchid. Plants similar to *P. sparsiflora*. **LEAVES** also similar in size, but initially broadly rounded, later acute; sometimes with a thick, succulent-like texture. **INFL** similar to *P. sparsiflora*, but generally more robust, with occasionally a greater number of flowers, often more than 10. **FLOWERS** similar, generally larger, light to deep green, with a distinctive cucumber-musty scent, held at a 45° angle or less to rachis; lip 1.5 times longer than that of *P. sparsiflora*, the basal median ridge lacking, spur greater than 1.5 times lip length. **FRUIT** as in *P. sparsiflora*. [*Habenaria zothecina* L. C. Higgins & S. L. Welsh; *Limnorchis zothecina* (L. C. Higgins & S. L. Welsh) W. A. Weber]. The most distinctive feature about this orchid is its distribution primarily in hanging gardens, alcoves, and under protective ledges of the Colorado and San Juan river drainages. It is locally abundant, but inconspicuous in discontinuous, cool, very shady, mesic pockets of vegetation protected by high sandstone cliffs often with seasonal seeps, springs, or drip pools, and occasionally in quite dry, but cool locations screened by dense vegetation surrounded by hot, dry, arid or semiarid habitat, such as near Lake Powell. ARIZ: Apa, Nav; UTAH. 1100–2195 m (3600–7200'). Flowering: Jun–Aug. Fruit: Jun–Oct. Known only from the Colorado River drainage of

Arizona, Colorado, and Utah. Our pollinator exclusion studies of this orchid in Natural Bridges National Monument (Reeves and Reeves 1993) have suggested that a pollinator is necessary for seed set, but many hours of observation have failed to discover the culprit, probably a midge or mosquito. Studies of *Malaxis paludosa* (L.) Sw. (Reeves and Reeves 1984) have revealed a similar scent and fungus gnats as pollinators, but these flowers are far too large for insects of that size to carry the large, multigrained pollinaria.

Spiranthes Rich. Ladies' Tresses, Rein Orchid

(Greek *speira*, coil, + *anthos*, flower) Short and delicate to tall and robust herbs; roots fleshy, tuberous. **LEAVES** linear to broadly ovate, basal or cauline, becoming sheathing bracts below and on the inflorescence. **INFL** a congested, spirally twisted spike, the longitudinal rows in several ranks. **FLOWERS** mostly white, cream, greenish white, or yellow, occasionally other colors and/or or faintly striped, often highly fragrant; sepals and lateral petals forming a tube with apices often spreading to recurved; lip concave and grooved near the base, simple or lobed, spreading to strongly recurved; column short; pollinia 2 with a common viscidium in a pollinarium. **FRUIT** ellipsoid to ovoid. A genus with about 300 species, mainly in the New World and Europe, with a single species in the western Pacific. Hybridization is common in this genus. Pollination in many species is accomplished by small bees that visit the lower flowers, first obtaining nectar from fully mature flowers. They then work upward, encountering fresh flowers without nectar and unavailable stigmas, but are quickly burdened with pollinaria. The bees continue to search for nectar on a new spike, again beginning at the lowest flower, where they deposit the pollinia on the elevated stigma and collect abundant nectar.

Spiranthes romanzoffiana Cham. (named in honor of Nicholas Romanzoff, 1754–1826, a Russian minister of state) Hooded ladies' tresses. Plant erect, robust to somewhat slender, glabrous below, pubescent above, to 50 cm tall, roots enlarged, fascicled and fleshy. **LEAVES** 3–7, 5–25 cm long, 5–15 mm wide, linear to obovate, present during and after flowering, bright green, mostly basal, forming bracts upward. **INFL** a very congested 3-ranked spike with up to 70 flowers. **FLOWERS** creamy white; sepals and lateral petals lanceolate, with apices not to slightly reflexed, forming a hood over the column and lip; lip base with small tuberosities, constricted above the middle, apex finely dentate, dilated and recurved; column small; pollinia 2, soft, in one pollinarium. **FRUIT** erect, ellipsoid, 1 cm long × 0.4 cm wide, often many. $2n = 60$. [*Triorchis stricta* (Rydb.) Nieuwl.; *Spiranthes stricta* (Rydb.) A. Nelson, *Neottia gemmipara* Sm.] Locally confined to higher-elevation open, boggy, grassy meadows near mountain streams. ARIZ, Apa, COLO, Hin, LPl, Min, RGr, SJn. 2440–3475 m (8000–11400'). Flowering: Jul–Oct. Fruit: Aug–Oct. Alaska and southern Canada east to the Hebrides and Ireland, south to California, Nevada, Utah, Colorado, New Mexico, Arizona, Iowa, Illinois, Ohio east to New England. Halictine bees (*Halictus* spp., *Chlorhalictus* spp.) and bumblebees (*Bombus* spp.) reported to be pollinators.

OROBANCHACEAE Vent. BROOMRAPE FAMILY

Kenneth D. Heil and J. Mark Porter

Herbaceous annuals or perennials, mostly caulescent or subacaulesent; parasitic on the roots of other plants. **STEMS** simple or branched at the base, erect to decumbent. **LEAVES** alternate or mostly basal, entire, toothed to bipinnatifid or reduced to scalelike. **INFL** a spike, raceme, corymbose panicle, or of solitary flowers. **FLOWERS** tubular or bilabiate; calyx 4-cleft, 2–5-lobed, lobes equal or unequal; corolla yellow, reddish, purple, or white; stamens 4, didynamous; ovary superior, 1–2-loculed, style 1, stigma capitate, peltate, or lobed. **FRUIT** a capsule. **SEEDS** few to many. Approximately 65 genera and about 1990 species in the Northern Hemisphere, especially temperate and subtropical regions. *Orobanche* is used as a drug by the Navajo for wounds, open sores, and food. *Castilleja* is used as an ornamental, drug, and food. *Pedicularis* is used as an ornamental and by the Navajo in certain ceremonies.

1. Upper corolla lip 2-lobed ..... (2)
1' Upper corolla lip entire, occasionally upper lip toothed ..... (3)

2. Plants with chlorophyll (green); stems neither fleshy nor succulent; corolla dehiscing when senescent ..... ***Agalinis***
2' Plants lacking chlorophyll (not green); stems fleshy or succulent; corolla persistent when withered ..... ***Orobanche***

3. Anther cells equal; galea rounded adaxially, often extending into a narrow beak or truncate, sometimes with 2 teeth just below the apex ..... (4)
3' Anther cells unequal, the larger cell attached by its middle and the smaller by its apex or absent; galea straight, sometimes rounded at the very tip in *Orthocarpus* and *Cordylanthus*, neither toothed nor extending into a beak; leaves entire to pinnately 3- to 7-lobed ..... (5)

4. Leaves opposite, toothed; calyx 4-toothed, becoming inflated with prominent veins, enclosing the fruit ..***Rhinanthus***
4' Leaves alternate or basal, crenate, serrate, pinnatifid, or pinnately compound; calyx incised on one or both sides, becoming distended but not bladdery-inflated ..... ***Pedicularis***

5. Plants perennial, or if annual (*C. exilis*), the galea much exceeding the lower lip and the bracts entire .... ***Castilleja***
5' Plants annual, the galea subequal to or only slightly longer than the lower lip; bracts 3- or more-parted with linear lobes ..... (6)

6. Calyx tubular-campanulate, cleft less than halfway on the abaxial side and to about halfway on the adaxial, forming 2 lateral primary lobes, each divided into 2 segments; bracts leaflike, only 1 subtending each flower ..... ***Orthocarpus***
6' Calyx bractlike, cleft to or nearly to the base on abaxial side, forming a single ligulate, entire or bifid structure in back; bracts of 2 types, the outer leaflike and the inner resembling and opposing the ligular calyx ..... ***Cordylanthus***

Agalinis Raf. Gerardia

(wonder-flax, referring to a superficial similarity to *Linum*) Annual (ours) or perennial herbs, often hemiparasitic. **STEMS** erect, usually 4-angled due to decurrent ridges from the leaf bases, branching, glabrous or with ascending-scabrous pubescence. **LEAVES** opposite or subopposite, sessile, entire, linear to filiform (in ours), sometimes lanceolate, scabridulous or scabrous on the upper surface and glabrous below, often revolute, the leaves of the fascicles and branchlets smaller and narrower. **INFL** a raceme; bracts leaflike below and progressively reduced upward, sometimes becoming alternate on the branches; pedicels often expanded at the receptacular attachment. **FLOWERS** weakly bilabiate; calyx nearly regular, somewhat accrescent, campanulate, sometimes shortly so, 5-lobed or 5-toothed, lobes usually shorter than the tube, triangular to lanceolate or subulate, acute or acuminate, the adaxial one often slightly larger than the others; corolla 5-lobed, pink to magenta or pale purple, with 2 yellow lines and purplish or reddish spots within the throat abaxially, the tube campanulate, often somewhat distended abaxially, the throat open, the lobes shorter than the tube, slightly irregular, ciliate, the upper 2 lobes usually somewhat smaller, arched, spreading to somewhat reflexed or sometimes projecting, the lower 3 lobes spreading, external in bud; stamens 4, in 2 pairs, the lower pair longer, usually included, the filaments pubescent, at least toward the base, anthers 2-celled, the cells parallel, obtuse to caudate at the base, villous; stigma solitary, flattened, somewhat elongate. **FRUIT** a globose or subglobose capsule, sometimes ellipsoid; loculicidal dehiscence. **SEEDS** numerous, triangular, reticulate. [*Gerardia* Benth.] *Agalinis* includes about 45 species formerly included in Scrophulariaceae. In our area, only one species occurs as somewhat of an outlier to its range (Canne 1979, 1981; Pennell 1928, 1929).

Agalinis tenuifolia (Vahl) Raf. (thin or narrow leaf) Threadleaved gerardia, small-flowered gerardia. Glabrous or subglabrous, often turning black upon drying. **STEMS** to about 50 cm tall, branched, axillary fascicles present (in ours) or absent, dark green. **LEAVES** spreading to arched-ascending, entire, linear, acuminate, dark green, 3–7 cm long, 1–2 mm wide, finely scabrous to glabrous. **INFL** a raceme, pedicels widely divaricate, filiform, 7–20 mm long. **FLOWER** calyx hemispherical, 3.5–5.5 mm long, the lobes broadly triangular, apiculate, sometimes subulate, 1–2 mm long, the sinuses broadly rounded; corolla 10–15 mm long, glabrate or glabrous, lobes 3–5 mm long, the margins ciliate, the upper lip concave-arched, projecting forward over the anthers and stigma; anthers 1.5–2.2 mm long, densely to sparingly (in ours) villous. **FRUIT** a globose capsule, 4–6 mm long. **SEEDS** dark brown to blackish, 0.7–0.9 mm long, bluntly trapezoid or triangular, the reticulations irregularly elongate. $2n = 28$. [*Gerardia tenuifolia* Vahl var. *parviflora* Nutt.] Damp and sandy soils. NMEX: RAr. 1370–1680 m (4500–5500'). Flowering: Aug–Oct. Fruit: late Aug–Nov. Southern Quebec to southern Manitoba, Canada; south to Florida, eastern Texas, Oklahoma, eastern Colorado, eastern New Mexico, and a disjunct area in northwestern New Mexico. In our area, this species is represented by **var. *parviflora*** (Nutt.) Pennell (small-flowered).

Castilleja Mutis ex L. f. Indian Paintbrush, Painted-cup

Mark Egger

(for Spanish botanist Domingo Castillejo, 1744–1793) Root-hemiparasitic herbs to occasionally small shrubs, annual or more commonly perennial, often with more or less woody base. **STEMS** single to clumped, branched or unbranched, strongly decumbent to erect. **LEAVES** mostly alternate along stems, sessile to rarely short-stipitate or auriculate, entire to pinnately or rarely somewhat palmately divided. **INFL** a compact to elongate spike or spicate, rarely secund, raceme; often compact when young, strongly elongating with age. **BRACTS** usually differing gradually upward from leaves, often becoming shorter, broader, more deeply divided, and differently colored, at least on upper portions; colors predominantly shades of red-orange, yellow, white, pink, violet, magenta, or purple, usually more

conspicuous than or contrasting with the colors of the corolla; in a few species, green with brighter colors borne on calyx and corolla. **FLOWER** calyx sessile to long-pedicellate, tubular, divided above in several strongly differing and usually diagnostic patterns, either cleft into 4 subequal segments or with the segments variously fused and unequal in length, forming 2 lateral primary lobes, these entire, emarginate, or cleft into shorter secondary segments, entirely or more often upper portions conspicuously colored, usually as in bracts, but contrastingly in a few species; corolla long and narrow, usually greenish to less commonly yellowish to pale orange-red, tubular below, strongly bilabiate above and divided into an upper beak, its lobes joined to the tip and often differently and more brightly colored along the thin margins, and a highly variable lower lip, in ours either of greatly reduced and somewhat incurved greenish teeth or of unpouched to moderately pouched, subpetaloid, more brightly colored lobes with small apical teeth. **FRUIT** a somewhat irregular, loculicidal capsule, ovate to oblong, acuminate. **SEEDS** small, numerous, with a loose, reticulate, pitted coat. $n = 12$ (rarely $n = 10, 11$), about half of all species exhibiting various levels of polyploidy, including $n = 24, 36, 48, 60, 72$. About 200 species. Widespread in the Western Hemisphere, with most species in mountainous regions of western North America, including Mexico. A smaller number of species found in eastern North America, Central America, Andean South America, and boreal-Arctic regions of Eurasia.

While most of our species are fairly well defined and easily identified, many species of this genus, especially outside our area, show substantial phenotypic variation both within local populations and across edaphic and geographic discontinuities. Some species are taxonomically difficult, probably due at least in part to allopolyploidy. Synonymy lists for many *Castilleja* species are extensive, and only those relevant to our region are included here. Species with red to red-orange inflorescences are often visited and pollinated by nectar-seeking hummingbirds, but an even larger proportion, including some red to red-orange species, are pollinated by pollen-collecting insects, mostly hymenopterans, especially *Bombus*. A few species outside our area are self-pollinating. Some species are important larval food sources for various Lepidoptera, especially of the genera *Euphydryas* and *Platyptilia*, and as a nectar source for hawkmoths (*Hyles*). Several species are used (with some difficulty) as ornamentals, as natural dyes, for nectar, and by Native Americans for medicinal and ceremonial purposes. A number of species are known to contain alkaloids, including some assimilated from parasitized hosts via the haustorial bridge. Some species are known to serve as intermediate hosts for certain rust fungi (*Cronartium*, *Endocronartium*) and for hummingbird flower mites (Mesostigmata: Ascidae). The inflorescence and herbage of *Castilleja* are used as an adult food source by a variety of insects, including Coleoptera, Heteroptera, and Homoptera. *Castilleja* species are also grazed by a range of mammals, including voles (*Lemmiscus*), packrats (*Neotoma*), porcupines, deer, cattle, and goats. Many species known to decrease in numbers (*C. guadalupensis*) and when subjected to overgrazing by domestic livestock, including the extinction of one species (*C. guadalupensis*) and the near extinction of several others. None of our species is of grave conservation concern, though several, such as *C. minor* and *C. lineata*, are range- and habitat-restricted and should be monitored. The ranges of two species, *C. lineata* and *C. haydenii*, occur primarily within our area, though no species is strictly endemic.

1. Plants annual; bracts always entire, narrowly lanceolate, apically more or less attenuate, and brightly colored only at the tips ..... (2)
1' Plants perennial; bracts various but never with the combination of characters above ..... (3)

2. Lobes of lower lip of corolla always dull white to pale yellow, spreading, with short, obtuse teeth; plants tending to be larger and more robust, with coarse, often broadly lanceolate leaves; pubescence of stem spreading, densely hirsute to pilose; fairly common in our area but absent from the extreme southern portion ..... ***C. exilis***
2' Lower lip of corolla always red to red-violet, spreading-ascending, with small, acute, ascending teeth; plants tending to be smaller and more slender, with softer textured, narrowly lanceolate to linear leaves; pubescence of stem less dense, lax, short-pilose; rare in our area, limited to extreme southern portion and absent from Utah and Colorado ..... ***C. minor***

3. Inflorescence predominantly pale white to pale yellow or pale yellow-green, fairly often suffused with pale pink or dull red, often from base upward, usually then with white to yellow apices ..... (4)
3' Inflorescence predominantly various shades of red, orange, pink, magenta, red-violet, or purple, occasional individuals or localized swarms colored otherwise ..... (6)

4. Bracts and at least upper leaves deeply cleft from below middle upward into 3–7 long, spreading, subpinnate, linear-lanceolate lobes; pubescence of herbage mostly woolly to somewhat pilose ..... ***C. lineata***
4' Bracts and leaves entire or bracts relatively shallowly cleft from above the middle into 3–5 (7) shorter, mostly apical and palmate, linear-lanceolate to triangular lobes; pubescence of herbage lacking to pilose, never woolly ..... (5)

5. Plants 1–2 dm tall; stems usually decumbent; limited to moderately dry alpine habitats ..... ***C. occidentalis***
5′ Plants 2–8 dm tall; stems ascending to erect; mostly in montane and subalpine meadows, occasionally higher ..... ***C. septentrionalis***

6. Calyx cleft far more deeply in front (about 2/3) than in back (2/3 or less), with segments often upcurved; at maturity corolla often curved pendulously outward through front calyx cleft; calyx and corolla greatly exceeding bracts in length when fully developed; calyx and corolla usually much more conspicuously colored than bracts ..***C. linariifolia***
6′ Calyx divided more or less equally in front and in back or only slightly (1–3 mm) more deeply on one side or the other, with segments straight to occasionally slightly upcurved; corolla more or less parallel to calyx and usually not at all pendulous; calyx and sometimes corolla not greatly exceeding bracts in length when fully developed; bracts usually much more conspicuously colored than calyx and corolla ..... (7)

7. Inflorescence predominantly various shades of crimson, pink, magenta, red-violet, or purple, occasional individuals or localized swarms colored otherwise ..... (8)
7′ Inflorescence predominantly various shades of scarlet, red, or orange, occasional individuals or localized swarms colored otherwise ..... (9)

8. Upper leaves and bracts almost always deeply cleft into 3–7 spreading lobes; lower lip of corolla about 1/3 length of corolla beak, greenish at the base, becoming white to rose-pink on apical teeth ..... ***C. haydenii***
8′ Upper leaves usually entire, sometimes with a pair of ascending lobes, bracts entire or with 3–5 short, ascending lobes; lower lip of corolla 1/4 length of corolla beak or less, uniformly green ..... ***C. rhexiifolia***

9. Pubescence of stems and herbage usually either lacking or short-woolly and appressed to occasionally pilose, not at all hispid; leaves usually entire to occasionally divided into 3 lanceolate, acute lobes ..... (10)
9′ Pubescence of stems and herbage strongly hirsute; at least upper leaves usually divided into 3–5 narrowly lanceolate to oblanceolate, acute to obtuse lobes ..... (11)

10. Stems and herbage usually short-woolly with somewhat appressed hairs; leaves linear to linear-lanceolate, usually with strongly involute margins; bracts usually entire or occasionally divided into 3 acute lobes; calyx segments usually triangular to lanceolate and acute ..... ***C. integra***
10′ Pubescence of stems and herbage lacking or occasionally pilose on upper stems, not at all woolly-appressed; leaves usually lanceolate, margins not strongly involute; bracts usually divided into 3–5 sharply acute lobes; calyx segments usually linear-lanceolate and more or less acuminate ..... ***C. miniata***

11. Stems weakly decumbent, usually 1–2 dm tall; reduced scalelike leaves of lower stem extending upward well beyond the base; bract lobes usually narrowly lanceolate and acute-tipped; pubescence of herbage densely cinereous-hirsute; plants of sandstone or clay substrates ..... ***C. scabrida***
11′ Stems ascending to erect, usually 1.5–4 dm tall; reduced scalelike leaves of lower stem lacking or confined to extreme basal portion; bract lobes usually narrowly oblanceolate and more or less obtuse; pubescence of herbage densely hirsute but not cinereous; plants not limited to sandstone or clay substrates ..... ***C. chromosa***

Castilleja chromosa A. Nelson (colorful, referring to the brightly colored bracts) Desert paintbrush. Perennial herb, 1.5–4.5 dm tall. **STEMS** clustered, ascending to erect, usually several, usually unbranched above, hirsute. **LEAVES** 2.5–7 cm long, linear to narrowly lanceolate, hirsute; lobes 1–5, spreading. **INFL** 4–15 cm long, a fairly densely flowered spike, elongating with age, hirsute to occasionally pilose. **BRACTS** lanceolate, red or red-orange (rarely yellowish); lobes (1) 3–7, usually narrowly oblanceolate and obtuse. **FLOWER** calyx 15–25 mm long, colored as in bracts, divided 1/4–1/3 in front and back, about 1/7 on sides; segments obtuse to rounded; corolla 20–32 mm long; beak about 1/2 of corolla length, yellowish green with red margins; lower lip 2–3 mm, dark green, incurved; stigma bilobed. $n = 12$, 24. [*C. angustifolia* (Nutt.) G. Don var. *dubia* A. Nelson; *C. eremophila* Wooton & Standl.]. Sagebrush deserts and plains to arid, rocky woodlands. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1125–2700 m (3700–8800′). Flowering: Mar–Jun (–Sep). Southeastern Oregon to central Wyoming, south to southeastern California, northern Arizona, and northern New Mexico. Widespread and variable species closely associated with sagebrush. This species is sometimes either confused with or subsumed under the more northerly *C. angustifolia* (Nutt.) G. Don, from which it can be distinguished most easily by color and floral measurements. True *C. angustifolia* does not occur in our area. The name *C. applegatei* Fernald subsp. *martinii* (Abrams) T. I. Chuang & Heckard has been misapplied

to *C. chromosa* in some recent southwestern species lists, but the former name applies to a taxon endemic to California, western Nevada, and northern Baja California, and it is unknown from our region. Known to take up selenium from soil when available. Utilized by a variety of Native American groups as a dermatological aid for the treatment of sores and spider bites, as an aid for gastrointestinal and menstrual problems, and for sore eyes. Also used as a dye.

Castilleja exilis A. Nelson **CP** (thin, referring to its slender aspect) Alkaline paintbrush. Annual herb, 3–15 dm tall. **STEMS** ascending to usually erect, usually unbranched, single to few, densely pilose to hirsute and strongly stipitate-glandular. **LEAVES** 4–10 cm long, lanceolate and attenuate at apex, 4–15 mm wide near base, coarse-textured, entire. **INFL** 10–40 cm long, a narrow, elongating raceme with long internodes below, pilose to hirsute and stipitate-glandular. **BRACTS** 20–50 mm long, leaflike, lanceolate, green below with upper 1/3–1/4 red to red-orange (rarely yellow), entire, ascending. **FLOWER** calyx 14–20 mm long, subequally cleft about 2/3 in front and back, segments 1–3 mm long, acute; corolla 15–22 mm long; beak about 1/3 of corolla length, yellow, scarcely to not at all exserted above calyx, lower lip 1–2 mm long, whitish to pale yellow. $n = 12$. [*C. stricta* Rydb.]. Alkaline marshes and stream banks. ARIZ: Apa, Nav. COLO: LPl; NMEX: RAr, SJn; UTAH. 1600–2100 m (5300–6900'). Flowering: May–Sep. Eastern Washington east to southern Montana and western Wyoming, south on eastern side of Cascade-Sierra crest to south-central California, extreme northern Arizona, and extreme northwestern New Mexico. This species is very closely related to *C. minor*, but the ranges of these two forms are essentially allopatric, and the morphological differences are geographically consistent. They are probably best regarded as varieties of a single species, with *C. minor* being the name of priority. However, some recent treatments subsume *C. exilis* entirely; this treatment separates the entities pending further study. This is the more common and widespread of the two taxa in our area.

Castilleja haydenii (A. Gray) Cockerell **CP** (for geologist and archaeologist F. V. Hayden, 1829–1887) Hayden's paintbrush. Perennial herb, 10–20 cm tall. **STEMS** clustered, spreading to ascending, few to many, unbranched, glabrous below, usually becoming short-pubescent above, often purplish. **LEAVES** 2–8 cm long, linear and entire, often becoming broader and divided above into 3–5 linear lobes, glabrous to finely hairy. **INFL** at first a densely flowered spike, elongating somewhat with age, more or less pilose below. **BRACTS** broad and deeply cleft into 3–7 linear to linear-lanceolate, acute lobes, greenish below, becoming crimson to rose-pink or lilac-purplish above, glabrous to pilose, especially along the veins. **FLOWER** calyx 1.8–2.2 cm long, divided about 1/2 in front and back, segments divided about 1/4 on each side, acute, colored as in bracts; corolla 2–2.5 cm long, with only the beak and sometimes the lower lip exserted from the calyx, if at all; beak 7–8 mm long, greenish with rose-colored margins, lower lip about 1/3 the length of the beak, with incurved teeth, greenish at the base, becoming white to rose-pink on the tips; stigma exserted, slightly bilobed. $n = 12$. [*C. pallida* (L.) Spreng. var. *haydenii* A. Gray]. Rocky alpine slopes and ridges, usually with bunchgrasses. COLO: Con, Hin, LPl, Min, Mon, SJn; UTAH. 3400–3900 m (11000–12800'). Flowering: Jul–Sep. Fairly uncommon, endemic to alpine regions of southwestern Colorado and northwestern New Mexico, extending southward from our region only in the high elevations of the Sangre de Cristo Mountains. In Utah, known only from an old collection in the upper La Sal Mountains. Plants in the western portions of its range tend to have less-divided leaves.

Castilleja integra A. Gray (entire, referring to the often entire bracts) Entire-leaved paintbrush, southwestern paintbrush. Perennial herb, 1–5 dm tall. **STEMS** erect to ascending, 1 to several, sometimes branched above, finely and somewhat appressed-woolly. **LEAVES** 2–6 (rarely 8) cm long, linear to linear-lanceolate, spreading to somewhat ascending, margins usually strongly involute, usually entire. **INFL** 2–10 cm long, pilose. **BRACTS** 20–40 mm long, obovate to oblanceolate, pilose below, minutely glandular-pubescent above, orange-red to scarlet (rarely yellow); lobes 1–3, central lobe broad, obtuse, lateral lobes short, narrower, acute. **FLOWER** calyx 21–34 (rarely 38) mm long, short-pilose, colored as in bracts, divided about 1/3 in back, slightly less in front, divided on sides almost as deeply as in front, segments obtuse to rounded or acute; corolla 26–45 mm long, ascending; beak about 1/3 of corolla length, greenish with margins colored as in bracts, minutely pubescent, partially to strongly exserted from calyx, lower lip 1.3–2.8 mm long, reduced, dark green, incurved; stigma headlike. $n = 12, 24$. [*C. gloriosa* Britton; *C. integra* var. *gloriosa* (Britton) Cockerell]. Dry, gravelly soils on plains and slopes from open grasslands through juniper and pine-oak communities into subalpine meadows. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn. 1525–2200 m (5000–7800'). Flowering: (Apr–) May–Sep. Northern Arizona, northern New Mexico, southern Colorado, and western Texas south through northern Mexico to Durango. Widespread and one of our more common paintbrushes. Important to Native Americans as a source of dyes, a preservative for storage of foods, for ceremonial purposes, and for medicinal treatments for burns, stomach complaints, blood purification, and easing of labor in women.

Castilleja linariifolia Benth. (linear-leaved) Wyoming paintbrush. Perennial herb to subshrub, 3–10 dm tall. **STEMS** clustered, ascending to erect, few to many, often branched above, glabrous to short-pubescent, usually gray-green, becoming purplish with age. **LEAVES** 2–6 (rarely 8) cm long, linear to filiform (narrowly lanceolate), often with involute edges; lobes 1–3, spreading. **INFL** 5–20 cm, a loosely flowered spike, becoming racemose with age, hirsute to pilose. **BRACTS** 15–30 mm long, lanceolate, short-pubescent, lowermost green, becoming red to red-orange (rarely yellowish, white); lobes 3, linear to linear-lanceolate. **FLOWER** calyx 18–35 mm long, curved forward near base, then upward near tips, short-pubescent, colored as in bracts, divided 1/3 in back, 2/3 in front, about 1/8 on sides, segments acute; corolla 25–45 mm long; beak about 1/2 of corolla length, yellow-green with red margins; lower lip 2–3 mm, green, incurved; stigma slightly bilobed. $n = 12, 24$. [f. *omnipubescens* Pennell; var. *omnipubescens* (Pennell) Clokey]. Dry, sandy to rocky plains and hillsides, usually with sagebrush. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1100–3150 m (3600–10400'). Flowering: (Apr) May–Oct. Central Oregon to southern Montana south to southern California, central Arizona, and central New Mexico. Widespread and a common species often associated with sagebrush. An important plant to several southwestern Native American groups as a source of a variety of dyes, paints, decorations, and ceremonial materials, as well as for medicinal purposes, including contraception, menstrual relief, several types of pain relief, as a blood purifier, physic, and emetic, and in the treatment of venereal diseases. The Hopi also use the flowers as a food.

Castilleja lineata Greene (marked with parallel veins, referring to the prominent veins of the bracts) Lineated paintbrush. Perennial herb, 1–4 dm tall. **STEMS** clustered, ascending to erect, few to several, usually unbranched above, pilose to densely woolly. **LEAVES** 2–5 cm long, linear, ascending, strongly veined; lobes 1–5 (rarely 7). **INFL** 5–15 cm, a loosely flowered spike, densely woolly. **BRACTS** 20–35 mm, broadly lanceolate, densely woolly, pale yellow to pale yellow-green; lobes 3–7, linear, acute. **FLOWER** calyx 15–20 mm long, densely woolly, yellow, divided about 1/2 in back and front, about 1/3 on sides, segments linear, acute; corolla 18–22 mm long, ascending; beak 1/5–1/4 of corolla length, pale greenish with straw-colored margins, minutely woolly and slightly glandular, tip barely exserted from calyx; lower lip 1–3 mm long, straw-colored, ovate-acuminate, incurved; stigma distinctly bilobed. $n = 12$. Dry to moderately moist slopes and meadows. ARIZ: Apa; COLO: Arc, Hin; NMEX: RAr. 2150–2900 m (7100–9500'). Flowering: Jun–Aug. Uncommon and endemic to mountainous areas of northeastern Arizona, northwestern New Mexico, and southwestern Colorado; not recorded from Utah. Used by the Navajo for stomach complaints and for its sweet nectar.

Castilleja miniata Douglas ex Hook. (scarlet, referring to its most common color form) Scarlet paintbrush. Perennial herb, 2.5–7 (rarely 10) dm tall. **STEMS** erect to ascending, usually branched above, few to several, glabrous to (in many of ours) variously pilose, green to dark purple. **LEAVES** 3–8 cm long, linear to lanceolate, weakly to strongly ascending; entire to sometimes 3-lobed above. **INFL** 3–15 cm long, pilose with short glandular pubescence beneath, often with a whitish, powdery coating. **BRACTS** 15–35 mm long, lanceolate, green below, upper 2/3–3/4 scarlet to orange-red (rarely yellow); lobes 1–5, central lobe usually broad, rounded to acute, short lateral lobes narrow, acute. **FLOWER** calyx 10–30 mm long, short-pilose, colored as in bracts at least on upper 2/3, divided about 1/2–2/3 in front, slightly less in back, about 1/4 on sides, segments linear to lanceolate, acute to acuminate; corolla 20–44 mm long, ascending; beak 2/5–1/2 of corolla length, yellow-green with margins colored as in bracts, minutely pubescent, partially to fully exserted from calyx; lower lip 1–2 mm long, dark green, incurved; stigma indistinctly bilobed. $n = 12, 24, 36, 48, 60$. [*C. confusa* Greene]. Moist stream banks to dry woods and meadows from pine-fir communities to subalpine. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn; UTAH. 2550–3400 m (8400–11200'). Flowering: Jun–Oct (–Nov). Much of western North America, from southern Alaska and central Yukon east to western Ontario, then south to Baja California Norte, northern Arizona, and northern New Mexico. A widespread, highly variable, and complex species with numerous regional forms. Ours referable to **var. *miniata***. Widely used by many Native American groups for its putative medicinal value in treating hemorrhaging, coughs, sore eyes, kidney, lung, and orthopedic ailments and as a purgative and diuretic. Additional native uses include dyeing, especially for animal skins, consumption of its nectar, as a decoration, and in a variety of ceremonial and magical applications.

Castilleja minor (A. Gray) A. Gray (lesser, referring to its slender aspect) Seep paintbrush. Annual herb, 3–15 dm tall. **STEMS** erect, usually unbranched, single to few, moderately to sparsely pilose with lax hairs, moderately stipitate-glandular. **LEAVES** 4–10 cm long, linear-attenuate, 2–5 mm wide near base, moderately soft-textured, entire. **INFL** 10–40 cm long, narrow, with long internodes below, short-pilose and stipitate-glandular. **BRACTS** 20–50 mm long, leaflike, linear to linear-lanceolate, green below with upper 1/3–1/4 red to red-orange; entire, ascending. **FLOWER** calyx 13–18 mm long, short-pilose, greenish, divided about subequally 2/3–3/4 in front and back, segments about 1–3 mm, linear to triangular, acute; corolla 14–19 mm long, ascending; beak about 1/4–1/3 of corolla length, yellow,

scarcely to not at all exserted above calyx; lower lip 1–2 mm long, with strongly back-curved red-violet teeth; stigma indistinctly bilobed. $n = 12$. Grassy seeps, bogs, and stream banks in foothills and mountains. ARIZ: Apa; NMEX: McK. 1500–2450 m (4800–8000'). Flowering: Jun–early Sep. North-central Arizona and north-central New Mexico south to northeastern Sonora and northwestern Chihuahua, Mexico. Uncommon and local throughout its fairly limited range. See comments under *C. exilis*. Root bark used by White Mountain Apaches as dye for animal skins.

Castilleja occidentalis Torr. (western, referring to early impressions of its distribution) Western paintbrush, alpine paintbrush. Perennial herb, 0.7–2 dm tall. **STEMS** decumbent to ascending, unbranched, few to many, pilose and often viscid, especially above. **LEAVES** 2–5 cm long, linear to lanceolate, reduced below to sometimes with 1 pair of lobes above, usually short-pilose. **INFL** a relatively short, dense spike, strongly viscid-villous. **BRACTS** 15–20 mm long, ovate to broadly lanceolate, usually entire but fairly often with 1–3 pairs of short, triangular to lanceolate, ascending lobes on upper portion, pale yellow to sometimes suffused with dull reddish brown to dull purplish, especially below, viscid-pilose. **FLOWER** calyx 12–20 mm long, cleft about 1/2 in front and slightly less deeply behind, segments 1–4 mm long, more or less triangular, acute to obtuse or rounded, colored as in bracts, viscid-pilose; corolla 16–25 mm long; beak about 1/4 to 1/3 of corolla length, green with pale yellow margins; lower lip reduced, 1–3 mm long, triangular, incurved, greenish; stigma reduced, headlike. $n = 12, 24$. Alpine and upper subalpine, consolidated talus slopes and ridges to well above timberline. COLO: Con, Hin, LPl, Min, Mon, RGr, SJn. 3050–3900 m (10100–12800'). Flowering: Jun–Sep. Southern half of Canadian Rocky Mountains of Alberta and British Columbia south into northern Montana, then recurring again in the Rocky Mountains of Colorado southward into the Sangre de Cristo Mountains of northern New Mexico and the La Sal Mountains of southwestern Utah. It is often thought that this is an alpine form of the widespread *C. septentrionalis* (see below), but in several regions in the distribution of the latter, *C. occidentalis* is missing, even when extensive areas of suitable habitat are available.

Castilleja rhexiifolia Rydb. (*Rhexia*-leaved) Rhexia-leaved paintbrush. Perennial herb, 2–7 dm tall. **STEMS** ascending to erect, usually unbranched, few to several, glabrous to more often short-pilose, especially above. **LEAVES** 3–7 cm long, spreading to ascending, linear to linear-lanceolate, entire. **INFL** a fairly short, compact spike, elongating somewhat with age, viscid-pilose. **BRACTS** broadly lanceolate to ovate, sparsely to densely viscid-pilose, crimson to rose-pink or purplish, entire or with 1–2 pairs of short, triangular to lanceolate, ascending lobes. **FLOWER** calyx 15–25 mm long, cleft about 1/2, subequally to slightly more deeply in front, colored as in bracts, segments 2–7 mm long, triangular to lanceolate, obtuse to rounded or sometimes acute; corolla 20–34 mm long; beak about 1/3 of corolla length, green with margins colored as in bracts; lower lip reduced, 1–3 mm, long, with triangular, incurved, greenish teeth; stigma reduced, headlike. $n = 12, 24, 48$. Montane to alpine meadows, open woods, slopes and ridges. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3050–4000 m (10000–13000'). Flowering: Jun–Sep. Rocky Mountains and adjacent ranges from southern Canada southward to southern Utah and northern New Mexico, with outlying populations in the mountains of northeastern Oregon. A common and well-known paintbrush very closely related to and sometimes intergrading with *C. septentrionalis* and *C. occidentalis* but usually readily separable from them by color, minor habitat differences, and their only partially overlapping ranges.

Castilleja scabrida Eastw. (roughened, referring to the harsh pubescence) Rough paintbrush, sandstone paintbrush. Perennial herbs, 0.7–2.2 dm tall. **STEMS** decumbent and often somewhat sprawling, few to many, cinereous-hirsute. **LEAVES** 1.4–5 cm long, often slightly auriculate, mostly lanceolate, entire below, often deeply divided above into 1 to occasionally 2 pairs of spreading, linear-lanceolate lobes, cinereous-hirsute, often tinged with dull reddish purple on leaf surfaces; leaves on about lower 1/4 of stem strongly reduced and scalelike. **INFL** a densely flowered spike, hirsute. **BRACTS** deeply divided into 1–2 pairs of spreading, linear-lanceolate to lanceolate, acute lobes, hirsute, bright red to occasionally red-orange or yellow. **FLOWER** calyx 18–33 mm long, hirsute to pilose, colored as in bracts, cleft slightly less than 1/2 in front, slightly more than 1/2 in back, segments 5–9 mm long, lanceolate, acute; corolla 28–44 mm long; beak about 1/2 length of corolla, bright green with bright red margins; lower lip reduced to 3 incurved, greenish teeth; stigma headlike. $n = 12$. Largely limited to xeric habitats with sandstone or occasionally clay substrates. [*C. zionis* Eastw.]. ARIZ: Apa; COLO: Mon; NMEX: SJn; UTAH. 1550–2250 m (5100–7300'). Flowering: Mar–Jun. Rare in extreme northeastern Arizona and extreme northwestern New Mexico, fairly common in southern and eastern Utah and southwestern Colorado. Ours referable to **var. *scabrida***.

Castilleja septentrionalis Lindl. (northern, referring to a major portion of its distribution) Northern paintbrush, sulphur paintbrush. Perennial herbs, 2.5–6 dm tall. **STEMS** mostly ascending to erect, often branched above, few to many, glabrous or short-hirsute below, becoming pilose above. **LEAVES** 2–7 cm long, linear-lanceolate to broadly lanceolate, spreading to ascending, glabrous to short-hirsute. **INFL** a densely flowered spike, elongating with age,

pilose and short glandular-hairy. **BRACTS** broadly lanceolate to ovate, entire or with 1–2 pairs of short-lanceolate to triangular lobes on upper margin, usually green below and yellow, pale yellow, or white above, occasionally suffused with various shades of pink to pale red, especially above. **FLOWER** calyx 13–25 mm long, colored as in bracts, cleft about 3/5 in front, slightly less deeply behind, segments 1–4 mm long, acute to obtuse; corolla 16–30 mm long; beak about 1/4–1/3 of corolla length, green with pale yellow margins; lower lip reduced, 1–2.5 mm long, greenish; stigma weakly bilobed. $n = 12, 24, 48$. Montane to lower alpine meadows, open woods, slopes and ridges, often in fairly mesic habitats. [*C. luteovirens* Rydb.; *C. sulphurea* Rydb.; *C. rhexiifolia* Rydb. var. *sulphurea* (Rydb.) N. D. Atwood]. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr; UTAH. 2300–3700 m (7700–12200'). Flowering: Jun–Sep. North America from Hudson Bay west to the southern Canadian Rockies and south to northern New England, then westward through northern Michigan, Minnesota, and the Dakotas to the Rocky Mountain states and southward through mountainous portions of Montana, Wyoming, Idaho, Utah, Colorado, and northern New Mexico. Widespread and variable species, occasionally forming hybrid swarms with the closely related *C. rhexiifolia* and *C. miniata* but usually easily recognizable. Long known in western states as *C. sulphurea*, a later name.

Cordylanthus Nutt. ex Benth. Bird's Beak

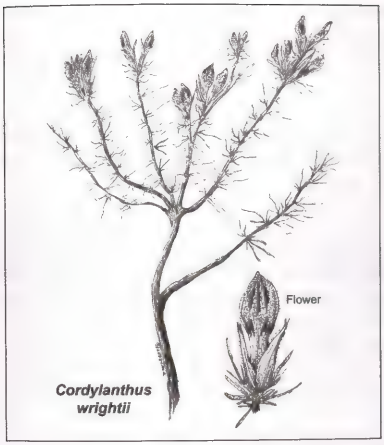
(club flower, referring to the clublike appearance of the distally expanding tubular corolla) Hemiparasitic annuals. **STEMS** single, usually branched, erect. **LEAVES** alternate, entire to more often pinnately or palmately divided with narrow segments, cauline. **INFL** a spike or sometimes reduced to a solitary flower, the spikes often congested into small, few-flowered heads, usually with 2 kinds of bracts, the outer bract(s) usually leaflike and seldom colored, the inner floral bracts usually resembling the calyx. **FLOWER** calyx cleft to or nearly to the base abaxially, forming a single adaxial lanceolate segment, entire or bifid apically, opposite the floral bracts, giving the appearance of a bilobed calyx; corolla dull yellow or purple, tubular, bilabiate, the upper lip galeate (hooded) and enclosing the anthers, often adaxially hooked at the apex, the lower lip about equaling or shorter than the galea, somewhat inflated, the 3 lobes short or obsolete, external to the upper in bud, fertile stamens 4 or 2, attached above the middle of the corolla tube, the anther cells unequally placed, the outer one attached by its middle and the inner suspended by its apex and smaller, sometimes obsolete; stigma solitary and minute, style swollen near the apex and bent forward at a right angle. **FRUIT** a loculicidal capsule, somewhat asymmetric, turgid, glabrous. **SEEDS** numerous to rather few, the coat deeply to shallowly reticulate (in ours). $2n = 28, 30, 42$. A genus of 20 species, occurring in western North America, formerly included in Scrophulariaceae (Chuang and Heckard 1986).

1. Inner bracts pinnately 3–7-divided; herbage and inflorescence noticeably pilose-pubescent; calyx cleft 1.2–3 mm deep; upper anther cell 1–1.3 mm long; barely entering our area in San Juan County, Utah ..... ***C. kingii***

1' Inner bracts entire or rarely pinnately divided; herbage finely puberulent to glabrous; calyx cleft 0.5–1 mm deep; upper anther cell 1.3–1.6 mm long; southeast Utah, southward and eastward ..... ***C. wrightii***

Cordylanthus kingii S. Watson (honoring Clarence R. King, geologist, explorer, 1842–1901) King's bird's beak. Annual, 5–30 cm tall. **STEMS** branched; densely to sparsely glandular-pubescent. **LEAVES** 1–4.5 cm long, pinnately 3–5-parted or entire, the lower segments sometimes again dichotomously divided, the divisions filiform. **INFL** a 2- to 4- or more flowered capitate spike, several terminating the branches; bracts of 2 kinds, the outer ones, when present, usually subtending the spike, not the individual flowers, usually smaller than the leaves, palmately 3–5-parted, with the lateral segments sometimes dichotomously divided from near the base, the inner bract subtending each flower, 7–22 (36) mm long, lanceolate, pinnately 3–7-parted, sometimes the bracts of the upper flowers entire, purplish violet. **FLOWER** calyx 14–26 mm long, narrowly lanceolate, bidentate, the cleft 1.2–3 mm deep; corolla 15–25 (34) mm long, the lips subequal, the galea violet with a greenish yellow tip, the lower lip purple, densely retrorsely villous; stamens 4, the anthers unequally 2-celled, the upper cell 1–1.3 mm long and the lower 0.6–1 mm long, the filaments pubescent to nearly glabrous. **FRUIT** a narrow capsule, 7–11 mm long. **SEEDS** 1.5–2.3 mm long. Sagebrush, desert scrub, piñon-juniper woodlands, mountain mahogany, and ponderosa pine communities. ARIZ: Coc; UTAH (Navajo Mountain). 1500–3000 m (4900–9900'). Flowering: Jun–Sep. Fruit: Jul–Oct. Western Nevada and adjacent California, to eastern Utah.

Cordylanthus wrightii A. Gray (honoring Charles Wright, botanist, 1811–1885) Wright's bird's beak, ke'lhokya (Hopi). Annual, 8–35 (50) cm tall. **STEMS** branched, the upper branches best developed; glandular-pubescent to glabrous. **LEAVES** 1.2–4 cm long, 3-parted, or if 5- or more parted, complexly palmate with the lower lateral divisions dichotomously divided near the base, the divisions filiform. **INFL** a 2- to 10-flowered capitate spike, several terminating the branches; bracts of 2 kinds, outer 1 or more subtending each spike, 10–25 mm long, complexly palmately divided as



the leaves but usually more so, the segments linear, the inner bract subtending each flower 15–25 mm long, narrowly lanceolate, entire or sometimes pinnately divided into 3–5 or more lobes apically, the divisions short and narrow. **FLOWER** calyx 15–20 (30) mm long, narrowly lanceolate to linear, bifid, the cleft 0.5–1 mm deep; corolla 16–24 (35) mm long, the lips subequal, yellow to lavender or lavender-marked, sparsely pubescent; stamens 4, the anthers villous-ciliate, unequally 2-celled, the upper cell 1.3–1.6 mm long and the lower 0.7–1 mm, the filaments villous. **FRUIT** a slender capsule, 10–12 (16) mm long. **SEEDS** 1.7–2 mm long. Dry sagebrush, desert scrub, resinbush, juniper, piñon-juniper woodlands, oak, and ponderosa pine communities; usually in sandy soil. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, Sln; UTAH. 1300–2500 m (4200–8200'). Flowering: mid-Jul–Sep (Oct). Fruit: Aug–Oct. Southeastern Utah and southwestern Colorado, south to Trans-Pecos Texas and Chihuahua, Mexico. The Hopi boiled the plant and used it as a bath to bleach the skin. Kayenta Navajo used *C. wrightii* to treat a prolapsed uterus.

Orobanche L. Broomrape
Turner Collins

(Greek *orobos*, vetch, + *anchein*, to strangle, referring to the parastic habit) Fleshy, succulent, root-parasitic herbs, lacking chlorophyll, yellowish white, brownish, or purple, glandular-pubescent aboveground. **STEMS** with scales, mostly underground. **LEAVES** reduced to appressed scales. **INFL** solitary or clustered in a terminal spike, raceme, or panicle. **FLOWERS** zygomorphic, perfect, subtended by a broad bract, calyx 5-lobed; corolla tubular, bilabiate with palatal folds in throat, tube curved; stamens 4, mostly included, anther cells distinct; pistil 1, the ovary 1-loculed, with 2–4 parietal placentae. **FRUIT** a 2-valved capsule. **SEEDS** many, small, less than 1 mm. $x = 12$. About 100 species (about 15 species in North America), mostly Eurasian in mainly subtropical and warm-temperate regions. Plants root-parasitic mostly on Asteraceae, frequently on *Artemisia* species.

1. Flowers borne on long slender pedicels without bractlets, 3–25 cm long; flowers solitary or several on a stem (sect. *Gymnocaulis*) ..... (2)
1' Flowers numerous, sessile or on short pedicels < 3 cm long; inflorescence a spikelike raceme or corymb; calyx with 2 subtending bractlets, lower corolla lobes usually with purple veins (sect. *Myzorrhiza*) ..... (3)

2. Stems slender, bearing 1–3 flowers; pedicel many times longer than the stem; calyx lobes longer than the calyx tube ..... ***O. uniflora***
2' Stems stout, bearing 3–12 flowers; pedicel equal to the stem or shorter; calyx lobes as long as or shorter than the calyx tube ..... ***O. fasciculata***

3. Inflorescence compactly corymbose; anthers woolly; pedicel 4–40 mm long; corolla 18–30 mm; plant 5–16 cm tall; placentae 2 ..... ***O. corymbosa***
3' Inflorescence an elongate raceme or spike; anthers glabrous or sparingly pubescent (except woolly in *O. multiflora*); plant 10–40 cm tall; placentae 4 ..... (4)

4. Corolla lobes pointed, triangular-acute or with apical tooth, 3–5 mm long; plant mostly dark purple ... ***O. cooperi***
4' Corolla lobes rounded (sometimes pointed in *O. ludoviciana*), 3–9 mm long; plant purple, rose-purple, lavender, or yellowish ..... (5)

5. Anthers woolly; plant grayish pubescent; flower 22–35 mm long, the lobes broadly rounded, calyx 14–20 mm long ..... ***O. multiflora***
5' Anthers glabrous or slightly pubescent; plant not grayish pubescent; flower 15–20 mm long, the lobes narrower than above, calyx 8–14 mm long ..... ***O. ludoviciana***

Orobanche cooperi (A. Gray) A. Heller (for James Graham Cooper, 1830–1902, ornithologist, surgeon-naturalist, and collector of plants) Desert broomrape. Fleshy, dark purplish aboveground. **STEMS** 10–40 cm tall, simple or branched,

often forming several stems from 1 base, yellowish belowground. **INFL** a spike or raceme, viscid glandular-pubescent. **FLOWERS** sessile or the lower pedicels less than 3 cm long, subtended by 2 narrow bractlets; calyx 8–12 mm long, lobes triangular, acuminate; corolla 18–32 mm, strongly constricted, purple, glandular, upper lip 5–10 mm long, the lobes triangular-acute or with an apiculate tooth, erect or reflexed; anthers variously pubescent or glabrous; stigma lobes 2, thin, recurved. $2n$ = 24, 48, 72. [*O. ludoviciana* Nutt. var. *cooperi* (A. Gray) Beck]. Sand dune, desert scrub, desert grassland, and piñon-juniper woodland communities. ARIZ: Apa, Coc, Nav; NMEX: San, SJn; UTAH. 1500–1980 m (4910–6500′). Flowering: May–Sep. Northern Arizona, southern Utah and Nevada, and northwest New Mexico. Our material belongs to **var. *cooperi***. Hosts are species of *Gutierrezia* in our area.

Orobanche corymbosa (Rydb.) R. S. Ferris (growing in clusters) Flat-topped broomrape, corymbose cankerroot. Fleshy, purplish or yellowish herbs. **STEMS** clustered or single, mostly below ground level, yellowish, 5–16 cm tall, erect, glandular-pubescent. **INFL** corymbose, sometimes narrow. **FLOWER** pedicel 4–40 mm long, the lower ones much longer than the upper, subtended by 2 narrow bractlets, perfect; calyx 12–20 mm long, the tube 2–7 mm long, the lobes 9–16 mm long; corolla 18–30 mm long, slightly constricted, light purple with pink guidelines on the lower lobes, upper lip 3–8 mm long, shallowly cleft; anthers woolly-pubescent. **FRUIT** a capsule, 8–14 mm long. $2n$ = 48, 96. [*Myzorrhiza corymbosa* Rydb.]. Shadscale, sagebrush, rabbitbrush, and piñon-juniper communities. COLO: Mon; NMEX: SJn. 1500–1970 m (5000–6500′). Flowering: May–Jul. Fruit: Jun–Aug. Washington and Oregon to Wyoming, south to Utah, Nevada, and California. Hosts are various species of *Artemisia.*

Orobanche fasciculata Nutt. **CP** (growing in bundles) Cluster broomrape, cluster cankerroot. Fleshy, purplish or yellowish herbs. **STEMS** solitary or clustered, mostly below ground level, 5–17 cm long, glandular-puberulent. **INFL** a raceme, pedicels 3–12 per stem, 3–25 cm long, equal to or shorter than the stem, bractlets absent. **FLOWERS** perfect; calyx 7–11 mm long, the lobes triangular, 3–5 mm long, shorter than the tube; corolla 15–30 mm long, purple to pinkish or yellow, the tube curved, slightly constricted, the lobes rounded, 2–5 mm long; anthers glabrous to woolly. **FRUIT** a capsule, 10–13 mm long. $2n$ = 24, 48. [*Phelipaea lutea* Desf.]. Rocky, sandy, or clay soils in saltbush, greasewood, sagebrush, rabbitbrush, cottonwood, piñon-juniper, and mountain brush communities. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1600–2320 m (5300–7650′). Flowering: May–early Jul. Fruit: Jun–Aug. Yukon Territory, British Columbia, south to California and Mexico, east to Oklahoma, Illinois, Indiana, and Michigan. Hosts are various species of *Artemisia*.

Orobanche ludoviciana Nutt. (of Louisiana) Louisiana broomrape, Louisiana cankerroot. Fleshy, yellowish or purplish herbs. **STEMS** solitary or clustered, 7–40 cm long, yellowish and glabrous belowground. **INFL** a raceme or spike, viscid glandular-pubescent, 4–20 cm long, purplish to rose. **FLOWERS** sessile or the lower ones on pedicels to 20 mm long; calyx 7–14 mm long, tube 2–5 mm long, the lobes 5–12 mm long; corolla 14–20 mm long, strongly constricted, purple, the throat pale, the lobes rounded or sometimes broadly triangular-acute, 3–7 mm long; anthers glabrous to sparingly pubescent. **FRUIT** a capsule, 7–10 mm long. $2n$ = 24, 38, 48, 72, 96. [*O. ludoviciana* var. *arenosa* (Suksd.) Cronquist]. Sandy soils in desert scrub, salt desert scrub, blackbrush, sagebrush, piñon-juniper woodland, and mountain brush communities. ARIZ: Apa; COLO: Mon; NMEX: RAr, San, SJn; UTAH. 1500–2270 m (5000–7500′). Flowering: May–Sep. Throughout the Great Plains in the United States and Canada, isolated populations in Washington, Oregon, Idaho, and western Colorado and New Mexico. Hosts are various species of *Artemisia* and other Asteraceae.

Orobanche multiflora Nutt. (many flowers) Manyflower broomrape. Fleshy, yellowish or purplish herbs. **STEMS** solitary or clustered, 10–40 cm long, glabrous and yellow belowground. **INFL** a dense raceme or thyrsoid, grayish viscid glandular-pubescent. **FLOWERS** sessile or on a short pedicel, densely pubescent; calyx 10–17 mm long; lobes unequal; corolla dark to light purple, the throat pale, 20–35 mm long, strongly constricted, upper lip 5–9 mm long, deeply cleft, lobes broadly rounded at the apex, often with purple veins in lower lobes; anthers woolly. **FRUIT** a capsule. Sandy soils in desert grassland, juniper, and piñon-juniper woodland communities. COLO: Mon; NMEX: McK, RAr, San, SJn. 1400–2800 m (4600–8500′). Flowering: Aug–Sep. Central and western New Mexico to southern Colorado.

Orobanche uniflora L. (single flower) Naked broomrape, one-flower cankerroot. Small, pale yellowish herbs. **STEMS** usually solitary, mostly below ground level, scaly, 0.5–5 cm long. **INFL** a raceme, glandular-pubescent. **FLOWER** pedicels bractless, 1–3 per stem, mostly 3–15 cm long, much longer than the stem; perfect; calyx 6–12 mm long, the lobes narrowly triangular-lanceolate, 4–9 mm long, longer than the tube; corolla 15–35 mm long, ochroleucous to purple, the tube curved, the lobes rounded, 2–7 mm long; anthers glabrous or woolly-pubescent. **FRUIT** a capsule, 8–10 mm long, ovoid. $2n$ = 36, 48, 72. [*Aphyllon uniflorum* (L.) A. Gray var. *occidentale* Greene]. Mostly rocky, moist places in sagebrush, piñon-juniper, mountain brush, and ponderosa pine communities. COLO: Mon; NMEX: SJn.

1600–2300 m (5300–7600'). Flowering: late Apr–Jul. Fruit: May–Aug. British Columbia south to California, northern Nevada, Utah, northern Arizona, western Colorado, and northern New Mexico. Our material belongs to **var. *occidentalis*** (Greene) Roy L. Taylor & MacBryde (western).

Orthocarpus Nutt. Owl-clover

(straight fruit, referring to the symmetrical capsules) Herbaceous annuals, mostly hemiparasitic. **STEMS** slender, erect. **LEAVES** alternate, sessile, entire to pinnately divided, wholly cauline. **INFL** a short to elongate spike or spicate raceme; bracts usually gradually differing from the leaves, some abruptly differing (wider), green to colored. **FLOWER** calyx tubular-campanulate, equally or unequally cleft into 4 lobes, the lobes often partly connate in lateral segments; corolla elongate and narrow, bilabiate, the upper lip galeate (hooded), beaklike, lobes united to the tip and enclosing the anthers, the lower lip somewhat saccate-inflated, less than or equal to the galea, usually 3-toothed, external to the upper in bud; stamens 4, in 2 sets of 2 stamens, attached near the summit of the corolla tube; anthers 2-celled, cells boat-shaped, unequal in size and placement, the outer one attached by its middle, the other suspended by its apex and smaller, sometimes obsolete; stigmas united and capitate. **FRUIT** a loculicidal capsule, ovoid to obovoid, more or less symmetrical, glabrous or rarely puberulent. **SEEDS** few to many, the seed coat reticulate or alveolate, often loose. $2n = 24$. A genus of about 25 species, of the western U.S., one species in Andean South America, formerly included in Scrophulariaceae (Keck 1927).

1. Corolla 9–14 mm long, yellow; galea more or less equaling the lower lip, the apex not hooked; stems strict or seldom branched; seeds 1.2–1.5 mm long ..... ***O. luteus***
1' Corolla 15–20 mm long, violet and white; galea noticeably longer than the lower lip, the apex projected into a small, forward-projecting beak; stems mostly with corymbose branching above; seeds 1.5–2.5 mm long ***O. purpureo-albus***

Orthocarpus luteus Nutt. (yellow) Yellow owl-clover. Herbaceous annuals, slender, erect. **STEMS** simple, rarely branched above, 8–30 (50) cm tall, glandular-pubescent and also with eglandular villous hairs. **LEAVES** 1.5–3.5 cm long, linear to linear-lanceolate, entire or the uppermost 3-lobed, glandular-puberulent. **INFL** a narrow spike, becoming elongate, the flowers usually short-pedicelled, glandular-puberulent; bracts leaflike at first, becoming shorter and wider, 3-parted, green. **FLOWER** calyx 6–8 mm long, the lateral clefts 1–2.5 mm deep, the median clefts unequal, 2–3.5 mm deep abaxially and 3–5 mm adaxially; corolla 9–12 (14) mm long, puberulent, yellow, the galea 2.5–4 mm long, short and broad, the lower lip and galea equal, simple-saccate, minutely 3-toothed, the tube gradually expanded into the pouch; anthers 2-celled, cells subequal, the upper 0.6–1.2 mm long, the lower 0.4–0.8 mm long, pubescent. **FRUIT** an elliptic capsule, 4.5–7 mm long. **SEEDS** several, 1.2–1.5 mm long, with a reticulate, wrinkled seed coat. $2n = 28$. Meadows, grasslands, stream edges, wetlands; sagebrush, oak, ponderosa pine, and aspen communities. ARIZ: Apa, Nav; COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 1500–3000 m (4900–9900'). Flowering: Jul–Sep. Fruit: late Jul–Sep. This, the most widespread species of *Orthocarpus*, occurs from British Columbia, Canada, to central California, east to Michigan, Minnesota, Nebraska, Colorado, and northern New Mexico.

Orthocarpus purpureo-albus A. Gray ex S. Watson (purple-white) Purple owl-clover. Herbaceous annual, erect. **STEMS** simple or usually branched above, 8–35 (55) cm tall; glandular-pubescent, purplish. **LEAVES** 1.5–3.5 cm long, linear to filiform, 3-parted, or the lowermost entire, the segments similar in shape, glandular-puberulent. **INFL** an elongate spike, many-flowered; bracts 3-parted from near the base, glandular-pubescent, green. **FLOWER** calyx 5–8 (9) mm long, glandular-pubescent, the lateral and abaxial clefts about 0.82 mm deep, the adaxial clefts 1.8–3 mm deep; vasculature dark green, becoming thick; corolla 15–20 mm long, the galea 3.5–5 mm long, puberulent, hooked at the tip, the lower lip 2.5–4.5 mm long from the base of the cleft, simple-saccate, without teeth; lower corolla violet, upper corolla violet with a white pouch; anthers 2-celled, cells subequal, the upper 0.9–1.2 mm long, the lower 0.7–1.1 mm long, puberulent. **FRUIT** a narrowly elliptic capsule, 6–7.5 mm long. **SEEDS** few, 1.8–2.5 mm long, with a deeply reticulate, angular seed coat. $2n = 28$. Sagebrush meadows and openings in piñon-juniper woodland, Gambel's oak, and ponderosa pine communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1830–2700 m (6000–8900'). Flowering: Jun–Sep. Fruit: Aug–Sep. Endemic to the Colorado Plateau of southeastern Utah, southwestern Colorado, northern and eastern Arizona, and western New Mexico.

Pedicularis L. Lousewort

(Latin *pediculys*, a louse) Presumed to become lice on sheep that contact them. Herbaceous perennials, hemiparasitic from fibrous or tuberous roots. **STEMS** erect, simple or branched. **LEAVES** alternate or basal, toothed to bipinnatifid. **INFL** a bracteate spike or spicate raceme. **FLOWER** calyx 2–5-lobed, the lobes unequally cleft; corolla bilabiate, red, purple, yellow, or white, the galea hooded, the lower lip 3-lobed; stamens 4, didynamous, glabrous; stigmas united,

capitate. **FRUIT** a loculicidal capsule, glabrous. **SEEDS** several, slightly winged. $x = 8$. About 400 species. Northern Hemisphere, mostly in the mountains of central and eastern Asia, one in the Andes of South America.

1. Flowers over 2 cm long; plants in loose clusters at ground level, often under piñon or juniper trees; blooming in early spring ..... ***P. centranthera***
1' Flowers less than 2 cm long; plants with erect stems; plants with basal or alternate leaves, not forming loose mats; wet mountain valleys, spruce-fir and alpine communities; blooming in summer ..... (2)

2. Calyx lobes 2; leaves simple, serrate to crenate ..... ***P. racemosa***
2' Calyx lobes 5; leaves pinnatifid or bipinnatifid ..... (3)

3. Corolla pink or purple ..... (4)
3' Corolla yellowish or white ..... (5)

4. Galea prolonged into a slender curved beak, the flower resembling an elephant's head; inflorescence glabrous or nearly so; flowers in an elongated spike ..... ***P. groenlandica***
4' Galea not beaked, with lateral broadly triangular teeth; inflorescence usually woolly-pubescent, sometimes glabrous; flowers crowded in a short spike ..... ***P. scopulorum***

5. Leaves shallowly or deeply pinnatifid, leaflets joined together by a common winged rachis; upper lip of corolla terminating in a prominent sickle-shaped beak; plants 0.5–3 dm tall ..... ***P. parryi***
5' Leaves compound, fernlike; corolla beakless; plants 3–11 dm tall ..... (6)

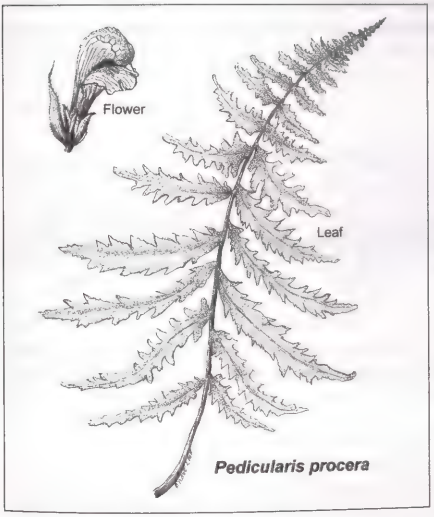
6. Plants much less than 1 m tall; corolla 20–26 mm long; calyx 7–10 mm long; lower lip not reaching the tip of the galea ..... ***P. bracteosa***
6' Plants up to 1 m tall; corolla 25–36 mm long; calyx 10–16 mm long; lower lip almost reaching the tip of the galea ..... ***P. procera***

Pedicularis bracteosa Benth. (having bracts) Bracteate lousewort. **STEMS** erect, glabrous, leafy, 3–9 dm tall. **LEAVES** pinnatifid, 7–16 cm long, linear to oblong-lanceolate, mostly cauline, the cauline sessile to short-petiolate, the basal long-petiolate. **INFL** a densely flowered spike, 5–45 cm long, the bracts 8–16 mm long, simple, lanceolate. **FLOWER** calyx 7–10 mm long, lobes 5, 3–5 mm long, the posterior one short, the anterior cleft the deepest; corolla 20–26 mm long, yellow or yellowish, the galea 9–12 mm long, extended above the lower lip, abruptly truncate, not beaked, the lower lip 4–6 mm long; anthers 1.8–2.5 mm long. **FRUIT** a capsule, 10–12 mm long, asymmetrical. $n = 16$. Engelmann spruce and corkbark fir, willow-grass, and alpine communities. COLO: Con, Hin, LPl, Min, Mon, RGr, SJn. 3300–3950 m (11000–13000'). Flowering: Jul–Aug. Fruit: Aug–Sep. Four Corners material belongs to **var. *paysoniana*** (Pennell) Cronquist [*P. paysoniana* Pennell]. Wyoming, Idaho, Montana, and Utah.

Pedicularis centranthera A. Gray (*centrum*, a prickle or sharp point, referring to the long-spurred anthers) Dwarf lousewort, piñon-juniper lousewort. **STEMS** from a tuberous root, shorter than the leaves, glabrous, 4–7 cm tall. **LEAVES** petiolate, pinnatifid, 6–15 cm long, the segments double-crenate to dentate. **INFL** a compressed spicate raceme, bracts leaflike, becoming reduced upward. **FLOWER** calyx 15–22 mm long, lobes 5, 6–9 mm long, ciliate; corolla 30–35 mm long, purple or yellowish, glabrous, anthers 3.8–4.7 mm long, aristate at the base. **FRUIT** a capsule, 10–13 mm long, ovoid, nearly symmetrical. **SEEDS** 3–4.5 mm long, curved or twisted. $n = 16$. Piñon-juniper, ponderosa pine, Douglas-fir, white pine, aspen, and Engelmann spruce communities. ARIZ: Apa, Nav; COLO: Dol, LPl, Mon, SMg; NMEX: McK, SJn; UTAH. 1950–3140 m (6400–10380'). Flowering: Mar–May. Fruit: Apr–Jun. The dwarf lousewort is found from near the base of Navajo Mountain to the top at 10380'. Oregon, Nevada, and Wyoming. The Shoshoni give this drug to children for stomachaches.

Pedicularis groenlandica Retz. **CP** (for Greenland) Elephant-head. **STEMS** often clustered, glabrous, 1.5–7 dm tall. **LEAVES** mostly basal, petiolate, pinnatifid, 5–25 cm long, the segments narrow, dentate to crenate. **INFL** densely spicate, bracts mostly shorter than the flowers. **FLOWER** calyx 3.5–5.5 mm long, lobes 5, about 1 mm long, entire, with prominent veins; corolla 10–15 mm long, violet to purple, strongly hooded, prolonged into an upturned beak, the lobes deflexed, resembling an elephant's head; anthers 1.5–2 mm long. **FRUIT** a capsule, 7–9 mm long, asymmetrical. **SEEDS** 3–3.5 mm, winged, reticulate. $2n = 16$. Mostly in wet areas and along rivulets in sedge-grass, spruce-fir, and alpine tundra communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3330–3940 m (11000–13000'). Flowering: Jun–Sep. Fruit: Aug–Oct. Across North America south to California and New Mexico. Powdered leaves and stems are taken for coughs by the Cheyenne.

Pedicularis parryi A. Gray (for Charles Christopher Parry, physician, botanist, and explorer) Parry's lousewort. **STEMS** clustered on a thick caudex, glabrous to villous, 0.5–3 dm tall. **LEAVES** basal and cauline, glabrous, the basal ones long-petiolate, pinnatifid, mostly 15–30 cm long, with irregularly serrate segments. **INFL** spicate, 15–35 cm long, villous, the bracts linear, entire to toothed, the lower ones longer than the flowers. **FLOWER** calyx 10–16 mm long, lobes 5, 3–5 mm long, the posterior one shorter; corolla 25–36 mm long, pale yellow, sometimes streaked with red, the galea 9–16 mm long, beakless but with 2 lateral teeth below the apex, the lower lip 7–12 mm long. **FRUIT** a capsule, 10–16 mm long, ovoid, subsymmetrical. $2n = 32$. Spruce-fir, sedge-forb, and alpine meadow communities. COLO: Con, Hin, LPl, Min, Mon, SJn. 3180–4090 m (10500–13500'). Flowering: Jul–Aug. Fruit: Aug–Sep. Wyoming and Utah, to Colorado, Arizona, and New Mexico. Our plants belong to **var. *parryi***.



Pedicularis procera A. Gray (tall) Gray's lousewort. **STEMS** erect, sometimes branched above, glabrous, 5–11 dm tall. **LEAVES** mostly basal, petiolate, pinnatifid, mostly 3–12 cm long, the segments toothed or incised. **INFL** spicate-racemose, 5–25 cm long, the bracts pinnately 3–7-lobed, glabrous to villous. **FLOWER** calyx 7–12 mm long, lobes 5, more deeply cleft in front; corolla 16–22 mm long, pink to pale yellow, the galea curved downward at the tip, 6–10 mm long, the beak straight; anthers 2–2.8 mm long. **FRUIT** a capsule, 10–14 mm long, asymmetrical. **SEEDS** 1.8–2.2 mm long. $2n = 16$. [*Pedicularis grayi* A. Nelson] Moderately moist aspen-fir, Gambel's oak–aspen, Douglas-fir, aspen–white fir, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn; UTAH. 2455–3090 m (8100–10200'). Flowering: Jul–Aug. Fruit: Aug–Sep. Wyoming and the Black Hills to Nebraska, south to Arizona and New Mexico. Sometimes used in Navajo ceremonies.

Pedicularis racemosa Douglas ex Benth. (raceme) Leafy lousewort. **STEMS** usually clustered, from a woody caudex, glabrous, 1.5–5 dm tall. **LEAVES** mostly cauline, short-petiolate, simple, serrate to crenate, 4–7 cm long. **INFL** a relatively loose raceme, some flowers in the upper leaf axils, bracts foliose below, reduced upward. **FLOWER** calyx 5–7.5 mm long, the lobes 2, obliquely ovate, 1.5–3 mm long, more deeply cleft in front; corolla 9–15 mm long, white or pale yellow, the galea 5–8 mm long, strongly arching and tapering into a slender decurved beak, the beak 5–7 mm long, the lower lip prominent, deflexed-spreading; anthers 1.8–2.4 mm long. **FRUIT** a capsule, 10–16 mm long, asymmetrical. **SEEDS** 1.6–2.1 mm long. $2n = 16$. Mostly in subalpine spruce-fir, aspen communities, and meadows. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2700–3640 m (8900–12000'). Flowering: Jun–Sep. Fruit: Jul–Oct. Western Canada south through Washington, Oregon, Idaho, Montana, and Wyoming to Arizona and New Mexico. Our plants belong to **var. *alba*** (Pennell) Cronquist.

Pedicularis scopulorum A. Gray (of the Rockies) Sudetic lousewort. **STEMS** erect, glabrous, 1–2 dm tall. **LEAVES** basal and cauline, petiolate, pinnately parted not quite to the midrib, the divisions lanceolate-toothed to incised, 3–8 cm long. **INFL** spicate, 3–20 cm long, bracts narrow, usually with narrow lateral divisions, lower and often longer than the flowers, the upper shorter. **FLOWER** calyx 8–10 mm long, arachnoid-villous, the lobes triangular-subulate; corolla 15–20 mm long, rose to purple, the galea about 10 mm long, curved near the end, with 2 broadly triangular teeth near the apex, not beaked. **FRUIT** a capsule, 10–15 mm long, asymmetrical. **SEEDS** mostly 3 mm long. [*Pedicularis sudetica* Willd. subsp. *scopulorum* (A. Gray) Hultén]. Wet areas in alpine communities. COLO: Con, Hin, Min, SJn. 3370–3940 m (11130–13000'). Flowering: Jul–Aug. Fruit: Aug–Sep. Wyoming, Colorado, and New Mexico.

Rhinanthus L. Rattleweed, Yellowrattle

(nose or snout flower, referring to the beaked upper lip of a flower; not relevant as the species that this refers to has been removed from the genus) Caulescent, herbaceous annuals; scabrous. **STEMS** erect, 4-angled, branching. **LEAVES** opposite, sessile, rather thick and rigid, scabrous, linear to lanceolate, sharply serrate or dentate. **INFL** a dense, subspicate raceme, often secund upward, bracts leafy. **FLOWER** calyx 4-toothed, becoming bladderlike but

compressed, with prominent veins in fruit; corolla yellow, at least the tube, bilabiate, the upper lip arched (galeate) and minutely 2-toothed below apex, lower lip shorter, with 3 spreading lobes; stamens 2 differing sets, ascending under the upper lip, anthers pilose, anther sacs equal, parallel; stigma united and capitate, at the summit of the downcurved (abaxially) style. **FRUIT** an orbicular-compressed capsule, dehiscence loculicidal. **SEEDS** several, winged. A genus of 45–50 species, formerly included in Scrophulariaceae.

Rhinanthus minor L. (smaller, inferior, or lesser) Lesser rattleweed. Herbaceous annual, hemiparasitic. **STEMS** (14) 20–80 (180) cm tall, often pilose in longitudinal lines, simple or branching, frequently black-spotted. **LEAVES** linear to lanceolate, 2–3.5 cm long, acute, serrate to dentate, strigose, sessile. **INFL** a secund, leafy spike, puberulent to glandular-villous. **FLOWER** calyx 9–12 mm long, becoming bladdery-inflated, with prominent veins; corolla 7–10 mm long, light yellow, upper lip (galea) with 2 purple or whitish teeth. **FRUIT** a capsule, 5–12 mm long, orbicular, flat. **SEEDS** orbicular, flattened, 2.5–3.5 mm wide. [*Rhinanthus borealis* Chabert; *R. rigidus* Chabert] Meadows, clearings, and wooded slopes. COLO: Arc, Con, Hin, LPl, Min, Mon; NMEX: RAr. 2130–2750 m (7000–9000'). Flowering: Jun–Sep. Fruit: Jul–Oct. Alberta south to Colorado, westward to Alaska, and south to Arizona and Washington. Our material belongs to **subsp**. ***borealis*** (Sterneck) Á. Löve (northern).

OXALIDACEAE R. Br. WOODSORREL FAMILY

Eve Emshwiller, Kenneth D. Heil, and J. M. Porter

Ours annual or perennial herbs with sour juice; some with creeping rhizomes or bulbs. Worldwide includes subshrubs, shrubs, and even trees. **LEAVES** palmately or pinnately compound or monofoliolate, usually with petioles. **INFL** cymes, sometimes umbellate, or solitary on axillary peduncles. **FLOWERS** perfect, regular; most heterostylous; 5 distinct sepals; 5 distinct petals; stamens 10, united at the base; pistil 1, superior, ours with 5 carpels, the locules equaling carpels in number; styles 5, distinct. **FRUIT** a capsule in ours. **SEEDS** appear arillate, but aril is actually outer integument, which explodes to disperse the seeds. $x = 5–12$. Five genera, over 600 species; worldwide, tropical to temperate. This family is much more diverse elsewhere than in the Four Corners. Includes *Averrhoa*, *Sarcotheca*, and *Lepidobotrys*.

Oxalis L. Woodsorrel

(Greek *oxys*, sour) Ours are perennial or annual herbs, some with bulbs or underground rhizomes, caulescent or acaulescent. **LEAVES** petiolate, palmately compound, 3–11 obcordate leaflets. **FLOWERS** perfect, tristylous, distylous, or homostylous, the petals clawed and coherent near the base; stamens 10, obdiplostemonous; pistil 5-carpelled; styles 5, free, the ovary superior. About 575 species. The juice contains oxalic acid but may be used in salads in moderation. Many species are used as ornamentals; however, some have become weeds. During collection, note flower color and be sure to collect underground parts to ensure identification (Ornduff and Denton 1998; Denton 1973; Eiten 1963). Worldwide the genus includes subshrubs and small shrubs, but not trees. Found mostly in southern Africa and South America.

1. Plants with basal leaves originating from a bulb; orange calli (or black when dry) at apices of sepals and often on leaves; flowers purple, blue, pink, or rarely white, not yellow ..... (2)
1' Plants with aerial stems, without bulbs; calli absent; flowers yellow ..... (3)

2. Bulb scales usually with 5 or more (up to 30) nerves, rarely 3; leaves on mature plants with 5–13 leaflets (3–4 in juvenile plants), lacking calli on leaflets ..... ***O. decaphylla***
2' Bulb scales 3-nerved; 3–5 leaflets, with or without calli ..... (4)

3. Septate patent hairs (at 40×) present on stems, petioles, or pedicels; erect stems arising from a slender fleshy underground rhizome, lacking stipules; lacking taproot; pedicels may be horizontal or erect, but not deflexed in fruit ..... ***O. stricta***
3' Septate hairs (at 40×) absent from stems, petioles, or pedicels; erect, prostrate, or decumbent stems arising from a thickened taproot; stipules present, pedicels in fruit usually deflexed ..... (5)

4. Flanges extending along petiole bases 0.5–1.5 cm above the bulb; leaflets 3–5, calli absent, or present only at distal end of lobes ..... ***O. caerulea***
4' Flanges absent above bulb; leaflets 3, calli absent or randomly distributed ..... ***O. alpina***

5. Seeds brown, rarely with whitish lines on the transverse ridges; stems creeping, often rooting at nodes, hairs on stems variously patent, ascending, retrorse, or absent; in gardens, lawns, and greenhouse soil ..... ***O. corniculata***
5' Seeds with conspicuous whitish lines on the transverse ridges; stems mostly erect, or decumbent at the base, not rooting at nodes; white hairs on stems appressed upward ..... ***O. dillenii***

Oxalis alpina (Rose) R. Knuth (growing in the alpine) Alpine woodsorrel. Bulbs 0.8–2 cm long, up to 20 bulblets. **LEAVES** basal, 4–30 cm tall; leaflets 3, 1–3 cm wide, usually wider than long. **INFL** 1–7-flowered; pedicels less than 4 cm long. **FLOWERS** usually tristylous, some distylous or homostylous, purple, pink, or white, petals up to 27 mm long. **FRUIT** an ellipsoid capsule, 5–12 mm long. **SEEDS** 1–1.5 mm long. ||*O. metcalfei* Small|| $2n$ = 14, 28, 42, 56, 84. Moist, rocky places in pine-oak and coniferous forests. COLO: Arc, Hin, LPl, Min; NMEX: McK. 1800–2700 m (6000–9000'). Flowering: Jul–Sep. Fruit: Aug–Oct. New Mexico, Arizona, Texas south to Guatemala. Sometimes mistaken for *O. violacea* L., a species that is more common in the eastern half of the United States, but which is not confirmed in the study area. The capsule differs in *O. alpina* in being longer, 5–12 mm, and cylindrical, whereas in *O. violacea* it is 4–6 mm and globose. The seeds of *O. alpina* have more prominent longitudinal ridges and those of *O. violacea* have more prominent transverse ridges. The calli on the sepal apices of *O. alpina* do not occupy the entire sepal apex whereas on *O. violacea* they do.

Oxalis caerulea (Small) R. Knuth (blue) Blue woodsorrel. Bulbs 0.8–1.5 cm long, bulblets rarely formed, bulb scales 3-nerved. Flanges at petiole bases extend 0.5–1.5 cm above the bulb. **STEMS** absent. **LEAVES** basal, leaflets 3–5, 5–12 mm long and equally wide, notched 1/5 to 2/5 of their length, calli absent or only on distal end of each lobe. **INFL** 1–5-flowered, pedicels 6–14 mm long, glabrous. **FLOWERS** distylous, corolla 9–14 mm long, rose-red to pinkish lavender, yellow-green at base; sepals with 2 calli 0.4–0.8 mm long, confluent or separate. **FRUIT** an ellipsoid capsule, 3.5–6 mm long, glabrous. **SEEDS** 1 mm long, with both transverse and longitudinal ridges. Rocky hillsides, pine forests. ARIZ: Apa; NMEX: McK. 2000–2300 m (6560–7010'). Flowering: Apr–Aug. Fruit: Jul–Aug. Arizona, New Mexico, and Mexico.

Oxalis corniculata L. (with small hornlike appendages) Bulbs absent. **STEMS** creeping or decumbent, to 40 cm long, often rooting at the nodes, hairs pointed in all directions. **LEAVES** cauline; leaflets 3, to 2 cm long, often purplish. **INFL** 2–5-flowered; pedicels less than 1 cm long. **FLOWERS** homostylous, yellow, petals 4–8 mm long. **FRUIT** a cylindric capsule, angled, 10–20 mm long, hairs spreading, mostly short with few long hairs intermingled. **SEEDS** 1.2–1.5 mm long. $2n$ = 24, 28, 44, 48. Common in lawns, gardens, disturbed sites, greenhouses, and occasionally escaping to woodlands and grasslands. COLO: Arc, Hin, Mon; NMEX: McK, SJn. 1525–2440 m (5000–8000'). Flowers all year, pantropical, introduced weed in temperate zones worldwide. Used as a drug, food, and a yellow dye.

Oxalis decaphylla Kunth (with ten leaflets) Tenleaf woodsorrel. Bulbs 1–2 cm or more long; bulblets seldom formed, fewer than 10 when present; bulb scales (3) 5–20 (–30)-nerved. **STEMS** absent. Septate hairs on the scapes and the petioles. **LEAVES** cauline, leaflets 5–13 (3–4 on juvenile plants), usually 1.5–13 times longer than wide, rarely as wide as long, leaflets lobed at least 1/6 of length, lacking calli. **INFL** 6–11-flowered, pedicels 11–27 mm long. **FLOWERS** distylous; calli on sepals 2, 0.2–1 mm long, orange, usually confluent; corolla 9–17 mm long, petals pinkish purple, pink, or lavender, tubes yellow or yellow-green. **FRUIT** an ellipsoid capsule, 3–11 mm long. **SEEDS** 0.8–1.2 mm long, with transverse and faint longitudinal ridges. Disturbed habitats near oak, pine, and fir forests, grasslands, and thornscrub communities. 1830–2440 m (6000–8000'). ARIZ: Apa, Nav. Flowering: May–Oct. Fruit: Jun–Oct. Southwestern United States to central Mexico.

Oxalis dillenii Jacq. (for J. J. Dillenius) Bulbs absent. **STEMS** erect or decumbent, to 40 cm long, hairs antrorse, pointed, nonseptate. **LEAVES** cauline; leaflets 3, 4–18 mm long. **INFL** umbelliform, 1–5-flowered; pedicels 10–30 mm long. **FLOWERS** yellow, petals 5–12 mm long. **FRUIT** a cylindric capsule, 8–25 mm long, strigose. **SEEDS** 1–1.5 mm long, brown with white spots or lines on transverse ridges. $2n$ = 16, 18, 20, 22. Grassy openings in coniferous forest. COLO: Arc, Hin. 2270–2600 m (7500–8500'). Flowering: Jun–Sep. Fruit: Jul–Sep.

Oxalis stricta L. (very upright) Bulbs absent. Main root not thicker than stem. Mature plants with herbaceous underground rhizomes. **STEMS** usually erect, unbranched, to 75 cm tall, with spreading septate trichomes. **LEAVES** cauline, leaflets 3, 5–20 mm long. **INFL** 2–7-flowered; regularly cymose (dichasial), peduncles 8–10 cm long. **FLOWERS** may be homostylous or heterostylous; petals yellow, 3.5–11 mm long. **FRUIT** cylindrical, 8–15 mm long, with spreading septate hairs. **SEEDS** 0.8–1.3 mm long. $2n$ = 18, 24. Montane grasslands. COLO: Hin; NMEX: McK, SJn. 1980–2575 m (6500–8500'). Flowering: Jun–Aug. Fruit: Jul–Sep. Used as a drug, food, and a yellow dye.

PAPAVERACEAE Juss. POPPY FAMILY

Lynn M. Moore

Perennial herbs with milky or colored juice. **LEAVES** basal or alternate, dissected, toothed, or lobed. **INFL** solitary or few to several in cymes or racemes. **FLOWERS** regular; perfect; sepals 2 or 3, separate, completely enclosing bud before anthesis, caducous; petals 4–6, separate; ovary superior, carpels 2 to many; stigma large, discoid, lobed, and dry; stamens numerous, distinct in several whorls, anthers 2-loculed. **FRUIT** a poricidal or septicidal capsule. $x = 5$, 6, 7, 8–11, or 19. Worldwide distribution mainly in the Northern Hemisphere. Seventeen genera and 63 species in North America (26 genera and 250 species worldwide). All members of the Papaveraceae produce latex. The family is famously known for the opium poppy, *Papaver somniferum*, an important plant in medicine and problematic as an illegal drug (Kiger 1997; Heywood 1993; Zomlefer 1989).

1. Petals white, sometimes lavender; leaf blades and capsules stoutly armed with prickles ..... ***Argemone***
1′ Petals yellow; leaf blades and capsules not prickly, although pubescent with hispid hairs ..... ***Papaver***

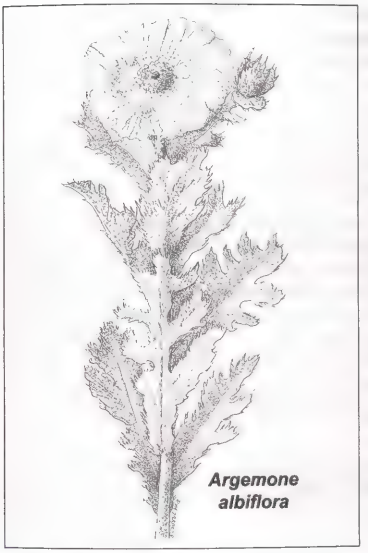
Argemone L. Prickly Poppy

(Greek *argemos*, "a white spot (cataract) on the eye" which this plant was once supposed to cure) Plants annual or perennial herbs or subshrubs from taproots; sap yellow or orange; caulescent, leafy, and branching. **LEAVES** sessile, basal rosulate, cauline alternate; blade unlobed or lobed; dentate, each tooth spine-tipped; glaucous; unarmed or prickly; glabrous or hispid. **INFL** terminal cyme; bracteate. **FLOWER** sepals 2–3, prickly; petals 6 in 2 whorls of 3; white, sometimes pale lavender; carpels 3–4 (5), locule 1, style short, stigma 3–4 (5)-lobed; stamens 20–250 or more. **FRUIT** capsule erect, 3–5 (7)-valved, grooved over sutures, prickly. **SEEDS** numerous; subglobose; minutely pitted. Tropical and temperate North America, South America, and Hawaii; introduced elsewhere. Thirty-two species (three in our flora). A revision is currently under production by Andrea Schwarzbach of Kent State University. The revision is working through significant problems with species boundaries and hybridization. Molecular data have been helpful in elucidating some of these problems and will likely play a significant role in working through the revision. All prickle characters that deal with density or presence or absence of prickles do not work well in *Argemone* because exceptions exist for all of these characters and species. Gerald Ownbey spent many years investigating this genus and wrote a 1958 revision of *Argemone* in North America and the West Indies. Unfortunately, Ownbey's keys do not adequately separate the species that occur in the San Juan River drainage. Upon completion of the revision, new insight will hopefully be available to further separate this genus in a satisfactory way; until then it is recommended that fresh material and observations of shape in the field be noted to aid in identification (Schwarzbach, personal communication 2006; Ownbey 1958).

1. Prickles along primary veins on both upper and lower leaf surfaces; leaf blades thick and leathery; latex bright orange when fresh; sepal horns sometimes flattened ..... ***A. corymbosa***
1′ Prickles on upper surface absent or sparingly armed along veins; leaf blades succulent; latex yellow when fresh; sepal horns terete ..... (2)

2. Sepal horns wider at the base, gradually narrowing from the main body of sepals, sepal horns often devoid of prickles; during early stages of flowering, shape of plant rectangular and leaf length uniform throughout plant ..... ***A. albiflora***
2′ Sepal horns distinctly narrowing from the main body of sepals; sepal horns with prickles; during early stages of flowering, shape of plant triangular and lower leaves longer than upper leaves ..... ***A. pleiacantha***

Argemone albiflora Hornem. (white-flowered) Bluestem prickly poppy. Plants annual or biennial herbs with bright yellow latex (when fresh). **STEMS** 1–5; 4–8 (12) dm tall; cymosely branched; shape during early stages of flowering rectangular. **LEAVES** glaucous, succulent; oblanceolate; lobed to 2/3 the distance to the midrib; prickles along primary veins on lower surface only; leaf length during early stages of flowering uniform throughout the plant. **FLOWERS** 7–10 cm in diameter; sepal horns 6–10 (15) mm long; terete, wider at the base, gradually narrowing from the main body of sepals; sepal horns often devoid of prickles. **FRUIT** capsule 35–50 mm long; elliptic; spines stout, widely spaced, spreading to recurved, the largest 8–10 mm long. **SEEDS** about 2 mm across. $x = 14$. [*A. alba* F. Lestib.]. Prairies, foothills, and mesas, on roadsides, sandy areas, and often disturbed sites. ARIZ: Apa; COLO: Dol, LPl, Mon; NMEX: SJn; UTAH. 1125–1900 m (3700–6000′). Flowering: Apr–Jun. Native to North America from the Midwest to the Great Basin. Work by Andrea E. Schwarzbach shows very little if any difference between *A. albiflora* and *A. polyanthemos*. She



proposes that *A. polyanthemos* is a synonym for *A. albiflora*. Molecular data support this as well. Ownbey's keys in the *Flora of North America* provide for a wide range of overlap in characters between the two taxa and application of the keys to our material is not satisfactory. This taxon has also been called *A. intermedia*, but this name has been misapplied and is a nomen confusum. This name cannot be applied to any species of *Argemone* with assurance. Accurate identification of this species and *A. pleiacantha* is difficult. Of the two taxa, *A. albiflora* is more common in the Four Corners flora. Fresh material and field observations of overall shape in the early stages of flowering (i.e., some flowers, some buds, but no ripe fruits) and differences in leaf length throughout the plant will certainly aid identification. Dried specimens are problematic, as important characters such as the shape and the relative thickness of the sepal horns from the base of the horn to the tip of the horn can be lost in the pressing process. Four Corners material belongs to **subsp. *albiflora***.

Argemone corymbosa Greene (from the stem; meaning cluster of fruit or flowers) Mojave prickly poppy. Plants perennial herbs with orange latex (when fresh). **STEMS** 1–5; 2–6 dm tall; moderately branched. **LEAVES** glaucous or green; blades thick and leathery; elliptic, lanceolate to oblanceolate; lobes 1/2 to 4/5 the distance to the midrib; prickles along primary veins on both upper and lower surfaces. **FLOWERS** 4–8 cm in diameter; sepal horns 5–7 mm long, sometimes flattened in a tangential plane. **FRUIT** capsule 25–35 mm long; ovate to lanceolate; spines stout, equal-sized, speading, the largest 5–6 mm long. **SEEDS** bluish black, about 2 mm across. $x = 14$. [*Argemone corymbosa* var. *arenicola* (G. B. Ownbey) Shinners]. Dry desert valleys and plains in stabilized or actively moving sand dunes. UTAH. 1125–1500 m (3700–5000'). Flowering: May–Jun, also blooming in fall under favorable conditions. Endemic to Arizona and Utah. Apparently restricted to actively moving or stabilized rust-colored sand. This taxon has been called *A. intermedia* but this name has been misapplied and is a nomen confusum. This name cannot be applied to any species of *Argemone* with assurance. This taxon is more readily identifiable than the other two. The leaves consistently have stout, even-sized spines along the veins on both sides of the leaf surfaces, although more so beneath than above. Fresh material will aid in identification as this species has bright orange latex whereas the other two taxa have yellow latex. Our material belongs to **subsp. *arenicola*** G. B. Ownbey (living in sand).

Argemone pleiacantha Greene (with radiating spines) Southwestern prickly poppy, cowboy fried eggs. Plants annual or perennial herbs with bright yellow latex (when fresh). **STEMS** 1–several from the base; 5–15 dm tall, sparingly branched in the upper 1/2; shape during early stages of flowering triangular. **LEAVES** glaucous, succulent; oblanceolate to elliptic-lanceolate; lobes 4/5 the distance to the midrib; prickles on upper surface absent or sparingly armed along veins; leaf length during early stages of flowering longer in the lower leaves than the upper ones. **FLOWERS** 8–12 (16) cm in diameter; sepal horns 4–12 mm long; terete or flattened; more or less equal in diameter at the base and at the tip, distinctly narrowing from the main body of sepals; sepal horns with prickles. **FRUIT** capsule 25–45 mm long; ovate to elliptic-lanceolate; mostly closely prickly, surface partially obscured, spines straight or incurved, the largest 4–6 mm long. **SEEDS** 2–2.5 mm across. $2n = 28$. Prairies, foothills, and mesas, on roadsides, sandy areas, and often disturbed sites. ARIZ: Apa. 1525–2200 m (5000–7300'). Flowering: May–July. Native to the southwestern United States and northern Mexico. Our material belongs to **subsp. *pleiacantha***. *Argemone pleiacantha* subsp. *pleiacantha* can be confused with *A. albiflora* because of the smooth upper surface of the leaves. They can sometimes be distinguished by the sepal horns; *A. albiflora* has horns devoid of prickles whereas *A. pleiacantha* subsp. *pleiacantha* has sepal horns with prickles. But this character does not hold true for all specimens. The relative thickness of the sepal horns from the base of the horn to the tip of the horn is apparently a more consistent character and is best discerned when fresh. This species, like *A. albifora*, is difficult to identify. Fresh material and field observations of overall shape in the early stages of flowering (i.e., some flowers, some buds, but no ripe fruits) and differences in leaf length throughout the plant will certainly aid identification. Dried specimens are problematic, as important characters such as the shape and relative diameter of the sepal horns are lost in the pressing process.

Papaver L. Poppy, Pavot

(classical Latin for the poppy flower) Plants annual, biennial, or perennial herbs with taproots; sap white; scapose. **LEAVES** cauline, basal rosettes; subsessile, petiolate; blades lobed, entire, dentate, crenate, or incised; hispid with light brown trichomes. **INFL** cymose on long scapes or peduncles; bracteate, buds nodding. **FLOWER** sepals 2–3, distinct; petals 4–6; yellow; carpels 3–18 (22); locule 1, sometimes multilocular by placental intrusion; style absent; stigma 3–18 (22); stamens numerous. **FRUIT** capsule erect; 3–18 (22) valves; pubescent. **SEEDS** many; minutely pitted. Temperate and Arctic North America. Seventy to 160 species (one in our flora). The poppy is known for its alkaloid compounds, primarily opiates. Native North American poppies are scapose and occur primarily in Arctic and alpine regions.

Papaver radicatum Rottb. **CP** (from stem, meaning to take root) Alpine poppy, Arctic poppy. Plants perennial herbs with milky sap. **STEMS** loosely caespitose; 12–15 cm tall; persistent leaf bases. **LEAVES** gray to blue-green on both sides; 2–8 cm long; pinnately lobed into 5 unequal elliptic segments. **INFL** scapose; peduncles with short, light brown hairs. **FLOWER** petals 4 (6); yellow (pink-tinged or brick-red); 2 cm broad or less; stamens approximately 25; filiform; anthers yellow. **FRUIT** capsule ellipsoid-subglobose to oblong-obconic; strigose; hairs light brown. $2n = 42, 56$. [*P. kluanensis* D. Löve]. Dry, rocky, alpine or Arctic ridges. Known from a single collection on Mount Windom, San Juan Mountains, by C. W. Pendland in 1933. COLO: LPl. 4055 m (13300'). Flowering: Jun–Aug. Native to North America with disjunct occurrences from Alaska, across the Yukon, Alberta, British Columbia, Idaho, Montana, Wyoming, Utah, Colorado, and New Mexico (Murray 1995; Löve 1969). The San Juan Mountain material belongs to **subsp**. ***kluanense*** (D. Löve) D. F. Murray (for the Kluane Range, Yukon).

PARNASSIACEAE Martinov GRASS-OF-PARNASSUS FAMILY

Roy Taylor

(for Mt. Parnassus, Greece) Perennial herbs, glabrous, somewhat succulent. **LEAVES** mostly basal, petiolate, the blade simple, palmately veined; the cauline leaves (if any) reduced, sessile, often clasping, alternate; stipules lacking. **INFL** of solitary flowers. **FLOWERS** showy, regular, perfect; sepals 5, connate at the base; petals 5, sessile or clawed, the margin entire to fimbriate; androecium of 5 staminodia alternating with 5 functional stamens, alternate with the petals; gynoecium of (3) 4 carpels, the ovary 1-locular, superior or partly inferior; ovules numerous on each placenta. **FRUIT** a loculicidal capsule. **SEEDS** numerous, small, with a winglike testa (Cronquist, Holmgren, and Holmgren 1997a).

Parnassia L. Grass-of-Parnassus

Perennial, glabrous herb from short rootstock. **LEAVES**: basal leaves entire. **STEMS** with or without solitary, entire bract. **FLOWERS** solitary, terminal, perfect, regular; hypanthium calyxlike, sometimes nearly obsolete; sepals 5; petals 5, white; stamens 5, alternating with clusters of gland-tipped staminodia; ovary superior or slightly inferior, 1 locule, styles short or lacking; stigmas 3 or 4, sessile or subsessile. **FRUIT** a capsule, loculicidal. **SEEDS** numerous, cellular-reticulate.

1. Petals fringed or comblike on lower 1/2 ..... ***P. fimbriata***
1' Petals not fringed or comblike on lower 1/2, entire ..... (2)

2. Flowering stems bractless or with near basal bract; petals 1–3 (5)-veined ..... ***P. kotzebuei***
2' Flowering stems usually with bract above level of basal leaves, petals usually 7–13-veined ..... ***P. palustris***

Parnassia fimbriata K. D. Koenig (fringed) Fringed grass-of-Parnassus. Perennial, glabrous herb from short rootstocks with fibrous roots. **FLOWERING STEMS** 1–several, 15–30 cm tall; single bract cordate, clasping stem, 5–17 mm long, inserted at or considerably above middle of scape. **LEAVES** with petioles 2–16 cm long, blades reniform, orbicular, or broadly ovate, cordate or truncate at base; blade 12–45 mm wide and long. **FLOWERS** solitary, terminal; hypanthium nearly obsolete; sepals 4–7 mm long, 2–4 mm wide, sometimes fimbriate; petals 8–15 mm long, including clawlike base, strongly fimbriate below middle; staminodia thickened, scalelike, flared above middle. **FRUIT** a capsule to 1 cm long. [*P. rivularis* Osterh. ex Rydb.]. Montane to alpine, tundra; mixed forest, often along moist seeps, creeks. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2745–3500 m (9000–11485'). Flowering: Jul–Sep. Alaska, Yukon, and western Northwest Territories, east to Alberta, south to California and New Mexico.

Parnassia kotzebuei Cham. ex. Spreng. (for Otto von Kotzebue, 1787–1846, Russian navigator and commander of northern Pacific exploring expeditions) Perennial herb. **FLOWERING STEMS** mostly single, 2 or 3, rarely as many as 7; usually bractless, if present near base, bract ovate to lanceolate, nonclasping, to 15 mm long. **LEAVES** with petiole of basal leaves equal to or considerably longer than blade; ovate or deltoid-ovate to nearly elliptic, 5–20 mm long;

base of leaf from truncate to tapered. **FLOWERS** 1 per scape; calyx adnate to ovary for 1–4 mm, sepals to 7 mm long, usually 3-nerved; petals elliptic-lanceolate or elliptic-ovate, mostly equal to calyx lobes, 1–3-veined, filaments slender, equaling the sepals, much longer than the staminodia. **FRUIT** a capsule up to 1 cm long. COLO: SJn. 3655 m (12000'). Flowering: Jul–Aug. Alaska, Yukon, and Northwest Territories to Greenland and Labrador, south in the western mountains to Washington, Montana, Idaho, Wyoming, Colorado, and Nevada.

Parnassia palustris L. (marsh) Marsh parnassia. Perennial, glabrous herb. **FLOWERING STEMS** 1 several, erect, 8–44 cm tall, 1 sessile leaf 3–22 mm long, linear to ovate, sometimes clasping, borne mostly below middle of stem. **LEAVES** with petioles 0.7–4 cm long; blades 7–27 mm long, 5–20 mm wide, ovate to nearly orbicular; mostly cuneate or obtuse at base, rarely truncate. **FLOWERS** solitary, terminal; hypanthium about 2 mm long; sepals 3–10 mm long, petals 6–14 mm long, including narrow claw, entire, white; staminodia with thickened scalelike base, flared upward, divided into 5–11 slender filamentous segments, terminating in capitate knobs. **FRUIT** an ovoid capsule 8–12 mm long. [*P. parviflora* DC.; *P. montanensis* Fernald & Rydb.]. Montane to subalpine, tundra; mixed conifer/deciduous forest; along water, with forbs, grasses. ARIZ: Apa; COLO: Arc, Hin, LPl, SJn; NMEX: SJn. 2250–3070 m (7390–10075'). Flowering Jul–Aug. Quebec south to Colorado, Nevada, and California.

PEDALIACEAE R. Br. SESAME FAMILY (includes MARTYNIACEAE)

Linda Mary Reeves

Herbs and a few shrubs, with stalked, broad-headed, glandular pubescence, often giving the plant surface a sticky appearance. **LEAVES** opposite, occasionally alternate, simple, entire to toothed or shallowly lobed. **INFL** a terminal or axillary raceme, cyme, or solitary. **FLOWERS** perfect; bracts often present beneath the calyx; sepals 4–5, often somewhat united; corolla zygomorphic, occasionally weakly spurred at base, lobed and often distinctly marked; stamens attached to the corolla, 1 or more of the stamens represented by a staminode; stigma bifid; ovary superior, bilocular or unilocular and secondarily quadrilocular. **FRUIT** a capsule, drupe, or nut, often with various hooks or prickles that aid in animal distribution. About 20 genera and 80 species, primarily dry and shore areas of the Old World tropics or subtropics. *Sesamum indicum*, native to tropical Asia, produces sesame seeds and oil. *Harpagophytum procumbens*, the grapple plant of South Africa, is also a member of this family.

Proboscidea Schmidel Unicorn Plant, Devil's Claw, Cinco Llagas

(Greek for proboscis-like fruit) Herbs with a pungent odor and sticky, mucilaginous secretions on all green parts. **STEMS** generally upright, but sometimes clambering and viny. **LEAVES** mostly opposite, glandular-pubescent; bract beneath petiole small, often deciduous. **INFL** in terminal racemes; pedicels lengthening and thickening as fruit develops on inflorescence. **FLOWERS** with calyx membranous, 5-lobed; corolla 5-lobed, weakly bilabiate; functional stamens 4, paired; ovary initially unilocular, becoming secondarily quadrilocular. **FRUIT** a capsule with initially fleshy, deciduous exocarp and a single stout, incurved beak, the endocarp becoming woody and dehiscent, ventrally crested, the beak splitting into 2 sharp, curved horns that become tangled in animal feet and hooves, allowing seeds to be dispersed from the opening between the horns. $x = 8, 13, 14, 15, 18$. Young fruits sometimes picked and eaten by many tribes. About 10 species, most in warm-temperate or subtropical North America.

1. Inflorescence with 8–20 flowers per raceme; flowers very inflated and open, 3.5–5.5 cm long and strongly colored ..... ***P. louisiana***
1' Inflorescence with up to 10 flowers per raceme; flowers 2.5–3.5 cm long, mostly dull or pale colored ..... ***P. parviflora***

Proboscidea louisiana (Mill.) Thell. (from Louisiana, alluding to southern United States distribution) Unicorn plant, ram's horn. Weedy, clambering annual 20–25 cm tall. **INFL** a raceme with up to 20 or more flowers. **FLOWERS** conspicuous; calyx deciduous; corolla zygomorphic, inflated, open, 3.5–5.5 mm long, pale pink, yellow, and white, often with darker pink, bluish or purplish, and/or yellow markings. **FRUIT** often with "horns" 2 to 3 times longer than mature fruit body. [*Martynia louisiana* Mill.]. Fields, cattle feedlots or grazing areas, probably introduced with livestock feed. COLO: Mon; UTAH. 1700–2500 m (5500–8300'). Flowering: Jun–Sep. Fruit: Jul–Sep. Southern United States to California, south to Mexico and Central America.

Proboscidea parviflora (Wooton) Wooton & Standl. (small-flowered) Devil's claw, unicorn plant, doubleclaw. Taprooted annual, blooming when a young, upright plant, but continuing to bloom while growth continues as the plant becomes clambering and sprawling in habit, depending upon moisture available, up to 60 cm tall and 2 m wide. All green sur-

faces covered with viscid pubescence. **LEAVES** cordate to triangulate; entire to weakly toothed or lobed; to 20 cm long, about as wide as long; petioles as long as blade. **INFL** a raceme with up to 10 flowers, often much fewer. **FLOWERS** zygomorphic; calyx subtended by deciduous bracts; corolla 2.5–3.5 cm long, 1–1.5 cm wide, pale to dull yellowish, pinkish, or purplish, often with darker purplish splotch on upper lobe. **FRUIT** dark gray or black, 15–35 cm long, 1.5–2.5 cm wide, fimbriate-crested; "horns" quite variable in length, 2.5–25 cm. [*Martynia parviflora* Wooton]. Blackbrush, desert scrub, roadsides, and fields. ARIZ: Apa; NMEX: SJn. 1500–1900 m (5000–6300'). Flowering: Jun–Sep. Fruit: Jul–Oct. Utah to New Mexico, south to Sonora, Sinaloa, and Chihuahua. The "horns" of the dry, mature fruit easily catch in the feet of hoofed animals, which scatter the seeds most effectively by walking. Often grown as an ornamental or used in basketry, especially by Tohono O'odham (Papago) people of southern Arizona. The cultivars have exceptionally long, thin "claws" that produce a long, fine black fiber for basket weaving by Papagos. It has been suggested that the cultivar represents a different species or variety. Baskets made of this fiber are often waterproof and have been used to hold milk.

PHRYMACEAE Schauer MONKEY-FLOWER FAMILY

(**SCROPHULARIACEAE** IN PART)

J. Mark Porter

Annual or perennial, mostly herbs (ours), some shrubs. **LEAVES** opposite, petiolate to sessile, simple, margins entire or toothed. **INFL** racemose, sometimes a spike, terminal or axillary. **FLOWER** calyx bilabiate, tubular, 5-toothed, 5-nerved or subplicate-ribbed; corolla more or less funnelform, zygomorphic, bilabiate, the upper lip 2-lobed, external in bud, the lower lip 3-lobed, the throat with 2 elevated ridges forming a palate, this sometimes partially or completely closing the orifice, usually bearded, rarely actinomorphic; stamens 4, anthers in 2 sets, subreniform, 2-celled, the cells confluent; ovary (1) 2-carpellate, locules 1 (pseudomonomerous) or 2; placentation basal or axial, style solitary, apical or lateral; stigma broadly 1- or 2-lobed, the lobes ligulate, receptive only on the adaxial surface, sensitive (thigmotropic), the lobes closing together upon contact. **FRUIT** a capsule, indehiscent and nutlike (achene), or (in ours) dehiscing loculicidally only at the apex, calyx persistent in fruit. **SEEDS** solitary or numerous, small, oblong to oval or fusiform, reticulate to almost smooth; endosperm present, cotyledons folded. $n = 7+$. Phrymaceae includes about 16 genera, with 234 species. The largest genus is *Mimulus*, and with nearly 170 species, it is the only representative of this family in our area. The family is nearly worldwide, with two centers of diversity, in North America and Australia; however, there are also representatives in the New World tropics, in Mexico and Central America. The family was traditionally included within a broad Scrophulariaceae (Olmstead et al. 2001; Oxelman et al. 2005; Beardsley and Olmstead 2002).

Mimulus L. Monkey-flower

(Latin, little clown or comic, referring to the facelike form of the corolla) Annual or perennial herbs, some rhizomatous or stoloniferous, the annuals often flowering from near the base; often glandular-pubescent to slightly viscid or pilose, less often glabrous. **LEAVES** opposite, petiolate or sessile, entire or toothed, sometimes laciniate. **INFL** consisting of flowers borne in pairs from the axils of opposite leaves, or less often a bracteate raceme; pedicels nonbracteolate. **FLOWER** calyx tubular to campanulate, often inflated, the tube strongly 5-angled (plicate), the lobes decidedly shorter than the tube, equal to unequal; corolla yellow, orange, red to purple, or bluish, campanulate, slightly to strongly bilabiate, the upper lip 2-lobed, erect to reflexed, external in bud, the lower lip 3-lobed, spreading or deflexed, the throat with 2 elevated, abaxial ridges forming a palate, this sometimes partially or completely closing the orifice, often bearded; stamens 4, in 2 sets, all with well-developed anther cells, the anthers 2-celled, divergent; stigmas 2, lamelliform, sensitive to touch, the spreading receptive stigmas closing to become appressed. **FRUIT** a loculicidal capsule, sometimes also splitting down the septum, membranous to coriaceous, glabrous (ours). **SEEDS** numerous, small, oblong to oval or fusiform, reticulate to almost smooth, the areolas arranged in longitudinal rows, mostly yellowish. $n = 7, 8, 14, 15, 16$. A large, complex genus of about 150–170 species, occurring mostly in western North America, particularly California; some species native to Chile, parts of eastern Asia, southern Africa, New Zealand, and Australia (Campbell 1950; Grant 1924; Pennell 1951).

1. Corolla 30–57 mm long, red or orange-red to pink, violet, or sometimes yellowish; calyx 16–30 mm long; the stems scandent to pendulous from ceiling of overhanging ledges ..... ***M. eastwoodiae***

1' Corolla less than 30 mm long, or if up to 30 mm, then yellow or blue; calyx 3–16 (20) mm long; stems creeping-decumbent, ascending to erect, but not scandent to pendulous ..... (2)

2. Fruiting calyx strongly inflated, the upper lobe much longer than the others ..... (3)
2' Fruiting calyx cylindrical to campanulate, not or only moderately inflated, the lobes more or less equal ..... (5)

3. Corolla throat more or less open; lateral calyx teeth blunt and relatively short, sometimes nearly absent, not folded inward in fruit; corolla 7.5–20 mm long; rare in the region ..... ***M. glabratus***
3' Corolla throat closed by the well-developed palate; lateral calyx teeth more or less acute and tending to fold inward in fruit; corolla 9–30 mm long ..... (4)

4. Stems usually several-flowered; corolla usually less than 20 mm long when few; plants often over 20 cm tall, annuals or perennials; low and middle elevations in the mountains and higher valleys, the most common species in the region ..... ***M. guttatus***
4' Stems only 1–3 (5)-flowered; corolla large, 17–30 mm long; plants low, 20 cm or less tall, rhizomatous or stoloniferous perennials; high elevations in the taller mountains of the region ..... ***M. tilingii***

5. Leaves petiolate, petioles 1–12 mm long; calyx lobes triangular, acute to acuminate; leaves ovate to lanceolate, rounded to cordate at base ..... ***M. floribundus***
5' Leaves sessile, except sometimes the lowermost; calyx lobes rounded, often mucronate; leaves linear to lanceolate ..... (6)

6. Calyx lobes usually ciliate; plants open, loose, simple or few-branched, the internodes usually longer than the leaves; pedicels 7–22 mm long, arched in fruit; corolla yellow or often pinkish to violet ..... ***M. rubellus***
6' Calyx lobes not ciliate; plants compressed, much-branched, the internodes usually shorter than the leaves; pedicels 2–7 (10) mm long, becoming sigmoid-curved in fruit; corolla usually yellow ..... ***M. suksdorfii***

Mimulus eastwoodiae Rydb. **CP** (honoring Alice Eastwood, botanist, 1859–1953) Eastwood's monkey-flower. Herbaceous perennial, with stolons bearing small leaves less than 1 cm long, producing new fertile plants wherever stolons root. **STEMS** 5–30 cm long, scandent to pendent from ceilings of overhanging cliffs, glandular-puberulent, sometimes viscid-villous. **LEAVES** sessile, the lower 1.7–2.3 cm long, 10–20 mm wide, flabellate, the upper 2.5–4 (5) cm long, (5) 10–20 mm wide, obovate to oblanceolate, acute, upper and lower coarsely toothed and palmately 3- to 5-veined. **FLOWER** calyx 16–23 (27) mm long, the lobes subequal, 4–7 mm long, lanceolate, acuminate, ciliate, pedicels 1–3 (4) cm long; corolla dropping soon after anthesis, 30–40 mm long, scarlet to orange-red, strongly bilabiate, the upper lip erect or arched, with nearly completely fused lobes, the lower lip of 3 subequal, spreading or reflexed, emarginate lobes, the tube 23–27 mm long; anthers exserted, villous on back, the cells 1–1.5 mm long. **FRUIT** a capsule, included in the calyx, 6–9 mm long, elliptic, acuminate. $2n = 16$. Moist areas, seeps, shaded places in crevices of overhanging sandstone cliffs. ARIZ: Apa, Nav; NMEX: SJn; UTAH. 1220–1980 m (4000–6500'). Flowering: May–Sep. Fruit: Jun–Sep. Endemic to the Canyonlands region of southeastern Utah and adjacent Colorado, Arizona, and New Mexico.

Mimulus floribundus Douglas ex Lindl. (profusely flowering) Floriferous monkey-flower, seep monkey-flower. Small annual, 3–22 (40) cm tall. **STEMS** erect to decumbent, simple or branched; glandular-pubescent, sometimes viscid. **LEAVES** petiolate, the blade (0.3) 0.8–2 (3) cm long, (1) 5–13 mm wide, ovate to lanceolate, rounded to cordate at the base, sparingly dentate, pinnately to subpalmately veined, thin, the petiole 1–12 mm long. **FLOWER** pedicels 5–14 (18) mm long; calyx cylindrical, 3.5–7 mm long at anthesis, to 9 mm in fruit, glandular-pubescent, at least on the ribs, the lobes subequal, 0.8–1.6 (2) mm long, triangular, acute or obtuse, ciliate; corolla dropping soon after anthesis, 7–14 mm long, yellow, tubular, slightly bilabiate, the lobes of the upper lip slightly longer, the palate pubescent, often with reddish spots; anthers included in the tube, glabrous, the cells about 0.3 mm long. **FRUIT** a capsule, included in the calyx, 3.5–5 mm long, obovoid to elliptic, acuminate. **SEEDS** 0.3–0.4 mm long. $2n = 32$. Vernally moist places, along streams, and hanging gardens in piñon-juniper woodlands, spruce-fir, and aspen communities. COLO: Hin, RGr; 1220–2600 m (4000–8500'). Flowering: late May–Jul. Fruit: Jun–Aug. Southern British Columbia to Montana and South Dakota, south to California, Arizona, western New Mexico, and Chihuahua.

Mimulus glabratus Kunth (made nearly glabrous) Smooth monkey-flower. Herbaceous perennial. **STEMS** 10–50 cm long, creeping, decumbent or more or less ascending, rooting at the lower nodes; glabrous to sparsely viscid-hispid or glandular-pubescent. **LEAVES** short-petiolate below, sessile above, the blade usually broader than long, 1.3–2.4 (2.8) cm long, 15–30 mm wide, broadly ovate to orbicular, rounded above, rounded to cordate below, dentate, undulate, or entire, palmately 3–5-veined. **FLOWER** pedicels (1) 1.5–3 (6) cm long; calyx campanulate, 5–11 (16) mm long, glabrous, sometimes splotched with red, the lobes unequal, the adaxial lobe more than twice as long as the others, blunt, the

lateral lobes very short, sometimes obsolete, not folding inward in fruit; corolla dropping soon after anthesis, 7.5–20 mm long, yellow, distinctly bilabiate, the throat only partially closed by the palate, the palate bearded, often red-brown-spotted; anthers with cells about 0.6 mm long. **FRUIT** a capsule, included in the calyx, 5–9 mm long, broadly ovate, rounded. **SEEDS** 0.4–0.6 mm long. $2n$ = 28, 30, 60 (subsp. *fremontii*); $2n$ = 28, 30 (subsp. *utahensis*). Aquatic habitats, wet, often submerged soils of streams and springs; piñon-juniper, oak. Manitoba and Ontario south through North Dakota, Minnesota, Wisconsin, and Michigan to Mexico, extending west in Montana, Colorado, Utah, Nevada, and Arizona; also in Central America and South America. Pennell (1935) subdivided *M. glabratus* into four North American subspecies, two of which are in our region.

1. Pedicels 1–2 (3) cm long; calyx 5–10 mm long; leaves suborbicular ..... **subsp. *fremontii***
1′ Pedicels 2–6 cm long; calyx 7–16 mm long; leaves oval ..... **subsp. *utahensis***

subsp. *fremontii* (Benth.) A. L. Grant (honoring John Charles Frémont, explorer, 1813–1890) Mud of streams, ditches, springs, and seeps; piñon-juniper, mountain brush, and aspen. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr; NMEX: McK, RAr, SJn; UTAH. 1220–2600 m (4000–8500′). Flowering: Jun–Aug. Fruit: Jul–Sep. Extending west from the Great Plains to Arizona and southwestern Utah.

subsp. *utahensis* Pennell (geographic reference to Utah) Aquatic habitats of streams, springs, or seeps; piñon-juniper, mountain brush. UTAH. 1675–1830 m (5500–6000′). Flowering: Jun–Aug. Fruit: Jul–Sep. *Mimulus glabratus* subsp. *utahensis* is easily distinguished from the other subspecies of *M. glabratus*, but it can easily be confused with *M. guttatus* DC., from which it can be distinguished by its short calyx lobes and its presumably open corolla throat.

Mimulus guttatus DC. (spotted) Common monkey-flower, yellow monkey-flower. Annual or perennial herb, rooting at the lower nodes, rarely rhizomatous or stoloniferous, 5–55 (90) cm tall. **STEMS** stout and fistulous or slender, erect or decumbent, simple or branched; glabrous to pubescent. **LEAVES** variable, petiolate below and often sessile above, the blade (0.5) 1.5–5.5 (10) cm long, (5) 10–40 (85) mm wide, obovate or broadly ovate to orbicular, rounded above, rounded or cordate below, coarsely and irregularly toothed, palmately or subpinnately 5–7 (9)-veined, the petiole 2–40 (55) mm long, sometimes with lobed margins (pinnatifid). **FLOWER** pedicels 1–3.5 (5.5) cm long; calyx campanulate, 6–16 mm long at anthesis, to 20 mm and much inflated in fruit, glabrous or puberulent, tinged or splotched with red, the lobes broadly triangular, the adaxial lobe 2–3 times longer than the others, lanceolate, obtuse, the lateral and abaxial pair of lobes usually folded over the orifice in fruit; corolla dropping soon after anthesis, 9–23 (30) mm long, yellow, distinctly bilabiate, the margins of the upper lip reflexed, the lobes of the lower lip longer and spreading, the palate raised and closing the throat, densely hairy and spotted with red; anther with cells 0.5–1 mm long. **FRUIT** a capsule, included in the calyx, (7) 9–12 mm long, oblong-obovate, rounded distally, narrowed to a stipitate base. **SEEDS** 0.4–0.5 mm long. $2n$ = 16, 26, 28, 30, 32, 48, 56. Springs, seeps, and streams, wet or marshlike areas; piñon-juniper, ponderosa pine, Douglas-fir, spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 1220–2400 (3000) m (4000–7900′ (9000′)). Flowering: Jun–Aug. Fruit: Jul–Sep. Alaska and Yukon, south throughout the western mountains to northern Mexico; adventive in New England and Europe. *Mimulus guttatus* is the most common species of monkey-flower in our region; it is an extremely complex species morphologically, with several recognized varieties. A careful study of this species is needed.

Mimulus rubellus A. Gray (reddish) Little red monkey-flower, reddish monkey-flower. Slender herbaceous annual, 1–22 cm tall. **STEMS** simple or loosely branched, the internodes relatively elongate; glandular-puberulent. **LEAVES** sessile, 0.3–1.5 (2.2) cm long, 2–4 (7) mm wide, narrowly lanceolate to linear, often connate at the base, entire to shallowly sinuate-denticulate, 1–3-veined. **FLOWER** pedicels 7–18 (22) mm long, becoming somewhat arched in fruit; calyx tubular, 4–7 mm long at anthesis, to 9 mm in fruit, the ribs reddish, the lobes subequal, 0.5–1 mm long, broadly ovate, rounded, ciliate; corolla dropping soon after anthesis, 6–8 (10) mm long, yellow with maroon dots, or the limb sometimes pinkish or purplish, the throat narrow, weakly bilabiate, the subequal lobes rounded to emarginate, the palate puberulent; anthers slightly exserted or in the throat, glabrous, the cells about 0.2 mm long. **FRUIT** a capsule, included in the calyx, 4–6.5 mm long, ovoid, acuminate, sometimes stipitate. **SEEDS** 0.4–0.5 mm long. Moist areas, often along intermittent streams. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, SJn; UTAH. 1500–2750 m (4900–9000′). Flowering: Apr–Jun. Fruit: May–Jun (Jul). From southeastern California across Nevada and southern Utah to southwestern Colorado, Arizona, New Mexico, western Texas, and northern Mexico.

Mimulus suksdorfii A. Gray (honoring Wilhelm N. Suksdorf, botanist, 1850–1932) Suksdorf's monkey-flower. Small, compressed, herbaceous annual, 1–7 (11) cm tall. **STEMS** much-branched; glandular-puberulent. **LEAVES** sessile,

0.5–1.6 (2) cm long, 1–3 (4) mm wide, lanceolate to linear, entire or nearly so, the lower leaves sometimes oblanceolate, subpetiolate, 1- to 3-veined. **FLOWER** pedicels 2–7 (10) mm long, becoming sigmoid-curved in fruit, calyx 3–5 mm long at anthesis, hardly expanding in fruit, glandular-pubescent, reddish, at least on the ribs, the lobes subequal, 0.2–0.7 mm long, broadly ovate, rounded, mucronate, the margins not ciliate; corolla dropping soon after anthesis, 4–6.5 mm long, yellow, tubular-funnelform, weakly bilabiate, the lobes subequal, emarginate, the palate puberulent, red-spotted; anthers slightly exserted or in the throat, glabrous, the cells 0.15–0.2 mm long. **FRUIT** a capsule, included to slightly exserted, (3.5) 4.5–5 mm long, ovoid, acuminate. **SEEDS** about 0.4 mm long. Moist to moderately dry, exposed places or streamsides in sagebrush, piñon-juniper woodland, and ponderosa pine communities. NMEX: SJn; UTAH. 1200–2440 m (4000–8000'). Flowering: May–Jun (Aug). Fruit: Jun–Aug. Southern Washington, eastern Oregon, and eastern California, east across Idaho, Nevada, and Utah to western Wyoming, northern Colorado, and northern Arizona.

Mimulus tilingii Regel (honoring Heinrich S. T. Tiling, botanist, 1818–1871) Subalpine monkey-flower. Tiling's monkey-flower. Low, herbaceous perennial, bearing stolons or rhizomes, 7–20 cm tall. **STEMS** often decumbent at the base, simple or branched below; glabrous to puberulent. **LEAVES** petiolate or the upper sometimes sessile, the blade 1–2.6 cm long, 5–15 (25) mm wide, ovate or broadly ovate to suborbicular, dentate, sometimes obscurely so, palmately 3- to 5-veined, the petiole 1–12 mm long. **FLOWER** pedicels 1–4 (6) cm long; calyx campanulate, 7–15 mm long at anthesis, to 20 mm and much inflated in fruit, pale yellow-green with red-brown spots, the lobes unequal, the adaxial lobe longer than the others, 3–7 mm long, triangular to lanceolate, obtuse, rounded, the lateral and abaxial pairs of lobes usually folded over the orifice in fruit; corolla dropping soon after anthesis, 17–30 mm long, yellow with pale red spots on the palate, broadly funnelform, distinctly bilabiate, the palate densely yellow-bearded, raised and nearly closing the throat; anther with cells 1–1.5 mm long. **FRUIT** a capsule, included in the calyx, 7–10 mm long, oblong or oval, rounded distally, narrowing to a stipitate base. **SEEDS** 0.5–0.6 mm long. $2n$ = 28, 30, 36, 48, 50, 56. Wet places around springs, shores of ponds, stream banks, and mountain meadows; ponderosa pine, aspen, Douglas-fir, spruce-fir, and alpine communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2300–4260 m (7600–14000'). Flowering: Jul–Aug. Fruit: late Jul–Sep. Southern British Columbia and southwestern Alberta south to California, across Nevada, northern Arizona, and northern New Mexico.

PLANTAGINACEAE Juss. SNAPDRAGON FAMILY or VERONICA FAMILY

(much of traditional Scrophulariaceae)

J. Mark Porter and Kenneth D. Heil

Annuals and perennials, herbs, vines (*Maurandya*), rooted aquatics, or terrestrial plants, some shrubs (not ours); taprooted, short-rhizomatous, or fibrous-rooted; caulescent or acaulescent. **LEAVES** opposite or alternate, sometimes more or less basal, exstipulate, simple to dissected, petiolate or sessile, sometimes with sheathing petioles. **INFL** a raceme, spike, head, panicle (*Veronica*), or in some the flower solitary in leaf axil; bracts foliaceous to reduced. **FLOWERS** perfect, rarely imperfect (*Callitriche*); calyx of 4 or 5 (as few as 1 or 2 in *Synthyris*, absent in *Callitriche*) distinct or united sepals, regular or irregular; corolla sympetalous (absent in *Callitriche*), slightly or usually evidently zygomorphic, some spurred or saccate at the base, 4- or 5-lobed, often 2-lipped, tubular, campanulate or sometimes rotate, rarely wanting; stamens epipetalous, 4 and in 2 sets, 4 fertile and 1 sterile (referred to as a staminode), or 2; anthers 2-celled or 1-celled (*Limosella*); ovary superior, 2-carpellate, 2-locular, rarely 1-locular in upper part (*Limosella*), the anatropous ovules on axile placentae; style solitary and entire or sometimes forked into 2 stigmatic lobes. **FRUIT** a capsule (ours), dehiscence septicidal, loculicidal, or both (4-valved), circumscissile or via pores or ruptures. **SEEDS** usually many and small, rarely few, wingless or winged, the embryo small in a well-developed endosperm. n = 6 or more. Plantaginaceae is composed of about 90 genera and 1700 species; all but *Plantago* and *Callitriche* were formerly included in Scrophulariaceae (Olmstead et al. 2001; Oxelman et al. 2005; Albach, Meudt, and Oxelman 2005).

1. Leaves arranged in whorls, linear; aquatic, stems wholly or partly submerged ..... ***Hippuris***
1' Leaves not whorled, variously shaped; aquatic or terrestrial ..... (2)

2. Flowers unisexual; staminate flowers with 1 stamen; small aquatic herbs ..... ***Callitriche***
2' Flowers bisexual (perfect); flowers with 2 or more stamens, terrestrial or aquatic plants ..... (3)

3. Corolla 5-lobed, upper corolla lip 2-lobed, sometimes only shallowly so, overlapping the lower lip in bud; capsule dehiscence usually septicidal, often secondarily loculicidal as well ..... (4)
3' Corolla 4-lobed (occasionally fewer), upper corolla lip entire, overlapped by lower lip in bud or buds imbricate; capsule dehiscence loculicidal or circumscissile ..... (11)

4. Style forked with 2 distinct stigmatic lobes, these often lamellate; leaves opposite ..... (5)
4' Style entire with a single stigma, this sometimes slightly 2-lobed; leaves opposite or alternate ..... (6)

5. Fertile stamens 4; leaves broadly obovate to rotund, entire, sessile; plants aquatic or subaquatic, floating or prostrate; corolla nearly regular, the lobes subequal and about as long as the tube ..... ***Bacopa***
5' Fertile stamens 2; leaves lanceolate to ovate; plants terrestrial, ascending to erect; corolla bilabiate, the lobes irregular and shorter than the tube ..... ***Gratiola***

6. Plants acaulescent, the leaves in basal tufts; corolla nearly regular; anthers 1-celled ..... ***Limosella***
6' Plants usually caulescent and leafy throughout; corolla bilabiate; anthers 2-celled ..... (7)

7. Corolla tube neither gibbous nor spurred; staminode (a sterile stamen) present ..... (8)
7' Corolla tube gibbous or spurred at the base; staminode absent or glandlike ..... (9)

8. Leaf bases of opposing basal leaves connate, forming a scarious sheath; calyx funnelform to tubular, 5-lobed, lobes short and unequal ..... ***Chionophila***
8' Leaf bases sessile or petioled, rarely connate, but never producing a scarious sheath; calyx with 5 relatively long, subequal lobes (divided nearly to the base) ..... ***Penstemon***

9. Leaves all opposite; corolla pouched at the base on the adaxial side; anthers not coherent and the cells not divergent; capsule primarily septicidal ..... ***Collinsia***
9' Leaves, at least the upper, alternate; corolla gibbous to spurred at the base on the abaxial side; anthers coherent in pairs and the cells divergent; capsule dehiscing by loculicidal pores or irregular rupture ..... (10)

10. Corolla gibbous at the base, blue, purple, violet, or red; stems twining ..... ***Maurandya***
10' Corolla spurred at the base, yellow; stems erect ..... ***Linaria***

11. Corolla imbricate in bud; stamens 4; stigma 2-lobed; fruit a circumscissile capsule ..... ***Plantago***
11' Upper corolla lobe overlapped by lower in bud; stamens 2; stigma capitate; fruit a loculicidal capsule ..... (12)

12. Leaves wholly cauline, opposite (not to be confused with the alternate, leaflike floral bracts in some); corolla subrotate; inflorescence a terminal raceme or composed of lateral racemes ..... ***Veronica***
12' Leaves both basal and cauline, the basal well developed and the cauline reduced and bractlike, alternate; corolla more or less tubular; inflorescence a dense, cylindrical spike or spikelike raceme ..... ***Synthyris***

Bacopa Aubl. Water Hyssop

(aboriginal name, used by the natives of French Guiana) Disc water hyssop. Aquatic or subaquatic, caulescent perennial (sometimes annual) herbs. **STEMS** creeping or floating (in ours). **LEAVES** opposite, mostly sessile, ours broadly obovate to rotund, entire and palmately veined. **INFL** reduced, flowers borne singly or in pairs in the axils of the leaves; pedicels not bracteolate. **FLOWER** calyx of 5 dissimilar, nearly distinct lobes, accrescent, the adaxial lobe broadest and the adaxial lateral pair (innermost) narrowest; corolla tubular-campanulate, 5-lobed, weakly bilabiate, the upper lip shallowly 2-cleft, external in bud, the lower lip 3-lobed; stamens 4, 2 sets of different lengths, all fertile; anthers distinctly 2-celled, the cells more or less parallel; style forked, each fork terminating in a dilated stigmatic lobe. **FRUIT** a capsule, septicidal and loculicidal dehiscence (4-valved), membranous. **SEEDS** numerous, reticulate, the areolas usually arranged in longitudinal rows. A genus of 56–60 species, occurring mostly in tropical and warm-temperate regions of the world, centering in South America. Formerly included in Scrophulariaceae. One species occurring in our area (Barrett and Strother 1978; Pennell 1946).

Bacopa rotundifolia (Michx.) Wettst. (almost round-leaved) Aquatic or subaquatic herbs, rooting at the lower nodes, prostrate or floating. **STEMS** pilose to hispid when young. **LEAVES** 12–27 (40) mm long, (8) 12–23 (30) mm wide, obovate to suborbicular, sessile, entire, clasping, palmately veined. **INFL** reduced, flowers solitary or in pairs in leaf axils, the pedicels 6–17 (23) mm long, usually shorter than the subtending leaves, pilose to hispid when young. **FLOWER** calyx 3–4.5 mm long at anthesis, to 6 mm in fruit, the 3 outer segments ovate to subrotund and the 2 inner lanceolate; corolla 4.5–7 mm long, campanulate, the lobes subequal, weakly bilabiate, white with a yellow throat; stamens 4,

the anther cells 0.6–0.7 mm long, versatile, dark, the filaments white. **FRUIT** a subglobose capsule, 3.5–5.5 mm long. **SEEDS** about 0.5 mm long, ellipsoid to cylindroid, reticulate. $2n = 56$. Rooted in bottom of shallow water of ponds and slow-moving streams and on muddy banks. COLO: LPl. 1370–2440 m (4500–8000'). Flowering: July–Sep. Fruit: Aug–Oct. Common from North Dakota, Minnesota, Illinois, and Indiana, south to Texas, Louisiana, and Mississippi and at scattered localities westward in central Montana, southwest Idaho, Colorado, and California.

Callitriche L. Water-starwort

C. Barre Hellquist

(*calli*, beautiful, + *trich*, hair) Annual or perennial, aquatic and terrestrial herbs. **LEAVES** opposite, lacking stipules, margin entire. **INFL** with staminate flowers 1–3 in foliar leaf axils. **FLOWERS** unisexual, perianth lacking, each flower subtended by a pair of bracteoles or lacking in some; styles 2, often longer then the ovary. **FRUIT** a schizocarp splitting into 4 achenelike mericarps; these 1-seeded, flattened, winged, margined, or smooth (Fassett 1951; Philbrick 1989). Around 40 species. *Callitriche hermaphroditica* L. is to be looked for in our flora.

1. Fruit as long as broad, rounded at base and on edges ..... ***C. heterophylla***
1′ Fruit longer than broad, narrowed to base, sharply keeled or narrowly winged above ..... ***C. verna***

Callitriche heterophylla Pursh (diverse-leaved) Perennial, aquatic herbs with compressed filiform stems. **LEAVES** submersed and floating; submersed leaves linear, notched at apex, 1-veined, and a rosette of floating obovate leaves, 3–5-veined; plants with linear to obovate to oblong leaves. **FRUIT** sessile; 0.6–1.2 mm long, the height approximately equaling the width; carpel more broadly rounded at the apex than at the base, therefore the fruit is slightly heart-shaped, thickest just above the base; margins of carpel wingless or with a narrow wing to apex, styles 1–6 mm long, persistent or falling off early. COLO: SJn; NMEX: McK. 2425–2750 m (8800–9000'). Flowering: Jul–Aug. Fruit: Jul–Aug. British Columbia east across southern Canada to Newfoundland, south to California, New Mexico, Texas, and Florida, Mexico.

Callitriche verna L. (spring) Perennial, aquatic herbs. **LEAVES** submersed and floating; lower submersed leaves linear, clasping at base, 1-veined with a shallow notch at tip; upper submersed leaves spatulate and petioled, 3-veined, 1–3 (–5) cm long; floating leaves forming a rosette, petioles broad, blades ovate to orbicular, 3–5-veined, rounded or notched at apex; bracteoles conspicuous, linear, oblong, or obliquely oval. **FLOWERS**: staminate with filaments 1–3 mm long. **FRUIT** sessile, suborbicular, 0.6–1.4 mm wide, with height always exceeding width (drying may conceal this trait); face of mericarp reticulate, the reticulations appearing in vertical rows; margin of carpel with a scarious wing, widest at the summit. [*C. palustris* L.; *C. palustris* var. *bolanderi* Ieps.; *C. palustris* var. *stenocarpa* Ieps.]. Still waters of lakes, ponds, streams, and ditches, often terrestrial along pond margins. ARIZ: Apa; COLO: Arc, Con, Hin, Mon, SJn; NMEX: RAr, SJn. 2425–3580 m (8000–11825'). Flowering: Jul–Aug. Fruit: Jul–Aug. Alaska east to Newfoundland and Greenland, south to California, New Mexico, Nebraska, Minnesota, Illinois, West Virginia, and New England.

Chionophila Benth. Snow-lover

(Greek, snow-loving) Perennial herbs, from shortly rhizomatous and slightly tuberous roots. **STEMS** decumbent to erect, unbranched. **LEAVES** opposite, mostly basal with a few reduced cauline. **INFL** a raceme, sometimes dense and spikelike, few- to many-flowered; bracts reduced and imbricate. **FLOWER** calyx funnelform to tubular, membranous in texture, lobes 5, triangular, scarious to chartaceous in age (in ours) or lobes divided nearly to the base and glandular; corolla cream-colored or dull greenish white, tubular, throat slightly dilated, bilabiate, upper lip obscurely bilobed, lower 3-lobed, the upper lobes external to the lower in bud; fertile stamens 4, in 2 sets of 2, anthers 2-celled, cells divaricate and confluent; staminode filamentous, glabrous; stigmas united and minutely capitate. **FRUIT** a loculicidal capsule, splitting septicidally at the apex as well, asymmetrical, oblongoid, glabrous. **SEEDS** numerous, seed coat loose, areolate-reticulate. A small genus of two species, restricted to the mountains of the western United States, formerly included in Scrophulariaceae.

Chionophila jamesii Benth. **CP** (honoring Edwin James, naturalist, 1797–1861) Rocky Mountain snow-lover. Perennial herbs, from short rhizomes, 3.5–15 cm tall, clothed in marcescent leaf bases (sheaths). **STEMS** decumbent to erect; minutely puberulent. **LEAVES** opposite, basal with a few reduced cauline leaves, the basal entire, blade 1–7.3 cm long, 1.5–11.5 mm wide, spatulate, oblanceolate to lanceolate, thick, leaf bases of opposite leaves connate, forming a scarious sheath, 0.7–2.8 cm long; the cauline reduced, lanceolate to linear, 1.2–3.5 cm long, 1.4–4 mm wide, 1–2 pairs, rarely alternate; leaves often turning dark upon drying. **INFL** a spikelike raceme, dense, mostly secund; bracts opposite

and connate but imbricate, reduced, lanceolate, 7–10 mm long, 2–4 mm wide, glabrescent, somewhat ciliate. **FLOWER** calyx funnelform to tubular, somewhat inflated, 6–12 mm long (to 14 mm in fruit), more or less oblique, 5-lobed, lobes 1.5–4.5 mm long, triangular-acute, becoming scarious or chartaceous; corolla cream-colored or dull greenish white, sometimes suffused with brown or purple (often drying dark), tubular, throat slightly dilated, bilabiate, upper lip erect and slightly concave, 2.5–4.5 mm long, bilobed, the notch about 1 mm deep, lower lip convex, 5–6 mm long, densely bearded, 3-lobed, the lobes recurved, 1–2.5 mm long, the upper lobes external to the lower in bud; fertile stamens 4, in 2 sets, the adaxial pair diverging from the corolla near the base, the abaxial pair diverging 4.5–6 mm above the base; anthers 2-celled, 1–2 mm long, black, cells divaricate and confluent, glabrous; staminode short, 4.8–6.5 mm long, affixed 2–3 mm above the base of the corolla tube, glabrous; stigmas united and minute, style 8–11 mm long, ovary 2–2.5 mm long, 0.5–1 mm wide, glabrous. **FRUIT** a loculicidal capsule, splitting septicidally at the apex as well, 6–7.5 mm long, 3–4.5 mm wide, asymmetrical, oblongoid, acute, glabrous. **SEEDS** numerous, 1–2.2 mm long, 0.8–1.5 mm wide, oblongoid, angular, sometimes flattened with a marginal wing, seed coat loose, areolate-reticulate, dark brown with a metallic sheen. Slopes in talus, scree, or clay; alpine tundra. COLO: Con, Hin, LPl, Min, Mon, RGr, SJn. 3450–3810 m (11000–13100'). Flowering: Jul–Aug. Fruit: late Jul–Sep. Restricted to Colorado and southern Wyoming.

Collinsia Nutt. Blue-eyed Mary

(honoring Zacchaeus Collins, botanist, 1764–1831) Annual herbs. **STEMS** erect, simple or branching. **LEAVES** opposite (or whorled), entire, crenulate, or toothed, the upper sessile or clasping. **INFL** a raceme, the flowers in pairs or fascicles in the axils of opposite foliaceous bracts. **FLOWER** calyx campanulate, irregularly 5-lobed, united below; corolla somewhat pealike, strongly bilabiate, the upper lip 2-lobed, erect, external in bud, the lower lip 3-lobed, extended horizontally, the middle lobe forming a pouch that encloses the style and stamens, shorter than the lateral lobes, the throat often occluded by a fold or palate; stamens 4, of 2 lengths, the anther cells divaricate, confluent at the tip, the lower pair inserted higher in the corolla tube than the upper pair; staminode present, but much reduced, glandlike; stigmas united and capitate or slightly 2-lobed. **FRUIT** a capsule, septicidal and loculicidal dehiscence, 4-valved, thin-walled. **SEEDS** 1–many in each cell, flattened to concavo-convex, smooth to reticulate, more or less winged. $2n = 14$. A genus of 18–20 species of North America, largely Californian. Formerly included in Scrophulariaceae (Newsom 1929).

Collinsia parviflora Douglas ex Lindl. (little flower) Small-flowered blue-eyed Mary. Annual from a taproot, 3–20 (50) cm tall. **STEMS** decumbent to ascending or subscandent, simple or branched; puberulent, often glandular above and glabrous below. **LEAVES** connected by a line around the stem, sessile or narrowed to a petiolate base, the lower leaves small, orbicular, petiolate, the upper sometimes whorled; blade entire, 1.5–3 (5) cm long, 3–5 (12) mm wide, oblanceolate, obtuse to rounded. **INFL** a raceme with foliaceous bracts, appearing as solitary flowers in axils of leaves, sometimes in whorls in the upper axils; pedicels 3–30 mm long, becoming reflexed from the base. **FLOWER** calyx 3.5–5.5 mm long, to 7 mm in fruit, glabrous, the teeth 2–3 mm long, lanceolate, acuminate, the sinuses rounded; corolla blue with a white upper lip, 4–5.5 (7) mm long, the lobes of the upper lip erect, the lobes of the lower lip projecting, the tube gibbous on upper side, near the base; anthers 0.3–0.4 mm long. **FRUIT** a capsule, 4–5.5 mm long, oblong, ovoid to ellipsoid. **SEEDS** 1.5–2.2 mm long, ovoid or elliptic, grooved on one side, smooth, brown, 2 per locule. $2n = 14$, 28. Moderately moist slopes of woodlands, forests, and meadows; sagebrush, piñon-juniper, oak, ponderosa pine, aspen, and spruce communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1980–2740 m (6500–9300'). Flowering: Apr–Jun. Fruit: May–Jul. Southern Alaska to eastern California, eastern Washington, eastern Oregon, Nevada, and northern Arizona to Ontario, Canada; Michigan, South Dakota, Colorado, and New Mexico. Ground and combined with *Sisymbrium*, the smoke was given to a horse to increase running speed (Kayenta Navajo).

Gratiola L. Hedge Hyssop

(Latin: grace or favor, referring to its supposed medicinal properties) Annual, biennial, or perennial caulescent herbs. **STEMS** low, erect or diffuse. **LEAVES** opposite, lanceolate to ovate, sessile, entire or toothed, palmately veined. **INFL** reduced, flowers borne singly or in pairs in the axils of the leaves; pedicels usually bearing (0–1) 2 bractlets just below the calyx. **FLOWER** calyx of 5 distinct or somewhat united lobes, subequal to unequal; corolla tubular or narrowly campanulate, the tube quadrangular, bilabiate, the upper lip shallowly 2-lobed, flat, external in bud, the lower lip 3-lobed; fertile stamens 2, included, the anther cells parallel on a membranous expansion of the connective, the abaxial pair of stamens wanting or represented by vestigial filaments near the base of the corolla tube; style divided into 2 lamelliform stigmas. **FRUIT** a capsule, septicidal and generally also loculicidal dehiscence (4-valved), membranous.

SEEDS numerous, reticulate, the areolas arranged in longitudinal rows. $2n = 16$. A genus of about 20 species, occurring in the temperate regions and in the mountains of tropical regions in both hemispheres, formerly included in Scrophulariaceae.

Gratiola neglecta Torr. (overlooked, neglected) Common American hedge hyssop. Small annual, 5–22 (30) cm tall. **STEMS** ascending to decumbent, simple or branched, fistulose below; glandular-puberulent. **LEAVES** 1–3.5 (5) cm long, oblanceolate to obovate, acute, denticulate in upper 1/2 or sometimes entire, slightly clasping at base. **INFL** reduced, solitary flowers in axils of one or both opposite leaves, glandular-pubescent, the pedicels 8–22 mm long, 2 bracteoles, the bractlets similar to the calyx segments or longer. **FLOWER** calyx 3.2–5.5 mm long at anthesis, to 7 mm in fruit, the lobes lanceolate, acute to obtuse, rarely rounded, united at the very base, subequal; corolla 7–10 (12) mm long, the 2 lobes of the upper lip nearly completely united, the 3 lobes of the lower lip broad and emarginate, pilose within the tube, especially on the adaxial side, the tube yellow, the limb white to pale lavender; stamens included, the anthers 0.7–1 mm long. **FRUIT** a capsule, 3.5–5.5 (6.5) mm long, globose-ovoid, acuminate. **SEEDS** 0.5–0.6 mm long, oblong-ovoid, reticulate, light brown. $2n = 16$. Moist places, often in mud at the edge of lake shores, ponds, streams, and drying springs. COLO: Arc. 2130–2440 m (7000–8000'). Flowering: Jun–Aug. Fruit: Jul–Sep. Southern British Columbia to Quebec, Canada; south to east-central California, northern Arizona, northern New Mexico, eastern Texas, Louisiana, Mississippi, northern Alabama, and northern Georgia.

Hippuris L. Mare's-tail

C. Barre Hellquist

(Greek: of a horse) Perennial aquatic or amphibious herbs. **LEAVES** whorled, sessile, blade margin entire. **INFL** forming a long terminal spike along middle to upper stem. **FLOWERS** minute, pistillate or perfect, epigynous, hypanthium enclosing the ovary and bearing perfect flowers at the tip; perianth lacking; ovary 1-celled and 1-ovuled. **FRUIT** nutlike, hard, indehiscent, 1-seeded (McCully and Dale 1961a, 1961b). Three species worldwide.

Hippuris vulgaris L. (common) Mare's-tail. Rhizomatous aquatic herbs. **STEMS** submersed and flaccid, or erect, hollow, simple. **LEAVES** 6–12 in a whorl, linear-attenuate, firm and thick, or flaccid. **INFL** in axils of middle to upper portions of stem. **FLOWERS** with petals absent; stamen 1, inserted on anterior edge of calyx; ovary inferior. **FRUIT** 2–3 mm long, 1-celled and 1-seeded. Ponds, lakes, and streams. ARIZ: Apa; COLO: Arc, Hin, LPl; NMEX: McK, RAr, SIn. 2200–2750 m (7300–9100'). Flowering: Jun–Jul. Fruit: Jul–Aug. Alaska east to Newfoundland, south to Arizona, Nebraska, Minnesota, Illinois, New York, New Hampshire, and Maine. This is a fairly common plant of high-elevation ponds.

Limosella L. Mudwort

(Latin for mud) Small, caespitose, scapose annual or perennial herbs, usually stoloniferous, often submerged, glabrous. **LEAVES** in a basal tuft, entire, mostly long-petiolate, palmately veined. **INFL** long, slender pedicels arising from the tuft of leaves; pedicels nonbracteolate. **FLOWER** calyx with 5 equal lobes, the tube as long as or longer than the lobes; corolla rotate-campanulate, white or pinkish, essentially regular, the 5 spreading lobes shorter than the tube, the upper 2 lobes external in bud; stamens 4, subequal, the anthers 1-celled; stigmas united and capitate. **FRUIT** a septicidal capsule, membranous, distally 1-celled (the septum not extending to the top). **SEEDS** numerous, reticulate, the areolas arranged in longitudinal rows. $2n = 20$. A genus of about 12 species, occurring throughout the world. Formerly included in Scrophulariaceae (Glück 1934).

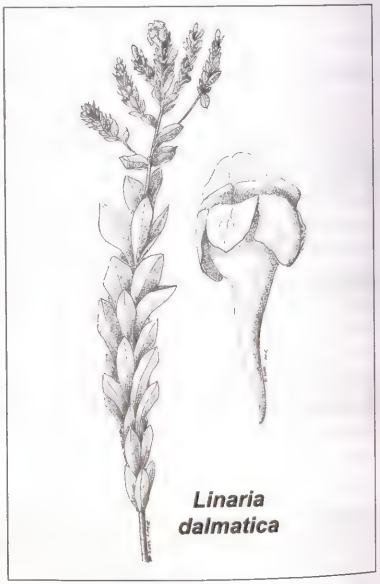
Limosella aquatica L. (of water) Small, caespitose, stoloniferous perennial, often submersed with floating leaves. **STEMS** very short. **LEAVES** slender, long-petiolate, some petioles as long as the water is deep and the blades floating, the blade 1–3 cm long, 3–12 mm wide, narrow-spatulate to broadly oblong-elliptic, rounded, 3–5-veined, the petiole 3–10 (20) cm long, wider at the base. **INFL** of many elongate pedicels arising from the axils of the tufted leaves, pedicels usually shorter than the leaves. **FLOWER** calyx campanulate, 2–2.5 mm long, pale green with purplish spots beneath the sinuses, the lobes equal, 0.5–0.8 mm long, broadly triangular, apiculate; corolla slightly longer than the calyx, more or less regular, white to pink, lobes equal, 0.8–1.2 mm long, oblong, acute, scarcely pilose within; stamens 4, the filaments flattened, the anthers circular, 0.3 mm across, often purple; stigma capitate. **FRUIT** a capsule, 3–3.5 mm long, ovoid-spherical, membranous. **SEEDS** 0.6–0.7 mm long, dark brown. $2n = 36, 40$. Mud flats and shallow water; drying borders of ponds and springs. ARIZ: Apa; COLO: Arc, Hin, Min, LPl, Mon; NMEX: McK, SIn. 2130–2740 m (7000–9000'). Flowering: late Jun–Aug. Fruit: Jul–Sep. Widespread over North America, Andean South America, and mountainous regions of the Old World.

Linaria Mill. Toadflax

(flax, referring to similarity to flax) Annual or perennial herbs, glabrous. **STEMS** erect, simple or branched at the base. **LEAVES** opposite or whorled below, alternate above, sessile, entire to dentate or lobed, pinnately veined. **INFL** a raceme or spike. **FLOWER** calyx 5-lobed, lobes mostly distinct, subequal; corolla 5-lobed, 2-lipped, yellow to blue, violet, or white, the tube spurred at the base, strongly bilabiate, the upper lip external in bud, the lower with reflexed lobes, the throat nearly closed; functional stamens 4, in 2 pairs, the anthers distinct, glabrous, 2-celled; stigmas united, small, capitate. **FRUIT** a symmetrical capsule, dehiscent by transverse loculicidal slits, ovoid to cylindrical or subglobose, thin-walled. **SEEDS** many, flat and winged, or angled, sometimes tuberculate. $2n = 12$. A genus of more than 100 species, mostly in Eurasia, only one species native to North America, though many are cultivated. Formerly included in Scrophulariaceae (Alex 1962).

1. Leaves lanceolate to ovate, 10–35 mm wide; calyx 5–9 mm long ..... ***L. dalmatica***
1′ Leaves linear, 2–6 mm wide; calyx 2.5–3.2 mm long ..... ***L. vulgaris***

Linaria dalmatica (L.) Mill. (Latinized geographic reference to Dalmatia) Broom-leaved toadflax, Dalmatian toadflax. Perennial herb, 40–70 (100) cm tall. **STEMS** erect, branched above, spreading by horizontal rootstocks; glabrous and glaucous. **LEAVES** 2–5 cm long, 10–16 (35) mm wide, ovate to lance-ovate, acute, sessile, clasping, palmately veined, rigid. **INFL** an elongate raceme, the pedicels 2–4 mm long at anthesis, to 6 mm in fruit. **FLOWER** calyx lobes subequal, 5–7.5 (9) mm long, broadly lanceolate to ovate, acute, rigid; corolla 14–24 mm long, excluding the 9–17 mm spur, strongly bilabiate, the upper lip (7) 10–15 mm long, the lower lip 5–11 mm long, palate occluding the throat, bright yellow, glandular-pubescent on the sides, the palate densely white- to orange-bearded; anthers 1.2–1.3 mm across after dehiscence. **FRUIT** a capsule 6–7 (8) mm long, subglobose, dehiscing by irregular splitting at the apex of each carpel. **SEEDS** 1.2–2 mm long, tetragonal to discoid-compressed, rugulose, the angles winged. $2n = 12$. [*L. genistifolia* (L.) Mill. subsp. *dalmatica* (L.) Maire & Petitm.]. Waste places and roadsides; sagebrush, oak, ponderosa pine, aspen, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, SJn; UTAH. 2000–2800 m (6600–9200′). Flowering: May–Sep. Fruit: late Jul–Sep. A native of the Mediterranean region.



Linaria vulgaris Mill. (common, ordinary) Butter-and-eggs. Perennial herb, 30–60 (80) cm tall; taprooted. **STEMS** erect to ascending, 1–several, simple to branched, glabrous to sparsely pilose. **LEAVES** 2.5–4 (5) cm long, 2–6 mm wide, linear. **INFL** a congested raceme, glabrous to glandular-puberulent, pedicels 1–4 mm long. **FLOWER** calyx lobes subequal, 2.5–3.2 mm long, lanceolate to broadly lanceolate; corolla 10–14 (18) mm long excluding the nearly straight 8–14 mm long spur, strongly bilabiate, the upper lip 8–12 mm long, the lower lip 6–9 mm long, palate occluding the throat, bright yellow, the crest of the palate orange-bearded; anthers 0.8–1.2 mm across after anthesis. **FRUIT** a capsule, 5–9 mm long, subglobose, dehiscing by irregular splitting at the apex of each carpel. **SEEDS** 1.8–2.3 mm long, discoid with broad wings, the central portion tuberculate. $2n = 12$. Waste places, roadsides, stream edges, and meadows; sagebrush, oak, ponderosa pine, aspen, and spruce-fir communities. COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn. 1700–3200 m (5600–10500′). Flowering: May–Sep. Fruit: Jul–Sep. A native of Eurasia and widely naturalized in temperate North America.

Maurandya Ortega Twining Snapdragon

(honoring Catherine P. Maurandy, botanist) Climbing or prostrate perennial herbs. **STEMS** twining. **LEAVES** alternate to subopposite, petioles twining, coarsely toothed or hastate, palmately veined and lobed. **INFL** a raceme or of solitary flowers (in ours) in the axils of leaves. **FLOWER** calyx of 5 distinct, subequal segments; corolla bilabiate, lower lip forming a gibbous or saccate corona, with 2 prominent abaxial ridges, the upper lip external in bud, the throat closed

(in ours) or open; fertile stamens 4, filaments with 2 rows of tack-shaped glands; stigmas united, small, subcapitate. **FRUIT** a capsule, globose, symmetrical to oblique, 1–2 locules, dehiscence by irregular rupturing near the apex. **SEEDS** oblong, pitted, winged or more often (in ours) tuberculate. $2n = 24$. A genus of about 20 species, occurring in the southwestern United States and Mexico. Formerly included in Scrophulariaceae (Pennell 1935; Munz 1926, Elisens 1985).

Maurandya wislizeni Engelm. ex A. Gray (for Friedrich Adolph Wislizenus, 1810–1889, a St. Louis physician who collected plants in the West) Viny snapdragon. Perennial vine. **STEMS** twining; glabrous; woody-based; 30–80 dm long, slender, usually much-branched, especially at the base. **LEAVES** 2–6 cm, usually longer than wide, hastate or triangular-hastate, the petioles flexuous, about as long as the leaves. **INFL** reduced to solitary flowers in the axils of the leaves; the pedicels 1–4 cm long. **FLOWER** calyx 5-lobed, strongly expanded in fruit, becoming strongly carinate and reticulate, closely enclosing the capsule; corolla 20–30 mm long, 2-lipped, usually blue, purple, or nearly white, slightly gibbous or saccate at the base; stamens 4, included, the filaments glandular or puberulent. **FRUIT** a capsule, 6–8 mm long, globose, subsymmetrical, dehiscing by 2 slits. **SEEDS** 0.8–1.5 mm long, dark brown, narrowly winged, corky-tuberculate. $2n = 24$. Sandy soils; desert grassland. NMEX: SJn. 1520–1800 m (5000–5900'). Flowering: late May–Jul. Fruit: Jun–Sep.

Penstemon Mitch. Beardtongue, Penstemon
David L. Bleakly

(Greek *pente*, five, + *stemon*, thread; probably referring to the distinctive fifth "stamen" or staminode; in the 19th and early 20th centuries, the genus was usually spelled *Pentstemon*, or rarely *Pentastemon*) Glabrous (sometimes glaucous), pubescent, or glandular-pubescent perennial herbs, or rarely shrubs with a taproot. **STEMS** decumbent or erect, solitary or several, from a herbaceous or woody caudex. **LEAVES** opposite, simple, entire or rarely serrate, linear to much broader, the lower usually petiolate, the upper typically sessile, reduced and bractlike or leaflike in inflorescence, rarely connate-perfoliate, often with a basal rosette. **INFL** axillary; in verticillate, cymose, or thyrsoid panicles (sometimes called simply cymes or thyrses), grouped at each node in verticillasters; sometimes secund. **FLOWERS** complete, generally unscented (scented in *P. palmeri*); sepals 5, fused at base, lobes equal, sometimes growing longer in fruit, entire to erose and/or scarious; corolla sympetalous, zygomorphic (only slightly so in *P. ambiguus*), bilabiate, the upper lip 2-lobed and the lower 3-lobed, less often nearly regular; tubular to ampliate (inflated); usually some shade of blue, less commonly purple, red, pink, or white, proximal tubular part, throat, and lobes often different colors; throat often with nectar guides (lines in contrasting colors), sometimes plicate; palate bearded or not; fertile stamens 4; distinct; included or exserted; epipetalous, inserted near base of corolla, filaments typically curving toward upper side of the flower; anthers divided into 2 sacs, these usually dehiscing the entire length of cells and often opening completely (explanate), but sometimes opening only at bases (and across connective) or tips, usually with minute teeth on sutures, sacs mostly opposite or divaricate (in line), but rarely the pair curved into a horseshoe shape; surface glabrous or pubescent; pistil stigma fused, capitate; style slender, elongate, curved toward top of flower. **STAMINODE** (sterile stamen) 1; conspicuous; epipetalous, inserted on upper surface of corolla near level of top of ovary and typically curving so that apex lies at base of lower lobes; usually as long as the fertile stamens, included or exserted, often dilated and bearded at apex (hence the origin of the common name). **FRUIT** a capsule with 2 locules, septicidal, often loculicidal at apex, fruiting immediately after flowering. **SEEDS** numerous, irregularly angled. A genus of about 250–270 species, primarily in western North America, centered in Utah, but ranging from Alaska to the eastern United States and south to Central America (one species in northeastern Asia). It is one of the largest genera in the Four Corners region and the largest genus of the family in North America. Penstemons are very popular garden plants because of their beautiful but predominantly odorless flowers. This is a complex genus with many closely related and interfertile species, although natural hybrids are apparently uncommon. Species with sucrose-rich nectars and usually tubular flowers tend to be hummingbird-pollinated, while insects normally pollinate flowers that are more open and hexose-rich. Plants may usually be identified by careful attention to small but mostly well-marked differences visible on mature plants. Vestiture or lack of it, glaucescence, leaf size and shape, architecture of the stems and inflorescence (arrangement of parts), and characteristics of the calyx, corolla, stamens, and staminodes are all of critical importance for correct identification of specimens. Several features that are necessary for keying are often difficult to determine on pressed plants and should be noted in the field, including glaucescence, fresh flower color, presence of folds or ridges in the throat of the corolla, and whether the inflorescence is secund or not. Pistils, fruits, and seeds are of little value for identification. Many species are narrowly endemic, often to specific substrates, which should also be noted in the

field. Measurements in the key and descriptions are from pressed specimens with mature flowers and from naturally open, mature anther sacs (Nisbet and Jackson 1960).

1. Plants shrubby, stem woody well above base, glabrous; leaves linear and greater than 35 mm long; corolla pink externally, 15–24 mm long, white on the face of the lobes; upper lobes reflexed, lower lobes projecting, tube narrow and curved; sandy soils ..... ***P. ambiguus***
1' Plants herbaceous (stem bases of *P. crandallii* and *P. linarioides* often somewhat woody); leaves linear and longer or broader; corollas red, pink, bluish, or purplish (occasionally white) ..... (2)

2. Corollas red or pink ..... (3)
2' Corollas blue, bluish, purple, purplish, rarely pink or pinkish or white ..... (8)

3. Corollas definitely red; leaves never connate-perfoliate or serrate; anthers explanate or not ..... (4)
3' Corollas pink to rose, glandular; upper stem leaves connate-perfoliate, serrate; anthers explanate ..... (7)

4. Both anther sacs curved as a pair into horseshoe shape ..... (5)
4' Anther sacs not curved into horseshoe shape, typically opposite or divaricate (in a line) ..... (6)

5. Anther sacs dehiscent by a short slit across the connective, the tips remaining closed; corolla 22–33 mm long, slightly glandular outside, glabrous within, strongly bilabiate, upper lip projecting, lower reflexed; staminode included, glabrous ..... ***P. rostriflorus***
5' Anther sacs dehiscent at tips only, connective intact, minutely puberulent; corolla barely bilabiate, palate glabrous; staminode glabrous to slightly bearded at tip ..... ***P. eatonii***

6. Anthers becoming explanate; corolla tubular-salverform, more or less bilabiate, lower lip projecting, upper reflexed, glandular outside and in; herbage glabrous and glaucous ..... ***P. utahensis***
6' Anthers dehiscent distal 2/3–3/4, but not across connective and not explanate; corolla more or less tubular, strongly bilabiate, upper lobes projecting, lower lobes long, narrow, reflexed, glabrous outside, palate sometimes sparsely bearded ..... ***P. barbatus***

7. Corolla throat inflated, palate sparsely hairy; staminode exserted, densely bearded with yellow hairs ..... ***P. palmeri***
7' Corolla throat gradually expanding, palate glabrous; staminode included, glabrous ..... ***P. pseudospectabilis* subsp. *connatifolius***

8. Leaves linear to linear-oblanceolate, or linear-lanceolate and short (less than 35 mm long); calyx and exterior of corolla (sparsely) glandular; staminode bearded; inflorescence secund ..... (9)
8' Leaves not linear, or if so, then much longer than 35 mm, entire; inflorescence secund or not ..... (10)

9. Pubescence of leaves of minute, retrorsely appressed, flat, scalelike hairs, stem hairs slender, terete, erect or retrorsely curved; stems erect or ascending, older stems sometimes subwoody, prostrate, rooting, and forming mats; corolla ampliate, throat not plicate, palate lightly bearded; staminode sparsely bearded with short hairs, longer golden hairs in apical tuft ..... ***P. linarioides***
9' Pubescence of slender, terete, erect or retrorsely curved hairs throughout; stems prostrate, ascending, or erect, often forming mats from spreading rootstocks; corolla not ampliate, throat plicate ..... ***P. crandallii***

10. Foliage slightly to heavily glaucous and glabrous; leaves usually thickened or fleshy; staminode tip bearded with golden hairs, usually expanded, recurved ..... (11)
10' Foliage glabrous, puberulent, and/or glandular, but not glaucous; leaves not thickened ..... (12)

11. Lowest 2–4 inflorescence bracts prominent; inflorescence not secund, either open or congested, usually rather elongate; corolla 15–20 mm long; anthers completely dehiscent (including connective) but not explanate ..... ***P. angustifolius***
11' Only the lowest 1 or 2 inflorescence bracts relatively large; inflorescences usually distinctly to more or less secund, often open, peduncles and pedicels usually elongate ..... ***P. lentus***

12. Inflorescence and calyx (and often corolla) glandular-pubescent externally; staminode usually densely bearded most of length or only at apex ..... (13)
12' Inflorescence, calyx, and corolla not glandular-pubescent; glabrous or puberulous; staminode various ..... (18)

13. Anther sacs explanate, glabrous ..... (14)
13' Anther sacs not explanate, but widely dehiscent, glabrous ..... (17)

14. Corolla dull purple (rarely white), lower lobes projecting 3–5 mm longer than upper lobes, palate plicate; staminode exserted, apex with tuft of yellow hairs ..... ***P. whippleanus***
14' Corolla violet-blue, blue-purple, lower lobes not projecting, not noticeably longer than upper lobes ..... (15)

15. Stems prostrate, 5–15 cm long; inflorescence secund; leaves almost all cauline, rather broad; corolla lilac-purple, 15–20 mm long; alpine, above 3200 m (10500') ..... ***P. harbourii***
15' Stems erect, longer; not alpine ..... (16)

16. Corolla 5–6 mm wide, 12–20 mm long, orifice as high or higher than wide; throat not to moderately inflated; lower lip not glandular within; anther sacs 0.6–1 mm long; staminode not or barely exserted ..... ***P. breviculus***
16' Corolla 8–19 mm wide, 14–22 mm long, orifice much wider than high; throat much inflated; lower lip glandular within; anther sacs 0.8–1.2 mm long; staminode usually prominently exserted ..... ***P. ophianthus***

17. Inflorescence secund; corolla (14) 18–24 mm long, bluish purple to violet-purple; throat glabrous; staminode often exserted; habitat rocky alpine slopes near and above timberline, above 3200 m (10000') ..... ***P. hallii***
17' Inflorescence not secund; corolla 8–14 mm long; throat sparsely white-bearded; anther sacs 1–1.2 mm long; staminode included or barely exserted ..... ***P. parviflorus***

18. Inflorescence not at all secund, in dense fascicles usually separated by long internodes; corolla 10–14 mm long; anthers glabrous, explanate; plants usually puberulent ..... ***P. rydbergii***
18' Inflorescence secund (slightly or strongly), verticillasters not in dense fascicles ..... (19)

19. Plants entirely glabrous; corolla 19–23 mm long, abruptly expanded, palate sparsely white-bearded; anthers villous or glabrous; endemic to upper Navajo Mountain, Utah ..... ***P. navajoa***
19' Plants puberulent, at least below; anthers always at least slightly villous; grows elsewhere ..... (20)

20. Anthers densely villous; calyx 8–10 mm long, segments usually lanceolate, acuminate, or caudate, lower margins scarious, erose; staminode short-bearded on distal 1/2; corolla pale blue to lavender, 21–30 (35) mm long ..... ***P. strictiformis***
20' Anthers sparsely to densely villous; calyx 3–6 (8) mm long, segments usually ovate; staminode glabrous or with a few hairs at the tip ..... (21)

21. Inflorescence narrow, cymes 1–2-flowered on short, usually appressed peduncles and pedicels; corolla often deep blue, 18–32 mm long, anthers less densely pubescent than *P. comarrhenus*, occasionally sparse ..... ***P. strictus***
21' Inflorescence usually broader, cymes often much-branched, peduncles and pedicels elongate and divaricate; corolla pale blue to lavender, 25–38 mm long ..... ***P. comarrhenus***

Penstemon ambiguus Torr. **CP** (uncertain, perhaps referring to its relationship to other more typical, herbaceous penstemons or to its nearly actinomorphic corolla) Sand, bush, moth, phlox, or gilia beardtongue. **STEMS** 2–6 dm tall, profusely branched candelabra-like, woody well above the base; plants glabrous. **LEAVES** entire, 6–30 mm long, linear, mucronate, usually inrolled, margins not or remotely and very minutely scabrescent. **INFL** narrow, not secund; 1–2 flowers per peduncle. **FLOWER** calyx 2–3 mm long; lobes ovate, acute; margins scarious; corolla 15–24 mm long; glabrous outside, throat pubescent within; tubular, expanding slightly, curved, pale to deep pink; nectar guidelines prominent; faces of lobes glistening white, in single plane; upper lobes reflexed, lower projecting; stamens included; anthers ultimately explanate, glabrous. **STAMINODE** included, glabrous, tip not expanded. $2n = 16$. [*Leiostemon ambiguus* (Torr.) Greene]. Sandy soil, mostly low to mid-elevation shrublands and woodlands. ARIZ: Apa; NEV; UTAH. 1460–1600 m (4800–5500'). Flowering: May–Jun. Northern Mexico, southern New Mexico, and Trans-Pecos Texas to southern Utah, northern Arizona, and southern Nevada. This is the only woody beardtongue in our area. Our material belongs to **var. *laevissimus*** (D. D. Keck) N. H. Holmgren (smoothest).

Penstemon angustifolius Nutt. ex Pursh (narrow leaf) Broadbeard, narrowleaf, or taperleaf beardtongue. **STEMS** 1–several, 2–5 dm tall, stout; plants glabrous and glaucous. **LEAVES** entire, 2–9 cm long, 2–25 (35) mm wide, fleshy; basal usually shorter and narrower than cauline, lanceolate to oblanceolate, short-petiolate; cauline broadly lanceolate, acuminate. **INFL** glabrous, not secund; usually elongate; verticillaster usually dense and many-flowered but widely separated; lowest 2–4 inflorescence bracts prominent, lower large, lanceolate or broader, tip acuminate or caudate (tip

often folded over when pressed). **FLOWER** calyx 4–7 mm long; lobes lanceolate to narrowly ovate, acute to acuminate; margins broadly scarious at base; corolla 17–23 mm long; usually glabrous but occasionally with a few short hairs on palate; tube gradually expanding, blue or bluish purple to lavender or pinkish; lobes nearly equal, spreading; stamens included; anthers completely dehiscent but not explanate, glabrous. **STAMINODE** bearded with short, deep yellow hairs, more numerous near dilated tip. $2n = 16$. Sandy soils in shrublands and piñon-juniper woodlands. 1500–1860 m (4900–6100′). Flowering: late Apr–Jun. Southern Great Plains, northern New Mexico, southwest Colorado, northeast Arizona, and southeast Utah. Similar to *P. lentus*, but in *P. angustifolius* the cauline leaves are typically wider, the inflorescence is not at all secund, the lowest two to four inflorescence bracts are conspicuous and relatively broad, if smaller than the cauline leaves and increasingly smaller upward, and the peduncles and pedicels are short, making the flowers clustered or clumped. Except for flower color, the following varieties are not different.

1. Corollas pale blue to bluish purple ..... **var. *caudatus***
1′ Corollas lavender to pinkish ..... **var. *venosus***

var. *caudatus* (A. Heller) Rydb. (with a tail-like appendage, referring to the caudate inflorescence bracts) Corolla blue to bluish purple. COLO: LPl; NMEX: McK, RAr, San, SJn. 1585–1860 m (5200–6100′). Flowering: late Apr–Jun. Southern Great Plains, northern New Mexico, and southwest Colorado.

var. *venosus* (D. D. Keck) N. H. Holmgren (conspicuously veined) Corolla lavender to pink. ARIZ: Apa, Coc, Nav; COLO: Dol, Mon; NMEX: SJn; UTAH. 1500–1800 m (4900–5900′). Flowering: late Apr–Jun. Central Colorado Plateau, northwest New Mexico, southwest Colorado, northeast Arizona, and southeast Utah.

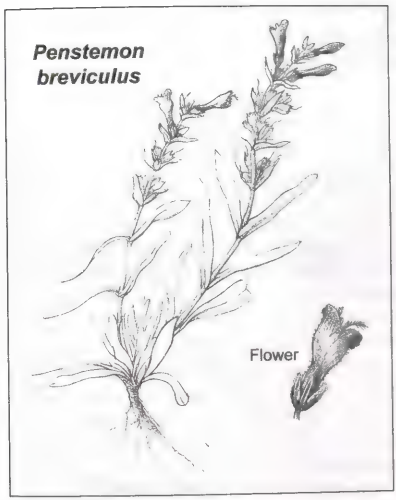
Penstemon barbatus (Cav.) Roth (bearded, referring to the hairy throat of var. *barbatus*) Torrey or scarlet beardtongue. **STEMS** 1–few, 3–11 dm tall; plants glabrous or puberulous below, glabrous above. **LEAVES** entire, 5–10+ cm long, basal and lower cauline wider than upper leaves (10–25 mm wide, mostly oblanceolate, and petiolate versus 1–10 mm wide and linear or narrowly lanceolate). **INFL** glabrous; more or less secund; verticillasters usually widely separated, peduncles and pedicels typically elongate and often branched. **FLOWER** calyx 3–7 mm long; lobes lanceolate to ovate, acute to short-acuminate, usually glabrous; margins entire, often scarious; corolla scarlet red, 25–35 mm long; externally glabrous, throat glabrous or sparsely white-bearded, essentially tubular, bent at base, markedly bilabiate, the upper lobes projecting, lower lobes reflexed; stamens exserted; anther sacs opening partially from the distal end, not across the connective, glabrous (lightly villous in var. *trichander*). **STAMINODE** included, glabrous, tip slightly expanded. $2n = 16$. [*Chelone barbata* Cav.]. Dry hillsides, from piñon-juniper and oak woodlands into ponderosa pine forests. 1740–2620 m (5700–8600′). Flowering: Jun–Aug. Mexico north to Trans-Pecos Texas, New Mexico, eastern Arizona, southwest and south-central Colorado, and southern Utah. Inflorescence architecture and corolla color and shape are similar to *P. rostriflorus*, but the anthers are not horseshoe-shaped and open in the distal end only (not across the connective).

1. Anthers glabrous ..... **var. *torreyi***
1′ Anthers villous ..... **var. *trichander***

var. *torreyi* (Benth. ex DC.) A. Gray (for John Torrey, 1796–1873, famous American botanist) Anthers glabrous; palate glabrous to sparsely villous. COLO: Mon, SJn; NMEX: RAr. 2290–2620 m (7500–8600′). Flowering: late Jun–Aug.

var. *trichander* A. Gray (hairy anther) Scarlet or beardlip beardtongue. Anthers lightly villous; palate glabrous. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1740–2315 m (5700–7600′). Flowering: Jun–Aug.

Penstemon breviculus (D. D. Keck) G. T. Nisbet & R. C. Jacks. (diminutive, referring to the short stature and/or small flowers) Shortstem, little, or narrowmouth beardtongue. **STEMS** 1–few, 1–3.5 dm tall; plants puberulent or glabrous below, usually retrorsely puberulent and glandular above. **LEAVES** entire (rarely irregularly toothed), 2–8 cm long, 4–16 mm wide; mostly narrowly oblanceolate, lower wider and petiolate, upper sessile. **INFL** glandular, subsecund, narrow due to short peduncles and pedicels. **FLOWER** calyx glandular; 5–7 mm long; lobes lanceolate, acute, scarious at base; corolla 12–20 mm long; glandular outside; dark blue to bluish purple with conspicuous dark guidelines, funnel-shaped; palate with long, pale yellow hairs, not glandular; stamens included; anthers glabrous, explanate. **STAMINODE** mostly included, densely bearded with threadlike, yellow hairs. [*Penstemon jamesii* Benth. subsp. *breviculus* D. D. Keck] Sandy, gravelly, or clay soils in sagebrush and piñon-juniper woodland. ARIZ: Apa; COLO: LPl, Mon; NMEX: RAr, SJn; UTAH. 1525–1980 m (5000–6500′). Flowering: late Apr–early Jun. Northwest New Mexico, northeast Arizona, southwest



Colorado, and southeast Utah. This species is very similar to and sometimes difficult to distinguish from *P. ophianthus* Pennell. The range of *P. breviculus* is relatively small (near the Four Corners monument) and is essentially entirely included within but at the eastern edge of the distribution of *P. ophianthus*. *Penstemon breviculus* is overall smaller than *P. ophianthus* and it is usually relatively distinct in its core area, but many plants in the Four Corners region exhibit characters that overlap with *P. ophianthus*. Hartman and Nelson (2001) subsume it within the latter, perhaps with justification.

Penstemon comarrhenus A. Gray (hair + male, referring to the densely hairy anthers) Dusty beardtongue. **STEMS** 1–few, 3–8 (12) dm tall; plants glabrous or rarely puberulent below. **LEAVES** entire; 3–12 cm long, 2–20+ mm wide; mostly oblanceolate, lower wider and petiolate (and more or less winged), upper narrower to linear and sessile. **INFL** glabrous, usually somewhat secund, open, with lower peduncles and pedicels typically elongate and divaricate. **FLOWER** calyx glabrous; 3–6 (10) mm long; ovate, obtuse to apiculate, margins scarious, erose; corolla 25–35 mm long; glabrous outside and inside; tube pale bluish white; throat markedly expanded; pale pinkish or bluish lavender with dark guidelines; stamens exserted; anthers usually densely villous, mostly dehiscent (opening at distal 3/4 or more). **STAMINODE** essentially included, usually glabrous (rarely sparsely bearded), tip moderately dilated. In sagebrush, oak and piñon-juniper woodlands, ponderosa pine forests. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: RAr, SIn, UTAH. 1890–2530 m (6200–8300'). Flowering: Jun–Jul. Northwest New Mexico, northeast Arizona, southwest Colorado, and southern Utah. Very similar to *P. strictus* and *P. strictiformis*, and the ranges of all three species overlap in the Four Corners area. The inflorescences of all three are at least somewhat secund and the classic open inflorescence architecture in *P. comarrhenus* is not always apparent. The anther sacs are usually densely villous, but not always so, and the corolla tends to be pale. Correct identification of any of these three species may be difficult in depauperate, immature, or atypical specimens.

Penstemon crandallii A. Nelson (for Charles Spencer Crandall, 1852–1929, Colorado collector and professor at the Agricultural College and Experiment Station, now Colorado State University, Fort Collins, 1889–1899) Crandall's beardtongue. **STEMS** usually several, 5–25 cm long, ascending to decumbent or sometimes prostrate, older, woodier stems often rooting; plants usually puberulent throughout with fine, terete, erect or retrorse hairs (rarely nearly glabrous), glandular-puberulent in inflorescence. **LEAVES** entire; essentially linear, sometimes slightly wider, 10–35 mm long, 1–3 mm wide, mucronate. **INFL** secund; glandular-puberulent. **FLOWER** calyx 5–8 mm long; lobes ovate to lanceolate, acuminate to caudate; margins scarious only in lowest; corolla 14–23 mm long; glandular-puberulent outside, palate sparsely bearded; throat plicate, only slightly expanded; blue to bluish purple or reddish purple; stamens reaching to near orifice; sacs dehiscing completely but not explanate; glabrous. **STAMINODE** included; densely bearded with golden hairs most of length. $2n = 16$. Oak and piñon-juniper woodlands, ponderosa pine to spruce/fir forests. 1920–2710 m (6300–8900'). Flowering: May–early Jul. Northern New Mexico, southwest, south-central, and central Colorado, and southeast Utah. In our area, leaf vestiture will consistently differentiate this species from *P. linarioides*, which otherwise is very similar. The hairs on *P. crandallii* are slender, terete, and erect or retrorse throughout, while those on the leaves of *P. linarioides* subsp. *coloradoensis* are flat and appressed and those on the stems are usually slender and erect or retrorse. Additionally, the leaves of *P. crandallii* are usually essentially linear while those on *P. linarioides* are typically broader, but this is not entirely consistent. The ranges of the following subspecies overlap somewhat in southwestern Colorado, with subsp. *glabrescens* occurring slightly eastward of the other.

1. Leaves sparsely scabrid on upper surface, usually denser on lower ..... **subsp. *crandallii***
1' Leaves glabrous on upper surface ..... **subsp. *glabrescens***

subsp. *crandallii* Leaves sparsely to moderately puberulent on upper surface and typically denser on lower surface, linear-oblanceolate, moderately crowded; corolla 14–20 mm long. COLO: Arc, Dol, Mon, SMg; UTAH. 2255–2710 m (7400–8900'). Flowering: late May–early Jul. Colorado and Utah.

subsp. *glabrescens* (Pennell) D. D. Keck (nearly or becoming smooth) Leaves glabrous on upper surface but usually puberulent on lower surface, linear or nearly so, more densely crowded; plants rarely nearly glabrous; corolla 15–23 mm long. COLO: Arc, LPl, SMg; NMEX: RAr, SJn. 1920–2380 m (6300–7800'). Flowering: May–Jun. Colorado and New Mexico.

Penstemon eatonii A. Gray (for Daniel Cady Eaton, 1834–1895, botanist at Yale University) Eaton's or firecracker beardtongue, scarlet bugler. **STEMS** few–several, 3–10 dm tall; plants robust, glabrous or puberulent, not glaucous. **LEAVES** entire, sometimes wavy; 3–10+ cm long, 1–5 cm wide; lower wider and petiolate; upper somewhat narrower, sessile, sometimes subcordate and/or clasping. **INFL** glabrous or puberulent; secund; verticillasters usually separated; peduncles and pedicels short. **FLOWER** calyx 3–6 mm long; lobes ovate, obtuse or acute, occasionally short-acuminate; glabrous; margins scarious, entire to slightly erose; corolla cardinal red; 20–30 mm long; glabrous inside and out, including palate; essentially tubular, often decurved near base, obscurely bilabiate, the lobes short, nearly equal, and mostly projecting; stamens included to exserted; anthers horseshoe-shaped, dehiscing at tips only; minutely puberulent. **STAMINODE** included; glabrous (rarely sparsely bearded at tip). $2n = 16$. Dry, rocky or sandy areas in shrublands, piñon-juniper woodlands, ponderosa pine forests. 1460–2500 m (4800–8200'). Flowering: May–Jun (Aug). Northwest New Mexico, southwest Colorado, northern Arizona, Utah, southern Nevada, and southern California. Presence or absence of pubescence has been used to define two varieties. However, both glabrous and puberulent plants occur in proximity in our area and the differences seem trivial. One of four red-flowered beardtongues in our area, each of which has a unique set of characters that make it readily identifiable. This species is the only one in the region with horseshoe-shaped anther sacs opening at the tips.

1. Herbage glabrous throughout ..... **var. *eatonii***
1' Herbage puberulent ..... **var. *undosus***

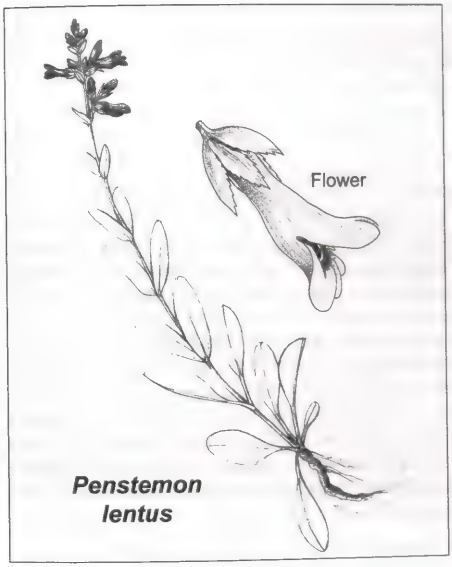
var. *eatonii* CP Plants glabrous. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: SJn; UTAH. 1585–2500 m (5200–8200'). Flowering: May–Jun. Northwestern New Mexico, southwest Colorado, northern Arizona, Utah west to southern California.

var. *undosus* M. E. Jones (wavy) Plants puberulent. ARIZ: Apa, Coc, Nav; COLO: Dol, Mon; NMEX: RAr, SJn; UTAH. 1460–2500 m (4800–2165'). Flowering: May–Jun (Aug). Northwestern New Mexico, southwest Colorado, Arizona, southern Utah to southern California.

Penstemon hallii A. Gray (for Elihu Hall, 1820–1882, an early plant collector in Colorado and associate of J. P. Harbour) Hall's beardtongue. **STEMS** short (10–20 cm), several to many, sometimes forming mats; plants glabrous below, sparsely glandular-puberulent above. **LEAVES** entire, glabrous, 2–6 cm long, 3–8 mm wide; basal leaves conspicuous, mostly narrowly oblanceolate, lower larger than upper. **INFL** secund, glandular-pubescent, condensed or elongate. **FLOWER** calyx 5–9 mm, lobes broadly ovate, usually acute, with wide scarious margins; corolla 18–24 mm long, minutely glandular-pubescent or glabrous outside, glabrous within, including palate, abruptly ampliate, blue, pink, or violet-purple; stamens dehiscing completely, including across connective, but not explanate; cells glabrous (minutely puberulent or rarely with a few longer hairs). **STAMINODE** usually exserted; short-bearded entire length, denser at widened tip. Rocky or gravelly soils near and above timberline. COLO: Arc, Con, Hin, Min, Mon, RGr, SJn. 3530–3840 m (11600–12600'). Flowering: Jul–Aug. This plant is endemic to most of the high mountains in Colorado.

Penstemon harbourii A. Gray **CP** (for J. P. Harbour, an early plant collector in Colorado and associate of Elihu Hall) Scree or Harbour's beardtongue. **STEMS** short (5–15 cm), slender, ascending, from long, creeping rootstocks, sometimes forming matlike mounds; plants puberulent below, glandular-puberulent above. **LEAVES** entire, 1–2 cm long, about 5–10 mm wide; no basal rosette; lower mostly petiolate, broader (spatulate to oblanceolate), and longer; upper sessile, narrower, shorter, and extending into inflorescence. **INFL** short (2–4 cm), secund, leafy, glandular-pubescent, mostly few-flowered and rather crowded. **FLOWER** calyx 6–9 mm, lobes linear-lanceolate, margins entire, not scarious; corolla 15–20 mm long, glandular-pubescent outside, palate densely bearded, throat slightly expanded, plicate, reddish purple to lilac and pale blue; stamens dehsicing completely, becoming explanate, glabrous. **STAMINODE** densely bearded most of length, tip dilated. Rocky, open places in alpine habitat. COLO: Hin, LPl, Min, Mon, RGr, SJn. 3475–3810 m (11400–12500'). Flowering: late Jun–Aug. This readily recognizable plant is endemic to most of the high mountains in Colorado.

Penstemon lentus Pennell (pliant) Pliant, Abajo, or handsome beardtongue. **STEMS** 1–few, 3–5 dm tall, plants glabrous and glaucous throughout. **LEAVES** entire, fleshy, 2–10 cm long, 1–2 cm wide; mostly obovate, petiolate,



longer, and wider below, usually lanceolate, short, and narrower above. **INFL** glabrous, more or less secund, verticillasters usually separated, lower peduncles and pedicels often elongate; only lowest 1 or 2 inflorescence bracts prominent. **FLOWER** calyx 4–7 mm long, lobes usually ovate to lanceolate, acute or obtuse, margins scarious (about 0.5 mm wide), entire or erose; corolla 17–22 mm long; glabrous outside, palate sometimes sparsely white-bearded, moderately ampliate, blue, bluish violet, or white (var. *albiflorus*); stamens included, sacs dehiscing completely including across connective and usually divergent, but not explanate, glabrous. **STAMINODE** essentially included; bearded with short hairs in distal 1/2; tip dilated. Sandy or gravelly soils in sagebrush, piñon-juniper, oak, and ponderosa pine habitats. 1735–2410 m (5700–7900'). Flowering: May–Jun. Four Corners region. Similar to *P. angustifolius*, but in *P. lentus* the cauline leaves are usually narrower, the inflorescence is more or less secund, only the lowest one or two inflorescence bracts are somewhat large, and the peduncles and pedicels are usually long, causing the inflorescence to appear relatively open. Weber and Wittmann (2001) subsume *P. lentus* under *P. osterhoutii*, a species endemic to north-central Colorado, despite the apparently discontinuous ranges and somewhat different features of the two.

1. Corolla white; limited to the west side of the Abajo Mountains and the Natural Bridges National Monument area, Utah ..... **var. *albiflorus***
1' Corolla bluish violet; widespread in Four Corners area ..... **var. *lentus***

var. *albiflorus* (D. D. Keck) Reveal (white-flowered) White-flowered beardtongue. Corolla white. ARIZ: Apa. UTAH: 2000–2350 m (6560–7700'). Flowering: May–Jun. Endemic to the west side of the Abajo Mountains, Utah, and the vicinity immediately to the south (including Natural Bridges National Monument).

var. *lentus* Corolla blue to bluish violet. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, SIn; UTAH: 1735–2410 m (5700–7900'). Flowering: May–Jun. Northwest New Mexico, southwest Colorado, northeast Arizona, and southeast Utah.

Penstemon linarioides A. Gray [from the genus *Linaria* (toadflax), referring to the similar leaf shape] Colorado toadflax beardtongue. **STEMS** few to many, 15–30 cm tall; sometimes decumbent and rooting at nodes, thus occasionally forming small mats; plants with tiny, retrorsely appressed, scalelike hairs on leaves, stems usually with terete, slender, erect or retrorse hairs; inflorescence glandular-puberulent. **LEAVES** entire, nearly linear or more often narrowly oblanceolate, mucronate; mostly 1–2 (3.5) cm long, 1–2.5 mm wide, similar in size and shape throughout; stems leafy but leaves also usually crowded near stem bases. **INFL** secund, glandular-puberulent. **FLOWER** calyx 5–8 mm, lobes ovate-lanceolate, acute or more commonly acuminate, margins scarious usually more than 1/2 of length; corolla 15–20 mm long, glandular-puberulent outside, palate lightly bearded, throat moderately ampliate, plicate, with prominent dark nectar guidelines, tube and throat pale-colored, elsewhere reddish lavender to bluish purple; stamens reaching orifice, cells dehiscing completely including across connective but not explanate, glabrous. **STAMINODE** included, bearded most of length, longer hairs at slightly widened tip. $2n = 16$. Dry, sandy or rocky slopes in sagebrush, shrublands, and woodlands. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, SIn; UTAH: 2040–2650 m (6700–8700'). Flowering: May–Jun. Northwest New Mexico, northeast Arizona, southwest Colorado, and southeast Utah. Our material belongs to **subsp. *coloradoensis*** (A. Nelson) D. D. Keck (of Colorado). The shape of the leaf hairs will consistently distinguish this species from *P. crandallii*. The ranges of the two species overlap in southwest Colorado. Other varieties of *P. linarioides* occur south and west of this taxon.

Penstemon navajoa N. H. Holmgren (for Navajo Mountain, Utah, the type locality) Navajo Mountain beardtongue. **STEMS** 1–few, 2–4 dm tall, plants glabrous. **LEAVES** entire, 2–9 cm long, 1–15 mm wide; narrowly (ob)lanceolate.

broader and petiolate toward base of plant, narrower to linear and sessile near top of stems. **INFL** glabrous, more or less secund. **FLOWER** calyx glabrous, 3.5–5 mm long, lobes ovate, acute or obtuse, scarious margins less than 0.5 mm wide; corolla 17–25 mm long, glabrous outside, palate sparsely white-bearded, tube light blue to white, throat blue, ampliate; stamens exserted, sacs usually villous, sometimes glabrous, dehiscent except for connective. **STAMINODE** glabrous, tip expanded slightly. Rocky, open places in ponderosa pine, Douglas-fir, and subalpine habitats. UTAH. 2250–3170 m (7400–10400'). Flowering: Jul–Aug. Grows only on the upper part of Navajo Mountain, San Juan County, Utah; a Four Corners regional endemic.

Penstemon ophianthus Pennell (snake + flower) Coiled anther or Loa beardtongue. **STEMS** 1–several, 1–4 dm tall, plants glabrous or puberulent below, glandular-pubescent above. **LEAVES** entire to sometimes sinuate-dentate, 3–12 cm long, 6–22 mm wide; wider and petiolate below, narrower above. **INFL** glandular, more or less secund. **FLOWER** calyx 6–10 mm long, lobes (narrowly) lanceolate, acute to acuminate, herbaceous, sometimes narrowly scarious-margined at base; corolla 15–22 mm long, 7–10 mm wide when pressed, moderately ampliate, opening wider than tall, glandular-puberulent outside, palate with numerous long, whitish, villous hairs, also sometimes with short, glandular hairs, bluish to pale lavender or blue-violet; stamens included or slightly exserted, sacs glabrous, becoming explanate. **STAMINODE** clearly exserted, densely bearded with long yellow hairs. $2n = 16$ [*P. jamesii* Benth. subsp. *ophianthus* (Pennell) D. D. Keck]. Sandy or gravelly soils in sagebrush, piñon-juniper, oak, and ponderosa pine habitats. ARIZ: Apa; COLO: Mon; NMEX: McK, SJn; UTAH. 1400–2410 m (4600–7900'). Flowering: late May–early Jul. Northwest and western New Mexico, northeast Arizona, southwest Colorado, southeast and south-central Utah. Closely related to *P. jamesii* and *P. breviculus*. *Penstemon jamesii* has larger flowers and occurs in central and eastern New Mexico. *Penstemon breviculus* is partly sympatric with and not always distinguishable from *P. ophianthus*. Hartman and Nelson (2001) consider *P. breviculus* and *P. parviflorus* to be synonyms of *P. ophianthus*, which may be correct.

Penstemon palmeri A. Gray (for Edward Palmer, 1821–1911, Western plant collector) Palmer's beardtongue, pink wild snapdragon, balloon flower. **STEMS** few to several, robust, 5–14 dm tall, plants glaucous, glabrous below, glandular-pubescent in inflorescence. **LEAVES** usually serrate, fleshy, 5–12 cm long, 2–5 cm wide; lower petiolate, becoming connate-perfoliate above. **INFL** glandular-pubescent, more or less secund, typically elongate. **FLOWER** calyx 4–6 mm long, lobes ovate, acute; corolla sweetly fragrant, 25–35 mm long, abruptly expanded, throat inflated, white to pink, dark guidelines conspicuous, palate with sparse white hairs; stamens included, cells dehiscing completely including across connective and becoming explanate, glabrous. **STAMINODE** exserted, densely bearded with yellow hairs. $2n = 32$. Washes and roadsides in shrublands, piñon-juniper woodlands, and ponderosa pine forests. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: San, SJn; UTAH. 1370–1830 m (4500–6000'). Flowering: May–Jul. A distinctive, easily recognizable plant. Probably only native in the extreme western portion of the San Juan drainage. Widely planted in the Southwest for revegetation on roadsides. This species is a popular garden plant because of its robust growth habit, drought resistance, and its beautiful, large, fragrant flowers.

Penstemon parviflorus Pennell (small flower) Small-flowered penstemon. **STEMS** short (15–20 cm tall); plants glandular-puberulent. **LEAVES** linear-lanceolate, 3–5 cm long, and 3–5 mm wide. **INFL** narrow, more or less secund. **FLOWER** calyx lobes about 8 mm long and linear-lanceolate; corolla about 12 mm long and glandular-puberulent outside, palate pubescent, throat ampliate, apparently purplish blue; stamen sacs minutely puberulent and dehiscing completely but not explanate. **STAMINODE** more or less included and densely bearded most of its length. COLO: Mon. Flowering: May–Jul. Known from one collection by Alice Eastwood in 1890 near Mancos, Colorado. Although the plants in the Mancos, Colorado, area have been rather thoroughly collected since 1890, *P. parviflorus* has never been relocated. Hartman and Nelson (2001) consider it to be a synonym of *P. ophianthus*, perhaps with some justification.

Penstemon pseudospectabilis M. E. Jones **subsp. *connatifolius*** (A. Nelson) D. D. Keck (Greek *pseudo*, false, and Latin *spectabilis*, showy, referring to this plant's similarity, in some respects, to *P. spectabilis* Thurb. ex A. Gray, a species from southern California and Baja California, Mexico). Desert, spectacular, pink showy, or canyon beardtongue. **STEMS** several to many, 4–10 dm tall, from a woody base; plants glabrous (except corolla), glaucous. **LEAVES** serrate; petiolate below, becoming connate-perfoliate above; upper perfoliate leaves to 18 cm long and 7.5 cm wide. **INFL** often 1/2 the height of the plant; more or less secund; glabrous; of several verticillasters, each with 1–5 flowers; the lower peduncles often elongate. **FLOWER** calyx 5–7 mm long, lobes typically ovate, apices acute to acuminate, margins narrowly scarious; corolla pale to deep rose or rose-magenta, with darker guidelines, 22–33 mm long, to 12 mm wide when pressed, glandular-puberulent externally and internally, throat gradually expanding, palate glabrous; stamens included, anther sacs explanate, glabrous. **STAMINODE** included, glabrous, narrow. [*Penstemon connatifolius* A. Nelson; *Penstemon*

spectabilis Wooton & Standl., not Thurb.]. Piñon-juniper woodlands (to ponderosa pine forests elsewhere in its range) UTAH. 1060 m (4800'). Flowering about Jun. Often common in Arizona from the southeast to the northwest (it apparently has not been collected in the northeastern part of the state) and southwestern New Mexico, but very uncommon in southern Utah (only a handful of collections). This subspecies is readily recognizable by its pinkish flowers, connate-perfoliate upper leaves; glabrous palate; explanate, hairless anthers; and glabrous staminode. Other subspecies grow elsewhere in Arizona and southern California; subsp. *connatifolius* is the most widespread.

Penstemon rostriflorus Kellogg (beak flower) Beak-flowered, beaked, or Bridges' beardtongue. **STEMS** few to several, 3–10 dm tall, plants glabrous or obscurely puberulent and sometimes glaucous below, glandular-pubescent above. **LEAVES** entire, mostly cauline, 2–9 cm long, 2–8 mm wide; lower oblanceolate and petiolate, upper linear or narrow and sessile. **INFL** glandular-pubescent, secund, typically open, lower peduncles sometimes elongate and branched. **FLOWER** calyx glandular-pubescent, 4–6 mm long, lobes mostly lanceolate, margins not or slightly scarious; corolla red to orange-red (rarely yellow), 23–33 mm long, lightly glandular-pubescent outside, palate pale yellow, glabrous, narrowly funnel-shaped, often decurved near base, markedly bilabiate, the lower lobes reflexed, the upper lobes nearly united and projecting, slightly glandular outside, stamens exserted, anthers horseshoe-shaped, dehiscing near connective only, glabrous. **STAMINODE** more or less included, glabrous, tip not expanded. $2n = 16$; 42 [*Penstemon bridgesii* A. Gray]. Many habitats including shrublands, oak and piñon-juniper woodlands, and ponderosa pine and montane conifer forests. ARIZ: Apa, Coc, Nav; COLO: Dol, LPl, Mon; NMEX: SJn; UTAH. 1890–2770 m (6200–9100'). Flowering: Jun–Sep. Northwest and western New Mexico, northern Arizona, southwest Colorado, southern Utah, southern Nevada, California. Inflorescence architecture and corolla color and shape are similar to *P. barbatus*, but the anthers are horseshoe-shaped and open only at the connectve in *P. rostriflorus*.

Penstemon rydbergii A. Nelson (for Per Axel Rydberg, 1860–1931, well-known American botanist) Rydberg's beardtongue. **STEMS** few to several, 2–5 dm tall, plants usually puberulent. **LEAVES** entire; 3–12 cm long, 3–20 mm wide, basal and lower petiolate, longer, and wider, upper sessile, shorter, and narrower. **INFL** typically puberulent but not glandular, not secund, usually in distinctly separated, densely flowered verticillasters. **FLOWER** calyx 4–6 mm long, lobes ovate, acuminate, margins broadly scarious and erose; corolla 12–20 mm long, glabrous outside, palate bearded, throat moderately ampliate, blue to purple; stamens slightly exserted, sacs dehiscing completely including across connective but not explanate, glabrous; blackish. **STAMINODE** reaching orifice, usually densely yellow-bearded. $2n = 16$. Relatively moist to dry places in meadows, shrublands, and forests in mountains. ARIZ: Apa, COLO: Arc, Dol, Hin, Mon, NMEX: SJn. 2740–3230 m (9000–10600'). Flowering: Jul–Aug. Southeastern Arizona, northern New Mexico, Colorado, central Utah, Wyoming, southwestern Montana, Idaho, northeast Oregon, southeast Washington. One of the more widespread species of *Penstemon*, with two or three varieties. Our material belongs to **var. *rydbergii***.

Penstemon strictiformis Rydb. (tight shape) Mancos beardtongue. **STEMS** 1–few, mostly 2–6 dm tall, plants glabrous. **LEAVES** entire; 2–15 cm long, 5–15 mm wide, mostly narrowly (ob)lanceolate and similar width throughout, basal and lower cauline petiolate and longer, upper sessile, shorter, and often folded. **INFL** glabrous; more or less secund, rather narrow or contracted, peduncles and pedicels short. **FLOWER** calyx 5–8 mm, lobes lanceolate, acuminate or caudate, lower margins scarious; corolla (15) 20–30 mm long, glabrous outside and inside, throat ampliate, pale bluish lavender or bluish purple; stamens exserted, anthers densely to sparsely villous, but cells not obscured, cells mostly dehiscent (opening at distal 3/4 or more) but not across connective. **STAMINODE** included, glabrous to sparsely villous, tip slightly expanded. [*P. strictus* Benth. subsp. *strictiformis* (Rydb.) D. D. Keck]. In sagebrush, oak and piñon-juniper woodlands, ponderosa pine forests. ARIZ: Apa, Nav; COLO: Arc, Mon; NMEX: RAr, SJn; UTAH. 2100–2560 m (6900–8400'). Flowering: late May–Jul (Sep). Northwest New Mexico, northeast Arizona, southwest Colorado, and southeast Utah. Very similar to *P. comarrhenus* and *P. strictus*, and the ranges of all three species overlap in the Four Corners area. Many plants are difficult to place and exhibit intermediate characters. Anther sacs are sometimes densely villous but just as often are sparsely so. Corollas are generally smaller than the other two species and the calyx is usually longer. This seems to be the least well-defined taxon of the three. Weber and Wittmann (2001) subsume this species within *P. strictus* with some justification.

Penstemon strictus Benth. (close, tight, narrow) Rocky Mountain, porch, or stiff beardtongue. **STEMS** 1–few, 3–8 dm tall, plants glabrous or slightly puberulent in lower parts. **LEAVES** entire, 5–15 cm long, 4–20 mm wide, mostly narrowly oblanceolate; basal and lower petiolate; upper sessile, somewhat shorter and narrower, often folded. **INFL** strongly secund, narrow, peduncles 3–15, appressed. **FLOWER** calyx 2.5–5 mm long, lobes ovate, usually obtuse (sometimes apiculate), margins scarious; corolla 23–32 mm long, glabrous outside and in, throat expanded, blue to

dark blue or blue-purple; stamens exserted, sacs villous, mostly dehiscent (opening at distal 3/4 or more), but not across connective. **STAMINODE** essentially included; sparsely villous or glabrous. $2n = 16$. In sagebrush, oak and piñon-juniper woodlands, ponderosa pine forests. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 2100–2865 m (6900–9400'). Flowering: late May–early Aug. Northern New Mexico, northeast Arizona, western Colorado, Utah, and southwest Wyoming. Closely related and very similar to *P. strictiformis* and *P. comarrhenus*, and the ranges of all three species overlap in the Four Corners area. Although this species is usually readily identifiable, some specimens cannot be satisfactorily placed due to overlap in characters among the three species.

Penstemon utahensis Eastw. **CP** (of Utah) Utah beardtongue. **STEMS** 1–few, 1.5–6 dm tall, plants glabrous (except for glandular-pubescent corollas) and glaucous. **LEAVES** entire, thick, leathery or fleshy, 1–10 cm long, 5–20 mm wide; lower petiolate, mostly oblanceolate, and wider and longer than upper, which are elliptic or lanceolate and sessile. **INFL** subsecund, elongate. **FLOWER** calyx 2.5–5 mm long, lobes broadly ovate, acute or mucronate, margins broadly scarious; corolla 16–25 mm long; typically red-rose, mostly tubular-salverform, bilabiate, limbs conspicuous, more or less in same plane, often at oblique angle with lower lip projecting, glandular outside and in but palate not bearded, stamens included; sacs glabrous, becoming explanate. **STAMINODE** included; glabrous or papillate at tip. Sandy soils in shrublands and piñon-juniper habitats. ARIZ: Apa, Coc, Nav; COLO: Mon; UTAH. 1200–2000 m (3900–6600'). Flowering: Apr–May. Southwestern Colorado, northeast Arizona, southern Utah, southern Nevada, and southeast California. One of four red-flowered beardtongues in our area each of which has a unique set of characters that make it readily identifiable. This is the only one with spreading corolla lobes and explanate anther sacs.

Penstemon whippleanus A. Gray (for Amiel Weeks Whipple, 1816–1863, explorer with the U.S. Army Corps of Topographical Engineers) Whipple's or dusky beardtongue. **STEMS** 1–several, 2–10 dm tall, plants glabrous below, glandular-pubescent above. **LEAVES** entire or dentate, 2–10 cm long, 10–30+ mm wide; cluster of well-developed basal leaves usually present, lower wider than upper, with long petioles, upper narrower (but not linear) and sessile or clasping; mostly lanceolate throughout. **INFL** glandular-pubescent, secund, cymes usually in dense clusters. **FLOWER** calyx 6–11 mm long, lobes (narrowly) lanceolate, acuminate, margins scarious at base; corolla 20–30 mm long, glandular outside, variable in color but often very dark (blackish purple) or violet, (dark) blue, lavender to whitish, lower lip projecting well beyond the short upper, throat ampliate, plicate, palate with long white hairs; stamens included or slightly exserted, sacs glabrous, becoming explanate. **STAMINODE** usually exserted beyond the upper lobe, white, tip with tuft of whitish hairs. $2n = 16$. Open and forested areas in mountains, from subalpine into alpine habitats. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr, SJn; UTAH. 3350–3810 m (11000–12500'). Flowering: Jul. Widespread in the western United States; central and north-central New Mexico, central Colorado, central Utah, Wyoming, southeast Idaho, and southwest Montana. This species is quite distinctive and usually readily recognizable.

Plantago L. Plantain

Tina J. Ayers

(Latin *planta*, flat and spread out, + *ago*, kind of) Annual or perennial, acaulescent herbs from taproots. **STEMS** extremely short, disclike, simple or branched. **LEAVES** simple, spirally arranged, usually all basal, estipulate, the blades entire or variously toothed, venation parallel. **INFL** a pedunculate, bracteate spike. **FLOWERS** regular, perfect or imperfect, several to many, inconspicuous, each subtended by a bract; sepals 4 (2 fused in *P. lanceolata*), distinct, usually with overlapping scarious margins; corolla 4-lobed, whitish, scarious or membranous, persistent, the lobes with a thickened or colored basal spot; stamens 2–4, exserted; ovary superior, of 2 fused carpels, with 2 locules, the placentation axile; style 1, exserted; stigma 2-lobed. **FRUIT** a circumscissile capsule with 2–many seeds, included in the sepals or exserted, often purplish brown. **SEEDS** mucilaginous when wet, flat, concave or irregularly angled, the outer surface often patterned. About 255 species, worldwide. *Plantago afra* and *P. ovata* are used as laxatives (Morris 1900, 1901).

1. Plants annual; leaves threadlike to linear-lanceolate, rarely more than 1 cm wide ..... (2)
1' Plants perennial; leaves lanceolate to ovate, rarely less than 1 cm wide ..... (4)

2. Leaves threadlike; bracts keeled, bases extended and saclike; seeds usually 4 per capsule ..... ***P. elongata***
2' Leaves linear to linear-lanceolate; bracts flat to slightly keeled, bases not extended and saclike; seeds 2 per capsule ..... (3)

3. Bracts linear-triangular, 2–16 mm long, longer than sepals; seeds light brown to reddish brown, spring-flowering ..... ***P. patagonica***

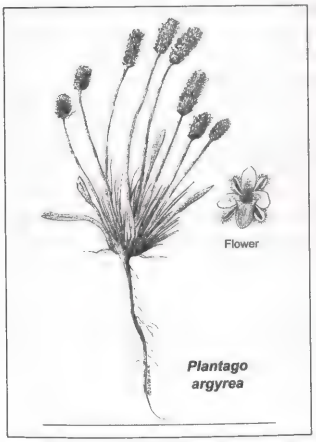
3' Bracts triangular, 2–3.5 mm long, about as long as sepals; seeds dark brown to black, summer- to fall-flowering ..... ***P. argyrea***

4. Leaves broadly ovate, abruptly narrowing into a petiole; seeds 6–many per capsule ***P. major***

4' Leaves lanceolate, oblanceolate, or elliptic, gradually tapering into the petiole; seeds 2–4 per capsule (5)

5. Outer pair of sepals (those adjacent to the bract) connate, appearing as a solitary, 2-veined, apically notched or entire sepal ..... ***P. lanceolata***

5' Outer pair of sepals (those adjacent to the bract) distinct ..... ***P. eriopoda***



Plantago argyrea E. Morris (silvery) Saltmeadow plantain. Annual herbs to 30 cm tall. **LEAVES** without a distinct petiole; blades linear to linear-lanceolate; 2.4–17.4 cm long, 0.2–0.5 cm wide, acute to acuminate at apex, densely villous (rarely woolly), distinctly 3-veined below, margins entire. **INFL** peduncle 5–26 cm long, hirsute, with most hairs appressed-ascending; spike 1–9.5 cm long, interrupted near base at maturity; bracts broadly triangular, 2–3 mm long, about as long as sepals, scarious-margined at base or to near middle, sparsely to densely villous, with tufts of white hairs in axils, midvein ciliate. **FLOWERS** perfect; sepals obovate, 2.3–3 mm long, scarious-margined, villous; corolla lobes spreading or reflexed, broadly ovate, 1.6–2.3 mm long; stamens 4. **FRUIT** breaking at or slightly below middle. **SEEDS** 2, narrowly elliptic, concave, 2.5 mm long, 1.2 mm wide, dark brown to black. (*Plantago purshii* Roem. & Schult. var. *argyrea* Poe). Locally common in dry piñon-juniper woodlands and ponderosa pine forest communities. ARIZ: Apa, Nav; NMEX: McK, SJn. 2250–2685 m (7400–8800'). Flowering: Jun–Sep. Arizona and New Mexico above the Mogollon Rim. The spelling presented here agrees with that found in the original publication of the species (Morris 1900). Some treatments use the correct spelling (e.g., Wooton and Standley 1915; McDougall 1973). In *Arizona Flora* (Kearney and Peebles 1969), *A Flora of New Mexico* (Martin and Hutchins 1981), and many Web resources the species name is incorrectly spelled *P. argyraea*.

Plantago elongata Pursh (elongated) Prairie plantain. Annual herbs to 10 cm tall. **LEAVES** without a distinct petiole; blades threadlike to linear, 1.5–7 cm long, less than 1 mm wide, attenuate at base, acute at apex, sparsely pubescent, with no evidence of venation, margins entire. **INFL** peduncle 2.6–16 cm long, sparsely to densely villous, usually becoming densely villous just below the inflorescence; spike 0.3–5.5 cm long, sometimes interrupted near base; bracts ovate, 1.5–2.2 mm long, broadly scarious-margined, bases extended and saclike, glabrous. **FLOWERS** perfect; sepals broadly ovate, 1.2–2 mm long, 1/2 as long as capsule, broadly scarious-margined; midvein thick, glabrous; corolla lobes spreading or reflexed, triangular to narrowly ovate, 0.5–0.7 mm long; stamens 2. **FRUIT** breaking at middle. **SEEDS** generally 4, narrowly elliptic, nearly flat, acute at both ends, 1.2 mm long, 0.3 mm wide, olive-green to dark brown. Desert grasslands and washes. COLO: Arc, Mon; NMEX: McK, RAr, SJn. 1860–2075 m (6100–6800'). Flowering: May–Jul. Widespread in western North America. Our plants are **var. *elongata***.

Plantago eriopoda Torr. (woolly-foot, referring to the stem) Redwool plantain. Perennial herbs to 40 cm tall. **LEAVES** petiolate; blades lanceolate, 5–12 cm long, 1–2.5 cm wide, attenuate at base, acute at apex, sparsely villous to glabrate, distinctly 5-veined below, the margins with a few remote, shallow teeth. **INFL** peduncle 5.5–16 cm long, white-villous; spike 2–10 cm long, interrupted near base; bracts ovate, (1.5) 2 mm long, ciliate, with tufts of tan hairs in axils. **FLOWERS** perfect; sepals broadly elliptic, about 2.5 mm long, broadly scarious-margined; corolla lobes spreading or reflexed, subulate to narrowly ovate, 1.2–1.8 mm long; stamens 4. **FRUIT** breaking well below middle. **SEEDS** 2, ellipsoid, concave, 2 mm long, 0.8–1 mm wide, light brown to reddish brown with clear rim at base. Alkaline marshes. ARIZ: Apa; COLO: Arc, LPl; NMEX: SJn. 1700–2240 m (5600–7350'). Flowering: Jun–Aug. Widespread in western North America.

Plantago lanceolata L. (lance-shaped) Narrowleaf plantain. Perennials to 65 (85) cm tall. **LEAVES** petiolate; blades lanceolate, 4–24.5 cm long, 0.5–4.2 cm wide, long-attenuate at base, acute at apex, sparsely pubescent to glabrate, distinctly 5 (7)-veined, with margins occasionally having a few remote teeth. **INFL** peduncle 13–86 cm, strigose; spikes

1.5–7 cm long, continuously flowered without interruption; bracts broadly triangular, (1.5) 2 mm long. **FLOWERS** perfect; sepals obovate, 1.5–2.5 mm long, broadly scarious-margined, the 2 outermost characteristically fused, appearing as a solitary, 2-veined, apically notched or entire sepal; midvein thin, ciliate at apex; corolla lobes spreading or reflexed, subulate to narrowly ovate, 2–2.5 mm long; stamens 4. **FRUIT** breaking well below middle. **SEEDS** 2, ellipsoid, concave, 1.5–2.5 mm long, 1 mm wide, brown. Moist soils in disturbed sites. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1600–2856 m (5470–9370′). Flowering: May–Aug. Native of Eurasia, now a cosmopolitan weed.

Plantago major L. (larger) Common plantain. Perennials to 42 cm tall. **LEAVES** petiolate; blades broadly ovate, 3.5–15 cm long, 2–9 cm wide, attenuate at base, acute at apex, sparsely pubescent, becoming glabrate, distinctly 3 (5)-veined, the margins with a few shallow lobes near base. **INFL** peduncle 4–20 cm long, sparsely pubescent to glabrous, sometimes appearing ridged to 4-sided; spikes 3–24 cm long, interrupted near base; bracts broadly ovate, 1.5–4.5 mm long, with broad scarious margins; midvein glabrous. **FLOWERS** perfect; sepals broadly ovate to elliptic, 1.2–2.3 mm long, broadly scarious-margined, midvein glabrous; corolla lobes spreading or reflexed, ovate, 0.7–1.5 mm long; stamens 4. **FRUIT** breaking well below middle. **SEEDS** 6–many, irregular in shape, 1 mm long, 0.5 mm wide, olive-green to dark brown. Weed of wet areas throughout the *Flora* area. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1730–3820 m (5690–12530′). Flowering: May–Oct. Cosmopolitan. A cold infusion of the plant was taken for "lightning infection" and as a "life medicine" by the Ramah Navajo. The Laguna and Acoma used the young leaves for food.

Plantago patagonica Jacq. (from Patagonia) Woolly plantain. Annual herbs to 21 cm tall. **LEAVES** without distinct petiole; blades linear to linear-lanceolate, 1–15 cm long, 0.1–0.7 cm wide, acute to acuminate at apex, sparsely to densely villous, distinctly 3-veined below, the margins entire. **INFL** peduncle 2–22 cm long, hirsute, with most hairs appressed-ascending; spike 1–13 cm long, continuously flowered without interruption; bracts linear-triangular to subulate, 2–16 mm long, longer than sepals, green throughout or scarious-margined near base, sparsely to densely villous, with tufts of white hairs in axils, with midvein long-ciliate. **FLOWERS** perfect; sepals obovate, 2–5 mm long, broadly scarious-margined, villous; corolla lobes spreading or reflexed, broadly ovate, 1.2–2.5 mm long; stamens 4. **FRUIT** breaking at or slightly below middle. **SEEDS** 2, ellipsoid, concave, 2.2 mm long, 1.2 mm wide, reddish brown to light brown (rarely dark brown). [*P. purshii* Roem. & Schult.]. Deserts and desert grasslands. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1690–2225 m (5550–7300′). Flowering: Feb–Jun. British Columbia to Saskatchewan, Canada; south to California, east to Texas; Argentina and Chile. Used by the Hopi to make a person more agreeable. Used by the Navajo as a gastrointestinal aid, laxative, and seeds given to babies with colic or constipation. A cold infusion of plant parts taken to reduce appetite and prevent obesity by the Ramah Navajo. The Ramah Navajo would also use an infusion of root, leaves, and seeds blown over a rattle at the beginning of the "hoof rattle song." Porridge seeds made into mush and used for food by the Kayenta Navajo. The Hopi would use the plant as a ceremonial item for participants of the "clowning crew."

Synthyris Benth. Kittentails, Besseya

(together or joined little door, after the manner in which the capsule dehisces) Subscapose perennial herbs with fibrous roots. **LEAVES**: basal well developed, usually maturing after anthesis, petiolate, the blades ovate to rotund, cordate, cordate-ovate to oblong, crenate, crenate-serrate, serrate to pinnatifid; cauline leaves reduced, bractlike, sessile, alternate. **INFL** a dense raceme, cylindrical spike, or spikelike raceme. **FLOWER** calyx with (1) 2–4 lobes, distinct or variously united; corolla blue, pink, lavender, violet-purple, yellow, or white, campanulate to subrotate, subequally 4-lobed, the upper lobe entire, slightly larger, the lower 3 lobes external to the upper in bud, or corolla wanting, vestigial, or present and strongly bilabiate, the upper lip entire, concave, much larger than the lower, the lower lip more or less 3-lobed, external to the upper in bud; stamens 2, exserted, exserted filaments conspicuously colored in flowers lacking a corolla, the anther cells parallel; stigmas united and capitate. **FRUIT** a loculicidal capsule, plump to somewhat compressed, notched apically or entire. **SEEDS** 2–many per locule, flattened or with incurved margins; $2n = 24$. [*Besseya* Rydb.] A genus of 16 species, occurring in the mountains of the western United States. Formerly included in Scrophulariaceae (Pennell 1933; Hufford and McMahon 2004).

1. Corolla dark violet-purple; the upper lip of the corolla with the middle lobe about 1/2 as long as the entire lip; plants generally less than 15 cm tall; leafy bracts 4–6 ..... ***S. alpina***
1′ Corolla white or yellow, sometimes pink-purple tinged; the upper lip of corolla with the middle lobe less than 1/2 as long as the entire lip; plants usually more than 15 cm tall; leafy bracts more than 6 ..... (2)

2. Corolla lemon-yellow; the upper lip ciliate, the lower lip of corolla with lobes no more than 1/5 as long as the entire lip; lateral calyx lobes united for 1/2 their total length ..... ***S. ritteriana***
2' Corolla white or pinkish purple; the upper lip entire, the lower lip of corolla with lobes more than 1/2 the length of the entire lip; lateral calyx lobes united for less than 1/3 their total length ..... ***S. plantaginea***

Synthyris alpina A. Gray (growing in the alpine) Alpine kittentails. Subscapose perennial herb, 5–15 (20) cm tall. **STEMS** simple; woolly to glabrate. **LEAVES**: basal petiolate, the blades (2.5) 4–6 cm long, (1) 2.5–4 cm wide, elliptic, ovate to broadly ovate, rounded to cordate basally, crenate, incisions 0.2–1 mm deep, the primary veins pinnate, petioles 3–6 (10) cm long; cauline leaves alternate, few, 4–6, bractlike, sessile. **INFL** subspicate, dense, villous, the bracts spatulate to obovate. **FLOWER** calyx 4–6 mm long, the 4 lobes elliptic-lanceolate, white-villous, especially on the margins; corolla 5–8 mm long, violet, purple; stamens exserted, with inconspicuously colored filaments. **FRUIT** a capsule 3–5 mm long and about as wide, orbicular, entire or scarcely notched, the style about 3.5–4 mm long. **SEEDS** 1–1.5 mm long, orbicular, flat, 4 per locule. $2n = 24$. [*Besseya alpina* (A. Gray) Rydb.]. Moist, rocky alpine tundra, meadows, and talus. COLO: Hin, LPl, Min, Mon, SJn. 3000–4300 m (9900–14200'). Flowering: Jul–Aug. Fruit: late Jul–Sep. High Rocky Mountains of south-central Wyoming, Colorado, and northern New Mexico, and in the La Sal Mountains of southeastern Utah.

Synthyris plantaginea (E. James) Benth. (referring to the similarity in form with *Plantago*) Plantain kittentails. Subscapose perennial herb, (10) 18–48 cm tall, tomentose but becoming glabrate. **LEAVES**: basal tomentulose, petiole usually 1.5–6.5 cm long; the blades 2–20 cm long, 1.5–4 cm wide, acute apically, ovate to obovate or oblanceolate, obtuse at base, broadly to narrowly cuneate basally, rarely subcordate, crenate, the incisions 0.2–0.8 mm deep, the primary veins pinnate, cauline leaves alternate, bractlike, sessile to subpetiolate below, broadly lanceolate to ovate, entire to serrate, pilose. **INFL** a subspicate raceme, 7–13 cm long, tomentulose, flowers dense. **FLOWER** calyx 4–7 mm long, 4- to 5-lobed, with lateral lobes connate for less than 1/3 their length, villous-ciliate; corolla about 4.5–8 mm long, white to pinkish purple, the upper (adaxial) lip slightly to well exserted from the calyx, the lower (abaxial) lip 1/2 as long as the upper, 2- to 3-lobed, the lobes over 1/3 the length of the lip; stamens exserted, with white or pale filaments, not conspicuously pigmented, 7–11 mm long. **FRUIT** a capsule, 4.5–6 mm long, 3.5–5 mm wide, pubescent to glabrous, notched at the apex, the style 3–5 mm long. **SEEDS** 1.2–3 mm long, orbicular, flat, mostly 4 per locule. [*Besseya plantaginea* (E. James) Rydb.]. Hills and mountains, often on moist wooded slopes and meadows. 1830–3050 m (6000–10000'). Wyoming, south to New Mexico and Arizona, but apparently absent from Utah. Two subspecies occur within our study area:

1. Largest leaf blades not more than 8 cm long, rounded or subcordate basally; corolla mostly less than 5 mm long; capsule acute to rounded at the apex, 4.5–5.2 mm long ..... **subsp. *arizonica***
1' Largest leaf blades up to 20 cm long, cuneate basally; corolla 5–8 mm long; capsule notched at the apex, 5–6 mm long ..... **subsp. *plantaginea***

subsp. *arizonica* (Pennell) J. M. Porter (of Arizona) Arizona kittentails. Subscapose perennial herb. **STEMS** 1 to several, 10–35 cm tall, tomentose but becoming strigose or glabrate. **LEAVES**: basal tomentulose abaxially, strigose to glabrate adaxially, petiole usually 1.5–6.5 cm long; the blades 2–8 cm long, 1.5–4 cm wide, acute apically, ovate to obovate, obtuse at base, broadly cuneate to subcordate basally, crenate, the incisions 0.2–0.6 mm deep, rarely entire, the primary veins pinnate, cauline leaves alternate, bractlike, sessile to subpetiolate below, broadly lanceolate to ovate, entire to serrate, pilose. **INFL** a subspicate raceme, 7–10 cm long, tomentulose, flowers dense. **FLOWER** calyx 4–7 mm long, 5-lobed, rarely 4-lobed, with lateral lobes connate for less than 1/5 their length, villous-ciliate; corolla about 4.5–5.3 mm long, white to pinkish purple, the upper (adaxial) lip slightly exserted from the calyx, the lower (abaxial) lip 1/2 as long as the upper, 2- to 3-lobed, the lobes over 1/3 the length of the lip; stamens exserted, with white or pale filaments, not conspicuously pigmented, 7–10 mm long. **FRUIT** a capsule, 3–4 mm long, 3.5–4.5 mm wide, glabrous, acute to rounded at the apex, the style 3–4 mm long. **SEEDS** 1.2–2.4 mm long, orbicular, flat, 4–6 per locule. Moist meadows; ponderosa pine and Douglas-fir communities. ARIZ: Apa; NMEX: McK, SJn. 2130–2900 m (7000–9500'). Flowering May–Jun. Fruit: Jun–Jul. Restricted to Arizona and New Mexico. Recent systematic work suggests that *S. plantaginea* and *Besseya arizonica* are conspecific. Because of the morphological and ecological differences between the two taxa, we choose to recognize *B. arizonica* at the subspecific rank, rather than reducing it to synonymy.

subsp. *plantaginea* Subscapose perennial herb. **STEMS** 18–48 cm tall, tomentose but becoming glabrate. **LEAVES**: basal tomentulose, petiolate, the blades 5–20 cm long, 2–4 cm wide, acute apically, ovate to obovate or oblanceolate, obtuse at base, broadly to narrowly cuneate basally, crenate, the incisions 0.3–0.8 mm deep, rarely simple, the primary

veins pinnate, petiole usually 2–5 cm long; cauline leaves alternate, bractlike, sessile to subpetiolate below, broadly lanceolate to ovate, entire to serrate, pilose. **INFL** a subspicate raceme, 7–13 cm long, tomentulose, flowers dense. **FLOWER** calyx 4–7 mm long, 5-lobed, rarely 4-lobed, with lateral lobes connate for less than 1/3 their length, villous-ciliate; corolla about 5–8 mm long, white to pinkish purple, the upper (adaxial) lip slightly exserted from the calyx, the lower (abaxial) lip 1/2 as long as the upper, 2- to 3-lobed, the lobes over 1/3 the length of the lip; stamens exserted, with white or pale filaments, not conspicuously pigmented, 7–11 mm long. **FRUIT** a capsule, 3–6 mm long, 3.5–5 mm wide, pubescent to glabrous, notched at the apex, the style 3–4.5 mm long. **SEEDS** 2–3 mm long, orbicular, flat, mostly 4 per locule. Hills and mountains, often on moist wooded slopes; sagebrush, piñon, oak, ponderosa pine, and mixed conifer communities. COLO: Arc, Hin, LPl, Mon, SMg; NMEX: RAr. 1830–3050 m (6000–10000'). Flowering: Jun–Jul. Fruit: Jul–Aug. Wyoming, south to New Mexico and Arizona, but apparently absent from Utah.

Synthyris ritteriana Eastw. **CP** (honoring B. W. Ritter, rancher and plant collector of Durango, Colorado) Ritter's kittentails. Subscapose perennial herb, (15) 20–35 cm tall. **STEMS** simple; pubescent to glabrate. **LEAVES**: basal often sparsely pubescent on the underside (abaxial), glabrate or ciliate on the upper (adaxial), the petioles 2.5–12 cm long; the blades 5–15 cm long, 1.5–7 cm wide, elliptic to oblong, acute and cuneate basally, acute apically, crenate to serrate, the incisions 0.3–1.4 mm deep, the primary veins pinnate, cauline leaves alternate, bractlike, sessile to subpetiolate below, broadly lanceolate to ovate, entire to serrate, sparsely villous. **INFL** a subspicate raceme, villous, flowers dense. **FLOWER** calyx 5–7.5 mm long, 3- or 4-lobed (5-lobed), orbicular to ovate, lateral lobes connate more than 1/2 the length of the calyx, villous-ciliate; corolla 5.5–6.5 mm long, lower lip of corolla with lobes short, only about 1/5 as long as the lip, lemon-yellow; stamens exserted, with white or pale filaments, not conspicuously pigmented, 6–8 mm long. **FRUIT** a capsule, 3.5–5 mm long, 3–4.5 mm wide, glabrous, rounded to notched at the apex, the style 5–6 mm long. **SEEDS** 2–3.2 mm long, orbicular, flat, mostly 4 per locule. [*Besseya ritteriana* (Eastw.) Rydb.; *S. reflexa* Eastw.; *S. ritteriana* subsp. *obtusa* A. Nelson]. Cliffsides and moist banks or meadows near timberline. COLO: Hin, LPl, Mon, SJn. 1230–3750 m (7000–12300'). Flowering: May–Aug. Fruit: late Jun–Sep. Endemic to west-central and southwestern Colorado.

Veronica L. Speedwell

(origin uncertain, possibly to honor St. Veronica) Annual, biennial, or perennial herbs. **STEMS** erect, decumbent, or prostrate. **LEAVES** opposite, cauline (not to be confused with the alternate, foliose floral bracts), entire, crenate, or serrate. **INFL** a terminal raceme or composed of lateral racemes from axils of upper leaves; bracts foliose or reduced, alternate or sometimes subopposite. **FLOWER** calyx of 4 essentially distinct lobes, sometimes united forming a short tube; corolla blue, violet to pink, or white, subrotate, the tube very short, irregularly 4-lobed, the adaxial (upper) lobe largest, the lower 3 lobes external to the upper in bud, the lowermost lobe the smallest; stamens 2, anther cells parallel; stigmas united and capitate. **FRUIT** a loculicidal capsule, strongly compressed to plump, ovoid, orbicular or often emarginate to deeply notched into a heart shape. **SEEDS** few to many, flattened, plano-convex or cup-shaped, smooth or rarely roughened. $2n = 14, 16, 18$. A large genus of between 180 and 250 species, in north-temperate Eurasia and North America, a few species in the Southern Hemisphere. Formerly included in Scrophulariaceae. Two of the following seven species are introduced from the Old World (Pennell 1921; Thieret 1955; Walters and Webb 1972).

1. Racemes axillary and opposite, never terminating the main stem; glabrous; perennial ..... (2)
1' Racemes terminal, rarely with additional axillary racemes (then often alternate); at least the stems pubescent; annual or perennial ..... (4)

2. Leaves all petiolate; pedicels 5–10 mm long; leaves lanceolate to ovate, acute to obtuse; capsule entire or scarcely notched; racemes 10–25-flowered; widespread ..... ***V. americana***
2' Leaves sessile, lower leaves sometimes subpetiolate ..... (3)

3. Leaves broadly lanceolate to ovate, 1.5–3 times as long as wide, somewhat succulent; racemes often more than 30-flowered, the pedicels upcurved to ascending; capsule slightly longer than wide, scarcely notched; corolla 5–10 mm across, blue or pale violet with purplish guidelines; widespread ..... ***V. anagallis-aquatica***
3' Leaves lanceolate, (2.5) 3–5 times as long as wide, thin; racemes less than 25-flowered, the pedicels more or less straight and spreading; capsule slightly wider than long with a more evident notch 0.1–0.3 mm deep; corolla 3–5 mm across, whitish to pink or pale blue ..... ***V. catenata***

4. Perennial, rhizomatous; raceme somewhat congested; montane ..... (5)
4' Annual, fibrous roots or taproot; raceme mostly elongate; valleys and foothills ..... (6)

5. Capsule as long as or longer than wide, 4.5–6.5 mm long, exceeding the calyx; style 0.8–1.3 mm long; corolla 6–10 mm across ..... ***V. nutans***

5' Capsule wider than long, 2.8–3.7 mm long, not exceeding the calyx; style 2.2–3 mm long; corolla 4–8 mm across ..... ***V. serpyllifolia***

6. Pedicels short, 0.5–1.5 (2) mm long; calyx 3–6 mm long, the segments lanceolate; capsule 3.5–5 mm wide; seeds many, 0.5–1 mm long, more or less strongly flattened and smooth ..... ***V. peregrina***

6' Pedicels 15–30 mm long; calyx (3) 4–12 mm long, the segments broadly lanceolate to ovate, often with pronounced veins and leaflike; capsule 4–8 mm wide, more or less plump; seeds few, 5–11 per locule, 1.2–2 mm long, cup-shaped, roughened ..... ***V. persica***

Veronica americana Schwein. ex Benth. (of America) American brooklime. Aquatic, rhizomatous perennial, 5–35 (60) cm tall. **STEMS** erect to ascending, decumbent at base, rooting at lower nodes, often branched, glabrous. **LEAVES** petiolate, the blade (0.5) 1.5–3 (5) cm long, (3) 7–20 (30) mm wide, lanceolate to ovate, crenate-serrate or subentire below, acute to obtuse apically. **INFL** an axillary raceme, 10- to 25-flowered, glabrous, bracts reduced, linear, pedicels 5–10 mm long, divaricate. **FLOWER** calyx 2.5–4.5 (5.5) mm long, the lobes oblanceolate to ovate, corolla 5–10 mm across, blue. **FRUIT** a septicidally and loculicidally dehiscing capsule, 2.5–3.8 mm long, 3–4 mm wide, entire or scarcely notched, the style 1.7–3 (4) mm long. **SEEDS** numerous, 0.5–0.7 mm long, brownish, plano-convex. $2n = 36$. Moist soils of springs, seeps, bogs, hanging gardens, slow-flowing streams, lake shores, or meadows. ARIZ: Apa. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr; NMEX: McK, RAr, SJn; UTAH. 1400–3300 m (4600–10800'). Flowering Jul–Aug. Fruit late Jul–Sep. Common throughout most of North America, but absent from the southeastern U.S. and only spotty in the higher mountains of Mexico.

Veronica anagallis-aquatica L. (water pimpernel) Water speedwell, brook-pimpernel. Aquatic, rhizomatous perennial, 9–65 (100) cm tall. **STEMS** erect, ascending, simple to much-branched at the base; glabrous. **LEAVES** somewhat clasping, 2–8 cm long, 0.5–4 cm wide, elliptic, upper leaves sessile, clasping, crenate to serrate, acute or acuminate; elliptic-lanceolate to ovate; lower leaves subpetiolate or sessile, oblanceolate to obovate, obtuse to acute, cordate, rounded, or truncate basally. **INFL** an axillary raceme, glabrous to glandular-puberulent, often more than 30-flowered, the bracts reduced, lanceolate to linear; pedicels 4–8 mm long, upcurved or ascending. **FLOWER** calyx 3.5–5 mm long, the lobes broadly lanceolate; corolla 5–10 mm across, blue, pale violet with purplish guidelines. **FRUIT** a septicidally and loculicidally dehiscing capsule, slightly longer than wide, 2.8–4 mm long, 2.5–3.8 mm wide, plump, scarcely notched, the style 1.5–3 mm long. **SEEDS** numerous, 0.3–0.5 mm long, more or less plano-convex. $2n = 18, 36$. *Veronica micromera* Wooton & Standl., described from ditches in the vicinity of Shiprock, New Mexico, and known only from the type collection, is assigned here. It was purported to differ in its oval to obovate, entire leaves that are less than 30 mm long and narrowed at the base, and the sepals being conspicuously longer than the capsule. No recent collections conform to this description. Wet meadows, stream banks, or in water of seeps, springs, and slow-moving streams. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1200–2500 m (4000–8200'). Flowering: Jun–Aug. Fruit: Jul–Sep. Native to Europe, Africa, and Asia, but widely naturalized in the New World.

Veronica catenata Pennell (chained, chainlike) Aquatic, rhizomatous perennial, 8–28 (60) cm tall. **STEMS** erect to ascending, branched; glabrous (ours) to pubescent. **LEAVES** sessile, clasping, blade 2.5–5 (9) cm long, 0.5–1.5 (2.5) cm wide, lanceolate, acute, entire or subcrenate, appearing thin in pressed specimens. **INFL** an axillary raceme, glabrous, 15–25-flowered, the bracts much reduced, narrowly lanceolate; pedicels more or less straight and spreading, 3–7 mm long. **FLOWER** calyx 2.5–3.5 mm long, the lobes broadly lanceolate to ovate, obtuse to acute; corolla 3–5 mm across, white to pink or pale bluish. **FRUIT** a septicidally and loculicidally dehiscing capsule, 2.5–3 mm long, 3–4 mm wide, plump, the notch evident, 0.1–0.3 mm deep, the style about 1.3–2 mm long. **SEEDS** numerous, 0.3–0.7 mm long, yellow-brown, plano-convex. $2n = 36$. Wet meadows, gravel bars, irrigation channels, banks of lakes and ponds, and slow-flowing streams. ARIZ: Apa; COLO: Arc, LPl; NMEX: RAr, SJn. 1370–1830 m (4500–6000'). Flowering Jun–Aug. Fruit: Jul–Sep. United States and adjacent Canada.

Veronica nutans Bong. (nodding) American alpine speedwell, western alpine speedwell. Rhizomatous perennial, 8–25 (40) cm tall. **STEMS** ascending, erect, occasionally decumbent at the base, usually simple, villous-hispid with loosely spreading hairs, leaves sometimes glabrous. **LEAVES** sessile, 2–3 (4) cm long, 0.8–1.8 cm wide, elliptic to broadly lanceolate, obtuse to acute, crenate to entire. **INFL** a compact to interrupted, terminal raceme, 2–4 (9) cm long, viscid-villous or glandular, the bracts linear to lanceolate; pedicels 2–6 mm long. **FLOWER** calyx 3.5–5.5 mm long, the lobes lanceolate to oblanceolate; corolla 6–10 mm across, deep blue. **FRUIT** a glandular-pubescent capsule, longer than the

calyx, longer than wide, 4.5–6.5 mm long, 2.8–4 mm wide, the notch 0.1–0.5 mm deep, the style 0.8–1.3 mm long. **SEEDS** numerous, small, 0.7–0.9 mm long, pale brown. $2n = 18$. [*Veronica wormskjoldii* Roem. & Schult., an eastern, tetraploid species, misapplied to our diploid species]. Moist subalpine and alpine meadows, tundra, stream banks, and shores of ponds and lakes. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr, SJn; UTAH. 2600–4260 m (8500–14000'). Flowering: Jul–Aug. Fruit: Aug–Sep. North American, from Alaska to Greenland, south to the mountains of California, northern Arizona, northern Mexico, and in the east to New Hampshire.

Veronica peregrina L. (foreign, wandering) Purslane speedwell, neckweed, necklace-weed. Annual, 5–22 (30) cm tall, with short taproot. **STEMS** erect, ascending, simple or branched at the base, occasionally branched inflorescence; glandular-pubescent; leaves and bracts often glabrous. **LEAVES** sessile or the lower ones narrowed to a petiolar base, the blades 5–22 mm long, 0.5–5 mm wide, narrowly oblong to oblanceolate, entire or irregular, crenate-serrate. **INFL** an elongate, glandular-puberulent, terminal raceme, the bracts foliaceous at the base, gradually reduced upward; pedicels 0.5–1.5 mm long. **FLOWER** calyx 3–6 mm long, the lobes subequal, narrowly elliptic to lanceolate; corolla inconspicuous, 2–3 mm across, whitish. **FRUIT** a capsule, 3–4.5 mm long, 3.5–5 mm wide, more or less obcordate with a broad notch 0.2–0.5 mm deep, the style very short, 0.1–0.4 mm long. **SEEDS** numerous, 0.5–1 mm long, plano-convex. $2n = 52$. Moderately moist to muddy meadows, stream banks, and lake or pond edges. ARIZ: Apa, Coc, Nav; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1500–2900 m (4900–9500'). Flowering: Jun–Aug. Fruit: Jul–Sep. Throughout temperate North and South America, eastern Asia, and Europe. Our plants belong to **subsp. *xalapensis*** (Kunth) Pennell (of Xalapa, Mexico), with pubescent stems, whereas subsp. *peregrina* is glabrous. Subspecies *xalapensis* ranges from Alaska and Yukon to Mexico and east to the northern midwestern U.S. and the St. Lawrence River Valley.

Veronica persica Poir. (of Persia) Persian speedwell, bird's-eye speedwell. Annual, 9–30 cm tall, with a short taproot. **STEMS** loosely ascending, usually decumbent at the base and sometimes rooting at the lower nodes, simple or branched at the base; pilose. **LEAVES** short-petiolate, the blades 0.7–2.5 cm long, 0.5–2 cm wide, ovate, broadly ovate, or suborbicular, deeply crenate-dentate, obtuse to rounded apically, broadly cordate to truncate basally, sometimes the lowermost entire. **INFL** an elongate, lax, terminal raceme, the bracts foliose at the lower nodes, gradually reduced upward; pedicels 15–27 (30) mm long. **FLOWER** calyx 4.5–8 mm long, the lobes prominent, broadly lanceolate, prominent veins, ciliate; corolla relatively large, 8–12 mm across, blue. **FRUIT** a capsule, 3.5–4.5 mm long, 5–7 mm wide, the lobes divergent, the notch prominent, 0.7–1.2 mm deep, the style 2–3 mm long. **SEEDS** 5–11 per locule, 1.2–2 mm long, cup-shaped, transversely rugose, brown. $2n = 28$. [*Pocilla persica* Fourr.]. Weed in lawns and cultivated fields. COLO: Arc, LPl, Mon; NMEX: RAr. 1220–2440 m (4000–8000'). Flowering: May–Jun. Fruit: Jun–Aug. A native of western Asia and southern Europe. Naturalized throughout Europe and most of North America.

Veronica serpyllifolia L. (wild thyme–leaved) Thyme-leaf speedwell. Rhizomatous perennial, 8–24 (30) cm tall. **STEMS** ascending, sometimes decumbent to procumbent at the base, simple or short-branched below; finely puberulent or glabrous. **LEAVES** short-petiolate below, subsessile above, blade 1–2.5 cm long, 0.8–1.5 cm wide, elliptic to broadly ovate, rounded to obtuse, obscurely crenate to entire. **INFL** a somewhat congested terminal raceme, 2.5–12 cm long, glandular-pubescent, the bracts lanceolate, foliaceous below; pedicels 2.5–5 (7.5) mm long. **FLOWER** calyx 2.5–4 mm long, the lobes ovate or oblong, slightly unequal; corolla 4–8 mm across, blue (in ours) or white, the tube pubescent within. **FRUIT** a capsule, slightly glandular-pubescent, shorter than the calyx, 2.8–3.7 mm long, 3.5–5 mm wide, the notch evident, 0.3–0.8 mm deep, the style 2.2–3 mm long. **SEEDS** numerous, 0.6–0.8 mm long, pale brown. $2n = 14$, 28. [*Veronicastrum serpyllifolium* (L.) Fourr. subsp. *humifusum* (Dickson) W. A. Weber]. Moist stream banks and gravel bars, meadows, and shores of lakes and ponds, muddy areas; Douglas-fir to subalpine communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX; SJn; UTAH. 1700–3600 m (5550–11800'). Flowering: Jun–Aug. Fruit: Jul–Sep. Widespread, particularly in the mountains of the Northern Hemisphere, native of North America from Alaska and Newfoundland, south to California, Nevada, northern Arizona, and northern New Mexico in the western United States, to Vermont in the east, and the mountains of Mexico. Our material belongs to **subsp. *humifusa*** (Dicks.) Syme.

PLUMBAGINACEAE Juss. SEA LAVENDER or SEA THRIFT FAMILY

Linda Mary Reeves

(Latin for leadlike, purplish blue coloring) Annual or perennial herbs, shrubs, and vines. **LEAVES** in a basal rosette or alternate on aerial branched stems; simple; without stipules. **INFL** a cyme, panicle, raceme, spike, or dense head, often with bracts that sometimes form an involucre. **FLOWERS** perfect; actinomorphic or tubular, generally 5-parted; sepals

5, forming a lobed persistent tube, often papery, sometimes colored; petals free, often connate at the base or fused; stamens 5, opposite petals, mostly free; ovary superior, carpels 5, locule 1; ovule 1; styles and or stigmas 5. **FRUIT** indehiscent, enclosed by the calyx. About 10 genera and about 560 species, worldwide distribution, often in dry and saline or seaside environments. *Limonium*, *Armeria*, *Ceratostigma*, and *Plumbago* have many important horticultural species and cultivars.

Limonium Mill. Sea Lavender, Marsh Rosemary

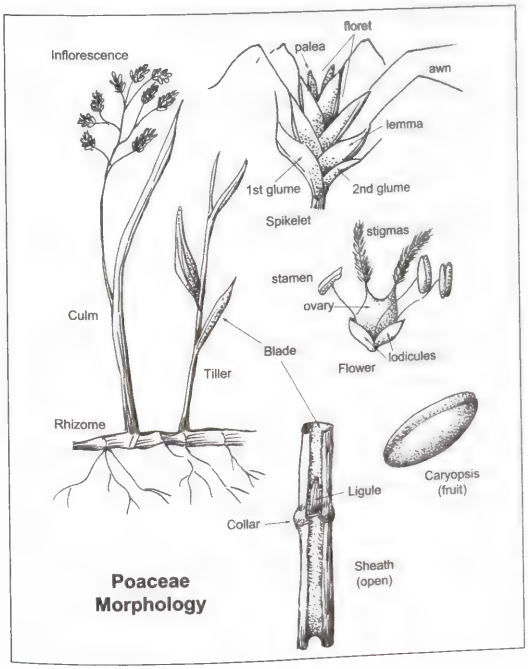
(Latin name for sea lavender) Suffrutescent perennial. **LEAVES** petioled, fleshy. **INFL** a panicle or spike, with flowers often arranged in smaller 1-sided spikelets. **FLOWERS** often appearing tubular; calyx funnelform, membranous, persistent; corolla of 5 somewhat distinct petals with long claws; stamens attached to petal bases; styles 5, rarely 3. **FRUIT** membranous, enclosed by calyx. About 300 widely distributed species.

Limonium latifolium Moench (one-sided, referring to the inflorescence) Sea lavender. Perennial herb. **LEAVES** basal, fleshy, simple; glabrous to glaucous; spatulate to obovate; margin entire; apex rounded, base tapered. **INFL** cymose, with flowers arranged in groups of 2–4 spikelets; often many flowering stalks present, giving the flowering plant a cloud-like appearance. **FLOWERS** with calyx persistent, white, 5-lobed; corolla tubular, papery, pink, purple, blue, or white. Introduced from the Mediterranean. Along roadsides. COLO: Mon. 1800 m (6000'). Flowering May–Sep. Fruit Jun–Oct. One specimen known from our area near Cortez, but may prove to be more widely established.

POACEAE Barnhart (Gramineae Juss.) GRASS FAMILY

Kelly W. Allred

Annual or perennial herbs, tufted, rhizomatous, or stoloniferous. **CULMS** mostly terete, simple or branched, with conspicuous nodes, the internodes hollow or pithy. **LEAVES** entire, alternate, 2-ranked, differentiated into sheath, ligule, and blade; sheaths tubular, enclosing the culm, the margins usually free from one another and overlapping (open sheath), or sometimes connate edge to edge (closed sheath), the upper margins sometimes prolonged into sheath auricles; ligules (appendages produced on the adaxial surface of the leaf at the junction of sheath and blade) membranous, composed of hairs, or a combination of a basal membrane with a ciliate fringe, absent only in *Echinochloa* in our plants; blades elongate, narrow, with parallel venation, flat to variously rolled, the lower margins at junction with sheath sometimes expanded into auricles. **INFL** a spike, raceme, or panicle, the flowers arranged in spikelets. **SPIKELETS** consisting of a central axis (rachilla) and associated bracts, glumes, lemmas, and paleas, the flowers borne within the lemma and palea and this unit termed a floret; florets 1–many per spikelet, the basal portion often hardened into a callus; glumes 2 (rarely 1 or absent), 1- to several-nerved, awned or awnless; lemmas 1- to several-nerved, awned or awnless; paleas 2-nerved and keeled, rarely awned; disarticulation above the glumes and the florets falling separately, above the glumes but the florets falling together, below the glumes and the spikelet falling entire, or within the inflorescence and the spikelets falling with accessory structures. **FLOWERS** highly reduced, hidden within the spikelets and florets; perianth represented by 2 (sometimes 1 or absent) delicate lodicules; stamens usually 3, sometimes fewer or none, the anthers



with 2 chambers; pistil 1 per flower, with a superior ovary, 1 ovule, and usually 2 plumose stigmas. **FRUIT** a 1-seeded, dry, indehiscent grain (caryopsis), the ovary and ovule walls fused (rarely separate). About 730 genera and 8000 species worldwide, in nearly all habitats. The grass family is the fifth largest plant family in the world in terms of number of species (behind Asteraceae, Orchidaceae, Fabaceae, and Rubiaceae). It is easily the most essential and important plant family to humans, in terms of food products and economic value. Important species include corn, wheat, oats, rice, sugarcane, barley, and millet, among many others (Allred 2005a; Clayton and Renvoize 1986; Gould and Shaw 1983; Grass Phylogeny Working Group 2001).

1. All or some of the spikelets concealed and hidden from view within modified structures, such as spiny burs, involucres, and detachable clusters of hard bracts ..... **GROUP A**
1′ Spikelets not concealed and not hidden within modified structures, but evident and easily seen, sometimes closely subtended by foliage leaves or covered by hairs ..... (2)

2. One or more bristles (sterile branchlets) borne immediately below the spikelets, the spikelets falling and leaving the bristles on the plant ..... ***Setaria***
2′ Bristles not borne immediately below the spikelets ..... (3)

3. Lemmas each with 9 plumose awns ..... ***Enneapogon***
3′ Lemmas with 1–3 awns or awnless ..... (4)

4. Flowering shoots 2 m or more tall ..... **GROUP B**
4′ Flowering shoots less than 2 m tall ..... (5)

5. All or many of the spikelets sessile and borne on the main axis; inflorescence branches absent, the inflorescence a spike, spicate raceme, or dense headlike cluster of spikelets ..... **GROUP C**
5′ All or most of the spikelets borne on branches, the inflorescence a panicle, or if branches absent then all the spikelets with evident pedicels and few (if any) sessile ..... (6)

6. Glumes mostly hardened and completely enclosing the florets, dorsally compressed; disarticulation below the glumes and nearly always in units consisting of a sessile spikelet with attached rachis joint and pedicel (the pedicelled spikelet present or absent); spikelets borne in pairs, one spikelet sessile or subsessile and one spikelet pedicelled (sometimes the pedicelled spikelet absent, but the pedicel always present); lemmas very thin and translucent, delicate, awned or awnless; Andropogoneae Tribe ..... **GROUP D**
6′ Combination of features other than above ..... (7)

7. Spikelets with a single floret only ..... **GROUP E**
7′ Spikelets with at least 2 florets, some may be small and poorly developed (look carefully) ..... (8)

8. Spikelets with 2 florets only, the upper bisexual and usually with a hardened lemma at maturity, the lower male or neuter; lemma of the lower floret similar to the second glume in size and texture; disarticultion below the glumes; spikelets dorsally compressed; Paniceae Tribe. ..... **GROUP F**
8′ Combination of features other than above ..... (9)

9. Lemmas with 3 nerves, the nerves usually prominent ..... **GROUP G**
9′ Lemmas with 5–many nerves, at least at the base, or the nerves not discernible ..... **GROUP H**

GROUP A Spikelets variously concealed

1. Spikelets enclosed in a bur of sharp, stiff spines, the bur falling entire ..... ***Cenchrus***
1′ Spikelets not enclosed in a bur of sharp spines, but in bony clusters hidden among the foliage ..... ***Buchloë***

GROUP B Flowering shoots 2 m or more tall

1. Grasses cultivated for ornament, landscaping, or as a harvested crop, occasionally escaping around fields or dwellings ..... (2)
1′ Grasses wild or weedy, or seeded for range or pasture improvement, but not crop or ornamental plants ..... (4)

2. Plants not in large tussocks, the shoots single, or if clustered, then with strong, vigorous rhizomes ..... ***Sorghum***
2′ Plants growing in large, thick tussocks with numerous flowering shoots; rhizomes lacking ..... (3)

3. Blades scabrous to smooth on the margins; spikelets borne in pairs on spicate branches, with no florets extending beyond the stiff glumes ..... ***Saccharum***
3′ Blades sharply saw-toothed on the margins; spikelets borne singly on rebranching branches of the inflorescence, with several florets extending beyond thin glumes ..... ***Cortaderia***

4. Plants tufted, not developing rhizomes ..... (5)
4′ Plants developing rhizomes ..... (9)

5. Inflorescence a spike, no branches developed ..... ***Elymus***
5′ Inflorescence a panicle with branches ..... (6)

6. Disarticulation above the glumes; spikelets awned ..... (7)
6′ Disarticulation below the glumes; spikelets awned or awnless; sheaths mostly rounded ..... (8)

7. Basal sheaths compressed-keeled; spikelets purplish; awns less than 1.5 cm long ..... ***Muhlenbergia***
7′ Basal sheaths round; spikelets greenish or tawny; awns 2–3 cm long ..... ***Achnatherum robustum***

8. Inflorescence branches 2–5 in number and mostly not rebranched, clustered toward the tip of the shoot ..... ***Andropogon gerardii***
8′ Inflorescence branches numerous and rebranched, not clustered toward the tip of the shoot ..... ***Panicum***

9. Disarticulation below the glumes, the spikelets falling entire ..... (10)
9′ Disarticulation above the glumes, the glumes remaining on the plant and the florets falling ..... (13)

10. Inflorescence a panicle of 2–5 spicate, unbranched primary branches clustered at the tip of the shoot, sometimes a few of the branches rebranching ..... ***Andropogon gerardii***
10′ Inflorescence a rebranched panicle, the numerous primary branches always rebranching ..... (11)

11. Outer bracts of the spikelet (glumes) membranous, thin and flexible, not hardened, upper floret hardened at maturity; spikelets awnless ..... ***Panicum***
11′ Outer bracts of the spikelet (glumes) stiff, hardened; inner floret very thin and delicate, not at all hardened, spikelets awned, at least when young ..... (12)

12. Spikelets dull, fuzzy-hairy, the hairs standing out from the spikelet; awns persistent through maturity ..... ***Sorghastrum***
12′ Spikelets somewhat shiny, glabrous or slightly pubescent, the hairs pressed against the spikelet, awns early-deciduous or absent ..... ***Sorghum***

13. Spikelets with a single floret ..... ***Calamovilfa***
13′ Spikelets with several florets ..... ***Phragmites***

GROUP C

Inflorescence a spike, spicate raceme, or dense headlike cluster, all or many of the spikelets sessile on the main axis, branches absent from the inflorescence

1. Disarticulation below the glumes, the spikelets falling entire or in clusters, no spikelet parts left on the axis (tardily so in the annual *Crypsis*) ..... (2)
1′ Disarticulation above the glumes, the glumes often remaining on the inflorescence ..... (15)

2. Main axis of the inflorescence breaking apart at maturity ..... (3)
2′ Main axis of the inflorescence remaining intact ..... (10)

3. Spikelets borne in pairs of 1 sessile and 1 pedicelled (sometimes only the pedicel present), glumes mostly enclosing the spikelet, the florets mostly not visible ..... ***Schizachyrium***
3′ Spikelets borne other than above; glumes may be longer than, but not enclosing the spikelet, the florets usually visible ..... (4)

4. Spikelets 3 at each node of the main axis, the lateral pair pedicelled, the central spikelet sessile; spikelets with 1 floret ..... ***Hordeum***
4′ Spikelets mostly 1 or 2 at each node of the main axis, if 3 then not otherwise as above; spikelets with 2 to many florets ..... (5)

5. Spikelets mostly 1 at each node of the main axis ..... (6)
5' Spikelets mostly 2 at each node of the main axis ..... (9)

6. Plants annual ..... (7)
6' Plants perennial ..... (8)

7. Spikes 0.6–2 cm long ..... ***Eremopyrum***
7' Spikes 5–10 cm long ..... ***Aegilops***

8. Spikes 3–7 (8) cm long, very dense; glumes 6–8 mm long, 1–3 (5)-nerved ..... ***Elymus scribneri***
8' Spikes 8–16 cm long, not especially dense; glumes 7–10 mm long, (3) 5–7-nerved ... these are hybrids and hybrid derivatives between *Elymus trachycaulus* and *E. scribneri*, *E. longifolius*, or *E. canadensis*. The high-elevation populations generally above 2750 m (9000') have been called *E. bakeri* (E. E. Nelson) Á. Löve.

9. Glumes 3–7 mm long; anthers 4–5 mm long ..... ***Psathyrostachys***
9' Glumes 25–100 mm long; anthers, when present, about 2 mm long ..... ***Elymus***

10. Plants strongly rhizomatous perennials ..... ***Pleuraphis***
10' Plants tufted annuals or perennials, not rhizomatous ..... (11)

11. First glume with 2 or 3 awns; lower stems angled or flattened somewhat ..... ***Lycurus***
11' First glume with a single awn or awnless; lower stems rounded ..... (12)

12. Ligules hairy; sheaths prominently inflated; blades widely spreading to reflexed; inflorescence dense and headlike, the base included in the sheath; much-branched annuals ..... ***Crypsis***
12' Plants not as above in all respects ..... (13)

13. Glumes awnless; lemmas awned (use a lens) ..... ***Alopecurus***
13' Glumes awned ..... (14)

14. Glumes strongly flattened laterally, ciliate on the keeled midnerve ..... ***Phleum***
14' Glumes rounded on the back, not keeled, not ciliate on the midnerve but may be pubescent elsewhere ... ***Polypogon***

15. Lemmas with 3 awns ..... ***Aristida***
15' Lemmas with 1 awn or awnless ..... (16)

16. Spikelets with 1 floret only ..... (17)
16' Spikelets with more than 1 floret, some may be poorly developed, rudimentary, or vestigial ..... (19)

17. Plants annual; leaves with prominent, clawlike auricles 2–6 mm long; awns 50–160 mm long ..... ***Hordeum***
17' Plants perennial; leaves without auricles, or occasionally with small rounded auricles about 1 mm long; awns 1–4 mm ..... (18)

18. Spikelets strongly compressed; glumes flattened, keeled on the midnerve, completely enclosing the floret ..... ***Phleum***
18' Spikelets not strongly compressed; glumes rounded on the back, only slightly keeled, not completely enclosing the floret ..... ***Muhlenbergia***

19. Spikelets in dense, sessile, headlike clusters that are mostly surpassed by and nestled within the foliage ..... (20)
19' Spikelets not in dense, headlike clusters, or if so then elevated well above the foliage ..... (21)

20. Plants annual; blades flat; glumes shorter than the lower lemma ..... ***Munroa***
20' Plants perennial; blades rolled; glumes longer than the lower lemma ..... ***Dasyochloa***

21. Lemmas with 3 conspicuous nerves ..... (22)
21' Lemmas with 1 or 5–several nerves ..... (23)

22. Lemmas conspicuously pubescent; spikelets with several well-developed florets; blades white-margined ..... ***Erioneuron***
22' Lemmas glabrous or scabrous; spikelets with 1 well-developed floret and 1–3 rudiments above it; blades not white-margined ..... ***Bouteloua***

23. Spikelets 2 or more per node of the rachis ..... (24)
23' Spikelets mostly 1 per node of the rachis ..... (28)

24. Rhizomes present, evident, creeping ..... ***Leymus***
24' Rhizomes absent, occasionally short rhizomes developed but the plants still forming dense clumps ..... (25)

25. Glumes absent or reduced to 1 or 2 minute bristles; spikelets horizontally spreading or ascending at maturity ..... ***Elymus***
25' Glumes present; spikelets rarely horizontally spreading ..... (26)

26. Glumes 2–10 cm long ..... ***Elymus***
26' Glumes shorter than 1.5 cm ..... (27)

27. Glumes 2- to 5-nerved; anthers 1.5–3 mm long ..... ***Elymus***
27' Glumes 1-nerved; anthers 3–5 mm long ..... ***Psathyrostachys***

28. Spikelets placed edgewise to the rachis, the first glume absent on all but the terminal spikelets ..... ***Lolium***
28' Spikelets placed flatwise to the rachis; both glumes present on all spikelets ..... (29)

29. Plants annual ..... (30)
29' Plants perennial ..... (32)

30. Spikes very short, 0.6–2 cm long; plants usually less than 30 cm tall ..... ***Eremopyrum***
30' Spikes longer, mostly 5–15 cm long; plants usually much more than 30 cm tall ..... (31)

31. Glumes narrow, linear, 1-nerved; spikelets with 2 florets ..... ***Secale***
31' Glumes broad, oblong to ovate, 3- to several-nerved; spikelets mostly with 3–5 florets ..... ***Triticum***

32. Glumes linear, needlelike, 1-nerved (occasionally broader at the base and 3-nerved) ..... ***Leymus***
32' Glumes lanceolate or broader, usually 3- to 7-nerved ..... (33)

33. Spikelets spreading away from the rachis, placed very close together on the main axis; rachis internodes between the spikelets 0.3–3 mm long in the middle of the spike ..... ***Agropyron***
33' Spikelets mostly pressed against the rachis, or curving outward toward the tip of the spikelet; rachis internodes between the spikelets 4–25 mm long ..... ***Elymus***

GROUP D Andropogoneae Tribe

1. Each inflorescence composed of a single unbranched spicate raceme without branches, subtended by a somewhat inflated bladeless sheath (spathe), the flowering shoot usually bearing numerous such inflorescences ..... ***Schizachyrium***
1' Each inflorescence composed of numerous branches, with or without inflated sheaths subtending the inflorescence (spathes) ..... (2)

2. Spikelets all similar in appearance and size ..... (3)
2' Spikelets not all similar, the pedicelled ones often smaller in size or different in appearance when compared to the sessile ones ..... (8)

3. Pedicels without a spikelet borne at the tip ..... (4)
3' Pedicels with a spikelet borne at the tip ..... (5)

4. Flowering shoots mostly with 1 or a few large, terminal panicles 10 cm or more long ..... ***Sorghastrum***
4' Flowering shoots with numerous small panicles clustered together, each less than 3 cm long and each with a subtending spathe ..... ***Andropogon glomeratus***

5. Panicles 30–70 cm long; plants escaped from cultivation and growing in large, tall tussocks ..... ***Saccharum***
5' Panicles 4–16 cm long; plants otherwise, usually in natural habitats ..... (6)

6. Pedicels and rame segments (rachis joints) with a central longitudinal groove or membrane, flattened in cross section; plants tufted ..... ***Bothriochloa***
6' Pedicels and rame segments without a central groove or membrane, nearly round in cross section; plants tufted or rhizomatous ..... (7)

7. Panicles narrow and spikelike, with soft silky hairs, 1–3 cm wide and 8–18 cm long, the branches scarcely noticeable at arm's length ..... ***Imperata***
7' Panicles not as above, usually wider and/or shorter or the branches obvious at arm's length ..... ***Andropogon***

8. Pedicels and rame segments (rachis joints) with a central groove or membrane running lengthwise, flattened in cross section ..... ***Bothriochloa***
8' Pedicels and rame segments without a central groove or membrane, nearly round in cross section, at least at the apex ..... (9)

9. Inflorescence an open panicle with numerous (more than 5) rebranched branches; spikelets ovoid to nearly globose ..... ***Sorghum***
9' Inflorescence a panicle with 2–5 nearly digitate and mostly unbranched branches; spikelets lanceolate ..... ***Andropogon gerardii***

GROUP E Spikelets with a single floret

1. Glumes and lemmas awnless ..... (2)
1' Glumes and/or lemmas awned ..... (18)

2. Inflorescence a panicle of evident, unbranched, spicate primary branches ..... (3)
2' Inflorescence a panicle of rebranched branches, or dense and spikelike ..... (6)

3. Panicle branches all attached at the tip of the main axis ..... ***Cynodon***
3' Panicle branches attached along the length of the main axis, not only at the tip ..... (4)

4. Glumes equal in length or nearly so; spikelets nearly round in outline ..... ***Beckmannia***
4' Glumes unequal, the first glume shorter than the second; spikelets lanceolate in outline ..... (5)

5. Spikelets widely spaced, rarely overlapping, appearing embedded in the branches; blades spirally twisted ..... ***Schedonnardus***
5' Spikelets very closely spaced, overlapping, not at all appearing embedded in the branches; blades not spirally twisted ..... ***Spartina***

6. Disarticulation below the glumes ..... (7)
6' Disarticulation above the glumes ..... (10)

7. Ligules hairy; sheaths prominently inflated; blades widely spreading to reflexed; inflorescence dense and headlike, the base included in the sheath; much-branched annuals ..... ***Crypsis***
7' Plants not as above in all respects ..... (8)

8. Spikelets nearly round in outline, the glumes somewhat inflated or puffy-looking ..... ***Beckmannia***
8' Spikelets mostly lanceolate in outline, the glumes not at all inflated or puffy-looking ..... (9)

9. Glumes softly pubescent on the midnerves; inflorescence dense and spikelike, rarely lobed ..... ***Alopecurus***
9' Glumes glabrous to scabrous, not softly pubescent; inflorescence usually lobed at least below ..... ***Polypogon***

10. Lemma hardened at maturity, enclosing the palea and flower ..... (11)
10' Lemma remaining thin and flexible, not hardened, not enclosing the palea ..... (13)

11. Lemma with 1 or 2 slender bracts, bristles, or scales at the base of the floret, these sometimes pubescent and often difficult to see without dissecting carefully ..... ***Phalaris***
11' Lemma without any bracts, bristles, or scales at the base of the floret ..... (12)

12. Florets dorsally compressed; lemma margins not overlapping, the palea exposed, at least in part ..... ***Piptatherum***
12' Florets terete; lemma margins slightly overlapping, the palea hidden ..... ***Oryzopsis***

13. Lemma with a single nerve; ligule a ring of hairs ..... (14)
13' Lemma with 3 or more nerves; ligule a membrane ..... (15)

14. Lemma with a tuft of hairs at the base ..... ***Calamovilfa***
14' Lemma without a tuft of hairs at the base ..... ***Sporobolus***

15. Lemma and palea nerves densely pubescent ..... ***Blepharoneuron***
15' Palea nerves glabrous or scabrous; lemma nerves not densely pubescent but may be short-pubescent ..... (16)

16. Sheath margins fused together for 1/2 their length or more ..... ***Catabrosa***
16' Sheath margins overlapping most of their length ..... (17)

17. Palea about as long as the lemma; body of the glumes (not including awn tips) shorter than the lemma, lemma mostly 3-nerved ..... ***Muhlenbergia***
17' Palea 1/2 or less as long as the lemma; body of the glumes longer than the lemma, lemma obscurely nerved ..... ***Agrostis***

18. Inflorescence a panicle of several evident, unbranched, spicate, primary branches ..... (19)
18' Inflorescence a panicle of rebranched branches, or a raceme, or in some the pedicels and branches poorly developed and the inflorescence spikelike ..... (21)

19. Spikelets nearly round in outline, the glumes somewhat inflated ..... ***Beckmannia***
19' Spikelets lanceolate in outline, the glumes not at all inflated ..... (20)

20. Panicle branches all less than 2 cm long ..... ***Bouteloua***
20' Panicle branches mostly longer than 2 cm ..... ***Spartina***

21. Lemma hard at maturity, usually enclosing the palea and flower, mostly with a well-developed and pointed callus (22)
21' Lemma not hard (somewhat so in *Apera* but then the rachilla prolonged beyond the palea), not enclosing the flower and palea; mostly without a well-developed callus ..... (27)

22. Ligule a ring of hairs; lemma terminating in 3 awns, the 2 lateral awns occasionally shortened and inconspicuous ..... ***Aristida***
22' Ligule a membrane; lemma terminating in a single awn, this may be deciduous ..... (23)

23. Lemma margins strongly overlapping; palea less than 1/3 the length of the lemma, glabrous, lacking veins ..... ***Nassella***
23' Lemma margins not or only slightly overlapping; palea 1/3 to equaling the length of the lemma, always pubescent when short, sometimes glabrous when longer, 2-veined ..... (24)

24. Awns 6–20 cm long or more; glumes longer than 1.8 cm ..... ***Hesperostipa***
24' Awns 0.5–7.5 cm long, if longer than 6 cm then the glumes 1–1.5 cm long ..... (25)

25. Palea pubescent, the apex flat, the veins terminating below the apex; lemma coriaceous at maturity but not strongly indurate ..... ***Achnatherum***
25' Palea glabrous or pubescent, the apex appearing prow-tipped or pinched, the veins extending to the apex; lemma indurate at maturity ..... (26)

26. Florets dorsally compressed; lemma margins not overlapping, the palea exposed, at least in part ..... ***Piptatherum***
26' Florets terete; lemma margins slightly overlapping, the palea hidden ..... ***Oryzopsis***

27. Inflorescence spikelike or headlike, the branches absent or highly shortened ..... (28)
27' Inflorescence a panicle with evident branches ..... (31)

28. First glume 2-nerved with 2 or 3 awns; lower stems angled or flattened somewhat ..... ***Lycurus***
28' First glume 1-nerved with a single awn or awnless; lower stems rounded ..... (29)

29. Glumes awnless; lemma awned ..... ***Alopecurus***
29' Glumes awned ..... (30)

30. Glumes strongly flattened laterally, ciliate on the keeled midnerve ..... ***Phleum***
30' Glumes rounded, not keeled, not ciliate on the midnerve, but may be pubescent on the body ..... ***Polypogon***

31. Disarticulation below the glumes ..... (32)
31' Disarticulation above the glumes ..... (37)

32. First glume with 2 or 3 awns; spikelets falling in pairs ..... (33)
32' First glume with a single awn or awnless ..... (34)

33. Plants perennial; awn of second glume longer than the body ..... ***Lycurus***
33' Plants annual; awn of second glume shorter than the body ..... ***Muhlenbergia***

34. Spikelets nearly circular in outline; glumes and lemma awnless (glumes with a tiny point, but not awned) ..... ***Beckmannia***
34' Spikelets elongate, not circular in outline; glumes and/or lemmas awned ..... (35)

35. Glumes awnless; lemma awned ..... *Alopecurus*
35' Glumes awned ..... (36)

36. Glumes strongly flattened laterally, ciliate on the keeled midnerve ..... *Phleum*
36' Glumes rounded, not keeled, not ciliate on the midnerve, but may be pubescent on the body ..... *Polypogon*

37. Glumes strongly flattened laterally, ciliate on the keeled midnerve ..... *Phleum*
37' Glumes rounded, not keeled, not ciliate on the midnerve ..... (38)

38. Lemma awned from the back, at about the middle or below ..... (39)
38' Lemma awned from the apex or just below ..... (40)

39. Floret with a tuft of hairs at the base; rachilla prolonged beyond the palea as a slender bristle ..... *Calamagrostis*
39' Floret without a tuft of hairs at the base; rachilla not prolonged beyond the palea ..... *Agrostis*

40. Rachilla prolonged beyond the palea as a slender bristle; plants annual ..... *Apera*
40' Rachilla not prolonged beyond the palea; plants annual or perennial ..... *Muhlenbergia*

GROUP F Paniceae Tribe

1. Spikelets subtended by 1 or more bristles or enclosed in a bur of spines ..... (2)
1' Spikelets not subtended by bristles or enclosed in spines ..... (3)

2. Spikelets subtended by 1 to several bristles, these remaining on the plant when the spikelets fall ..... *Setaria*
2' Spikelets enclosed in a bur of flattened spines, the spikelets falling within the bur and not remaining on the plant ..... *Cenchrus*

3. First glume usually less than 0.5 mm long, absent or vestigial ..... (4)
3' First glume usually more than 0.5 mm long, well developed, evident ..... (5)

4. Spikelets rounded on one side and flattened on the other, orbicular to ovate in outline; margins of the lemma of the upper floret firm and hard when mature, the apex rounded ..... *Paspalum*
4' Spikelets not rounded and flattened as above, lanceolate in outline; margins of the lemma of the upper floret thin and translucent when mature, the apex acute to acuminate ..... *Digitaria*

5. Ligule absent, the ligular region glabrous (but sometimes discolored); plants annual ..... *Echinochloa*
5' Ligule present, the ligular region often pubescent; plants annual or perennial ..... (6)

6. Inflorescence a panicle of simple or nearly simple spicate branches; spikelets nearly sessile; back of upper lemma wrinkled or bumpy, not smooth; plants annual ..... *Urochloa*
6' Inflorescence an open rebranched panicle, or if with simple branches (*Panicum obtusum*), then the plants stoloniferous perennials; spikelets often pedicelled; back of upper lemma smooth and shiny; plants annual or perennial ..... (7)

7. Plants perennial, with 2 distinct growth phases: during the cool season producing a basal rosette of short broad blades and terminal panicles; during the warm season producing much-branched lateral shoots with small axillary panicles ..... *Dichanthelium*
7' Plants annual or perennial, with a single growth phase; basal rosettes not produced; flowering during the warm season only ..... *Panicum*

GROUP G Lemmas 3-nerved; florets more than one

1. Spikelets in dense, sessile, headlike clusters closely subtended and mostly surpassed by the leaves ..... (2)
1' Spikelets not in dense, sessile, headlike clusters, and/or elevated well above the leaves ..... (4)

2. Disarticulation below the glumes, the spikelets in bony clusters and falling together; plants strongly stoloniferous perennials ..... *Buchloë*
2' Disarticulation above the glumes, the spikelets not falling in bony clusters; plants annual or perennial, stoloniferous or tufted ..... (3)

3. Plants annual; blades mostly flat ..... *Munroa*
3' Plants perennial; blades mostly rolled and needlelike ..... *Dasyochloa*

4. Inflorescence a panicle of definite and obvious spicate or racemose unbranched primary branches ..... (5)
4' Inflorescence a raceme, or a panicle of rebranched primary branches ..... (10)

5. Spikelets all male, 2-flowered, with orange-red anthers; lemmas awnless ..... ***Buchloë***
5' Combination of features otherwise ..... (6)

6. Panicle branches all digitate or in whorls near the apex of the main axis ..... (7)
6' Panicle branches distributed all along the main axis and most not in whorls, or with a single branch only ..... (8)

7. Spikelets awnless, glabrous or at least scarcely hairy to the naked eye ..... ***Cynodon***
7' Spikelets awned, prominently and obviously hairy ..... ***Chloris***

8. Spikelets with a single fertile, well-developed floret and with 1–3 smaller, rudimentary florets above ..... ***Bouteloua***
8' Spikelets with usually 3–many fertile, well-developed florets ..... (9)

9. Axils of primary panicle branches with tufts of long hairs; spikelets mostly few and widely spaced on each branch ..... ***Eragrostis***
9' Axils of primary panicle branches glabrous; spikelets mostly numerous and usually crowded on each branch ..... ***Leptochloa***

10. Sheath margins fused together for 1/2 or more their length ..... (11)
10' Sheath margins overlapping for most of their length, fused only at the base if at all ..... (12)

11. Spikelets less than 5 mm long ..... ***Catabrosa***
11' Spikelets usually more than 10 mm long ..... ***Bromus***

12. Lemmas pubescent on the nerves or at the base, the midnerve usually exserted as an awn or short point (except *Poa*) ..... (13)
12' Lemmas glabrous on the nerves and at the base, awnless ..... (15)

13. Ligules membranous; lemma midnerves not exserted as a small point ..... ***Poa***
13' Ligules a ring of hairs, or if membranous then the lemma midnerve exserted as a small point ..... (14)

14. Blades with white margins ..... ***Erioneuron***
14' Blades not white-margined ..... ***Tridens***

15. Ligule a membrane ..... (16)
15' Ligule a ring of hairs ..... (17)

16. Spikelets sessile or nearly so, the pedicels much shorter than the spikelets; plants tufted ..... ***Koeleria***
16' Spikelets on long pedicels mostly much longer than the spikelets; plants spreading from stolons or rhizomes ..... ***Muhlenbergia***

17. Panicles dense, congested, spikelike, usually light greenish or whitish; lemmas notched at the apex with a minute point; plants perennial ..... ***Tridens***
17' Panicles usually open, loose, often olive- or dark-colored; lemmas lacking a minute notch and point; plants annual or perennial ..... ***Eragrostis***

GROUP H Lemmas with 5–many nerves; florets more than one

1. Glumes and lemmas stiff-ciliate on the midnerves and keels; spikelets arranged in dense, 1-sided clusters at the branch tips; sheath margins fused together ..... ***Dactylis***
1' Glumes and lemmas glabrous or variously pubescent but not ciliate on the midnerves and keels, spikelets not so arranged; sheath margins fused or overlapping ..... (2)

2. Sheath margins fused together 3/4 or more their length ..... (3)
2' Sheath margins free from each other, overlapping, or fused only at the lower 1/3 or less ..... (7)

3. Callus of the floret with a prominent tuft of stiff hairs (otherwise glabrous) and lemmas prominently awned ..... ***Schizachne***
3' Callus of the floret lacking a tuft of hairs and/or lemmas awnless ..... (4)

4. Nerves of the lemma 7 in number, nearly parallel, not converging at the truncate or rounded apex ..... ***Glyceria***
4' Nerves of the lemma 3–11 in number, converging at the obtuse to acute apex, if parallel then less than 7 in number ..... (5)

5. Spikelets awned, or if awnless then longer than 15 mm; palea and grain strongly adherent to each other when mature ..... ***Bromus***
5' Spikelets awnless and shorter than 15 mm; palea and grain free from each other when mature ..... (6)

6. Spikelets on mostly racemose unbranched primary branches, hanging like flags away from the axis; upper florets empty, inrolled and represented by a club-shaped rudiment ..... ***Melica***
6' Spikelets variously arranged, but mostly on rebranched primary branches; upper florets usually not empty nor as above ..... ***Poa***

7. Disarticulation below the glumes, which are noticeably dissimilar in shape, one narrowly lanceolate and the other obovate or spatulate ..... ***Sphenopholis***
7' Disarticulation above the glumes, which may be similar or dissimilar ..... (8)

8. Spikelets (glumes and/or lemmas) awned ..... (9)
8' Spikelets (glumes and lemmas) awnless or at most with an awn tip no more than 1 mm long ..... (22)

9. Inflorescence a panicle of unbranched, spicate primary branches all clustered toward the apex of the stalk; plants annual ..... ***Chloris***
9' Inflorescence a panicle, but the main branches rebranched or the spikelets on obvious pedicels; plants annual or perennial ..... (10)

10. Florets dissimilar, some awned, some awnless ..... (11)
10' All florets alike and awned ..... (12)

11. Glumes large, more than 15 mm long ..... ***Avena***
11' Glumes small, less than 12 mm long ..... ***Arrhenatherum***

12. Glumes not extending beyond the lowermost floret ..... (13)
12' Glumes, at least the second, equal to or surpassing the lowermost floret ..... (15)

13. Spikelets 2 (4)-flowered; awn arising from the back of the lemma or from a deeply cleft apex ..... ***Trisetum***
13' Spikelets mostly 3- to many-flowered; awn arising from an entire apex ..... (14)

14. Plants perennial; flowers with 3 stamens ..... ***Festuca***
14' Plants annual; flowers with 1 stamen ..... ***Vulpia***

15. Lemmas awned from the back or base ..... (16)
15' Lemmas awned from an entire or cleft apex, if cleft, the awn arising from the sinus at the tip of the midnerve, or lemmas awnless ..... (20)

16. Spikelets not large, the glumes 2–8 mm long ..... (17)
16' Spikelets large, the glumes 10–30 mm long ..... (19)

17. Glumes dissimilar in size and shape, the first shorter and narrower than the second ..... ***Trisetum***
17' Glumes similar in size and shape, about the same length and breadth ..... (18)

18. Glumes exceeding the florets and often the awns; lemmas awned from near the middle; blades flat, some 4–8 mm wide or more ..... ***Vahlodea***
18' Glumes mostly slightly shorter than 1 floret and the awns; lemmas awned from below the middle; blades mostly folded, rarely more than 3 mm wide ..... ***Deschampsia***

19. Plants annual; glumes 18–30 mm long ..... ***Avena***
19' Plants perennial; glumes 10–15 mm long ..... ***Helictotrichon***

20. Awns of the lemma minute and nearly obsolete, scarcely visible even with a hand lens ..... ***Schismus***
20' Awns of the lemma well developed, easily visible with the naked eye ..... (21)

21. Spikelets mostly 2-flowered, 3.5–6.5 mm long; rachilla extending beyond the uppermost floret ..... ***Trisetum***
21' Spikelets 3- to 7-flowered, 6–15 mm long; rachilla not extending beyond the uppermost floret ..... ***Danthonia***

22. Glumes mostly longer than 2 cm and longer than the florets ..... ***Avena***
22' Glumes shorter than 2 cm and/or shorter than the florets ..... (23)

23. Spikelets appearing 1-flowered, but the large fertile floret subtended by 1 or 2 smaller scales or bristles representing rudimentary florets, these often appressed to the fertile floret and not immediately apparent ..... ***Phalaris***
23' Spikelets not as above ..... (24)

24. Glumes and lemmas at maturity stiff, firm, greenish to straw-colored; leaves distichous, the lower ones bladeless as the stems grade into rhizomes; lemmas 7- to 11-nerved, the nerves obscure; plants strongly rhizomatous, dioecious perennials of alkaline areas and floodplains ..... ***Distichlis***
24' Glumes and lemmas pliable, thin, often greenish to purplish; leaves not distichous, the lower ones usually with well-developed blades; lemmas generally 5- to 7-nerved (9-nerved in the annual *Schismus*); plants annual or perennial, of various habitats ..... (25)

25. First glume 5- to 7-nerved; blades threadlike; small tufted annuals of sandy desert areas ..... ***Schismus***
25' First glume 1- to 3-nerved; blades threadlike to much broader; annuals and perennials of various habitats ..... (26)

26. Glumes, at least the second, equaling or surpassing the lowermost floret ..... (27)
26' Glumes, at least 1 but usually both, not extending beyond the lowermost floret ..... (29)

27. Florets 3 in number, the lower (outer) 2 as large as the upper (middle) one but male, their margins prominently ciliate, the upper (middle) floret fertile, somewhat hardened, and pubescent at the tip ..... ***Hierochloë***
27' Florets not as above ..... (28)

28. Second glume broadened above the middle; palea colorless, scarious, white ..... ***Koeleria***
28' Second glume broadened below the middle; palea colored, at least on the nerves ..... ***Trisetum wolfii***

29. Lemmas awned or narrowing at the apex to an awn tip ..... ***Festuca***
29' Lemmas completely awnless, often blunt ..... (30)

30. Second glume broadened above the middle; palea colorless, scarious, white; pedicels puberulent ..... ***Koeleria***
30' Second glume, palea, and pedicels not all as above ..... (31)

31. Plants rhizomatous and dioecious; blades strongly striate-nerved, usually flat ..... ***Leucopoa***
31' Plants not rhizomatous and dioecious and with strongly striate blades ..... (32)

32. Sheath margins fused at least at the base; nerves of the lemma converging toward the acute apex; base of lemma with or without a tuft of cobwebby hair ..... ***Poa***
32' Sheath margins overlapping at the base; nerves of the lemma more or less parallel, not converging toward the truncate apex; base of lemma never with a tuft of cobwebby hairs ..... (33)

33. Nerves of the lemma conspicuous; plants with creeping rhizomes; blades mostly flat, 4–15 mm wide; plants of freshwater habitats ..... ***Torreyochoa***
33' Nerves of the lemma obscure; plants tufted, lacking rhizomes; blades rolled, or if flat then 1–3 (4) mm wide; plants of usually alkaline or saline habitats ..... ***Puccinellia***

Achnatherum P. Beauv. Needlegrass

(Greek *achne*, scale, and *ather*, awn, referring to the awned lemmas) Tufted perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat to rolled blades, and lacking auricles. **INFL** a narrow to open panicle, the branches rebranched. **SPIKELETS** 1-flowered, the florets terete, mostly indurate, disarticulating above the glumes; glumes longer than the florets, membranous, 1- to 5-nerved; lemmas convolute, but the margins scarcely overlapping, 5-nerved, the midnverve extended into an awn, this sometimes early-deciduous, with a strongly developed and hairy callus; palea 2-nerved, hyaline to membranous, glabrous to hairy. **STAMENS** 3. $x = 11$. Formerly included in the genus *Stipa*, which is now strictly Eurasian (Barkworth 1993).

1. Awns short, 3–5 mm long, quickly deciduous; panicle widely spreading at maturity, with dichotomous branches ..... ***A. hymenoides***
1' Awns longer than 6 mm, persistent or deciduous; panicle narrow, with ascending branches ..... (2)

2. Basal segment of the once-bent awns plumose with long hairs 4–8 mm long ..... ***A. speciosum***
2' Basal segment of the awns glabrous or with hairs less than 2 mm long ..... (3)

3. Awns 3–7.5 cm long, obscurely bent, the terminal segment flexuous or curving ..... ***A. aridum***
3' Awns 1–3 cm long, usually plainly bent, the terminal segment more or less straight ..... (4)

4. Leaf sheaths evidently ciliate-villous at the summit ..... (5)
4' Leaf sheaths glabrous at the summit, or only obscurely ciliolate on some of the lowermost sheaths ..... (7)

5. Lemma apex with hairs less than 2 mm long, about the same length as on the body of the lemma ..... ***A. robustum***
5' Lemma apex with hairs 2–3 mm long, noticeably longer than those on the body of the lemma ..... (6)

6. Palea less than 1/2 the length of the lemma ..... ***A. scribneri***
6' Palea about 2/3 the length of the lemma ..... ***A. coronatum***

7. Awns mostly 2–3 cm long; blades flat, 3–7 mm wide ..... ***A. nelsonii***
7' Awns mostly 1–2 cm long; blades flat to tightly rolled, 0.5–3 mm wide ..... (8)

8. Glumes about equal, 6–9 mm long; blades mostly involute-filiform, 0.2–2 mm wide; palea nearly as long as the lemma ..... ***A. lettermanii***
8' Glumes unequal, the first 10–15 mm long, the second 1–3 mm shorter; blades mostly flat, most at least 2–3 mm wide; palea 1/2–2/3 the length of the lemma ..... ***A. perplexum***

Achnatherum aridum (M. E. Jones) Barkworth (arid) Mormon needlegrass. **CULMS** 30–80 cm tall, slender. **LIGULES** less than 1 mm long. **BLADES** involute-filiform, less than 2.5 mm wide even when flat. **PANICLES** 10–30 cm long, spicate. **GLUMES** narrowly lanceolate with an acuminate-awned tip, shiny, mostly 3-nerved, the first 9–15 mm long, the second 7–10 mm long. **LEMMAS** 4–6 mm long, sparsely short-pilose nearly throughout, occasionally glabrous above, the hairs less than 0.7 mm long; awn 3–7.5 cm long, mostly nearly straight or obscurely geniculate. **PALEAS** about 1/2 as long as the lemmas, hairy. **ANTHERS** 2–3 mm long. [*Stipa arida* M. E. Jones; *S. mormonum* Mez]. Rocky ground in the lower desert regions; black sage, shadscale, sagebrush, and Utah juniper communities. ARIZ: Nav; NMEX: SJn; UTAH. 1200–1400 m (4000–4600'). Flowering: May–Jul. California east to Colorado and south through Arizona and northwestern New Mexico.

Achnatherum coronatum (Thurb.) Barkworth (crowned) Crested needlegrass. **CULMS** 20–80 cm tall, erect. **LIGULES** 0.5–1 mm long. **BLADES** flat, 20–60 cm long, 6 mm or less wide. **PANICLES** 10–26 cm long, spicate. **GLUMES** narrowly lanceolate, tapering to a slender point, mostly 3-nerved, the first 12–18 mm long, the second 11–15 mm long. **LEMMAS** 5–8 mm long, the body densely appressed-villous with hairs about 1 mm long, the apex with hairs 2–3 mm long; awn 1.2–2.5 cm long, once- or weakly twice-geniculate. **PALEAS** shorter than the lemmas, glabrous or sparsely pubescent below. **ANTHERS** 3.5–5 mm long. [*Stipa parishii* Vasey]. Dry, rocky slopes and ridges in juniper woodland regions; not common. UTAH. 1500–1850 m (5000–6000'). Flowering: Jun–Jul. Our material belongs to **var.** ***parishii*** (Vasey) S. L. Welsh (for S. B. Parish, California botanist). Southern California, Nevada, Utah, and Arizona.

Achnatherum hymenoides (Roem. & Schult.) Barkworth (membranelike) Indian ricegrass. **CULMS** 30–70 cm tall, erect, the internodes hollow. **LIGULES** 2.5–7.5 mm long. **BLADES** firm and strongly involute, about 1 mm long, elongate and often forming a fountainlike clump. **PANICLES** open, dichotomously branched, mostly 5–20 cm long and about 1/2 as wide. **GLUMES** ovate-acuminate, sometimes awn-tipped to 2 mm, mostly 3–5-nerved, at least at the base, the first 5–8 mm long, the second slightly shorter. **LEMMAS** fusiform to nearly globose, shiny and dark brown to black in age, 3–5 mm long, covered with long white pilose hairs 2–4 mm long, sometimes becoming glabrous; awn 3–3.5 mm long, straight, quickly deciduous and mostly absent in maturity. **PALEAS** similar to the lemmas in color, texture, and length. **ANTHERS** 0.8–1.5 mm long, with an apical tuft of hairs. $2n = 28, 48, 65, 130$. [*Oryzopsis hymenoides* (Roem. & Schult.) Ricker; *Stipa hymenoides* Roem. & Schult.]. Common in dry, open, mostly sandy sites at lower elevations, but extending upward exceptionally to nearly subalpine zones; desert scrub, piñon-juniper woodland, mountain brush, and pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1200–2500 m (4000–8200'). Flowering: May–Aug. Western Canada south through the western United States; Chile. Originally named in the genus *Stipa*, then transferred to *Oryzopsis* because of its plump florets, Indian ricegrass now finds a suitable home in *Achnatherum*, with whose other species it shows close relationship, as evidenced by its frequent hybridization with several of the species. Seeds are high in protein and the plants provide important forage on rangelands.

Achnatherum lettermanii (Vasey) Barkworth (for George Letterman, 1840–1913, Missouri botanist) Letterman's needlegrass. **CULMS** erect, 25–80 cm tall, much-branched below. **LIGULES** 0.2–2 mm long, truncate-rounded. **BLADES** strongly involute, filiform, only rarely flat and then less than 2 mm wide, short-hispid on the inner surface, mostly

glabrous on the outer. **PANICLES** narrow, 8–20 cm long, with erect branches and relatively few spikelets. **GLUMES** acuminate to an awn tip, often purplish, 3-nerved, subequal, 5–10 mm long. **LEMMAS** only slightly indurate, sericeous, the hairs at the summit (1–1.5 mm) longer than those on the body (0.2–0.5 mm), 4.5–6.5 mm long, awn 12–22 mm long, twice-geniculate. **PALEAS** about 2/3 as long as the lemmas, pubescent, the hairs at the tip longer than those below, sometimes exposed. **ANTHERS** 1.5–2.5 mm long. $2n$ = 32, 66, 68. [*Stipa lettermanii* Vasey] Sagebrush, mountain brush and woodlands, conifer and aspen forests at middle to high elevations in the mountains. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 2250–3300 m (7500–10800'). Flowering: Jul–Sep. Most of the western United States. Frequently confused with *A. nelsonii* of similar habitats, but that species has wider blades, longer awns, and shorter paleas.

Achnatherum nelsonii (Scribn.) Barkworth (for Aven Nelson, 1859–1952, Wyoming botanist) Nelson's needlegrass. **CULMS** stout, erect, 30–110 cm tall. **LIGULES** 0.2–1.5 mm long, truncate, often longer on the sides. **BLADES** mostly flat when fresh and involute upon drying, 2–7 mm wide, often strongly striate. **PANICLES** narrow, 10–36 cm long, the branches erect, sometimes interrupted below. **GLUMES** long-acuminate to awn tips, 3-nerved, subequal, 7–14 mm long. **LEMMAS** appressed-pilose, the hairs longer at the tip (to 1.5 mm) than on the body (to 0.5 mm), 5.5–8 mm long, the apical lobes sometimes prolonged as short lobes to 0.5 mm long; awn twice-geniculate, 2–3 (4) cm long. **PALEAS** less than 1/2 the length of the lemmas, pubescent. **ANTHERS** 2–3 mm long. $2n$ = 36, 44. [*Stipa nelsonii* Scribn.] Sagebrush, mountain brush and woodlands, conifer and aspen forests at middle to high elevations in the mountains. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon, SJn; NMEX: RAr. 1700–2900 m (5800–9500'). Flowering: Jun–Sep. Alaska and western Canada, south through most of the western United States, east to western Texas. Frequently confused with *A. lettermanii* of similar habitats, but that species has narrower blades, shorter awns, and longer paleas. This has been confused with *A. pinetorum* by some, but that species has long white spreading hairs 2–4 mm long throughout the lemma body and occurs at middle to high elevations in the mountains of the Gunnison Basin, it is not known from our region.

Achnatherum perplexum Hoge & Barkworth (perplexing) Perplexing needlegrass. **CULMS** erect, 35–90 cm tall. **LIGULES** 1–4 mm long. **BLADES** 1–3 mm wide, flat to involute upon drying. **PANICLES** narrow, the branches erect, 10–25 cm long. **GLUMES** long-acuminate, 3-nerved, unequal, the first 10–15 mm long, the second 1–4 mm shorter and somewhat outward-curving. **LEMMAS** appressed-pubescent, the hairs at the tip 1–2 mm long, the hairs on the body about 1 mm long; awns 10–20 mm long, once- to twice-geniculate. **PALEAS** 1/2–2/3 as long as the lemmas, pubescent. **ANTHERS** 2.5–4 mm long. $2n$ = unknown. Mountain grasslands, clearings, and dry slopes. NMEX: RAr. 2100–2750 m (6900–9000'). Flowering: Jul–Sep. Southwestern United States and northern Mexico. Most similar to *A. nelsonii*, but that species has broader blades, equal glumes, longer awns, shorter paleas, and flowers earlier.

Achnatherum robustum (Vasey) Barkworth (robust) Sleepygrass. **CULMS** erect, stout, 2–4.5 mm thick, usually over 1 m tall. **LIGULES** truncate to rounded, 1–2 mm long, or up to 4 mm long on the upper leaves. **BLADES** mostly flat, 6–10 mm wide. **PANICLES** narrow, 15–30 cm long, with appressed branches, densely flowered. **GLUMES** acuminate, subequal, 9–12 mm long. **LEMMAS** fusiform-cylindrical, appressed-pilose, the hairs at the tip somewhat longer than those on the body, 6–10 mm long; awn twice-geniculate, 2–3.4 cm long. **PALEAS** 2/3 to 3/4 the length of the lemmas, pubescent. **ANTHERS** 4–5 mm long. $2n$ = 64. [*Stipa robusta* (Vasey) Scribn.] Dry plains, hillsides, forest clearings, and roadsides. COLO: Arc, Mon; NMEX: McK, RAr, SJn. 1650–2600 m (5400–8500'). Flowering: Jul–Sep. Wyoming to Colorado and New Mexico; northern Mexico. Some plants, perhaps only those from the mountains of south-central New Mexico, contain a narcotic that induces torpor in grazing horses but is not lethal. Recent studies suggest the toxin is produced by endophytic fungi infesting the plants. *Achnatherum inebrians* (Hance) Keng of Mongolia, Tibet, and China produces the same effect and contains similar fungi.

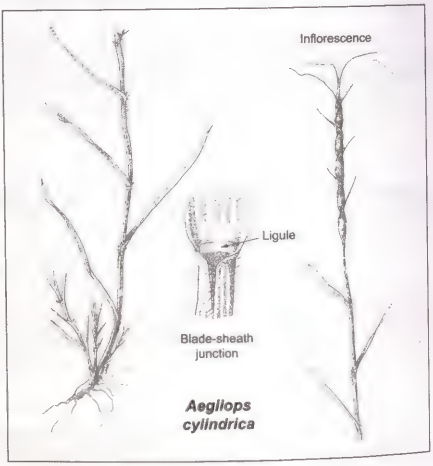
Achnatherum scribneri (Vasey) Barkworth (for Frank Lamson Scribner, 1851–1938, renowned USDA agrostologist) Scribner's needlegrass. **CULMS** erect, 35–80 cm tall. **LIGULES** irregularly truncate, finely ciliolate, 0.2–2 mm long. **BLADES** involute to flat, 1.5–5 mm wide. **PANICLES** narrow, 7–20 cm long, with appressed branches. **GLUMES** linear-lanceolate, acuminate to awn tips, 3-nerved, unequal, the first 12–18 mm long and somewhat curving or sickle-shaped, the second 1.5–2 mm shorter. **LEMMAS** pale, 5–8 mm long, appressed-pilose, the hairs at the tip 2–3 mm long and noticeably longer than those on the body; awn mostly once-geniculate, 1.4–2.2 cm long. **PALEAS** 1/3 to 1/2 the length of the lemmas, pubescent. **ANTHERS** about 4 mm long. $2n$ = 40. [*Stipa scribneri* Vasey]. Mesas, rocky plains, and slopes in desert regions. ARIZ: Apa; NMEX: McK, SJn. 1400–1650 m (4550–5400'). Flowering: Jun–Sep. Colorado, northern Arizona, and New Mexico. Grains often have a patchy sticky secretion, causing them to adhere to objects (such as teasing needles or birds' beaks).

Achnatherum speciosum (Trin. & Rupr.) Barkworth (showy) Desert needlegrass. **CULMS** stout and densely tufted, erect, 35–65 cm tall. **LIGULES** short, less than 0.5 mm long, finely ciliolate, with a conspicuous tuft of hairs at the shoulders. **BLADES** tightly involute, firm, 1 mm or less wide, elongate, glaucous. **PANICLES** narrow and compact, 8–20 cm long, with numerous spikelets, scarcely exceeding the leaves. **GLUMES** long-acuminate to an awn tip, 11–25 mm long, the second equal or somewhat shorter. **LEMMAS** fusiform, 7–10 mm long, short appressed-pilose to nearly glabrous upward; awn once-geniculate, 3–4.5 cm long, the terminal portion straight and scaberulous, the lower portion densely pilose with hairs 3–9 mm long. **PALEAS** glabrous, about 1/2 the length of the lemmas. **ANTHERS** 1.5–4 mm long. $2n = 60, 64, 66$. [*Jarava speciosa* (Trin. & Rupr.) Peñailillo, *Stipa speciosa* Trin. & Rupr.]. Sagebrush deserts and piñon-juniper woodlands in rocky or sandy ground. ARIZ: Apa, Coc, Nav; COLO: Min, Mon; NMEX: SJn; UTAH. 1500–1800 m (5000–5900′). Flowering: May–Jun. Southwestern United States, northern Mexico, South America. This species has affinities to some in South America, where it is disjunct, and is placed by some in the genus *Jarava*.

Aegilops L. Goatgrass

(Greek *aegiles*, preferred by goats, and *ops*, appearing like; a name used by Theophrastus for a grass that was similar to *Aegiles*, which is an unknown plant apparently palatable to goats) Annual, tufted herbs. **LEAVES** with open sheaths, ciliate auricles, and membranous ligules. **INFL** a thick spike, with a single spikelet per node. **SPIKELETS** with 2–7 florets, the upper often sterile; disarticulation below the glumes, the spikelets falling attached to the adjacent internodes.

Aegilops cylindrica Host (cylindric, alluding to the spike) Jointed goatgrass. **CULMS** erect to decumbent at the base, usually branched, 14–50 cm tall. **LIGULES** short, to 0.5 mm long. **BLADES** flat, 4–15 cm long, 2–5 mm wide. **SPIKES** 3–14 cm long, 2–4 mm wide, narrowly cylindrical, with numerous spikelets. **GLUMES** hardened, 9- to 13-nerved, with an awn on one side and a lobe on the other, the awns of the lower spikelets 3–10 mm long, the awns of the terminal spikelet 30–80 mm long. **LEMMAS** asymmetrical, 5- to 7-nerved, 8–11 mm long, the awns of the lower spikelets to about 20 mm long, the awns of the upper spikelets 30–70 mm long. **PALEAS** nearly as large as the lemmas. **ANTHERS** about 2.8 mm long. $2n = 28$. [*Triticum cylindricum* (Host) Ces., Pass. & Gibelli]. Disturbed sites, crop fields, roadsides, waste places. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1500–2350 m (4800–7800′). Flowering: May–Jun. Widely established in North America; native to southern Europe and central Asia.



Agropyron Gaertn. Wheatgrass

(Greek *agrios*, wild, + *puros*, wheat, the original species being weeds in wheat fields) Perennial, tufted herbs. **LEAVES** with or without auricles, the basal ones with closed sheaths, the upper ones open, and with membranous ligules. **INFL** a spike, the spikelets placed closely together and spreading from the rachis. **SPIKELETS** with several fertile florets, mostly awned; disarticulation above the glumes and between the florets. **GLUMES** unequal, shorter than the florets, 1- to 4-nerved, often keeled, acute to awn-tipped. **LEMMAS** 5-nerved, awned or awnless. **PALEAS** subequal to the lemmas, 2-nerved. **STAMENS** 3. $x = 7$ (Dewey 1983). A small genus of one to a few species, depending upon interpretation. We recognize a single species in our flora, with three subspecies.

Agropyron cristatum (L.) Gaertn. (crested) Crested wheatgrass. **CULMS** erect, 30–70 cm tall. **LIGULES** mostly less than 0.5 mm long, finely ciliolate. **BLADES** flat, 2–6 mm wide, sometimes more. **SPIKES** 3–10 cm long, 5–20 mm wide, the spikelets ascending to widely spreading. **GLUMES** 3-nerved, narrowly ovate, 3–5 mm long, the midnerve often extended into an awn 1–3 mm long or awnless. **LEMMAS** firm, narrow, 5-nerved, 5–8 mm long; awn 1–3 mm long or awnless. **PALEAS** about as large as the lemmas. **ANTHERS** 2–5 mm long. $2n = 14, 28, 42$. [*Agropyron pectiniforme* Roem. & Schult.] Disturbed and revegetated sites, roadsides, in desert scrub, sagebrush, mountain brush, piñon-juniper woodlands, ponderosa pine communities. 1350–2350 m (4500–7700′). Flowering: Jun–Aug. Widely distributed throughout much of the U.S. except for the southeast region; introduced from Russia for range restoration and forage. We have three subspecies, distinguished by the following:

1. Spikelets diverging from the rachis at an angle of more than 40°; glumes widespread, forming an angle of more than 120°, giving the spike a bristly appearance; spikes 8–20 mm broad ..... **subsp. *cristatum***
1′ Spikelets diverging from the rachis at an angle of less than 35°; glumes spreading at a narrow angle, spikes 5–10 mm broad ..... (2)

2. Lemmas with an awn 1–2 (4) mm long; glumes forming an angle of approximately 60° ..... **subsp. *desertorum***
2′ Lemmas awnless, sometimes mucronate; glumes forming an angle of approximately 45° ..... **subsp. *fragile***

subsp. *cristatum* Fairway crested wheatgrass. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SJn, SMg, NMEX: McK, RAr, San, SJn; UTAH.

subsp. *desertorum* (Fisch. ex Link) Á. Löve (of the desert) Desert crested wheatgrass. ARIZ: Apa; COLO: Dol, LPl, Mon, SMg; NMEX: McK, RAr, SJn.

subsp. *fragile* (Roth) Á. Löve (brittle or easily broken) Siberian crested wheatgrass. NMEX: McK.

Agrostis L. Bentgrass

(Greek *agros*, a field) Tufted, rhizomatous, or stoloniferous annuals and perennials (ours) with hollow culms. **LEAVES** with open sheaths, membranous ligules, and lacking auricles. **INFL** a panicle with often capillary branches, diffuse to contracted and spikelike. **SPIKELETS** small, 1-flowered; disarticulation above the glumes, the rachilla mostly not prolonged beyond the palea. **GLUMES** 1-nerved, usually exceeding the floret. **LEMMAS** obscurely 3- to 5-nerved, awned or awnless. **PALEAS** hyaline, well developed or obsolete. **STAMENS** 3. $x = 7$ (Björkman 1960) A genus of about 100 species in temperate and Arctic regions of the world.

1. Palea well developed, 0.5–2 mm long, 1/2 to 3/4 the length of the lemma ..... (2)
1′ Palea obsolete or a small scale less than 0.4 mm long, never as much as 1/2 the length of the lemma ..... (4)

2. Panicle dense, compact, interrupted; spikelets usually disarticulating below the glumes ..... see ***Polypogon viridis***
2′ Panicle open or closed but not dense or compact; spikelets disarticulating above the glumes ..... (3)

3. Anthers (0.8) 1–1.6 mm long; rachilla not extended as a minute bristle; plants of low- to high-elevation wet places ..... ***A. stolonifera***
3′ Anthers 0.4–0.8 mm long; rachilla extended as a minute bristle (20×), lying against the base of the palea; plants of subalpine to alpine bogs, meadows, and tundra ..... ***A. humilis***

4. Panicle open to diffuse, often less than 3 times longer than broad, nearly always more than 4 cm wide ..... ***A. scabra***
4′ Panicle narrow, contracted, several times longer than broad, rarely more than 2 cm wide ..... (5)

5. Spikelets and panicles greenish, maturing to straw-colored; plants mostly much more than 20 cm tall; panicles 4–20 cm long; blades mostly 2–10 mm wide ..... ***A. exarata***
5′ Spikelets and panicles purplish to brownish; plants usually less than 20 cm tall; panicles 2–6 (8) cm long; blades 1–2 (3) mm wide ..... ***A. variabilis***

Agrostis exarata Trin. (plowed up, alluding to furrows between the nerves) Spike bentgrass. **CULMS** erect or sometimes decumbent and rooting at the nodes, rarely developing short rhizomes in wet ground, 20–100 cm tall or more. **LIGULES** 2–7 mm long, truncate to obtuse, lacerate. **BLADES** green, flat, 2–10 mm wide. **PANICLES** compressed and at least somewhat spikelike, 4–20 cm long or more, rarely more than 2 cm wide, greenish, maturing to straw-colored. **GLUMES** 1.8–2.7 mm long, acute. **LEMMAS** 1.2–2.5 mm long, awnless. **PALEAS** absent or minute. **ANTHERS** 0.3–0.6 mm long. $2n = 28, 42, 56$. Woodland, forest, and alpine communities in the mountains and upper foothills; moist to sometimes wet ground, often along streams and in shade. ARIZ: Apa, Nav; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, SJn; UTAH. 1850–3100 m (6150–10100′). Flowering: Jul–Aug. Alaska south through the western U.S. into Mexico, east to South Dakota and Texas; Siberia. Some choose to recognize the widespread variation of this species at the varietal level; our material would correspond to **var. *minor*** Hook., having smaller spikelets than the typical form.

Agrostis humilis Vasey (low-growing) Mountain bentgrass. **CULMS** tufted, erect, 5–50 cm tall. **LIGULES** 0.5–2 mm long, truncate to obtuse. **BLADES** flat to folded, 0.5–4 mm wide. **PANICLES** loosely contracted, short, 1–14 cm long,

1–2.5 cm wide, the branches typically terete and nearly smooth. **GLUMES** subequal, 1.5–2.2 mm long, purplish. **LEMMAS** lanceolate, 1.5–2.2 mm long; awnless. **PALEAS** 1–1.6 mm long; rachilla vestige very short to sometimes absent. **ANTHERS** 0.4–0.8 mm long. $2n = 14$. [*Agrostis thurberiana* Hitchc.]. Subalpine to alpine meadows and bogs, not common. COLO: Min, SJn. 2900–3800 m (9800–12500'). Flowering: May–Aug. Most of western North America. The dwarf form of this species is easily overlooked and can be confused in the key with *A. variabilis* if the palea is not noticed. This and *A. thurberiana* (included herein in synonymy) are sometimes treated in a separate genus, *Podagrostis*, based mostly on the prolongation of the rachilla. Here a more traditional view is taken awaiting more conclusive studies.

Agrostis scabra Willd. (rough) Ticklegrass, rough bentgrass. **CULMS** tufted, erect, mostly 30–80 cm tall, sometimes shorter. **LIGULES** 1–3 mm long, truncate to obtuse, erose. **BLADES** flat, sometimes folded, usually narrow, 0.8–1.5 (2) mm wide. **PANICLES** diffuse, 10–25 cm long, mostly 5–18 cm wide, narrower when young, the branches subcapillary, flexuous, scaberulous, mostly branched above the middle. **GLUMES** purplish, unequal, the first 2.5–3.2 mm long and usually slightly but noticeably longer than the second, sometimes awn-tipped. **LEMMAS** lanceolate, 1–2 mm long; awnless in ours. **PALEAS** absent or to 0.3 mm long. **ANTHERS** 0.3–0.6 mm long. $2n = 28, 42, 43$. Meadows, stream banks, open slopes, mountain grasslands, above the juniper zone. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, SJn. 1950–3100 m (6500–10200'). Flowering: Jul–Aug. Most of North America; Asia; naturalized in Europe. The key to *A. scabra* is deliberately broad, to include plants intermediate between *A. scabra* and *A. variabilis*, which have been referred to *A.* ×*idahoensis* Nash, a catchall name without biological significance applied to apparent hybrid derivatives between the two. These intermediates are scattered within populations of *A. scabra* and *A. variabilis* and typically are recognized by culms 10–25 cm tall and panicles 5–12 cm long with ascending branches forking below their midlength, though they may have mixed combinations of various features.

Agrostis stolonifera L. (bearing stolons) Redtop, creeping bentgrass. Plants rhizomatous or stoloniferous. **CULMS** erect to geniculate to decumbent-based, 40–100 cm tall or more. **LIGULES** truncate to obtuse, erose, 2–6 (8) mm long. **BLADES** mostly flat or folded, those of the innovations involute when young, 2–6 mm wide. **PANICLES** open and pyramidal to contracted and spikelike, green to purplish, the branches naked or spikelet-bearing near the base, 8–22 cm long or more. **GLUMES** lanceolate, acute, scabrous on the keel, the first 2–2.5 mm long, the second slightly shorter, often open and gaping after the floret falls. **LEMMAS** 3- to 5-nerved, 1.5–2 mm long; awnless. **PALEAS** about 1/2 the length of the lemmas. **ANTHERS** 0.5–1.4 mm long. $2n = 28–46, 56$. [*A. alba* of numerous authors]. Stream banks, meadows, marshes, wet places, from low to high elevations, from desert to subalpine communities. Two intergrading forms may be found; these are often regarded as separate species but are here treated as subspecies:

1. Panicles open both during and after anthesis, more than 1.5 cm broad, the branches ascending to widely spreading; plants with well-developed rhizomes bearing more than 3 scale leaves, not stoloniferous, erect at the base ..... **subsp. *gigantea***

1′ Panicles open during anthesis but contracted thereafter and when mature, mostly 1–1.5 cm broad, the branches erect-appressed; plants often stoloniferous and decumbent at the base, if short rhizomes developed then these bearing no more than 3 scale leaves ..... **subsp. *stolonifera***

subsp. *gigantea* (Roth) Beldie [*Agrostis stolonifera* L.]. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: SJn. 1450–3550 m (4800–11600'). Flowering: Jun–Oct. Widespread throughout North America.

subsp. *stolonifera* [*Agrostis palustris* Huds.]. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SMg; NMEX: McK, RAr, SJn; UTAH. 1600–2700 m (5300–8900'). Flowering: Jun–Oct. Native to Eurasia and north Africa, introduced throughout the cool-temperate regions of the world as a pasture and forage grass, meadows, and lawns; widespread throughout North America.

Agrostis variabilis Rydb. (Variable) mountain bentgrass. Plants densely tufted. **CULMS** erect, 8–25 cm tall, rarely more. **LIGULES** truncate to obtuse, ciliolate, 0.5–4 mm long. **BLADES** mostly flat or folded, those of the innovations involute, 0.5–2 mm wide. **PANICLES** contracted and loosely spikelike, purplish, 2–7 cm long. **GLUMES** lanceolate, acute, scaberulous on the keel, 1-nerved, the first 2–2.5 mm long, the second slightly shorter. **LEMMAS** 5-nerved, 1.8–2.3 mm long, mostly awnless or rarely with an awn from midlength. **PALEAS** minute or absent. **ANTHERS** 0.4–0.7 mm long. $2n = 28$. [*Agrostis rossiae* of numerous authors, not Vasey]. Moist meadows and slopes, subalpine to alpine communities. COLO: LPl, SJn. Flowering: Jul–Aug. Widespread throughout the mountain regions of western North America, and previously confused with *Agrostis rossiae* Vasey, an endemic of hot springs in Yellowstone National Park.

Alopecurus L. Foxtail

(Greek *alopex*, fox, + *oura*, tail, referring to the narrow, sometimes bristly, panicle) Tufted annuals or perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat blades, lacking auricles. **INFL** a very compact cylindrical, spikelike panicle, the branches rudimentary, shortened and obscure. **SPIKELETS** 1-flowered, strongly flattened; glumes subequal, exceeding the floret and pilose-ciliate, connate below, lemmas connate below, awned from the back from below the middle; disarticulation below the glumes, the spikelets falling entire. Temperate regions of the Northern Hemisphere. About 25 species.

1. Awn only slightly exserted beyond the glumes, scarcely visible without magnification ..... ***A. aequalis***
1' Awn well exserted beyond the glumes, easily visible without magnification ..... (2)

2. Spikelets large, 5–6 mm long ..... ***A. pratensis***
2' Spikelets smaller, 2–4 mm long ..... (3)

3. Glumes pubescent throughout with prominent villous hairs; panicles densely woolly-looking, 1–4 (5) cm long ..... ***A. alpinus***
3' Glumes pubescent mostly on the keels; panicles not woolly-looking, 2–10 cm long ..... ***A. geniculatus***

Alopecurus aequalis Sobol. (equal, perhaps alluding to the glumes) Short-awn foxtail. Plants perennial. **CULMS** tufted, sometimes decumbent and rooting at the nodes, 10–50 cm tall. **LIGULES** attenuate, lacerate or entire, 3.5–7 mm long. **BLADES** flat, 1.5–4 mm wide. **PANICLES** narrowly cylindrical, 2–8 cm long, 4–5 mm wide. **GLUMES** 1.7–2.5 mm long, pubescent on the keels and nerves. **LEMMAS** lance-ovate, 1.8–2.2 mm long, glabrous, awn 0.7–2.5 mm long, included or only slightly exserted from the glumes. **PALEAS** absent. **ANTHERS** 0.5–1 mm long. $2n = 14$. Edges of ponds, along streams, wet meadows, in the mountains up to subalpine communities. ARIZ: Apa. COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn. 2050–3150 m (6800–10300'). Flowering: Jun–Aug. Circumboreal, south to California and New Mexico, east across Kansas to Pennsylvania; Argentina, Eurasia. This has been confused with *A. carolinianus* Walter, which is not found in our area, and which can be distinguished by its annual habit, ligules 2–3.5 mm long, awns 3–5 mm long and easily visible without magnification, and anthers 0.3–0.5 mm long.

Alopecurus alpinus Sm. (alpine) Alpine foxtail. Plants rhizomatous or stoloniferous. **CULMS** erect, 25–80 (100) cm tall. **LIGULES** truncate, finely erose, 2–4 mm long. **BLADES** flat, 3–6 mm wide. **PANICLES** woolly, ovoid, 1–4 cm long, 6–10 mm wide. **GLUMES** densely villous throughout, 2.8–4 mm long. **LEMMAS** ovate, 2.5–4 mm long, awn 3.5–7 mm long. **PALEAS** absent. **ANTHERS** 1.8–2.2 mm long. $2n = 98, 100, 105, 110, 112–130$. Stream banks, wet meadows, riparian areas, subalpine to alpine vegetation. COLO: Arc, Hin, SJn. 2950–3800 m (9800–12400'). Flowering: Jun–Aug. Alaska across northern Canada, south along the Rocky Mountains to Colorado. Eurasia.

Alopecurus geniculatus L. (bent sharply like a knee) Water foxtail. Plants perennial. **CULMS** spreading to decumbent and rooting at the nodes, 20–60 cm long. **LIGULES** acute, lacerate-tipped, 2–8 mm long. **BLADES** flat, 2–6 mm wide. **PANICLES** compact and spikelike, 2–10 cm long. **GLUMES** pubescent mostly on the keels only, 2–3.5 mm long. **LEMMAS** 2.5–3 mm long; awn 3.5–6 mm long. **PALEAS** absent. **ANTHERS** 1–2.2 mm long. $2n = 14, 28$. Wet meadows, edges of ponds, in aspen, ponderosa, and spruce-fir communities. COLO: LPl, Mon; NMEX: SJn. 1800–2700 m (6000–8900'). Flowering: Jun–Aug. Native to Eurasia, scattered locales in North America, through most of the western and eastern states.

Alopecurus pratensis L. (of meadows) Meadow foxtail. Plants perennial. **CULMS** erect to decumbent and sometimes rooting at the nodes, 30–80 cm long. **LIGULES** truncate to obtuse, ciliolate, 2–4 mm long. **BLADES** flat, 3–6 mm wide. **PANICLES** 3.5–10 cm long, 5–8 mm wide. **GLUMES** ovate-lanceolate, (4.5) 5–6 mm long, villous-ciliate on the keels and lateral nerves, scarcely pubescent between. **LEMMAS** 3–5 mm long, glabrous; awn 5–8 mm long, exserted and easily visible. **PALEAS** absent. **ANTHERS** 2–3.5 mm long. $2n = 14, 28, 42$. Meadows, ditch and stream banks, roadsides, often in drier sites than the other species. COLO: LPl, SJn; UTAH. 2050–2600 m (6800–8600'). Flowering: Jun–Jul. Native to Eurasia, introduced to North America as a pasture grass, escaped in much of the West and northeastern states.

Andropogon L. Bluestem

(Greek *andros*, man, + *pogon*, beard, referring to the hairy pedicelled spikelet that is usually staminate) Robust perennials with or without rhizomes; culms solid. **LEAVES** with open sheaths, membranous ligules, flat or folded blades, and lacking auricles. **INFL** a panicle of simple or slightly rebranching branches, with few panicles present on the flow-

ering shoot and terminating the culms, or with numerous small panicles produced in subtending spathes and clustered together on the flowering shoots. **SPIKELETS** 2-flowered, the lower floret highly reduced, the upper perfect (in the sessile spikelet), borne in repeating pairs of spikelets: one pedicelled, staminate or neuter, and awnless, the other sessile, perfect, and awned; disarticulation below the glumes, in a unit consisting of the sessile spikelet, rachis internode, and pedicelled spikelet; glumes subequal, hardened, enclosing the florets; lemmas highly reduced, entire or bifid, extended into the awn (in the sessile spikelet); palea tiny or absent; stamens 3. $x = 10$ (Campbell 1986; Gould 1967).

1. Flowering shoots little-branched above, the few inflorescences terminating the culms; pedicelled spikelets present, nearly as large as the sessile one; sessile spikelets at least 6 mm long ..... ***A. gerardii***
1' Flowering shoots much-branched above, with numerous inflorescences clustered together, broomlike; pedicelled spikelets vestigial or absent; sessile spikelets less than 4 mm long ..... ***A. glomeratus***

Andropogon gerardii Vitman (for John Gerard, 1546–1612, gardener-surgeon-barber, and author of an early important herbal) Big bluestem. Plants tufted or rhizomatous, robust. **CULMS** 50–130 cm or more tall, sparingly branched above. **LIGULES** 0.5–2.5 mm long. **BLADES** flat or loosely involute, 4–8 mm wide. **PANICLES** brownish to purplish, of 2–6 spicate, subdigitate, erect branches 4–10 cm long, the spikelets subtended by copious white to yellow hairs 2–6 mm long. **SESSILE SPIKELETS** 6–12 mm long, the second glume thinner and shorter than the first; awns absent or to 20 mm long. **PEDICELLED SPIKELETS** 3–8 mm long. **ANTHERS** 3–5 mm long. $2n = 20, 40, 60, 80–86$. Dry, open hills and slopes, sandy to rocky ground, ponderosa grasslands and clearings, roadsides. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, San, SJn; UTAH. 1600–2300 m (5400–7600'). Flowering: Jul–Oct. Plains and grasslands of North America, south to Arizona and Texas; Mexico. We have three intergrading subspecies:

1. Awn of sessile spikelet 0–5 mm long; rhizomes well developed; foliage glaucous ..... **subsp. *hallii***
1' Awn of sessile spikelet 8–20 mm long; rhizomes absent or well developed; foliage generally green ..... (2)

2. Hairs of panicle branch internodes (rachis joints) copious, 3–4 mm long and usually yellow or golden; rhizomes well developed ..... **nothosubsp. *chrysocomus***
2' Hairs of panicle branch internodes sparse to copious, 1–2 mm long; rhizomes absent or short ... **subsp. *gerardii***

nothosubsp. ***chrysocomus*** (Nash) Wipff (golden-haired) Sand bluestem. COLO: Mon; NMEX: McK, San, SJn; UTAH.

subsp. ***gerardii*** ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH.

subsp. ***hallii*** (Hack.) Wipff (for Elihu Hall, botanical collector from Illinois) Hall's bluestem, sand bluestem. [*Andropogon gerardii* Vitman var. *paucipilus* (Nash) Fernald; *A. hallii* Hack.]. ARIZ: Apa, Nav; NMEX: McK.

Andropogon glomeratus (Walter) Britton, Sterns & Poggenb. (wound up, glomerate) Bushy bluestem. Plants tufted, perennial. **CULMS** erect, much-branched above, 50–100 cm tall or more. **LIGULES** a firm membrane 0.4–1 mm long, accompanied by long hairs attached at the base of the blade. **BLADES** flat or folded, 2–6 mm wide, involute toward the long-acuminate tips. **PANICLES** of 2 delicate branches subtended by a reddish spathe, these tightly clustered and terminating numerous branches of the flowering shoots, which appear bushy and broomlike. **SESSILE SPIKELETS** 3–4.5 mm long; awns 1–2 cm long. **PEDICELLED SPIKELETS** typically absent, the pedicel remaining. **ANTHERS** 0.5–1.5 mm long. $2n = 20$. Hanging gardens and seeps of the Glen Canyon Recreation Area, with *Populus* and *Salix*. UTAH. 1100–1160 m (3600–3800'). Flowering: Aug–Oct. Throughout the southern states, west to Utah and Arizona; Mexico. Our material is referred to **var**. ***scabriglumis*** C. S. Campb.

Apera Adans. Silky-bent

(Greek *a*, not, + *peros*, maimed, apparently alluding to presence of the long awn) Plants annual, tufted, with hollow culms. **LEAVES** with open sheaths, membranous ligules, and lacking auricles. **INFL** an open to contracted panicle with numerous spikelets. **SPIKELETS** 1-flowered, the rachilla prolonged beyond the palea; disarticulation above the glumes; glumes longer than the floret, acuminate (ours) to aristate, 1- to 3-nerved; lemma becoming hardened at maturity, rounded on the back, faintly 5-nerved, awned from just below the tip; palea well developed, 2-nerved; stamens 3. $x = 7$ (Björkman 1960). A small genus of three species, native to cool-temperate regions of Europe and Asia.

Apera interrupta (L.) P. Beauv. (severed, interrupted, alluding to the panicle) Dense silky-bent. **CULMS** erect to decumbent at the base, 10–60 cm tall. **LIGULES** acute, erose, 1.5–4 mm long. **BLADES** flat to involute, 1–3 mm wide. **PANICLES** narrow and densely flowered, interrupted below, the branches ascending-erect, 6–18 cm long. **GLUMES** lanceolate, the first 1.7–2.2 mm long, the second 2–2.8 mm long. **LEMMAS** lanceolate, acute, 1.6–2.2 mm long; awn 5–15 mm long. **PALEAS** about 1/2 the length of the lemmas; rachilla prolonged as a bristle to 0.6 mm long. **ANTHERS**

0.3–0.4 mm long. $2n = 14, 28$. [*Agrostis interrupta* L.]. Disturbed sites in at least somewhat moist ground, lower elevations ARIZ: Apa. 1400–1700 m (4700–5600'). Flowering: May–Jul. Native to Eurasia; adventive in much of the United States

Aristida L. Threeawn

(Latin *arista*, awn) Tufted annuals or perennials with hollow culms. **LEAVES** with open sheaths, hairy or membranous ciliate ligules, usually involute blades, and lacking auricles. **INFL** an open or contracted panicle. **SPIKELETS** 1-flowered, glumes equal or unequal, relatively large, thin, 1- to 3-nerved; lemmas fusiform-terete, convolute (ours) or involute, 3-nerved, enveloping the palea and flower, indurate at maturity, sometimes narrowed at the apex into a beak, the nerves extended into 3 awns, these sometimes wound together into an awn column, the lateral 2 awns sometimes reduced to absent; palea about 1/2 the length of the lemma; disarticulation above the glumes. **STAMENS** 3 or 1. $x = 11$ (Allred 1984; Allred and Valdes-Reyna 1997). A genus of some 300 species in the arid and semiarid regions of the world

1. Plants annual, often branching from the lower to middle nodes ..... (2)
1' Plants perennial, usually branching only from the very basal nodes ..... (3)

2. Awns mostly 1–2 cm long; glumes mostly 5–12 mm long ..... ***A. adscensionis***
2' Awns 2–7 cm long; glumes mostly 20 mm or more long ..... ***A. oligantha***

3. Glumes equal or nearly so; blades usually flat and curling like wood shavings in age ..... ***A. arizonica***
3' Glumes noticeably unequal; blades usually rolled and not curling like wood shavings, but sometimes arcuate ..... ***A. purpurea***

Aristida adscensionis L. (from Ascension Island in the South Atlantic) Six-weeks threeawn. Plants annual, tufted. **CULMS** 10–75 cm tall or more, commonly geniculate and branched in the lower 1/2. **LIGULES** a short ciliate membrane about 0.5 mm long or less. **BLADES** involute on smaller plants to flat on larger plants, 0.5–2 mm wide. **PANICLES** narrow, congested to loose, 3–25 cm long, the branches usually ascending-erect, rarely spreading and with flexuous pedicels. **GLUMES** lanceolate to narrowly ovate, acute to acuminate, 1-nerved, often straw-colored, keeled, unequal, the first 4–7.5 mm long, the second 6–11 mm long, awnless or rarely short-mucronate. **LEMMAS** 5–9 mm long from base to awns; awns subequal with lateral slightly shorter, 9–25 mm long, rarely the lateral awns 1/2 or less the length of the central. **PALEAS** 1/2 or less the length of the lemmas. **ANTHERS** 0.6–1 mm long. $2n = 22$ [*Aristida bromoides* Kunth]. Desert scrub to piñon-juniper woodland, dry hills, slopes, valleys, and mesas. ARIZ: Apa; NMEX: SJn. 1300–1700 m (4300–5600'). Flowering: Mar–Oct. Southwestern United States, east to Missouri, south into Mexico, South America; Africa; Eurasia. Plant size varies in response to moisture, from tiny plants a few cm high, to robust, much-branched ones 3/4 m tall.

Aristida arizonica Vasey (from Arizona) Arizona threeawn. Plants perennial, tufted. **CULMS** 25–70 cm tall, branching only at the very base to form the tillers. **LIGULES** tiny, 0.2–0.3 mm long. **BLADES** mostly flat, curling like wood shavings in age, 1–4 mm wide. **PANICLES** narrow, congested, the branches and pedicels mostly erect-appressed, 8–18 cm long, less than 3 cm wide (including the awns). **GLUMES** subequal, 10–16 mm long. **LEMMAS** 12–18 mm long from base to awns, the terminal beak 3–6 mm long; awns 20–35 mm long, the lateral slightly shorter than the central. **PALEAS** about 1/2 the length of the lemmas. **ANTHERS** 1.3–2 mm long. $2n = 22$. Upper piñon woodlands to ponderosa forest understory, not common in the *Flora* region. NMEX: McK, SJn. 1850–2200 m (6100–7300'). Flowering Aug–Oct. Arizona to Texas, south through the highland mountains of Mexico. This species has been confused with *A. purpurea* var. *nealleyi*, and nearly all of the numerous specimens from our flora region identified as *A. arizonica* belong to that other species. *Aristida arizonica* is not known to the author from Utah or Colorado and would be especially out of place in desert scrub communities as reported in *A Utah Flora*.

Aristida oligantha Michx. (few-flowered) Old-field threeawn. Plants annual, tufted. **CULMS** 25–55 cm tall, highly branched, geniculate at the base. **LIGULES** less than 0.5 mm long. **BLADES** flat or loosely involute, 0.5–1.5 mm wide. **PANICLES** spicate or racemose, scarcely branched if at all, the spikelets on very short pedicels directly on the main axis and divergent from axillary pulvini, 7–20 cm long, 2–4 cm wide. **GLUMES** unequal, the first 3- to 7-nerved, 10–22 mm long, with a delicate awn 1–10 mm long, the second 1-nerved, 8–20 mm long. **LEMMAS** 10–22 mm long. **PALEAS** short, less than 1/3 the length of the lemmas. **ANTHERS** usually 1 and less than 0.5 mm long, rarely 3 and 2–4 mm long. $2n = 22$. Waste places, disturbed sites, roadsides, fields, usually in sandy soil, below 2000 m (6500'). ARIZ: Nav; NMEX: SJn. 1600–1800 m (5300–5800'). Found throughout much of the central and eastern states, and on the west coast; our plants seem to be adventive here, the result of infrequent introductions, perhaps with hay or livestock. The branched culms and nearly sessile spikelets render this species unmistakable.

Aristida purpurea Nutt. (purple) Purple threeawn. Plants perennial, tufted. **CULMS** 20–100 cm tall, branching only at the very base to form tillers. **LIGULES** less than 0.5 mm long. **BLADES** tightly involute to flat, 1–1.5 mm wide, not curling like wood shavings in age, but sometimes arcuate (while involute). **PANICLES** sparingly branched, often racemose, 5–30 cm long, 2–12 cm wide, the branches erect-appressed to spreading, drooping, or flexuous; axillary pulvini absent (in our species). **GLUMES** 1-nerved, typically strongly unequal, at least the majority, the first 4–12 mm long, the second 7–25 mm long. **LEMMAS** glabrous, scaberulous, or tuberculate, 6–16 mm long from base to awns, the apex 0.1–0.8 mm wide, the beak absent or less than 3 mm long; awns 1–12 cm long (rarely longer), subequal to rarely markedly unequal, the central not or only slightly thicker than the lateral ones. **PALEAS** 1/3–1/2 the length of the lemmas. **ANTHERS** 0.7–2 mm long. $2n = 22, 44, 66, 88$. Widely distributed in a variety of habitats, both disturbed and natural, from the low deserts to ponderosa forests. Flowering: Mar–Oct. Western Canada south throughout most of the western and central states into Mexico. We have four intergrading varieties, often intermingled in the same locale:

1. Awns 4–10 cm long.....(2)
1' Awns 1–4 cm long.....(3)

2. Second glume mostly less than 16 mm long; awns delicate, mostly 0.2 mm wide or less at their bases, 4–5 cm long .....**var. *purpurea***
2' Second glume 14–25 mm long; awns usually stout, more than 0.2 mm wide at the base, 4–10 cm long..... .....**var. *longiseta***

3. Panicle branches drooping at the tips; awns purplish.....**var. *purpurea***
3' Panicle branches stiffly erect; awns mostly brownish or straw-colored.....(4)

4. Panicle straw-colored; summit of lemma mostly less than 0.2 mm broad; awns delicate, mostly less than 0.2 mm wide at their bases.....**var. *nealleyi***
4' Panicle dark brown or olive-colored; summit of lemma mostly broader than 0.2 mm; awns stout, mostly 0.2 mm wide or more at their bases.....**var. *fendleriana***

var. *fendleriana* (Steud.) Vasey (for Augustus Fendler, German-born botanical collector for Asa Gray) Fendler's threeawn [*Aristida fendleriana* Steud.]. Open slopes, hills, and sandy flats. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1600–2350 m (5300–7700'). Western United States into Mexico.

var. *longiseta* (Steud.) Vasey (long-awned) Red threeawn. [*Aristida longiseta* Steud.]. Sandy or rocky slopes and plains, and in barren soils of disturbed ground. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, San, SJn; UTAH. 1100–2350 m (3700–7600'). Canada to northern Mexico.

var. *nealleyi* (Vasey) Allred (for Greenleaf Cilley Nealley, USDA botanical collector) Nealley's threeawn [*Aristida glauca* (Nees) Walp.]. Dry slopes and plains, frequently in desert grassland vegetation. ARIZ: Apa, Coc, Nav; COLO: Arc, Mon; NMEX: RAr, SJn; UTAH. 1100–1900 m (3700–6200'). Southwestern United States into Mexico.

var. *purpurea* Purple threeawn. Sandy to clay soils, along rights of way, or on dry slopes and mesas. ARIZ: Coc; UTAH. 1100–1500 m (3700–4800'). Canada to Mexico and Cuba.

Arrhenatherum P. Beauv. Oatgrass

(Greek *arrhen*, masculine, + *ather*, awn, referring to the awned staminate floret) Mostly tufted perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a narrow panicle, the branches short or slightly developed and the panicle racemose. **SPIKELETS** 2-flowered, the upper floret perfect, the lower staminate; rachilla prolonged beyond the upper floret as a bristle; disarticulation above the glumes, the florets falling together; glumes thin, unequal, the first shorter than the lower floret, the second equaling the upper floret; lemmas 5- to 7-nerved, awned from the back or not; paleas slightly shorter than the lemmas; stamens 3. $x = 7$. About six species native to Eurasia.

Arrhenatherum elatius (L.) J. Presl & C. Presl (taller) Tall oatgrass. Plants loosely tufted or occasionally with short rhizomes. **CULMS** 50–140 cm tall, sometimes bulbous (with corms) at the base. **LIGULES** obtuse to acute, ciliate, 1–3 mm long. **BLADES** 3–10 mm wide. **PANICLES** 8–28 cm long, 2–6 cm wide, the branches erect, whorled, usually spikelet-bearing to the base. **GLUMES** lanceolate-elliptic, unequal, the first 4–7 mm long, the second 7–10 mm long. **LEMMAS** 5–10 mm long; awn of lower lemma 10–20 mm long, bent, borne from the back at about midlength; awn of upper lemma absent or to 5 mm long, borne just below the apex. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 3.5–6 mm long. $2n = 14, 28, 42$. Meadows, stream banks, moist roadsides in the mountains; sometimes planted for

erosion control. UTAH. 2150–2900 (7100–9500'). Flowering: Jul–Aug. Native to Eurasia, widespread in eastern and western North America.

Avena L. Oats

(Latin *avena*, the ancient name for oats, possibly from *aveo*, desire, because it was sought by cattle) Tufted, robust annuals with hollow culms. **LEAVES** with open sheaths, flat blades, membranous ligules, lacking auricles. **INFL** an open panicle, the branches drooping, racemose in less developed plants. **SPIKELETS** with 2–3 florets, large, drooping, the rachilla prolonged beyond the terminal floret and often bearing a tiny rudiment; glumes large, several-nerved, papery, acuminate; lemmas hardened when mature, rounded, glabrous to hirsute, awned from the back (to awnless in cultivated forms); palea shorter than the lemma; stamens 3. $x = 7$ (Baum 1977). About 10–15 species native to Europe and Asia, widely cultivated throughout the world.

1. Awns usually well developed and bent abruptly; florets separating and falling separately, leaving a circular scar or "sucker-mouth" at the callus ..... ***A. fatua***
1' Awns usually absent or short and straight; florets falling together, when broken apart mechanically a small portion of the rachilla remaining attached to the callus ..... ***A. sativa***

Avena fatua L. (foolish or tasteless) Wild oats. **CULMS** 30–100 cm tall or more. **LIGULES** acute, 4–6 mm long. **BLADES** flat, 3–12 mm wide. **PANICLES** 10–30 cm long, 6–20 cm wide. **GLUMES** subequal, 18–32 mm long, 9- to 11-nerved. **LEMMAS** 14–22 mm long, typically densely strigose below the middle; awns 23–42 mm long. **ANTHERS** about 3 mm long. $2n = 42$. Roadsides, fields, among crops, disturbed sites. ARIZ: Apa; COLO: Arc, Mon; NMEX: SJn. 1250–2100 m (4200–6800'). Flowering: May–Sep. Native to Eurasia.

Avena sativa L. (planted or sown) Common oats. **CULMS** 40–140 cm tall or more. **LIGULES** acute, 3–8 mm long. **BLADES** 4–20 mm wide. **PANICLES** 15–40 cm long, 5–15 cm wide. **GLUMES** subequal, 20–32 mm long, 9- to 11-nerved. **LEMMAS** typically glabrous, 14–18 mm long; awns usually absent, 15–30 mm when present and mostly straight. **ANTHERS** 2–4 mm long. $2n = 42$. [*A. fatua* L. var. *sativa* (L.) Hausskn.]. Widely cultivated and then found along adjacent roadsides and fields, rarely persisting for long. ARIZ: Nav; COLO: LPl; NMEX: McK, SJn; UTAH: 1120–2150 m (3700–7000'). Flowering: May–Sep. Native to Eurasia. Sometimes considered merely a subspecies or variety of *A. fatua*.

Beckmannia Host, Sloughgrass

(for Johann Beckmann, 1739–1811, German botanist) Plants annual and tufted (ours), or perennial and rhizomatous. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a panicle of spicate, unilateral branches, secondary branches infrequent and poorly developed; disarticulation below the glumes, the spikelets falling entire. **SPIKELETS** laterally compressed, circular-ovate in outline, subsessile, with 1–2 florets, the rachilla not prolonged; glumes subequal, keeled, inflated, D-shaped in outline; lemmas lanceolate, awn-tipped, paleas similar to the lemmas in size and shape; stamens 3. $x = 7$.

Beckmannia syzigachne (Steud.) Fernald (scissorlike, referring to the glumes) American sloughgrass. Plants annual. **CULMS** solitary or loosely tufted, (20) 30–100 cm or more tall. **LIGULES** obtuse to acuminate, entire to lacerate, 4–11 mm long. **BLADES** 4–12 mm wide, scabrous. **PANICLES** narrow, congested, 8–30 cm long, the branches erect to ascending. **GLUMES** 3-nerved, apiculate, strongly keeled, 2–3 mm long. **LEMMAS** 2.5–3.5 mm long, slightly exceeding the glumes. **ANTHERS** 0.5–1.5 mm long. $2n = 14$. [*Beckmannia eruciformis* (L.) Host]. Marshes, floodplains, edges of ponds, streams, and ditches, low to high elevations. ARIZ: Apa; COLO: Arc, Hin, LPl, Mtn, Mon; NMEX: RAr, SJn; UTAH. 2000–2650 m (6500–8700'). Flowering: Jul–Sep. Alaska and Canada, throughout the western United States, east to the Great Lakes region; Eurasia. The panicles and spikelets are instantly recognizable. Spikelets occasionally have two florets. Our material is referred to **subsp.** ***baicalensis*** (Kusn.) T. Koyama & Kawano.

Blepharoneuron Nash, Pine Dropseed

(Greek *blepharis*, eyelash, + *neuron*, nerve, alluding to the ciliate nerves of the lemmas) Plants annual or perennial (ours), with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat to involute blades, lacking auricles. **INFL** a panicle of capillary, flexuous branches, the pedicels minutely glandular just below the spikelets. **SPIKELETS** 1-flowered, slightly laterally compressed, olive-colored; disarticulation above the glumes; glumes subequal, 1-nerved, glabrous, ovate to ovate-lanceolate; lemmas 3-nerved, slightly longer than the glumes, densely ciliate-sericeous on the 3 nerves; paleas villous between the 2 nerves; stamens 3. $x = 8$ (Peterson and Annable 1990). A genus of two species, an annual from northern Mexico, and a perennial (ours) from North America.

Blepharoneuron tricholepis (Torr.) Nash (hairy scale) Pine dropseed. Densely tufted perennials. **CULMS** erect, 15–70 cm tall. **LIGULES** truncate to rounded, 0.5–2 mm long, entire. **BLADES** 0.5–2.5 mm wide, usually folded to involute. **PANICLES** mostly 5–25 cm long, 2–10 cm wide, the branches erect-appressed to widely spreading; pedicels 2–9 mm long, capillary. **GLUMES** 1.8–2.8 mm long. **LEMMAS** 2–4 mm long. **ANTHERS** 1.2–2 mm long. $2n = 16$. Dry soils in ponderosa pine–Gambel's oak forests. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2100–3650 m (7000–12000'). Flowering: Jul–Oct. Utah and Colorado south to southern Mexico.

Bothriochloa Kuntze Bluestem

(Greek *bothros*, trench or pit, + *chloë*, grass, alluding either to the groove in the pedicels or to the pit in the lower glumes of some species) Plants perennial, tufted (ours) or stoloniferous, with pithy culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a terminal panicle of subdigitate to racemosely arranged branches (rames); rames with pairs of 1 sessile and 1 pedicelled spikelet; internodes with a translucent or opaque longitudinal groove, often villous on the margins; disarticulation in the rame, of the sessile and pedicelled spikelets with pedicel and rachis internode. **SPIKELETS** dorsally compressed; sessile spikelets with 2 florets, the lower reduced, hyaline and awnless, the upper fertile and awned (ours); glumes hardened, enclosing the florets except for the awn. **STAMENS** 3; pedicelled spikelets sterile or staminate, as large as or much smaller than the sessile spikelets, awnless. $x = 10$ (Allred 1983; Gould 1967). About 35 species of tropical to warm-temperate regions of the world, nearly all of which were formerly included in an expanded *Andropogon*.

1. Panicle branches subdigitate, most borne at the tip of the stem; spikelets typically purplish or reddish, with relatively fewer hairs, the spikelets scarcely obscured; pedicelled spikelets about as long and broad as the sessile ones ..... ***B. ischaemum***
1' Panicle branches mostly scattered along the main axis; spikelets typically greenish, silvery, or straw-colored, with copious hairs, the spikelets obscured; pedicelled spikelets definitely smaller than the sessile ones ..... (2)

2. Awns less than 18 mm long; sessile spikelets less than 4.5 mm long; foliage often glaucous ..... ***B. laguroides***
2' Awns longer than 18 mm; sessile spikelets 4.5–7 mm long; foliage rarely glaucous ..... ***B. barbinodis***

Bothriochloa barbinodis (Lag.) Herter (hairy-noded) Cane bluestem. **CULMS** 60–120 cm tall, erect to geniculate basally, often branched above in age; nodes hirsute with stiff, tan to whitish hairs 3–4 mm long. **LIGULES** 1–2 mm long, often erose. **BLADES** 2–7 mm wide, not glaucous. **PANICLES** 5–16 cm long on the larger shoots, oblong to somewhat fan-shaped, silvery; rachis 5–10 cm long, with numerous branches 4–9 cm long. **SESSILE SPIKELETS** 4.5–7 mm long, the lower glume with or without a dorsal pit; awns 20–35 mm long. **PEDICELLED SPIKELETS** 3–4 mm long, sterile, awnless. **ANTHERS** 0.5–1 mm long. $2n = 180, 220$. [*Andropogon barbinodis* Lag.]. Desert scrub and piñon-juniper woodlands, typically in dry sites below the ponderosa zone. ARIZ: Nav; UTAH. 1650–1800 m (5400–5800'). Flowering: Apr–Oct. Southwestern United States, south through Mexico and Central America, to Bolivia and Argentina.

Bothriochloa ischaemum (L.) Keng (resembling the genus *Ischaemum*) Yellow bluestem. Plants usually tufted, occasionally stoloniferous. **CULMS** 30–80 cm tall; nodes glabrous or short-hirsute. **LIGULES** 0.5–1.5 mm long. **BLADES** 2–4.5 mm wide, flat to folded, glabrous or with long scattered hairs at the base of the blade. **PANICLES** reddish purple, 5–10 cm long, with 2–8 branches clustered toward the tip of the flowering shoot. **SESSILE SPIKELETS** 3–4.5 mm long, narrowly ovate, the lower glume lacking a dorsal pit; awns 9–17 mm long. **PEDICELLED SPIKELETS** about as long as and nearly as broad as the sessile, sterile or staminate. **ANTHERS** 1–2 mm long. $2n = 40, 50, 60$. [*Andropogon ischaemum* L.]. Disturbed ground, roadsides, in desert scrub and grassland communities. ARIZ: Apa; NMEX: McK, RAr, SJn; UTAH. 1700–2300 m (5600–7400'). Flowering: Aug–Sep. Native to southern Europe and Asia, introduced for erosion control and forage in the Southwest, and spreading into other central and southern states. The groove in the pedicels and rachis internodes is not translucent and does not extend to the other side of the joint, which is rounded on the back. Two minor variants have been named: var. *songarica* (Rupr. ex Fisch. & C. A. Mey.) Celarier & J. R. Harlan (King Ranch bluestem) with pubescent nodes, and var. *ischaemum* with glabrous nodes.

Bothriochloa laguroides (DC.) Herter (resembling the genus *Lagurus*) Silver bluestem. **CULMS** erect or geniculate at the base, branched in age, 35–110 cm tall; nodes sparsely shortly hirsute or pilose with erect hairs, or glabrous. **LIGULES** 1–3 mm long. **BLADES** and foliage often glaucous, 2–7 mm wide, flat to folded, mostly glabrous. **PANICLES** narrowly oblong or lanceolate, silvery white or light tan, 4–12 cm long, with more than 10 branches, rarely with axillary pulvini, the lower branches shorter than the main axis. **SESSILE SPIKELETS** ovate, somewhat glaucous, with blunt apices, 2.5–4 mm long (rarely longer), the lower glume only rarely with a dorsal pit; awns 8–16 mm long. **PEDICELLED**

SPIKELETS 1.5–2.5 (3) mm long, sterile, distinctly smaller than the sessile. **ANTHERS** 0.6–1.4 mm long. $2n = 60$ [*Andropogon laguroides* DC.; *Bothriochloa saccharoides* of earlier works]. Roadsides and other disturbed moist sites in desert scrub and grassland communities. ARIZ: Nav; NMEX: McK, San, Sln. UTAH 1650–3000 m (5400–6800'). Flowering: Aug–Oct. Great Plains and adjacent regions, south into Mexico. South America. Our plants belong to **subsp.** ***torreyana*** (Steud.) Allred & Gould.

Bouteloua Lag. Grama

(for the brothers Claudio, 1774–1842, and Estéban, 1776–1813, Boutelou Agraz, Spanish botanists) Plants annual or perennial, tufted, stoloniferous, or rhizomatous, with pithy or hollow culms. **LEAVES** with open sheaths, ciliate ligules, flat, folded, or involute blades, and lacking auricles. **INFL** a panicle of spicate primary branches, disarticulation above the glumes or below with the branch. **SPIKELETS** sessile, 2- to 4-flowered, the lower floret perfect, the others staminate or vestigial; glumes unequal, 1-nerved; lower (fertile) lemmas membranous, 3-nerved, awned or awnless; upper lemmas reduced in size, often awned; stamens 3. $x = 10$ (Gould 1979). About 40 species of the Western Hemisphere.

1. Stem internodes (not the sheaths) woolly-pubescent ..... ***B. eriopoda***
1' Stem internodes glabrous ..... (2)

2. Inflorescence branches deciduous at maturity; spikelets 1–16 per branch ..... (3)
2' Inflorescence branches and glumes persistent on the plant; spikelets usually 20–60 per branch ..... (4)

3. Plants annual; panicles with 1–15 branches ..... ***B. aristidoides***
3' Plants perennial; panicles with (12) 20–80 branches ..... ***B. curtipendula***

4. Plants annual ..... (5)
4' Plants perennial ..... (6)

5. Inflorescence reduced to a single branch ..... ***B. simplex***
5' Inflorescence with 4–several branches, only rare culms with a single branch ..... ***B. barbata***

6. Panicle branch bristlelike, extending 4–10 mm beyond the attachment of the terminal spikelet ..... ***B. hirsuta***
6' Panicle branch not bristlelike and not extending past the last spikelet, but terminating in a spikelet ..... ***B. gracilis***

Bouteloua aristidoides (Kunth) Griseb. (resembling the genus *Aristida*) Needle grama. Plants annual, tufted. **CULMS** 5–45 cm tall, often geniculate at the bases. **LIGULES** 0.2–0.5 mm long. **BLADES** flat or folded, 1–2 mm wide, margins usually with papillose-based hairs near the ligule. **PANICLES** 2–10 cm long, with (1) 4–15 branches, these deciduous and densely pubescent at the base, the branch extending beyond the terminal spikelet. **SPIKELETS** with 1–2 florets, the upper sterile and awned, 1–6 per branch. **GLUMES** unequal. **FERTILE FLORET** 5–7 mm long, acute or awn-tipped. **STERILE FLORETS** reduced to a short column with 3 awns 2–7 mm long. **PALEAS** subequal to the lemmas. **ANTHERS** about 2.5 mm long, yellow or yellow and red. $2n = 40$. Dry, sandy ground in desert scrub vegetation, roadsides, not common. ARIZ: Apa. 1450–1700 m (4850–5500'). Flowering: Aug–Oct. California to Texas, Mexico, South America.

Bouteloua barbata Lag. (bearded) Six-weeks grama. Low, tufted annuals. **CULMS** numerous, sprawling to erect, 5–25 cm long, often geniculate, branching. **LIGULES** 0.5–1.2 mm long. **BLADES** mostly flat, 1–2 mm wide, often with whitish margins. **PANICLES** 3–10 cm long, with 2–8 branches, these often arcuate; disarticulation above the glumes. **SPIKELETS** with 1 fertile floret and 1–2 sterile rudimentary florets, crowded on the branches. **GLUMES** 1–2.5 mm long, unequal, awn-tipped to 0.7 mm long. **FERTILE FLORET** 1.5–2.5 mm long, appressed-pubescent, awns to 2.5 mm long. **PALEAS** subequal to the lemmas. **STERILE FLORETS** 0.5–1 mm long, globose, empty, awns to 3 mm long. **ANTHERS** about 0.5 mm long, yellow. $2n = 20, 40$. Dry, open places of deserts and lower foothills, washes and arroyos, roadsides and disturbed ground. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, Sln; UTAH. 1100–1850 m (3700–6100'). Flowering: Aug–Oct. Southern California through southern Utah and Colorado, south to Mexico.

Bouteloua curtipendula (Michx.) Torr. (short-hanging, referring to the branches) Sideoats grama. Tufted or short-rhizomatous perennials. **CULMS** erect, slender, 25–100 cm tall. **LIGULES** 0.2–1 mm long. **BLADES** typically flat, 2–4 mm wide. **PANICLES** long and narrow, 12–30 cm long, with (12) 20–80 branches, these 1–3 cm long and falling as a unit. **SPIKELETS** with 1–3 florets, the lower fertile and the others vestigial, 2–5 per branch. **GLUMES** unequal, the first 2.5–5 mm long, the second 4.5–7.5 mm long. **FERTILE FLORET** 3–6.5 mm long, short-awned to 6 mm. **PALEAS** subequal to the lemmas, unawned. **STERILE FLORETS** 0.4–3.5 mm long, with 3 unequal awns to 7 mm long. **ANTHERS** 1.5–3.5 mm long, yellow, orange, red, or purple. $2n = 20, 40, 41–103$. Widespread in grassy, desert scrub.

woodland, and ponderosa pine habitats, mostly at lower elevations. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1100–2150 m (3700–7100'). Flowering: Jul–Oct. Southern Canada, most of the United States; Mexico; South America.

Bouteloua eriopoda (Torr.) Torr. (woolly-footed) Black grama. Tufted perennials from knotty bases, often stoloniferous with long internodes. **CULMS** sprawling to ascending, the internodes with short, dense, woolly hairs, 25–70 cm long. **LIGULES** 0.1–0.4 mm long. **BLADES** flat when fresh, 1–2.2 mm wide. **PANICLES** 2–16 cm long, with 1–8 widely spaced branches, these 1.5–4 cm long and with a prominent tuft of hairs at the base; disarticulation above the glumes. **SPIKELETS** with 1 fertile floret and 1 rudimentary floret, 8–14 per branch. **GLUMES** unequal, the lower 2–4.5 mm long, the upper 4.5–8 mm long. **FERTILE FLORET** 4–7 mm long, the awns 0.5–4 mm long. **PALEAS** subequal to the lemmas. **STERILE FLORETS** rudimentary, terminating in 3 awns 4–9 mm long. **ANTHERS** 1.5–3 mm long, yellow to orange. $2n = 20, 21, 28$. Desert grasslands, scrublands, and into the lower foothills, sandy to rocky ground. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1450–2050 m (4800–6800'). Flowering: Jul–Sep. Western United States into northern Mexico. This is the only grass in our flora with woolly (not just pubescent) internodes.

Bouteloua gracilis (Kunth) Lag. ex Griffiths (slender) Blue grama. Plants densely tufted, sometimes with short rhizomes. **CULMS** erect to decumbent-based, 20–70 cm long, unbranched above the base. **LIGULES** 0.1–0.4 mm long, often with a tuft of hair at the edges. **BLADES** flat to involute, 0.5–2.5 mm long, with scattered hairs at the base. **PANICLES** 2–12 cm long, with 1–6 widely spaced branches, these 1.5–6 cm long; disarticulation above the glumes. **SPIKELETS** with 1 fertile floret and 1 rudimentary floret, 40–100 or more per branch. **GLUMES** sometimes with papillose-based hairs, unequal, the lower 1.5–3.5 mm long, the upper 3.5–6 mm long. **FERTILE FLORET** 3.5–6 mm long, with awns 1–3 mm long. **PALEAS** about 5 mm long, awn-tipped. **STERILE FLORETS** vestigial, 1–3 mm long, with 3 awns 1–3 mm long. **ANTHERS** 1.7–3 mm long, yellow or purple. $2n = 20, 28, 35, 40, 42, 60, 61, 77, 84$. Very widely distributed and common from desert plains through woodlands and forests to middle or rarely high elevations in the mountains, usually in open, dry sites. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1550–2450 m (5150–8000'). Flowering: Jul–Oct. Southwestern Canada through the southwestern and central United States to Mexico, rare eastward. Similar to *B. hirsuta*, but lacking the continuation of the rachis beyond the terminal spikelet. Sometimes the terminal spikelet will stick outward, mimicking a bristle; close inspection will reveal this. This is the state grass of New Mexico, and perhaps the most common grass in the Four Corners region.

Bouteloua hirsuta Lag. (shaggy or bristly) Hairy grama. Plants perennial, densely or loosely tufted, sometimes somewhat stoloniferous. **CULMS** erect to decumbent-based, rarely branched above, 15–70 cm long. **LIGULES** 0.2–0.5 mm long. **BLADES** flat to involute, 1–2.5 mm wide, often with papillose-based hairs. **PANICLES** 1–15 cm long, with 1–6 widely spaced branches, these 1–4 cm long; disarticulation above the glumes. **SPIKELETS** with 1 fertile floret and 1–2 rudimentary florets, 20–50 per branch. **GLUMES** unequal, the midnerve with papillose-based hairs, the first 1.5–3.5 mm long, the second 3–6 mm long. **FERTILE FLORET** 2–4.5 mm long, with awn(s) 0.2–2.5 mm long. **PALEAS** ovate, not awned. **STERILE FLORETS** 0.5–2 mm long, the 3 awns 2–6 mm long. **ANTHERS** 2–3.5 mm long, cream or yellow. $2n = 20, 40, 50, 60$. Relatively infrequent on bajadas and foothills, sandy and rocky ground. ARIZ: Apa; NMEX: McK, RAr, SJn; UTAH. 1500–1800 m (5000–5900'). Flowering: Jul–Sep. Great Plains south to Arizona and Texas; Mexico.

Bouteloua simplex Lag. (simple or single, referring to the branching) Mat grama. Plants annual. **CULMS** mostly geniculate-decumbent, 3–35 cm long. **LIGULES** tiny, 0.1–0.2 mm long. **BLADES** flat to involute, 0.5–1.5 mm wide, often pilose at the base near the sheath. **PANICLES** with a single branch terminating the culm, rarely some culms of a clump with 2–3 branches, these 1–4 cm long, straight to arcuate; disarticulation above the glumes. **SPIKELETS** crowded, with 1 fertile floret and 1–2 rudimentary florets. **GLUMES** glabrous, unequal, the first 1.5–2.5 mm long, the second 3.5–5 mm long. **FERTILE FLORET** ciliate-pilose on the nerves, 2.5–3.5 mm long; awns 3, 1–3 mm long. **PALEAS** obovate, awnless. **STERILE FLORETS** rudimentary, a short column with 3 awns 5–6 mm long. **ANTHERS** 0.4–0.6 mm long. $2n = 20$. Grassy and brushy plains and hills, roadsides, disturbed ground. ARIZ: Apa, Nav; COLO: Arc, LPl, Min, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1600–2250 m (5300–7400'). Flowering: Aug–Oct. Wyoming and Colorado south to Arizona and Texas; Mexico.

Bromus L. Bromegrass

(Greek *bromo*, food, the ancient name for oats) Plants annual to perennial, tufted or rhizomatous, with hollow culms. **LEAVES** with closed sheaths, membranous ligules, mostly flat blades, and with or without auricles. **INFL** a panicle, often lax and drooping, usually rebranching but sometimes poorly developed and racemelike with few spikelets. **SPIKELETS** large, several-flowered, strongly compressed to terete; glumes unequal, shorter than the lower lemma,

typically awnless; lemmas (3) 5- to 9-nerved, awned or awnless from the slightly bifid apex; palea shorter than to as long as the lemma, strongly ciliate on the 2 nerves, adhering to the caryopsis at maturity; stamens usually 3 or 7 (Allred 1993; Peterson et al. 2001; Wagnon 1952). About 100 species in the temperate regions of the world. Some recognize several segregate genera (*Anisantha*, *Bromopsis*, *Ceratochloa*), but a more traditional, practical circumscription is maintained here.

1. Plants perennial ..... (2)
1' Plants annual ..... (9)

2. Rhizomes present ..... ***B. inermis***

4. Lemma awns 0–2.5 mm long ..... ***B. catharticus***
4' Lemma awns 3–8 mm long (rarely as short as 2 mm) ..... ***B. carinatus***

5. First glume 3-nerved ..... (6)
5' First glume 1 (2)-nerved ..... (7)

6. Glumes and pedicels puberulent; blades erect, the midrib not narrowed below the collar ..... ***B. porteri***
6' Glumes and pedicels glabrous; blades mostly lax or spreading, the midrib often narrowed below the collar ..... ***B. frondosus***

7. Sheaths densely lanate, the hairs spreading from the sheath but becoming matted at the tips ..... ***B. lanatipes***
7' Sheaths glabrous to lightly pilose or hirtellous, if pubescent then not becoming matted ..... (8)

8. Sheaths with crinkled hairs at the corner of the collars; lemmas densely hairy on the margins but glabrous or nearly so on the median portion across the back; anthers mostly shorter than 2.2 mm; lemmas mostly longer than 8.6 mm ..... ***B. ciliatus***
8' Sheaths glabrous at the collars; lemmas hairy across the back, not glabrous on the median portion; anthers mostly longer than 1.8 mm; lemmas mostly shorter than 9.2 mm ..... ***B. anomalus***

9. Lemma awns 0–2.5 mm long ..... ***B. catharticus***
9' Lemma awns longer than 3 mm ..... (10)

10. Lemma body 6–9 (10) mm long at maturity ..... (11)
10' Lemma body (9) 10–30 mm long at maturity ..... (13)

11. Awns mostly less than 5 mm long; lemmas rounded, the margins usually rolled around the grain; plants mostly glabrous ..... ***B. secalinus***
11' Awns mostly more than 5 mm long; lemmas somewhat flattened, the margins not rolled around the grain; plants pubescent ..... (12)

12. Panicles dense, compact, 3–8 (10) cm long, the branches stiffly erect and shorter than the spikelets ..... ***B. hordeaceus***
12' Panicles open, 6–20 cm long, the branches spreading, at least some longer than the spikelets ..... ***B. japonicus***

13. First glume 3- to 5-nerved; awns 4–8 mm long ..... ***B. carinatus***
13' First glume mostly 1-nerved (occasionally 3-nerved in *B. diandrus*); awns (7) 10–60 mm long ..... (14)

14. Panicle dense, compact, ovoid; panicle branches stout, erect, and mostly much shorter than 2 cm ..... ***B. rubens***
14' Panicle loose, open, elongate; panicle branches often spreading or drooping, and mostly much longer than 2 cm ..... (15)

15. Awns mostly 3–6 cm long; lemmas 20–35 mm long ..... ***B. diandrus***
15' Awns mostly 1–3 cm long; lemmas 9–20 mm long ..... ***B. tectorum***

Bromus anomalus Rupr. ex E. Fourn. (irregular) Nodding brome. Plants perennial, tufted. **CULMS** erect, unbranched above the base, 45–110 cm long. **LIGULES** 1 mm or less long. **BLADES** flat, 3–7 mm wide, glabrous at the collar, the midrib narrowed just below the collar. **PANICLES** 8–24 mm long, open, the branches ascending to divaricate, lax. **SPIKELETS** not much compressed. **GLUMES** unequal, the first 1-nerved and 5–6 mm long, the second 3-nerved and

6–8 mm long. **LEMMAS** 6–11 mm long, shortly pilose on the margins and across the back between the nerves, occasionally on the margins only; awns 1–4 mm long. **ANTHERS** 1.7–4.5 mm long. $2n = 14$. [*Bromopsis anomala* (Rupr. ex E. Fourn.) Holub]. Mountain brush, ponderosa parklands, mountain meadows, and edges of coniferous forests, often in shaded understory; not common in the *Flora* area. NMEX: SJn; UTAH. 2600–3100 m (8500–10200'). Flowering: Jul–Sep. Southern Rocky Mountains south into Mexico.

Bromus carinatus Hook. & Arn. (keeled) Mountain brome. Plants perennial, tufted, sometimes flowering the first season. **CULMS** erect, 40–120 cm tall. **LIGULES** 1–3 mm long, erose. **BLADES** flat, 3–10 mm wide. **PANICLES** 10–25 cm long, open, the branches typically spreading to stiffly divaricate. **SPIKELETS** strongly compressed. **GLUMES** unequal, strongly keeled, the first 7–11 mm long and 3- to 5-nerved, the second 9–13 mm long and 5- to 7-nerved. **LEMMAS** keeled on the midnerve, glabrous to short-pilose, 11–15 mm long; awns 4–8 mm long. **ANTHERS** 1.5–3.5 mm long. $2n = 28, 42, 56$. [*B. marginatus* Nees ex Steud.; *B. polyanthus* Scribn.; *Ceratochloa carinata* (Hook. & Arn.) Tutin; *Ceratochloa marginata* (Nees ex Steud.) W. A. Weber; *Ceratochloa polyantha* (Scribn.) Tzvelev]. Mountain brush, coniferous forest, aspen glades, often in disturbed habitats. ARIZ: Apa; COLO: Arc, LPl, Mon, RGr, SJn; NMEX: McK; UTAH. 2250–2700 m (7400–8800'). Flowering: Jun–Sep. Widespread in western North America, from Alaska to Mexico. This is a highly variable, polyploid, agamic complex, the intergrading forms more or less corresponding to ploidy levels: *B. carinatus* = 28, 56; *B. marginatus* = 42; *B. polyanthus* = 56. The following key may allow recognition of some of these populations or plants:

1. Plants annual or biennial, 30–100 cm tall; awns usually more than 7 mm long.....**the *carinatus* phase**
1' Plants perennial, 60–120 cm tall; awns usually less than 7 mm long .....(2)

2. Sheaths and/or lemmas pubescent .....**the *marginatus* phase**
2' Sheaths and lemmas glabrous or merely scabrous .....**the *polyanthus* phase**

Bromus catharticus Vahl (cleansing, cathartic) Rescuegrass. Plants tufted annuals to short-lived perennials. **CULMS** erect to ascending, 20–100 cm long. **LIGULES** 2–5 mm long. **BLADES** flat, 2–10 mm wide. **PANICLES** 10–26 cm long, loosely contracted to open and pyramidal, the branches erect-ascending to divaricately drooping. **SPIKELETS** strongly compressed, often greenish yellow. **GLUMES** lanceolate, unequal, the first 5- to 7-nerved and 6–11 mm long, the second 7- to 9-nerved and 7–13 mm long. **LEMMAS** 9–15 mm long, scaberulous to typically glabrous; awns 0–2.5 mm long. **ANTHERS** about 3 mm long. $2n = 28, 42, 56$. [*B. unioloides* Kunth; *B. willdenowii* Kunth; *Ceratochloa cathartica* (Vahl) Herter]. Disturbed ground, roadsides, lawns, ditch banks, irrigated pastures. ARIZ: Nav; NMEX: SJn. 1500–1800 m (5000–6000'). Flowering: Mar–Jun. Native to South America, introduced for forage and escaping. Matua grass is a popular cultivar of this species planted for improved pastures.

Bromus ciliatus L. (fringed) Fringed brome. Plants perennial, tufted. **CULMS** erect, unbranched above the base, 50–140 cm tall. **LIGULES** 0.5–3.5 mm long. **BLADES** flat, 3–9 mm wide, glabrous or occasionally sparsely hirtellous on the upper surface, the midrib narrowed below the collar, the collar with a tuft of hairs at the corners. **PANICLES** 6–18 cm long, open or loosely contracted, the branches spreading to divaricate, occasionally ascending to erect. **SPIKELETS** not strongly compressed. **GLUMES** unequal, the first 1 (2)-nerved and 5–8 mm long, the second 3-nerved and 10–13 mm long. **LEMMAS** 7–15 mm long, pubescent on the margins and glabrous across the back, only rarely pubescent across the back; awns 3–5 mm long. **ANTHERS** 1.2–2.8 mm long. $2n = 14, 28$. [*Bromopsis ciliata* (L.) Holub; *Bromus canadensis* Michx.; *B. richardsonii* Link]. Sparingly in oak or piñon-juniper woodlands; more common at higher elevations in piñon pine and ponderosa pine forests, mountain meadows, and grassy slopes in the spruce-fir zone. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn. UTAH. 2100–3350 m (6900–11000'). Flowering: Jul–Oct. Northern North America south through the western states through Mexico. Populations with longer anthers and glumes have been segregated as *B. richardsonii* Link, but the distinctions fail to hold in our material.

Bromus diandrus Roth (with two stamens) Ripgut brome. Plants stiffly pilose to hirsute, annual. **CULMS** erect to decumbent-based, 20–80 cm long. **LIGULES** obtuse, 2–3 mm long. **BLADES** flat, 1–8 mm wide. **PANICLES** 12–25 cm long, the branches stiffly erect to spreading. **SPIKELETS** somewhat laterally compressed, but not especially strongly so. **GLUMES** narrowly lanceolate, unequal, the first 13–20 mm long and 1-nerved, the second 20–26 mm long and 3-nerved. **LEMMAS** 20–25 mm long, 7-nerved, tapering to a bifid apex with teeth 3–5 mm long; awns 30–65 mm long. **ANTHERS** 0.5–1 mm long. $2n = 42, 56$. [*Anisantha diandra* (Roth) Tutin; *B. rigidus* Roth]. Dry, disturbed sites, waste areas, roadsides. ARIZ: Apa; NMEX: SJn; UTAH. 1450–1700 m (4800–5600'). Flowering: Apr–Jun. Native to Eurasia, adventive to established in North America from British Columbia through much of the western United States to Mexico, rare eastward; South America. The stiff awns may cause severe injury to the nose, eyes, or underbelly of a grazing animal.

Bromus frondosus (Shear) Wooton & Standl. (leafy) Weeping brome. Plants tufted perennials. **CULMS** erect, unbranched above the base, 26–90 cm tall. **LIGULES** 0.5–1 mm long. **BLADES** flat or loosely folded, 2.5–5 mm wide, the midrib usually narrowed above the collar on the back. **PANICLES** well exserted from the sheath, open to loosely contracted, 8–28 cm long, the branches ascending to spreading. **SPIKELETS** terete to moderately laterally compressed, the pedicels glabrous. **GLUMES** glabrous, somewhat unequal, the first 5–8 mm long and the second 6–9 mm long. **LEMMAS** 7–10 mm long, pubescent across the back or on the margins only, awns 2–5 mm long. **ANTHERS** 1.5–3.5 mm long. $2n = 14$. [*Bromopsis frondosa* (Shear) Holub]. Mountain brush, oak-juniper woodlands, up into the ponderosa zone, mostly below 2500 m (8000'). ARIZ: Apa; COLO: Min, Mon; NMEX: McK, RAr, San, SJn. 1900–2600 m (6200–8500'). Flowering: Jun–Sep. Colorado, Arizona, and New Mexico, south into Mexico. Weeping brome intergrades with *B. anomalus* and *B. ciliatus* and is often confused with those species.

Bromus hordeaceus L. (resembling the genus *Hordeum*) Soft brome. Plants annual or biennial, softly pilose. **CULMS** erect to ascending, 5–60 cm tall. **LIGULES** obtuse, 1–1.5 mm long. **BLADES** flat, 1–4 mm wide. **PANICLES** ovoid, rather dense, 3–13 cm long, the branches stiffly erect. **SPIKELETS** terete to slightly compressed. **GLUMES** glabrous to pilose, unequal, the first 5–7 mm long and 3- to 5-nerved, the second 6.5–8 mm long and 5- to 7-nerved. **LEMMAS** 6.5–11 mm long, 7- to 9-nerved; awns 6–8 mm long, arising from just below the apex. **ANTHERS** 0.6–1.5 mm long. $2n = 28$. [*B. molliformis* Lloyd; *B. mollis* L.]. Disturbed ground and waste places at lower elevations. COLO: Dol, LPl, NMEX: SJn. 1500–1700 m (5000–5600'). Flowering: May–Jul. Native to Eurasia, now found throughout most of North America.

Bromus inermis Leyss. (unarmed, awnless) Smooth brome. Plants perennial, rhizomatous, mostly glabrous. **CULMS** erect to spreading, 50–130 cm long. **LIGULES** truncate, erose, 1–3 mm long. **BLADES** flat, 5–15 mm wide, rarely pubescent. **PANICLES** loosely open, 10–20 cm long, the branches ascending. **SPIKELETS** terete, sometimes purplish. **GLUMES** glabrous, awnless, unequal, the first 5–9 mm long and 1 (3)-nerved, the second 6–10 mm long and 3-nerved. **LEMMAS** elliptic to lanceolate, glabrous to scaberulous, 9–13 mm long, sometimes with a purplish brownish band at the apex; awns 0–3 mm long. **ANTHERS** 3.5–6 mm long. $2n = 28, 56$. [*Bromopsis inermis* (Leyss.) Holub]. Widespread in improved pastures, moist mountain slopes, roadsides, swales, and ditches, from lower valleys to upper mountains. ARIZ: Apa, Nav; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1280–2860 m (4200–9400'). Flowering: Jun–Sep. Native to Eurasia, adventive nearly throughout the cool-temperate regions. Smooth brome is the exotic counterpart to our native rhizomatous species, *B. pumpellianus* Scribn., which should be looked for in natural communities in the mountains, and which can be distinguished by having usually pilose nodes, leaves, and lemmas, and awns 1–6 mm long.

Bromus japonicus Thunb. ex Murray (of Japan) Japanese brome. Plants annual, tufted, usually densely pilose. **CULMS** erect to ascending, 25–70 cm long. **LIGULES** obtuse, lacerate, 1–2.2 mm long. **BLADES** flat, 2–4 mm wide. **PANICLES** erect to ascending, 25–70 cm long. **LIGULES** obtuse, lacerate, 1–2.2 mm long. **BLADES** flat, 2–4 mm wide. **PANICLES** open, 10–22 cm long, the branches ascending to spreading, often drooping. **SPIKELETS** terete to moderately compressed. **GLUMES** glabrous to scabrous, subequal, 5–8 mm long, 5- to 7-nerved. **LEMMAS** 7–9 mm long, mostly 9-nerved; awns 8–13 mm long, straight to divergent, arising just below the apex of the lemma. **ANTHERS** 1–2 mm long. $2n = 14, 28, 56$. [*B. commutatus* Schrad.]. Dry, weedy sites in the valleys and foothills, very common. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SMg; NMEX: McK, RAr, SJn; UTAH. 1350–2700 m (4500–8900'). Flowering: Jun–Sep. Native to Eurasia, now adventive nearly throughout North America. European agrostologists, desperate for diversity, recognize several closely related species in this complex, including *B. arvensis* L. and *B. racemosus* L., which have been reported from our flora. All of the material that I have seen from our flora corresponds to *B. japonicus*, but those desiring a taxonomic challenge may look for the following:

1. Awns arising 1.5 mm or more below the lemma apices, straight to strongly divergent; palea clearly shorter than the lemma ..... ***B. japonicus***
1′ Awns arising less than 1.5 mm below the lemma apices, straight or weakly divaricate; palea subequal to the lemma ..... (2)

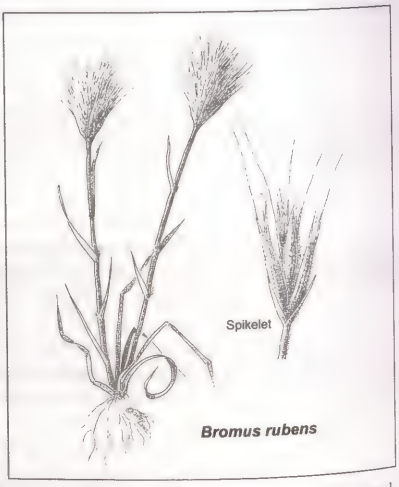
2. Anthers 2.5–5 mm long; panicles up to 30 cm long; lower leaf sheaths softly appressed-hairy ..... ***B. arvensis***
2′ Anthers 1–3 mm long; panicles less than 16 cm long; lower leaf sheaths with stiff hairs ..... (3)

3. Anthers 0.7–1.7 mm long; florets attached 1.5–2 mm apart on the rachilla; lemmas 8–12 mm long, the margins bluntly angled ..... ***B. commutatus***
3′ Anthers 1.5–3 mm long; florets attached 1–1.5 mm apart on the rachilla; lemmas 6.5–8 mm long, the margins rounded ..... ***B. racemosus***

Bromus lanatipes (Shear) Rydb. (woolly-footed, referring to the sheaths) Shaggy brome. Plants perennial, tufted. **CULMS** erect, unbranched above the base. **SHEATHS** lanate or sometimes only densely pilose, the hairs spreading away from the sheath but matted at the tips. **LIGULES** 1–2 mm long. **BLADES** flat, glabrous, 2–7 mm wide, the midrib narrowed below the collar. **PANICLES** loosely contracted to somewhat open, 5–15 cm long, the branches erect to ascending. **SPIKELETS** terete to somewhat compressed. **GLUMES** glabrous to sparsely short-pilose, unequal, the first 5–7 mm long and 1-nerved, the second 6–9 mm long and 3-nerved. **LEMMAS** pubescent across the back or sometimes on the margins only, 6–9 mm long; awns 2–4 mm long. **ANTHERS** 1.2–3.7 mm long. $2n = 28$. Dry habitats in piñon-juniper-oak woodlands, ponderosa pine, Douglas-fir. COLO: Arc, LPl, Mon; NMEX: McK. 1800–2150 m (6000–7000'). Flowering: Jul–Sep. Southwestern states south into northern Mexico. Shaggy brome has been confused with various other species that have pilose (rather than lanate) sheaths. The sheath pubescence of *B. lanatipes* is quite distinctive, the hairs extending at nearly right angles away from the sheath and becoming matted and tangled at the ends.

Bromus porteri (J. M. Coult.) Nash (for Thomas Conrad Porter, 1822–1901, Pennsylvanian botanist, poet, classicist) Porter's brome. Plants perennial, tufted, glabrous to sometimes puberulent. **CULMS** erect, unbranched above the base, 35–120 cm long. **LIGULES** 1–2 mm long. **BLADES** flat, mostly stiffly erect, 3–12 mm wide, the midrib not narrowed below the collar. **PANICLES** open or sometimes loosely congested, 7–15 cm long, the branches ascending or loosely spreading. **SPIKELETS** terete to slightly compressed, the pedicels puberulent, rarely only slightly so. **GLUMES** puberulent, unequal, the first 5–7 mm long and 1-nerved, the second 6–10 mm long and 3-nerved. **LEMMAS** pubescent across the back, 8–11 mm long; awns 1.5–4 mm long. **ANTHERS** 2–3.3 mm long. $2n = 14$. [*Bromopsis porteri* (J. M. Coult.) Holub]. Ponderosa parklands, aspen groves, mixed conifer forests, high mountain meadows, and openings in spruce-fir forests, generally above 2100 m (7000'). ARIZ: Apa; COLO: Arc, Dol, LPl, Mon, SJn; NMEX: McK, RAr, SJn. 1850–2900 m (6200–9500'). Flowering: Jun–Sep. Mostly Rocky Mountains and associated states, west into California, south into northern Mexico. Stiffly erect blades and puberulent pedicels and glumes are distinctive.

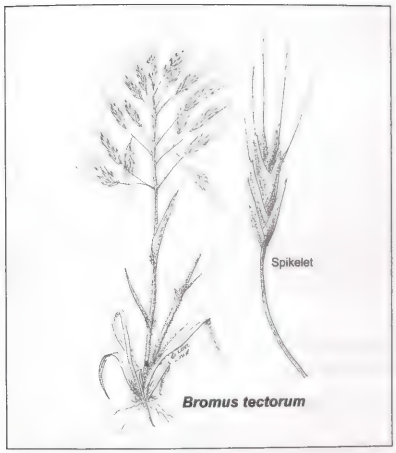
Bromus rubens L. (reddish) Foxtail brome, red brome. Plants annual, tufted, with dense retrorse pubescence. **CULMS** erect, 10–40 cm long. **LIGULES** obtuse, lacerate, 1–3 mm long. **BLADES** flat, 1–5 mm wide. **PANICLES** dense, compact, ovoid, 2–10 cm long, 2–5 cm wide, the branches stiffly erect and 1 cm or less long. **SPIKELETS** laterally compressed. **GLUMES** pilose with hyaline margins, unequal, the first 5–8 mm long, 1 (3)-nerved, the second 8–12 mm long and 3- to 5-nerved. **LEMMAS** linear-lanceolate, pubescent, 10–15 mm long, 7-nerved; awns 8–20 mm long, straight, reddish. **ANTHERS** 0.5–1 mm long. $2n = 14, 28$. [*Anisantha rubens* (L.) Nevski; *Bromus madritensis* L. subsp. *rubens* (L.) Husn.]. Dry, disturbed ground in the desert. ARIZ: Apa, Coc; COLO: Mon; NMEX: McK, SJn; UTAH. 1125–1900 m (3700–6300'). Flowering: Mar–Jun. Native to Eurasia, adventive mostly west of the Rocky Mountains.



Bromus rubens

Bromus secalinus L. (resembling the genus *Secale*) Rye chess. Plants annual, tufted, glabrous to loosely pilose. **CULMS** 20–80 cm long. **LIGULES** obtuse, 2–3 mm long. **BLADES** flat, 2–4 mm wide. **PANICLES** open, nodding, 5–20 cm long, the branches ascending to spreading and drooping. **SPIKELETS** ovoid, somewhat turgid, moderately laterally compressed. **GLUMES** glabrous, unequal, the first 4–6 mm long and 3- to 5-nerved, the second 6–7 mm long and 7-nerved. **LEMMAS** 6–9 (10) mm long, rounded across the back, glabrous or sometimes pubescent on the margins, the margins inrolled around the grain; awns 0–6 mm long. **ANTHERS** 1–2 mm long. $2n = 28$. Dry, disturbed ground, waste places, not common. COLO: Mon. 1550–1900 m (5200–6200'). Flowering: Jun–Jul. Native to Eurasia, now adventive throughout much of the United States, including Utah, though many are old collections and the species is becoming less common. Specimens of *B. japonicus* have been confused with rye chess, but that species is consistently pilose, has longer awns, and lemma margins that are not rolled around the grain.

Bromus tectorum L. (of roofs) Cheatgrass. Plants annual, tufted, mostly densely pilose. **CULMS** erect to geniculate, 5–90 cm long. **LIGULES** obtuse, lacerate, 2–3 mm long. **BLADES** flat, 1–6 mm wide. **PANICLES** loose, open, often



drooping, the branches and pedicels capillary and drooping **SPIKELETS** laterally compressed, expanding toward the tip. **GLUMES** glabrous to pubescent, unequal, the first 4–9 mm long and 1-nerved, the second 7–13 mm long, 3- to 5-nerved. **LEMMAS** lanceolate, glabrous to pubescent, 9–12 mm long, 5- to 7-nerved, the margins hyaline, the apex bifid with slender teeth 1–3 mm long; awns 10–18 mm long, straight. **ANTHERS** 0.5–1 mm long. $2n = 14$. [*Anisantha tectorum* (L.) Nevski]. Widely distributed in dry, disturbed sites, plains, valleys, foothills, open ground, and roadsides in the mountains. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1280–2450 m (4200–8100'). Flowering: Apr–Aug. Native to Eurasia, now widely adventive throughout North America, replacing many valuable rangeland grasses.

Buchloë Engelm. Buffalograss

(Greek *bukalos*, buffalo, and *chloë*, grass, a Greek rendering of the common name) A genus of one species (Columbus 1999).

Buchloë dactyloides (Nutt.) Engelm. (resembling the genus *Dactylis*) Buffalograss. Plants perennial, strongly stoloniferous, dioecious, often mat-forming. **CULMS** 1–30 cm tall, mostly unbranched above the base, the internodes solid or pithy, the nodes glabrous. **LEAVES** with open sheaths and ciliate-membranous ligules. **BLADES** flat, often curling when dry, sparsely pilose, 1–2.5 mm wide. **LIGULES** a ciliate membrane, 0.5–1 mm long. **STAMINATE INFL** a terminal panicle raised above the leaves, of 1–4 spicate, unilateral, pectinate, primary branches 5–15 mm long, glumes unequal, glabrous, 1- to 2-nerved; lemmas glabrous, 3-nerved, awnless; anthers mostly salmon-colored, also brownish to reddish. disarticulation above the glumes. **PISTILLATE INFL** partially hidden with bracteate leaf sheaths below the foliage leaves, burlike, with 3–5 spikelets; second glume hardened, whitish, 3-toothed, lemmas glabrous, membranous, 3-nerved, sometimes 3-awned. $x = 10$. $2n = 20, 40, 56, 60$. [*Bouteloua dactyloides* (Nutt.) Columbus]. Not common in the Four Corners region; dry plains and grasslands just above the desert floor. NMEX: McK, SJn. 1650–1950 m (5500–6400'). Flowering: Jul–Sep. Most of the central states, Montana and North Dakota south to Arizona and Texas. Recent molecular and morphologic studies indicate a close relationship to *Bouteloua*, and some have proposed that buffalograss be merged with that genus, a proposal not without considerable merit.

Calamagrostis Adans. Reedgrass

(Greek *calamos*, a reed, + *agrostis*, a grass) Plants usually tufted and with at least short rhizomes, the culms hollow. **LEAVES** with open sheaths, membranous ligules, flat to involute blades, and lacking auricles. **INFL** a rebranching panicle, open or contracted. **SPIKELETS** with a single floret, the rachilla prolonged as a tiny bristle, disarticulation above the glumes; glumes subequal, longer than the floret; lemmas 5-nerved, the callus with a dense tuft of pilose hairs, awned from the back below the middle; palea slightly shorter than the lemma; stamens 3. $x = 7$ (Greene 1984). A genus of more than 100 species of cool-temperate regions in both hemispheres. Hybridization, vivipary, polyploidy, and apomixis contribute to the taxonomic difficulty in the genus.

1. Awns exserted well beyond the glumes, easily visible, 4.5–8 mm long ..... ***C. purpurascens***
1' Awns scarcely if at all exserted beyond the glumes, less than 4.5 mm long ..... (2)

2. Pedicels glabrous or nearly so ..... ***C. scopulorum***
2' Pedicels evidently and distinctly scabrous ..... (3)

3. Glumes oblong, the apex abruptly acute and not drawn out to an awn tip; blades 1–4 mm wide, usually rolled and stiffly ascending; lemmas not translucent on the upper 1/3; callus hairs 1/2 to 2/3 as long as the lemma ..... ***C. stricta***
3' Glumes lance-ovate, the apex of especially the first drawn out to an awn tip; blades 3–10 mm wide, mostly flat and lax; lemmas translucent on the upper 1/3; callus hairs 2/3 to as long as the lemma ..... ***C. canadensis***

Calamagrostis canadensis (Michx.) P. Beauv. (of Canada) Canada reedgrass, bluejoint reedgrass. Plants perennial, in clumps and with rhizomes to 15 cm long. **CULMS** 50–150 cm tall or more, often branching above the base. **LIGULES** 3–10 mm long, lacerate. **BLADES** flat, lax, 3–10 mm wide, the upper surface strongly scabrous. **PANICLES** contracted

when young and open and nodding when mature, 8–20 cm long, the branches ascending to spreading-drooping, scabrous; pedicels scabrous. **GLUMES** 2.5–5 mm long. **LEMMAS** 2–4.5 mm long, slightly shorter than the glumes, translucent on the upper 1/3; callus hairs 2–4.5 mm long; awn 1–3 mm long, often hidden among the hairs, straight. **ANTHERS** 1–2 mm long. $2n = 42–66$. [*Calamagrostis scribneri* Beal]. Wet meadows, seeps, marshy ground, and other wet sites in the mountains. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr. 2500–3700 m (8200–12000'). Flowering: Jul–Sep. Circumboreal, throughout North America except in the southern states; Eurasia. Plants with a pubescent line across the collar and shorter callus hairs have been called *C. scribneri*, but this is a tenuous distinction and not recognized herein.

Calamagrostis purpurascens R. Br. (purplish) Purple reedgrass. Plants perennial, strongly tufted, with short rhizomes 1–4 cm long. **CULMS** 30–80 cm long, usually unbranched above the base. **LIGULES** 2–5 mm long. **BLADES** flat to involute, 2–5 mm wide. **PANICLES** narrow, contracted, 5–15 cm long, 1–2.5 cm wide, often purplish, the branches scabrous. **GLUMES** 5–7 mm long. **LEMMAS** 3.5–4.5 mm long, slightly shorter than the glumes; callus hairs 1–2 mm long; awn 4–8 mm long, exserted and easily visible. **ANTHERS** 1.5–2.5 mm long. $2n = 42–58, 84$. Subalpine to alpine slopes, meadows, forest openings, often in rocky areas. COLO: Hin, Min, SJn. 3000–4100 m (9800–13500'). Flowering: Jul–Aug. Alaska south through the Rocky Mountains to Nevada and New Mexico.

Calamagrostis scopulorum M. E. Jones (of the Rocky Mountains) Jones' reedgrass. Plants perennial, tufted, with short rhizomes to 2 cm long. **CULMS** 50–90 cm long. **LIGULES** obtuse to lacerate, 3–7 mm long. **BLADES** flat, 3–5 mm wide. **PANICLES** narrow, contracted, 6–16 cm long, 1–2.5 cm wide, pale green to purplish. **GLUMES** 4–6 mm long. **LEMMAS** 3.5–5 mm long, shorter than the glumes; callus hairs 2–3 mm long; awn 1–2 mm long, not exserted, easily overlooked when short. **ANTHERS** 2–3 mm long. $2n = 28$. Hanging gardens and similar rocky sites at lower elevations, and rocky slopes and cliffs in subalpine to alpine vegetation in the mountains. COLO: Arc, Min; NMEX: SJn; UTAH. 1050–3350 m (3500–11000'). Flowering: Jul–Aug. Montana south to Arizona and northern New Mexico.

Calamagrostis stricta (Timm) Koeler (constricted) Slender reedgrass. Plants perennial, tufted, with slender rhizomes 1–5 cm long. **CULMS** 35–100 cm long, usually unbranched above the base. **LIGULES** truncate to obtuse, 1–5 mm long. **BLADES** usually flat, 1–4 mm wide. **PANICLES** contracted, pale green to purplish, 8–18 cm long, 1–3 cm wide. **GLUMES** 3–4 (5) mm long. **LEMMAS** 2.5–3.5 (4) mm long, slightly shorter than the glumes; callus hairs 2.5–4 mm long; awn 2–2.5 mm long, straight, usually stout, easily distinguished from the callus hairs. **ANTHERS** 1–2 mm long, often sterile. $2n = 28, 56, 58, 70, 84$–ca. 120. Moist meadows, stream banks, ponderosa to spruce-fir forests. ARIZ: Apa; COLO: Arc, Min, RGr, SJn. 2350–2750 m (7800–9000'). Flowering: Jul–Aug. Circumboreal, south throughout the northeastern and western states. Our western material, with more robust growth and larger spikelet parts, is referred to **subsp. *inexpansa*** (A. Gray) C. W. Greene.

Calamovilfa Hack. Sandreed

(Greek *calamos*, reed, + *Vilfa*, a similar-looking genus) Plants perennial with rhizomes, the culms pithy. **LEAVES** with open sheaths, hairy ligules, and lacking auricles. **INFL** a rebranching panicle, open or contracted. **SPIKELETS** with a single floret, the rachilla not prolonged beyond the floret; disarticulation above the glumes; glumes unequal, the first shorter, 1-nerved, awnless; lemmas longer than the glumes, stiff-papery, 1-nerved, awnless, the callus bearded with long white hairs; palea equaling the lemma; stamens 3. $x = 10$ (Thieret 1966). A genus of five species, endemic to North America.

Calamovilfa gigantea (Nutt.) Scribn. & Merr. (gigantic) Big sandreed. Plants tough, robust perennials from strong rhizomes. **CULMS** erect, thick, 1–1.3 m tall. **LIGULES** about 1 mm long. **BLADES** flat to mostly involute, 5–10 mm wide at the base, glabrous. **PANICLES** pyramid-shaped, open, the branches stiffly spreading, 25–50 cm long. **GLUMES** glabrous, 1-nerved, unequal, the first 5–6.5 mm long, the second 6–8 mm long. **LEMMAS** lanceolate, 1-nerved, 6.5–8 mm long, awnless, villous on the midnerve; callus copiously villous, the hairs 3–4 mm long. **PALEAS** equaling the lemmas, villous on the 2 nerves. **ANTHERS** 3–5.5 mm long. $2n = 60$. Sand dunes and deep sandy soil in the desert and foothill regions. ARIZ: Apa, Nav; UTAH. 1500–1700 m (4900–5600'). Flowering: Jul–Sep. Arizona and Colorado, east to the southern Great Plains.

Catabrosa P. Beauv. Brookgrass

(Greek *catabrosis*, devoured, alluding to the chewed appearance of the glume and lemma apices) Aquatic perennials from rhizomes and stolons, the culms decumbent and rooting freely at the nodes, hollow. **LEAVES** with closed sheaths, flat blades, membranous ligules, and lacking auricles. **INFL** a rebranching open panicle, the branches whorled.

SPIKELETS 1- to 5-flowered (ours mostly 2-flowered); disarticulation above the glumes and between the florets, glumes unequal, membranous, flat, erose at the tip, nerveless or faintly 1-nerved, shorter than the lowermost floret, lemmas 3-nerved, the nerves parallel and not converging at the apex, truncate and erose at the tip, palea slightly shorter than the lemma; stamens 3. $x = 10$. A genus of seven species, mostly Eurasian.

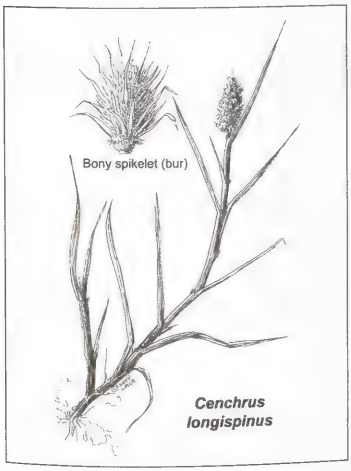
Catabrosa aquatica (L.) P. Beauv. (aquatic) Brookgrass. **CULMS** decumbent at the base and erect above, rooting at the nodes and forming stolons/rhizomes, 20–50 cm long. **LIGULES** 2–6 mm long. **BLADES** 3–8 mm wide, succulent. **PANICLES** 8–20 cm long, open, the branches stiffly spreading, whorled, and spikelet-bearing to near the base. **SPIKELETS** 1- to 2-flowered, but some 3-flowered spikelets occasionally encountered. **GLUMES** flat, ovate-lanceolate, 1-nerved, the first 0.6–1.5 mm long, the second 1.2–2.5 mm long. **LEMMAS** 2–3 mm long, scarious. **ANTHERS** 1.3–1.8 mm long. $2n = 20, 30$. Seeps, springs, slow-moving water of streams and ponds, ponderosa, aspen, and spruce zones; not common. COLO: LPl. 2650–2900 m (8800–9600'). Flowering: Jun–Sep. Throughout much of cool-temperate North America, also Argentina, Europe, and Asia.

Cenchrus L. Sandbur

(Greek *kenchros*, a kind of millet) Pesky annual and perennial plants, the culms geniculate to erect, pithy. **LEAVES** with open sheaths, flat or folded blades, hairy ligules, and lacking auricles. **INFL** a highly modified panicle, the spikelets borne in burs or involucres formed by fused bristles or spines (sterile branchlets), these often retrorsely barbed; disarticulation below the bur, which falls entire. **SPIKELETS** 2-flowered, dorsally compressed, awnless, the lower reduced, the upper perfect; glumes unequal, the first much smaller than the second; lower floret staminate or sterile, the lemma membranous and similar in size and texture to the second glume; upper floret perfect, the lemma and palea forming a hard seed case around the flower and grain; stamens 3. $x = 9$ (DeLisle 1963). A genus of about 16 species, mostly in the New World, but some in Africa, Asia, and Australia, and some worldwide.

1. Burs mostly with 45–75 spines, the inner bristles 0.5–1 mm wide; upper floret of the spikelets 5–7.6 mm long, both margins of the blade of uppermost leaf conspicuously crinkled at the base ..... ***C. longispinus***

1' Burs mostly with 8–40 spines, the inner bristles 1–2 mm wide; upper floret of the spikelets 3.5–5 mm long, only one margin of the blade of uppermost leaf crinkled at the base ..... ***C. spinifex***



Cenchrus longispinus (Hack.) Fernald (long-spined) Innocent-weed, long-spine sandbur. Plants annual, tufted. **CULMS** ascending to decumbent, 20–80 cm tall. **LIGULES** 0.6–1.8 mm long. **BLADES** 1.5–6 mm wide. **PANICLES** 2–10 cm long. **SPIKELETS** 2–3 (4) per bur, 5–7.8 mm long, the first glume 0.8–3 mm long, the second glume 4–6 mm long. **LOWER FLORETS** 4–6.5 mm long, the anthers 1.5–2 mm long. **UPPER FLORETS** 4–7.5 mm long, the anthers 0.7–1 mm long. $2n = 34$. [*Cenchrus pauciflorus* Benth. in part]. Sandy ground and waste areas, roadsides, gardens, disturbed sites. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1350–2000 m (4500–6500'). Flowering: Jul–Sep. Throughout most of the United States, southward to Venezuela.

Cenchrus spinifex Cav. (alluding to the genus *Spinifex*, which has spiny leaf blades) Common sandbur. Plants annual (rarely short-lived perennial), tufted. **CULMS** geniculate-based, 25–80 cm tall. **LIGULES** 0.5–1.5 mm long. **BLADES** 2–7 mm wide. **PANICLES** 3–9 cm long. **SPIKELETS** 2–4 per bur, 3.5–5.9 mm long, the first glume 1–3.3 mm long, the second glume 3–5 mm long. **LOWER FLORETS** 3–5.8 mm long, the anthers 1.3–1.6 mm long. **UPPER FLORETS** 3.5–5 (5.8) mm long, the anthers 0.5–1.2 mm long. $2n = 34$. [*C. incertus* M. A. Curtis; *C. pauciflorus* Benth. in part]. Sandy ground and waste areas, roadsides, gardens, disturbed sites. NMEX: SJn. 1350–2000 m (4500–6500'). Flowering: Jul–Sep. Throughout the southern United States and south into South America.

Chloris Sw. Windmillgrass

(Greek *Chloris*, the goddess of flowers) Plants annual or perennial, of various habits, but ours tufted, with pithy culms. **LEAVES** with open and keeled sheaths, flat or folded blades, and ciliolate membranous ligules. **INFL** a panicle of few to many spikelike primary branches, these digitate or whorled; disarticulation above the glumes and the florets falling together. **SPIKELETS** sessile, in 2 rows on one side of the primary branches, 2- to 3-flowered, usually only the

lowermost floret perfect, the others staminate or sterile; glumes unequal, shorter than the florets, usually awnless; lemmas of fertile florets 3-nerved, the marginal nerves pubescent, awned (ours) or awnless; paleas shorter than the lemmas, 2-nerved; stamens 3. $x = 10$ (Anderson 1974). A genus of about 55 species in the warm tropical to subtropical or arid regions of the world.

1. Panicle branches typically in several whorls along an axis 2 cm or more long; apex of lower lemma glabrous or with minute hairs less than 0.2 mm long; plants perennial ..... ***C. verticillata***
1′ Panicle branches in a single terminal whorl, or if in several whorls then the axis less than 2 cm long; apex of lower lemma with conspicuous pilose hairs 1–3 mm long; plants annual ..... ***C. virgata***

Chloris verticillata Nutt. (whorled) Tumble windmillgrass. Plants tufted perennials. **CULMS** mostly erect, sometimes geniculate or even decumbent and rooting at the nodes, 15–40 cm tall. **LIGULES** 0.7–1.3 mm long, ciliolate. **BLADES** 2–3 mm wide. **PANICLES** with 10–16 primary branches in at least 2 whorls, the branches 5–15 cm long, spreading to divaricate at maturity, spikelet-bearing to the base. **SPIKELETS** with 1 fertile floret and 1 sterile floret. **GLUMES** slightly unequal, the first 2–3 mm long, the second 2.8–3.5 mm long. **FERTILE FLORET** 2–3.5 mm long, glabrous or minutely puberulent just below the apex, with an awn 4.5–10 mm long. **STERILE FLORET** 1.1–2.3 mm long, somewhat inflated, with an awn 3.2–7 mm long. $2n = 40$. Roadsides, disturbed ground, waste areas, valleys, and foothills. ARIZ: Apa, Nav; NMEX: McK, SJn. 1550–1850 m (5200–6000′). Flowering: May–Sep. Central and southwestern United States, south into Mexico.

Chloris virgata Sw. (broomlike) Showy windmillgrass. Plants tufted annuals. **CULMS** 10–100 cm or more tall, erect. **LIGULES** 1–4 mm long, erose to ciliolate. **BLADES** 3–15 mm wide. **PANICLES** with 4–20 digitate primary branches in a single whorl at the apex of the stem, the branches 5–10 cm long, erect to ascending, spikelet-bearing to the base. **SPIKELETS** with 1 fertile floret and 1–2 sterile florets. **GLUMES** unequal, the first 1.5–2.5 mm long, the second 2.5–4.3 mm long. **FERTILE FLORET** 2.5–4.2 mm long, with a prominent tuft of pilose hairs just below the apex, with an awn 2.5–25 mm long. **STERILE FLORETS** 1.5–3 mm long, with an awn 3–10 mm long. $2n = 20, 30, 40$. Roadsides, disturbed ground, waste areas, valleys, and foothills. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1300–2150 m (4300–7000′). Flowering: Aug–Oct. Throughout much of the southern and southwestern United States, South America, Asia, Africa.

Cortaderia Stapf Pampasgrass

(name from the Spanish *cortada*, cutting, referring to the sharply serrate blades) Plants dioecious or monoecious perennials, forming often huge tussocks, with hollow culms. **LEAVES** primarily basal, with open sheaths, flat to folded blades, hairy ligules, and lacking auricles. **INFL** terminal, a large plumose panicle, subtended by a long, ciliate bract. **SPIKELETS** somewhat laterally compressed, usually unisexual, with 2–9 florets; disarticulation above the glumes and below the florets; glumes unequal, nearly as long as the spikelets, hyaline, 1-veined; lemmas 3–5 (7)-veined, long-acuminate, bifid and awned or entire and mucronate, usually long-sericeous, the callus pilose; paleas about 1/2 as long as the lemmas, 2-veined; stamens 3. $x = 9$. A genus of about 25 species, the majority from South America, some also in New Zealand (these might represent a different lineage and would be taken out of *Cortaderia*).

Cortaderia selloana (Schult. & Schult. f.) Asch. & Graebn. (for Friedrich Sellow, 1789–1831, German botanist who collected in South America in 1814) Pampasgrass. Plants usually dioecious. **CULMS** 2–4 m tall. **LIGULES** 1–2 mm long. **BLADES** to 2 m long, 3–8 cm wide, mostly flat, ascending to arching, bluish green, with a dense tuft of hairs at the base at the collar. **PANICLES** 30–130 cm long, only slightly elevated above the foliage, whitish or pinkish when young. **SPIKELETS** 15–17 mm long. **GLUMES** subequal, 1-nerved, nearly as long as the spikelet. **LEMMAS** shorter than the glumes, 3-nerved, translucent, narrowly lanceolate and tapering to an awn 2.5–8 mm long, the hairs on the back to 10 mm long. **PALEAS** no more than 1/2 as long as the lemmas. $2n = 36$. Grown for ornament and sometimes persisting around old dwellings, but not escaping to the wild. NMEX: SJn. 1550–1700 m (5100–5600′). Flowering: Aug–Sep. Introduced from South America and widely grown as an ornamental in the warmer parts of North America.

Crypsis Aiton Pricklegrass

(Greek *kryptos*, hidden, alluding to the partially concealed inflorescences) Plants annual, the culms prostrate to erect, pithy. **LEAVES** with open sheaths, flat to rolled leaves, hairy ligules, and lacking auricles. **INFL** a short, dense, spikelike or headlike panicle, usually partially hidden in the sheath. **SPIKELETS** small, 1-flowered, disarticulating above or below the glumes (ours, and tardily so); glumes shorter than the spikelet, keeled, 1-nerved, awnless; lemma thin, 1-nerved, awnless (ours) or awned, the callus glabrous; palea broad and slightly shorter than the lemma, 2-nerved;

stamens 3. $x = 9$ (Hammel and Reeder 1979). A genus of eight species native to the Mediterranean region and China, three of which are exotic in the United States.

Crypsis schoenoides (L.) Lam. (resembling the genus *Schoenus*) Swampgrass, swamp pricklegrass. Mat-forming annuals, the shoots much-branched, the sheaths prominently inflated. **CULMS** 3–50 cm long, prostrate to erect. **LIGULES** 0.5–1 mm long. **BLADES** 2–10 cm long, 2–6 mm wide, widely spreading to reflexed. **PANICLES** 0.5–7 cm long, 5–10 mm wide, at least the bases usually enclosed in the subtending sheath even when mature. **GLUMES** slightly unequal, the first 1.8–2.3 mm long, the second 2.2–2.7 mm long. **LEMMAS** 2.4–3 mm long, glabrous. **PALEAS** subequal to the lemmas. **ANTHERS** 0.7–1 mm long. $2n = 36$. Sandy ground of lake shores and edges of ponds. ARIZ: Apa, NMEX: McK. 1550–1950 m (5200–6400'). Flowering: Jul–Sep. Exotic in California and several other states across the continent, native to Eurasia and northern Africa. The inflated sheaths, widely spreading blades, and dense, ovoid panicles are distinctive.

Cynodon Rich. Bermudagrass

(Greek *cynos*, dog, + *odos*, tooth, taken from *chien-dent*, the French common name meaning dog's tooth) Plants perennial, often either stoloniferous or rhizomatous or both and forming dense turf, with hollow or pithy culms. **LEAVES** with open sheaths, flat to involute blades, hairy ligules, and lacking auricles, produced in a pattern of 2–3 short internodes followed by a long internode, giving the appearance of several leaves clustered together on the shoot. **INFL** a panicle of digitate primary branches at the tip of the shoot; disarticulation above the glumes. **SPIKELETS** with 1 fertile floret, the rachilla prolonged and usually bearing a minute rudiment, borne in 2 rows on 2 sides of a 3-sided rachis; glumes 1-nerved, subequal, slightly shorter than the floret; lemmas somewhat hardened, minutely pubescent on the 3 nerves, awnless; palea about as long as the lemma, 2-nerved; stamens 3. $x = 9$ (Mitich 1989). A genus of nine species native to the tropical regions of the Eastern Hemisphere, several species introduced for lawn and forage throughout the warm regions of the world.

Cynodon dactylon (L.) Pers. (a finger) Bermudagrass. Perennials, with well-developed rhizomes and stolons. **CULMS** 20–80 cm or more long, vegetative ones decumbent and rooting at the nodes, the reproductive ones often erect and leafy. **LIGULES** about 0.5 mm long. **BLADES** flat, 1.5–3 mm wide, long hairs at the collars. **PANICLES** with (2) 4–6 (9) branches, these 2–6 cm long in a single terminal whorl. **SPIKELETS** 2–3.2 mm long. **GLUMES** subequal, the first 1.5–2 mm long, the second 1.4–2.3 mm long with a mucro. **LEMMAS** ovate, blunt, 1.8–2.2 mm long, the nerves glabrous or pubescent. **ANTHERS** 0.6–1 mm long. $2n = 18, 36$. Lawns, roadsides, pastures, fields, disturbed ground. ARIZ: Apa; NMEX: McK, SJn; UTAH. 1100–2050 m (3600–6600'). Flowering: Apr–Oct. Widely introduced in North America and South America; native to Eurasia.

Dactylis L. Orchardgrass

(Greek *daktylos*, a finger). A genus of 1–5 species, depending on interpretation.

Dactylis glomerata L. (wound up, as in a ball of yarn, alluding to the densely clustered spikelets) Orchardgrass. Tufted perennials with hollow culms. **CULMS** erect, 30–100 cm tall or more. **LEAVES** with open sheaths. **BLADES** flat to folded, 4–8 mm wide, lax. **LIGULES** membranous, prominent, 4–8 mm long, rounded to lacerate. **INFL** a panicle of several primary branches with dense clusters of spikelets at the tips, pyramidal, 4–20 cm long. **SPIKELETS** (2) 3 (5)-flowered, subsessile or with short pedicels, laterally compressed, midnerves and keels of the bracts ciliate; disarticulation above the glumes and between the florets; glumes acute, keeled, 1-nerved, subequal, shorter than the lowermost lemma, 3–6 mm long, awn-tipped; lemmas lanceolate, 5-nerved, 4–8 mm long, awn-tipped; paleas subequal to the lemmas, 2-nerved. **STAMENS** 3, the anthers 2–3.5 mm long. $2n = 14, 21, 27–31, 42$. Common in pastures, meadows, roadsides in moist places, canyons, and similar sites. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1600–3050 m (5300–10000'). Flowering: Jun–Sep. Native to Eurasia and Africa, now introduced throughout most of the cool-temperate regions of the world for forage and pasture.

Danthonia DC. Danthonia, Oatgrass

(for Étienne Danthoine, French botanist) Plants perennial, tufted, the culms hollow. **LEAVES** with open sheaths; flat to rolled blades, hairy ligules, and lacking auricles. **INFL** a much reduced panicle or raceme, sometimes with a single spikelet. **SPIKELETS** 2- to 12-flowered, the terminal floret reduced; disarticulation above the glumes and between the florets; glumes subequal, mostly longer than the florets, papery, 1- to 7-nerved; lemmas 7- to 11-nerved, the margins short-pilose, awned between 2 lobes or teeth; awns geniculate and twisted; paleas about as long as the lemmas, 2-nerved; stamens 3. $x = 12$. Cleistogamous spikelets are usually produced in the axils of the lower sheaths. A genus of about 20 species native to Europe, North Africa, and the Americas.

1. Pedicels and panicle branches erect-appressed, the inflorescence less than 1.5 cm wide ..... (2)
1' Pedicels and panicle branches spreading outward at maturity, the inflorescence mostly 3–10 cm wide ..... (3)

2. Pedicels markedly puberulent-scabrous; lemmas 6–10 mm long, with awns 8–15 mm long; spikelets mostly straw-colored; clump of old basal sheaths persistent and prominent, 3–8 cm long ..... ***D. parryi***
2' Pedicels glabrous or scarcely scaberulous; lemmas 3–6 mm long, with awns 6–8 mm long; spikelets often greenish purplish; clump of old sheaths inconspicuous, 1–3 cm long ..... ***D. intermedia***

3. Upper blades usually strongly divergent or reflexed downward at the collar region; pedicels mostly much longer than the spikelets; lemmas glabrous or sparsely hairy across the back; mature culms breaking at the nodes ..... ***D. californica***
3' Upper blades erect or ascending at the collar region; pedicels shorter than to as long as the spikelets; lemmas pilose over the back, at least basally; mature culms not breaking apart ..... ***D. parryi***

Danthonia californica Bol. (of California) California danthonia. Plants tufted perennials. **CULMS** 30–100 cm tall or more, breaking easily at the nodes when mature. **LIGULES** about 0.5 mm long. **BLADES** 2–5 mm wide, flat to rolled. **PANICLES** with 3–6 spikelets, 2–5 cm long; pulvini in the axils of the pedicels. **SPIKELETS** 12–26 mm long, 5- to 8-flowered. **LEMMAS** 5–10 mm long, glabrous or sparsely hairy across the back, the margins usually pubescent; teeth 2.5–5 mm long; awns 8–12 mm long. **ANTHERS** 2.5–4 mm long. $2n = 36$. Somewhat dry meadows in forests. COLO: LPl. 2350–2600 m (7800–8600′). Flowering: Jun–Aug. Mountains of western Canada and the United States. *Danthonia californica* has been reported for the *Flora* area, but I have not located specimens to verify this and its occurrence is doubtful. *Danthonia parryi* is easily mistaken for this species by general appearance, but its cauline blades are erect-ascending at the collar.

Danthonia intermedia Vasey (intermediate) Timber danthonia. Plants tufted perennials. **CULMS** 20–50 cm tall, not breaking at the nodes when mature. **LIGULES** 0.2–0.5 mm long. **BLADES** 1–3.5 mm wide, flat to rolled. **PANICLES** with 4–10 spikelets, 3–8 cm long; pulvini absent from the axils, the branches and spikelets erect-appressed. **SPIKELETS** 11–16 mm long, 3- to 6-flowered. **LEMMAS** 3–6 mm long, glabrous across the back, densely pilose on the margins; teeth 1.5–2.5 mm long; awns 6–8 mm long. **ANTHERS** 1–3 mm long. $2n = 36, 98$. Dry to moist meadows in the mountains, aspen glens, rocky slopes, up to timberline. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn. 2700–3500 m (8800–11500′). Flowering: Jul–Aug. Alaska and Canada, south through the mountains of the western United States.

Danthonia parryi Scribn. (for Charles Christopher Parry, 1823–1890, botanical explorer of the West) Parry's danthonia. Plants tufted perennials. **CULMS** 30–80 cm or more tall. **LIGULES** 0.2–0.3 mm long. **BLADES** 2–4 mm wide, flat to rolled. **PANICLES** with 3–11 spikelets, 3–10 cm long. **SPIKELETS** 16–24 mm long, 3- to 6-flowered. **LEMMAS** 5.5–10 mm long, usually pilose across the back and densely so on the margin; teeth 3–8 mm long; awns 12–15 mm long. **ANTHERS** 4–6.5 mm long. $2n = 36$. Dry mountain meadows and grasslands. COLO: Con, Hin, LPl, Min, Mon. 2500–2850 m (8300–9400′). Flowering: Jul–Aug. Endemic to the Rocky Mountains of southern Canada and the western United States.

Dasyochloa Willd. ex Rydb. Fluffgrass

(Greek *dasys*, shaggy, + *chloa*, grass, referring to the densely ciliate spikelets) A genus of a single species endemic to North America (Valdés and Hatch 1997).

Dasyochloa pulchella (Kunth) Willd. ex Rydb. (beautiful) Fluffgrass. Low, tufted, stoloniferous perennials. **CULMS** 5–15 cm tall, pithy, consisting of an elongate internode topped by a cluster of leaves, which droops over and roots. **LEAVES** with open sheaths, hairy ligules, involute blades, and lacking auricles. **LIGULES** 3–5 mm long. **BLADES** 0.5–1 mm wide (rolled), arcuate. **INFL** terminal, a dense, ovoid panicle of short, spikelike branches, each subtended by leafy bracts and nestled among the leaves, 1–2.5 cm long and 1–1.5 cm wide, densely pilose, light green or purplish. **SPIKELETS** 4- to 10-flowered, 6–10 mm long; disarticulation above the glumes; glumes shorter than the spikelet, subequal to the adjacent lemma, glabrous, 1-nerved, mucronate to awn-tipped, 6–9 mm long; lemmas 3.5–5 mm long, 3-nerved, densely pilose on the nerves, 2-lobed, the lobes about 1/2 the length of the lemma body, the midnerve extended into an awn 2–4 mm long; palea about as long as the lemma. **STAMENS** 3, the anthers 0.2–0.5 mm long. $x = 8$, $2n = 16$. Rocky soils and open ground in the desert. ARIZ: Nav; COLO: Mon; NMEX: RAr, SJn; UTAH: 1500–1650 m (4900–5400'). Flowering: May–Oct. Southwestern United States to central Mexico.

Deschampsia P. Beauv. Hairgrass

(for Jean Louise Auguste Deschamps, 1766–1842, French surgeon-naturalist on the sailing vessel *La Recherche*) Tufted annuals and perennials with hollow culms. **LEAVES** with open sheaths, flat to involute blades, membranous ligules, and lacking auricles. **INFL** a panicle of rebranching branches, sometimes becoming racemose. **SPIKELETS** mostly 2-flowered (sometimes with 1 or 3 florets), the rachilla prolonged beyond the palea; disarticulation above the glumes and between the florets; glumes subequal, 1- to 3-nerved, exceeding the lowermost floret; lemmas 5- to 7-nerved, truncate and toothed at the apex, bearded on the callus; awn attached below the middle of the lemma, slender; palea nearly as long as the lemma. **STAMENS** 3. $x = 7$. A genus of about 30 species in temperate and cold regions of the world.

1. Glumes exceeding the florets and often the awns; lemmas awned from near the middle; blades flat, some 4–8 mm wide or more ..... see ***Vahlodea***
1′ Glumes mostly slightly shorter than 1 floret and the awns; lemmas awned from below the middle; blades mostly folded, rarely more than 3 mm wide ..... ***D. cespitosa***

Deschampsia cespitosa (L.) P. Beauv. (tufted) Tufted hairgrass. Plants perennial. **CULMS** 20–80 cm tall, erect. **LIGULES** acuminate, lacerate, 3–8 mm long. **BLADES** firm, flat or folded, 1–3 (5) mm wide. **PANICLES** loose and open, often nodding, 5–25 cm long, the branches capillary. **SPIKELETS** 2 (3)-flowered, usually shiny, purplish. **GLUMES** lanceolate, acute, glabrous or scaberulous on the nerves, subequal, 2.5–5.2 mm long. **LEMMAS** 2.4–4 mm long, purplish basally and whitish apically, 5-nerved, with 4 apical teeth; awns 2–6 mm long, attached below midlength. **ANTHERS** 1.3–2.2 mm long. $2n = 24–28, 52$. Moist to wet meadows and slopes, banks of slow-moving streams and ponds, subalpine to alpine areas in the mountains. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, SJn. 2700–4000 m (8800–13100'). Flowering: Jul–Sep. Circumboreal, south in the western United States into Mexico; Eurasia, Africa; introduced in Argentina. There have been reports of *D. elongata* (Hook.) Munro in the *Flora* region, but I have seen no specimens of this. It can be distinguished from *D. cespitosa* by having narrow, contracted panicles with erect-appressed branches, filiform basal blades, and tiny anthers 0.3–0.5 mm long.

Dichanthelium (Hitchc. & Chase) Gould Rosettegrass

(Greek *dicha*, paired, + *anthele*, inflorescence, referring to the two kinds of panicles) Plants perennial, producing a winter rosette of short, ovate-lanceolate blades; in the spring producing a simple flowering shoot with a terminal panicle; in the summer and fall producing highly branched shoots with numerous axillary panicles; culms hollow. **LEAVES** with open sheaths, mostly hairy ligules, flat blades, and lacking auricles. **SPIKELETS** plano-convex, dorsally compressed, awnless, 2-flowered, the lower floret staminate or sterile, the upper floret perfect; disarticulating below the glumes; glumes unequal, the first small and often clasping the base of the spikelet, the second as large as the spikelet and similar to the lowermost lemma; first floret staminate or sterile, the lemma several-nerved, membranous, longer than the upper floret, often with a hyaline palea; second floret fertile, the lemma clasping the palea and the two forming an indurate, smooth, shiny seedcase; stamens 3. $x = 9$. A genus of about 72 species, formerly included as a subgenus of *Panicum*. These species are not common in the flora, but unmistakable because of the rosettes.

1. Spikelets 1–2 mm long, usually puberulent ..... ***D. acuminatum***
1′ Spikelets 2.7–3.5 mm long, glabrous to sparsely puberulent ..... ***D. oligosanthes***

Dichanthelium acuminatum (Sw.) Gould & C. A. Clark (long-tapered, acuminate) Woolly rosettegrass. Plants tufted, with well-developed basal rosettes. **CULMS** 15–80 cm tall, erect to spreading, sometimes decumbent. **LIGULES** 1–5

mm long. **BLADES** 3–12 mm wide, broadly lanceolate to narrowly ovate, with subcordate bases, ascending to spreading from the culm, densely to sparsely pubescent. **PANICLES** of spring phase 4–12 cm long, usually open with spreading branches and branchlets, well exserted. **SPIKELETS** 1.1–2.1 mm long, ± obovoid, puberulent. **GLUMES** unequal, the first 1/4–1/2 the length of the second. **LOWER FLORET** sterile, the lemma as long as the second glume. **UPPER FLORET** 1.1–1.7 mm long, minutely apiculate. $2n = 18$. Moist to wet ground along lakes, ponds, and streams and around springs. ARIZ: Apa; UTAH. 1100–1700 m (3600–5600'). Flowering: May–Sep. Throughout much of North and Central America.

Dichanthelium oligosanthes (Schult.) Gould (few-flowered) Rosettegrass. Plants tufted, with basal rosettes. **CULMS** 20–50 cm tall, geniculate-based, stiffly erect above. **LIGULES** 1–1.5 mm long. **BLADES** 6–15 mm wide, narrowly ovate, with cordate bases, ascending to spreading. **PANICLES** of spring phase 5–9 cm long, 3–6 cm wide, partly enclosed to long-exserted. **SPIKELETS** 2.7–3.5 mm long, obovoid, glabrous to sparsely puberulent. **GLUMES** unequal, the first about 1/2 as long as the second, the second 1.4–3 mm long and with a prominent orange to purplish spot at the base. **LOWER FLORET** sterile, the lemma as long as the second glume, with a hyaline palea about 1/2 as long as the lemma. **UPPER FLORET** 2.5–3 mm long. $2n = 18$. Sandy woodlands, stream and creek banks, wet ground around springs. NMEX: SJn. 1900–2100 m (6200–6900'). Flowering: Jun–Sep. Our material belongs to **var.** ***scribnerianum*** (Nash) Gould (for Frank Lamson Scribner, renowned USDA agrostologist) Scribner's rosettegrass. Throughout much of southern Canada and the United States; not yet reported from Mexico.

Digitaria Haller Crabgrass

(Latin *digitus*, finger, alluding to the fingerlike arrangement of the panicle branches) Plants annual and perennial, sometimes stoloniferous, with hollow culms. **LEAVES** with open sheaths, flat blades, membranous ligules, and lacking auricles. **INFL** a panicle of few to several unbranched, spikelike branches, these digitate or spaced along the rachis. **SPIKELETS** slightly plano-convex, lanceolate to elliptic, dorsally compressed, borne in pairs of one subsessile and the other short-pedicelled, or borne singly or in groups of 3–5; awnless, 2-flowered, the lower floret staminate or sterile, the upper floret perfect; disarticulation below the glumes; glumes unequal, the first minute or absent, the second nearly as large as the spikelet and similar in texture to the lowermost lemma, 3-nerved; first floret staminate or sterile, awnless, the lemma membranous, 5-nerved, the nerves prominent, the palea absent or vestigial; second floret fertile, awnless, cartilaginous when mature but not strongly indurate, the lemma clasping the palea by hyaline margins and the two forming a smooth, shiny seedcase; stamens 3. $x = 9$ (Henrard 1950; Webster 1987). A genus of about 200 species of tropical to warm-temperate regions.

1. Sheaths essentially glabrous, sometimes with sparse hairs; spikelets in groups of 3 at midbranch; second glume about as long as the spikelet and nearly covering completely the upper (fertile) floret ..... ***D. ischaemum***
1′ Sheaths prominently hairy, often with stout, papilla-based hairs; spikelets in pairs at midbranch; second glume 1/3–1/2 as long as the spikelet and easily exposing the upper floret ..... ***D. sanguinalis***

Digitaria ischaemum (Schreb.) Muhl. (resembling the genus *Ischaemum*) Smooth crabgrass. Plants annual. **CULMS** 20–60 cm tall, decumbent, often rooting at the lower nodes. **SHEATHS** glabrous or sparsely pubescent. **LIGULES** 0.5–2.5 mm long. **BLADES** 3–5 mm wide, sparsely papillose-pilose toward the base. **PANICLES** terminal and axillary; terminal panicles with 2–7 branches, these 4–10 cm long, the axes wing-margined; axillary panicles nearly always present in the lower sheaths, mostly concealed. **SPIKELETS** in groups of 3, 1.7–2.3 mm long. **GLUMES** strongly unequal, the first absent or a tiny nerveless rim or membrane, the second nearly equaling or equaling the lower lemma, pubescent. **LOWER LEMMA** 1.7–2.3 mm long, 7-nerved. **UPPER LEMMA** dark brown when mature, obscured by the second glume. **ANTHERS** 0.4–0.6 mm long. $2n = 36$. Lawns, gardens, and fields, urban areas. NMEX: SJn. 1550–1700 m (5100–5500'). Flowering: Aug–Sep. Native to Eurasia, now found nearly throughout the warm-temperate regions of the world.

Digitaria sanguinalis (L.) Scop. (pertaining to blood, alluding to the sometimes reddish foliage) Hairy crabgrass. Plants annual. **CULMS** 20–75 cm long, often decumbent and rooting at the lower nodes. **SHEATHS** keeled and sparsely papillose-pilose. **LIGULES** 0.5–2.5 mm long. **BLADES** 3–8 mm wide, usually papillose-pilose on both surfaces, sometimes glabrous. **PANICLES** terminal, with 4–12 primary branches 3–18 cm long, these digitate or on a short rachis up to 6 cm long, the axes wing-margined. **SPIKELETS** in pairs at midbranch, one subsessile and one pedicellate, 1.7–3.4 mm long. **GLUMES** strongly unequal, the first 0.2–0.4 mm long, nerveless, the second 3-nerved and 1/3–1/2 as long as the adjacent lemma. **LOWER LEMMA** usually slightly shorter than the spikelet, 7-nerved, the lateral nerves scaberulous at least on the upper 1/2. **UPPER LEMMA** 1.7–3 mm long, yellow, gray, or brown, easily visible. **ANTHERS** 0.5–0.9 mm long. $2n = 28, 34, 36, 54$. Lawns, sidewalks, gardens, and fields, mostly urban areas. ARIZ: Nav; NMEX: McK, SJn. 1600–1750 m (5300–5700'). Flowering: Jul–Sep. Native to Eurasia, now found nearly throughout the world.

Distichlis Raf. Saltgrass

(Greek *distichos*, two-ranked, referring to the arrangement of the florets or leaves) Plants perennial, mostly monoecious, strongly rhizomatous (ours) and/or stoloniferous, with solid culms. **LEAVES** distichous, the sheaths closely overlapping, with open sheaths, ciliolate-membranous ligules, stiff pungent blades, and lacking auricles. **INFL** a terminal panicle or raceme, sometimes exceeding the leaves. **SPIKELETS** large, few- to many-flowered, laterally compressed, awnless, the pistillate and staminate spikelets similar; disarticulation of the pistillate spikelets above the glumes and between the florets, staminate spikelets not disarticulating; glumes 3- to 7-nerved, shorter than the florets; lemmas coriaceous, 7- to 11-nerved, the staminate thinner than the pistillate; paleas 2-nerved, about as long as the lemmas. **STAMENS** 3. $x = 10$. A genus of about five species of alkaline areas in the Western Hemisphere and Australia.

Distichlis spicata (L.) Greene (spikelike) Saltgrass. Plants rhizomatous and sometimes stoloniferous. **CULMS** usually erect, 10–60 cm tall. **LIGULES** 0.2–0.6 mm long. **BLADES** flat to folded or rolled, stiff and rigid to more lax, 2–4 mm wide. **PANICLES** 2–8 cm long, congested. **SPIKELETS** 3- to 12-flowered, 8–16 mm long, glabrous. **GLUMES** unequal, stramineous, the first 2–3 mm long, the second 3–4 mm long. **LEMMAS** 7- to 9-nerved, 4–8 mm long. **PALEAS** slightly shorter than (pistillate florets) or longer than (staminate florets) the lemmas. **ANTHERS** 2–5 mm long. $2n = 40$ [*Distichlis spicata* (L.) Greene var. *stricta* (Torr.) Beetle]. Moist, alkaline sites in playas, salt flats, plains, ditch banks. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1350–2000 m (4500–6500'). Flowering: May–Sep. Alkaline soils through much of the Western Hemisphere, Australia. Two or more varieties have been proposed, with var. *stricta* being the inland variety and var. *spicata* being coastal, but the differences seem to be inconsistent, difficult to ascertain, overlapping in expression, and unnecessary for our purposes.

Echinochloa P. Beauv. Barnyardgrass

(Greek *echinos*, hedgehog, + *chloa*, grass) Plants coarse annuals and perennials, tufted or rhizomatous, with pithy or hollow culms. **LEAVES** with compressed open sheaths, hairy or lacking (ours) ligules, flat blades, and lacking auricles. **INFL** a terminal exserted panicle of mostly unbranched spicate primary branches. **SPIKELETS** plano-convex, mostly 2-flowered, the lower floret staminate or sterile, the upper floret perfect; disarticulation below the glumes; glumes membranous, 3 (5)-nerved, unequal, the first acute and 1/4–1/2 the length of the second, the second as long as the spikelet, short- to long-awned; lower lemma similar to the second glume in size and texture, awnless to long-awned; upper (fertile) floret coriaceous to indurate, rounded on the back, smooth, awnless. **STAMENS** 3. $x = 9$ (Gould, Ali and Fairbrothers 1972). A genus of 40–50 species of tropical to warm-temperate regions of the world, usually in moist places.

1. Hairs of the spikelets and panicle branches not bulbous-based, not very stiff if at all; panicle branches 1–2 (3) cm long; spikelets awnless, 2.5–3 mm long ..... ***E. colonum***
1'. Hairs of the spikelets and panicle branches bulbous-based, stiff; panicle branches usually longer than 2 cm; spikelets awned or awnless, 2.8–4 mm long ..... (2)

2. Shiny apical portion of the fertile lemma with a line of minute hairs (use a lens); hairs of the panicle branches, at least some, longer than 3 mm ..... ***E. crus-galli***
2'. Shiny apical portion of the fertile lemma without a line of minute hairs; hairs of the panicle branches absent to rarely longer than 3 mm ..... ***E. muricata***

Echinochloa colonum (L.) Link. (of the farmers, a contraction of *colonorum*, often rendered *colona*) Jungle-rice. Plants annual. **CULMS** erect to decumbent and rooting at the lower nodes, 10–70 cm tall. **BLADES** 3–8 mm wide, mostly glabrous. **PANICLES** 2–12 cm long, with 5–10 erect to ascending primary branches 1–2 (3) cm long. **SPIKELETS** 2–3 mm long, awnless, puberulent to softly hispidulous, the hairs not very stiff. **GLUMES** unequal, the first about 1/2 the length of the spikelet, the second as long as the spikelet. **LOWER LEMMA** sterile, similar to the second glume in size and texture. **UPPER LEMMA** 2.6–2.9 mm long, the apex withering. **ANTHERS** 0.7–0.8 mm long. $2n = 54$. Uncommon in moist disturbed ground. NMEX: SJn. 1450–1600 m (4900–5200'). Flowering: May–Sep. Native to Old World tropical regions and widespread elsewhere in the world.

Echinochloa crus-galli (L.) P. Beauv. (resembling a cock's foot) Barnyardgrass. Plants annual. **CULMS** mostly erect, 30–200 cm tall. **BLADES** 5–30 mm wide, mostly glabrous. **PANICLES** 5–25 cm long, with several ascending to spreading primary branches 2–10 cm long, the axis usually beset with bulbous-based hairs, these often longer than the spikelets. **SPIKELETS** 2.5–4 mm long, awnless to long-awned, hispid with bulbous-based stiff hairs. **GLUMES** unequal, the first about 1/4–1/2 as long as the spikelet, the second as long as the spikelet. **LOWER LEMMA** sterile,

similar to the second glume, awnless to awned, the awn to 5 cm long. **UPPER LEMMA** 2–3 mm long, the apex early-withering and with a line of minute hairs. **ANTHERS** 0.5–1 mm long. $2n = 54$. Common in moist to wet waste places and disturbed ground. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1550–1950 m (5100–6400'). Flowering: Jul–Sep. Native to Eurasia, now found throughout most tropical and warm-temperate regions of the world.

Echinochloa muricata (P. Beauv.) Fernald (beset with sharp points) Cockspur. Plants annual. **CULMS** 50–150 cm tall, erect to sprawling. **BLADES** (2) 3–30 cm wide, glabrous. **PANICLES** 7–35 cm long, with 2–8 spreading branches, the axes glabrous to hispid, the hairs shorter than the spikelets. **SPIKELETS** 3–5 mm long, hispid with bulbous-based hairs. **GLUMES** unequal, the first 1/4–1/2 as long as the spikelet, the second as long as the spikelet. **LOWER LEMMA** sterile, similar to the second glume, awnless to awned, the awn to 16 mm long. **UPPER LEMMA** 2–3 mm long, the apex glabrous. **ANTHERS** 0.4–1.1 mm long. $2n = 36$. Common in moist to wet waste places and disturbed ground. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SJn; NMEX: RAr, SJn; UTAH. 1550–2600 m (5200–8500'). Flowering: Jul–Sep. Widespread in North America from southern Canada to Mexico. Our plants belong to **var. *microstachya*** Wiegand, common west of the Mississippi River.

Elymus L. Wildrye, Wheatgrass

(Greek *elymos*, a name for a kind of millet or grain) Tufted to rhizomatous perennials, with hollow culms. **LEAVES** with open sheaths, flat to rolled blades, membranous ligules, and with or without auricles. **INFL** a spike, the rachis persistent or disarticulating, bearing 1–many spikelets per node. **SPIKELETS** 2- to many-flowered, sessile, awned or awnless, disarticulating above or below the glumes; glumes and lemmas variable in size, shape, and nervation; paleas well developed. **STAMENS** 3. $x = 7$. A diverse genus of approximately 150 species or so, including many species formerly placed in the genera *Agropyron* and *Sitanion*. *Elymus* is treated herein in a broad sense and includes species sometimes placed in the segregate genera *Elytrigia*, *Lophopyrum*, *Pascopyrum*, *Pseudoroegneria*, *Thinopyrum*, and *Trichopyrum*. Conversely, some species formerly placed in *Elymus* are found herein in *Leymus* and *Psathyrostachys*. Hybridization occurs readily among many of the species, obscuring the boundaries and making identification difficult. This treatment must be considered tentative, awaiting more intensive study of the variation of our plants by some valiant botanist.

1. Spikelets mostly solitary at each node of the rachis ..... (2)
1' Spikelets 2 or more at each node of the rachis ..... (15)

2. Spikelets (glumes and/or lemmas) long-awned, the awns prominent and mostly greater than 10 mm long ..... (3)
2' Spikelets (glumes and lemmas) awnless or nearly so, any awns usually less than 5 mm long ..... (7)

3. Awns erect-appressed or nearly so; glumes 3/4 to equaling the length of the spikelet ..... ***E. trachycaulus***
3' Awns spreading moderately outward to reflexed; glumes 1/2 to 3/4 the length of the spikelet ..... (4)

4. Anthers 4–6 mm long; spikelets widely spaced and hardly overlapping ..... (5)
4' Anthers 1–2 mm long; spikelets at least moderately congested and overlapping ..... (6)

5. Spikes 15–30 cm long, often nodding; blades 4–6 mm wide ..... ***E. arizonicus***
5' Spikes 8–15 cm long, usually erect; blades 1–2 mm wide ..... ***E. spicatus***

6. Spikes 3–7 (8) cm long, very dense; glumes (4) 6–8 mm long, 1- to 3 (5)-nerved ..... ***E. scribneri***
6' Spikes 9–16 cm long, not especially dense; glumes (9) 10–12 mm long, (3) 5- to 7-nerved ..... ***E. bakeri***

7. Glumes blunt, nearly truncate, thick and very firm; sheaths typically ciliate on at least one margin ..... (8)
7' Glumes acute to acuminate, thin and membranous to stiff, but not thick; sheaths rarely ciliate ..... (9)

8. Plants with evident, long-creeping rhizomes; glumes with a tiny awn tip or mucro ..... ***E. hispidus***
8' Plants densely tufted, lacking evident rhizomes; glumes exactly truncate ..... ***E. elongatus***

9. Anthers 1–2 mm long ..... (10)
9' Anthers (3) 4–16 mm long ..... (12)

10. Glumes 1- to 2 (3)-nerved; rachis tending to break apart at maturity; sterile hybrid plants; these are *E. trachycaulus* × *E. longifolius* hybrids, occurring where the two parents grow together
10' Glumes (3) 5-nerved; rachis remaining intact; fertile to sterile plants ..... (11)

11. Plants mostly with rhizomes; glumes 1/2 to 2/3 the length of the spikelet ..... ***E. ×pseudorepens***
11' Plants tufted; glumes mostly 3/4 or greater the length of the spikelet ..... ***E. trachycaulus***

12. Plants lacking evident rhizomes, occasionally rhizomes weakly developed and short ***E. spicatus***
12' Plants with evident, long-creeping rhizomes ....(13)

13. Glumes acuminate, asymmetrical or somewhat sickle-shaped, gradually tapering to an awn tip; blades somewhat rigid and prominently ridged above ***E. smithii***
13' Glumes acute to acuminate, symmetrical, not gradually tapering; blades often lax, not prominently ridged above (14)

14. Blades flat, mostly 5–15 mm wide, dark green, often with a circular constriction toward the tip; anthers (3) 4–7 mm long ***E. repens***
14' Blades rolled or less than 4 mm wide when flat, usually glaucous, lacking a circular constriction toward the tip; anthers 3–5 mm long ***E. lanceolatus***

15. Rachis fragile and breaking apart at maturity ....(16)
15' Rachis persistent, not breaking apart at maturity....(17)

16. Lemma awns 4–17 mm long; rachis internodes 2.5–7 mm long; these are *Elymus longifolius* hybrids [*Elymus* ×*saundersii* Vasey, *Agropyron* ×*saundersii* (Vasey) Hitchc.]
16' Lemma awns 20–80 mm long; rachis internodes mostly 5–12 mm long ***E. longifolius***

17. Glumes nearly subulate, 1- to 2-nerved ***E. longifolius***
17' Glumes narrowly lanceolate, mostly conspicuously 3- to 7-nerved....(18)

18. At maturity, the spikes usually nodding or curved and the awns spreading outward; glumes 20 mm or more long; lemmas scabrous to short-hairy (rarely glabrous) ***E. canadensis***
18' At maturity, the spikes erect and the awns erect-appressed; glumes mostly less than 20 mm long; lemmas glabrous to scaberulous ***E. glaucus***

Elymus arizonicus (Scribn. & J. G. Sm.) Gould (of Arizona) Arizona wheatgrass. Plants perennial, tufted. **CULMS** erect, 40–80 cm tall. **LIGULES** to 1 mm long. **BLADES** flat, 4–6 mm wide. **SPIKES** often nodding, 15–30 cm long, the rachis somewhat zigzag and slender. **SPIKELETS** 1 per node, distant, scarcely overlapping; disarticulation above the glumes and between the florets. **GLUMES** subequal, elliptic, 3- to 7-nerved, 5–10 mm long, 1/2 to nearly as long as the lemma, short-awned. **LEMMAS** elliptic, 5-nerved, 8–12 mm long; awns 20–30 mm long, ultimately diverging (rarely nearly awnless). **ANTHERS** 3–5 mm long. $2n = 28$. [*Agropyron arizonicum* Scribn. & J. G. Sm.; *Elytrigia arizonica* (Scribn. & J. G. Sm.) D. R. Dewey; *Pseudoroegneria arizonica* (Scribn. & J. G. Sm.) Á. Löve]. Rocky slopes in the lower mountains. Not common in our area. NMEX: McK. 2050–2250 m (6800–7400'). Flowering: Jul–Aug. West Texas to California, northern Mexico. Similar to *E. spicatus*, but more robust, with longer, flexuous spikes and slightly longer and stiffer awns.

Elymus bakeri (E. E. Nelson) Á. Löve (for Charles Fuller Baker, 1872–1927, Colorado botanist, entomologist, and teacher) Baker's wheatgrass. Plants tufted, lacking rhizomes. **CULMS** ascending to erect, 30–50 cm tall. **LIGULES** 0.5–1 mm long. **BLADES** flat to rolled, 2–4 mm wide, stiff. **SPIKES** 9–16 cm long, dense but the rachis usually easily visible. **SPIKELETS** 1 per node, overlapping; disarticulation above the glumes and between the florets. **GLUMES** (9) 10–12 mm long, (3) 5- to 7-nerved, 2–2.5 mm wide; awns 2–8 mm long. **LEMMAS** 5-nerved, 8–12 mm long, awns 10–12 mm long, (3) 5- to 7-nerved, 2–2.5 mm wide; awns 2–8 mm long. **LEMMAS** 5-nerved, 8–12 mm long, awns 10–30 mm long, arcuate to recurved. **ANTHERS** 0.8–1.5 mm long. $2n = 28$. [*Agropyron bakeri* E. E. Nelson] Rocky, often grassy, slopes and ridges in high subalpine areas, close to timberline. COLO: Arc, Con, LPl, Min, SJn. 2750–3750 m (9000–12300'). Flowering: Jul–Aug. Rocky Mountains of the United States. This is easily confused with *E. scribneri*, which has similar-appearing spikes with divergent awns; that latter species has shorter and more densely flowered spikes and shorter glumes with fewer nerves, as in the key. *Elymus bakeri* may represent hybrids and hybrid derivatives between *E. trachycaulus* and *E. scribneri*, *E. longifolius*, or *E. canadensis*.

Elymus canadensis L. (of Canada) Canada wildrye. Plants perennial, tufted. **CULMS** 80–150 cm tall. **LIGULES** 0.3–1.4 mm long. **BLADES** flat, 3–10 mm wide or more; auricles well developed, 1–2 mm long. **SPIKES** curved or nodding to drooping, 8–20 cm long, sometimes longer, bristly, sometimes interrupted below. **SPIKELETS** mostly 2 (3) per node, overlapping; disarticulation above the glumes and between the florets. **GLUMES** equal, narrowly lanceolate, 3- to 5-nerved, 10–25 mm long, scabrous to ciliolate on the nerves, narrowing to an awn. **LEMMAS** 5- to 7-nerved, 8–15 mm long, long-scabrous, narrowing to a spreading awn 15–30 mm long. **ANTHERS** 2.5–3 mm long. $2n = 28, 42$. Stream banks, moist ground in meadows and along roads and ditches. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon; NMEX: RAr, San, SJn; UTAH. 1600–2400 m (5300–7800'). Flowering: Jul–Aug. Nearly throughout Canada and the United States except for the extreme southeast. Hybrids are known with *E. trachycaulus* and *E. longifolius*.

Elymus elongatus (Host) Runemark (elongated) Tall wheatgrass. Plants perennial, tufted, often glaucous. **CULMS** erect, robust, densely tufted, but sometimes producing short, thick rhizomes, 70–200 cm tall. **SHEATHS** typically ciliate on at least one margin, with erect auricles 1–2 mm long. **LIGULES** less than 1 mm long. **BLADES** flat to loosely rolled, 3–5 mm wide, the margins thick-veined and indurate. **SPIKES** 15–30 cm long, stiff, erect. **SPIKELETS** awnless, long, 15–20 mm long, widely spaced, often not overlapping at all, becoming arcuate in age and curving away from the rachis; disarticulation above the glumes and between the florets. **GLUMES** oblong, thick and indurate, the apex truncate and lacking a mucro, 5- to 7-nerved, the first 6–9 mm long, the second 7–10 mm long, shorter than the lowermost lemma. **LEMMAS** broadly lanceolate, 5-nerved, 8–11 mm long. **ANTHERS** 4–5.5 mm long. $2n = 14, 28, 42, 56, 70$. [*Agropyron elongatum* (Host) P. Beauv.; *Elytrigia elongata* (Host) Nevski; *Thinopyrum elongatum* (Host) D. R. Dewey]. Disturbed ground along roads, ditches, and agricultural fields. ARIZ: Apa; COLO: Dol, LPl, Mon, SMg; NMEX: SJn. UTAH. 1500–2200 m (5000–7200′). Flowering: Jul–Aug. Native to Eurasia, introduced in much of the western and central United States. Plants are sometimes mistaken for *E. hispidus*, which has creeping rhizomes and mucronate glumes.

Elymus glaucus Buckley (glaucous) Blue wildrye. Plants perennial, tufted, rarely with short stolons, green to glaucous, glabrous or sparsely short-pilose. **CULMS** erect to geniculate-based, 70–100 cm tall or more. **LIGULES** 0.3–1 mm long. **BLADES** flat, 4–12 mm wide, glabrous to lightly pilose above, with well-developed auricles about 2 mm long. **SPIKES** 5–15 cm long, erect. **SPIKELETS** mostly 2 per node, closely overlapping or somewhat distant below, 2- to 4-flowered; disarticulation above the glumes and between the florets. **GLUMES** subequal, 8–15 mm long, 3- to 5-nerved, almost parallel and concealing the base of the lowermost floret, tapering to a short awn. **LEMMAS** 8–12 mm long, 5-nerved, glabrous to scabrous, tapering to an awn 10–20 mm long. **ANTHERS** 1.5–3 mm long. $2n = 28$. Open woods, shady meadows, streamsides in the mountains. COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: SJn; UTAH. 2250–2500 m (7400–8200′). Flowering: Jul–Aug. Wide, flat blades, parallel glumes, and erect awns help to distinguish this species of shaded mountain sites. Western Canada south into Mexico.

Elymus hispidus (Opiz) Melderis (spiny, hispid) Intermediate wheatgrass. Plants perennial, rhizomatous, usually glaucous. **CULMS** erect, 50–100 cm tall. **LIGULES** about 0.5 mm long. **BLADES** flat to loosely folded or rolled with drying, 2–6 mm wide, the auricles well developed. **SPIKES** erect, slender, stiff, 5–18 cm long. **SPIKELETS** 1 per node, rather distant but overlapping somewhat, 3- to 8-flowered, 8–15 mm long, glabrous or hirsute, awnless. **GLUMES** elliptic-lanceolate, thick and rigid, obtuse, mucronate, the first 4–7 mm long, the second 6–9 mm long. **LEMMAS** broadly lanceolate, faintly 3- to 5-nerved, 7–10 mm long, obtuse. **ANTHERS** 3–5 mm long. $2n = 42$. [*Agropyron hispidum* Opiz; *Agropyron intermedium* (Host) P. Beauv.; *Elytrigia intermedia* (Host) Nevski]. Roadsides, pastures, fields, reseeded sites, waste ground, in woodland to subalpine communities. COLO: Arc, Dol, Hin, LPl, Mon, SJn, SMg; NMEX: RAr; UTAH. 1900–3000 (6500–9800′). Flowering: Jun–Aug. Native to Eurasia, introduced in much of the western United States. Large plants are sometimes mistaken for *E. elongatus*, which is tufted and has exactly truncate glumes. Plants with hispid spikelets have been referred to subsp. *barbulatus* (Schur) Melderis.

Elymus lanceolatus (Scribn. & J. G. Sm.) Gould (lance-shaped) Thickspike wheatgrass. Plants perennial, with creeping rhizomes, the herbage usually glaucous, glabrous or pilose. **CULMS** 40–80 cm or more tall. **LIGULES** less than 0.5 mm long. **BLADES** mostly rolled, 1–3.5 mm wide, stiff, the auricles well developed. **SPIKES** slender, erect, 6–20 cm long. **SPIKELETS** mostly 1 per node (sometimes 2 per node), awnless, 4- to 8-flowered, 10–18 mm long. **GLUMES** broadly lanceolate, acute to acuminate, symmetrical, glabrous to pubescent, faintly 3- to 5-nerved, about 1/2–2/3 as long as the lowermost floret. **LEMMAS** 7–10 mm long, acute to awn-tipped, villous to glabrous. **ANTHERS** 4–5 mm long. $2n = 28$. [*Agropyron dasystachyum* (Hook.) Scribn. (not *Elymus dasystachys* Trin. ex Ledeb.); *Agropyron lanceolatum* Scribn. & J. G. Smith; *Elytrigia dasystachya* (Hook.) Á. Löve & D. Löve]. Sagebrush plains, juniper woodlands, mountain brush. ARIZ: Apa; COLO: Dol, Mon; NMEX: McK; UTAH. 1750–2400 m (5800–7800′). Flowering: Jun–Aug. Across Canada and south through the western and central United States into Mexico. This species is characterized by having creeping rhizomes, flat blades, short glumes, and short anthers. It is not well expressed in our region, being more distinct and more common northward. In *Agropyron* and *Elytrigia* the basionym *dasystachyum* has priority, but this epithet is preempted in *Elymus* by *E. dasystachys* Trin. ex Ledeb. Across southern Canada, south through the western United States.

Elymus longifolius (J. G. Sm.) Gould (long-leaved) Longleaf squirreltail. Plants perennial, tufted, glabrous to puberulent. **CULMS** erect to spreading, 15–50 cm tall. **LIGULES** less than 0.5 mm long. **BLADES** flat to folded or involute, 1–5 mm wide, mostly glabrous. **SPIKES** 5–15 cm long (excluding the awns), stiffly erect; disarticulation in the rachis, the spikelets falling with the subtending rachis internode, sometimes remaining intact and the disarticulation above the glumes. **SPIKELETS** 2 per node (sometimes 1 or 3), with 2–6 florets, the lowermost floret fertile and well developed.

GLUMES subulate and awnlike, stiff, not bifid, 3–8 cm long, 2-nerved but sometimes appearing as a single channel or nerve down the middle of the glume, spreading to reflexed when mature. **LEMMAS** 7–10 mm long, 3- to 5-nerved, tapering to an awn 2–8 cm long, spreading to reflexed when mature. **ANTHERS** 1–2 mm long. $2n = 28$. [*Sitanion brevifolium* J. G. Sm.; *S. caespitosum* J. G. Sm.; *S. hystrix* (Nutt.) J. G. Sm. in part; *S. longifolium* J. G. Sm.] Widespread and common throughout the Four Corners region in plains, grasslands, woodlands, mountain slopes, and forest clearings, roadsides. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr; UTAH: San, SJn. UTAH 1120–3400 m (3700–11200'). Flowering: May–Aug. Western and central Canada and United States, south into Mexico. Longleaf squirreltail commonly forms hybrids with *E. trachycaulus* and *E. canadensis*, among other species. A similar species, *E. elymoides* (Raf.) Swezey s.s., is not known from our area; it can be distinguished by having the glumes bifid and the lowermost lemma reduced and subulate so it resembles an extra glume.

Elymus* ×*pseudorepens (Scribn. & J. G. Sm.) Barkworth & D. R. Dewey (false *Elymus repens*) False quackgrass. Plants perennial, with creeping rhizomes, sometimes these short. **CULMS** 40–80 cm tall. **LIGULES** less than 1 mm long. **BLADES** flat or folded, 2–4 mm wide; auricles short or lacking. **SPIKES** slender, 5–20 cm long. **SPIKELETS** 1 per node, overlapping about 1/2, 3- to 5-flowered; disarticulation above the glumes and between the florets. **GLUMES** lanceolate, acute to short-awned, 5-nerved, 1/2–2/3 the length of the spikelet. **LEMMAS** 3- to 5-nerved, awnless or short-awned. **ANTHERS** 1–2 mm long. $2n = 28$. Washes, foothills, mountains slopes and meadows, moist roadsides. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Min; NMEX: McK, RAr; UTAH. 1550–2400 m (5200–7800'). Flowering: Jul–Sep. Widespread in the West. These plants are at least partially fertile hybrids and derivatives of *E. trachycaulus* × *E. lanceolatus*, *E. repens*, or *E. smithii* crosses that have become well established in various habitats. This causes a bewildering array of variation among these species, rendering their circumscription tenuous and difficult. Because the plants are so common, I apply the hybrid name herein.

Elymus repens (L.) Gould (creeping) Quackgrass. Plants perennial, strongly rhizomatous, green. **CULMS** 45–85 cm tall or more, erect to geniculate-based. **LIGULES** about 0.5 mm long. **BLADES** flat, mostly 5–15 mm wide, some might be narrower, often with a constriction toward the apex. **SPIKES** erect, 10–18 cm long. **SPIKELETS** 1 per node, 3- to 8-flowered, stiffly spreading somewhat, overlapping; disarticulation above the glumes and between the florets. **GLUMES** lanceolate, stiff, 5- to 7-nerved, acute and usually short-awned, the awn mostly less than 8 mm long. **LEMMAS** 5-nerved, 7–10 mm long, acute to awn-tipped, the awn mostly less than 5 mm long. **ANTHERS** (3) 4–7 mm long. $2n = 42$. [*Agropyron repens* (L.) P. Beauv.; *Elytrigia repens* (L.) Nevski]. Mesic ground along ditches and roadsides, pastures, valley bottoms, not as common in our area as northward. ARIZ: Nav; COLO: Arc, LPl, Mon, RGr; NMEX: McK, RAr; SJn. 1700–2350 m (5600–7700'). Flowering: Jun–Aug. Native to Eurasia, now nearly throughout the United States. It seems that many plants identified as *E. repens* belong more accurately to hybrids of *E. trachycaulus* and other species, perhaps including *E. repens*.

Elymus scribneri (Vasey) M. E. Jones (for Frank Lamson Scribner, 1851–1938, prominent North American agrostologist) Scribner's wheatgrass. Plants perennial, tufted. **CULMS** decumbent, geniculate, or ascending, the shoots rarely taller than 30 cm. **LIGULES** about 0.5 mm long. **BLADES** narrow, involute to sometimes flat, 1–3 mm wide, short auricles present. **SPIKES** short, 3–7 (8) cm long, erect to curving abruptly downward. **SPIKELETS** 1 per node, crowded, 3- to 6-flowered, often purplish; disarticulation above the glumes and between the florets but also in the rachis in age. **GLUMES** narrowly lanceolate, 2- to 3 (5)-nerved, the body 6–8 mm long, tapering to a slender awn 12–20 mm long and curving outward. **LEMMAS** 7–10 mm long, faintly 5-nerved, tapering to a scabrous divergent awn 15–25 mm long. **ANTHERS** 1–1.8 mm long. $2n = 28$. [*Agropyron scribneri* Vasey] Rocky, often grassy, slopes and ridges in alpine and high subalpine areas, nearly always above timberline. COLO: Arc, Hin, LPl, Min, RGr, SJn. 3700–3900 m (12200–12700'). Flowering: Jul–Aug. High mountains of western Canada and the United States. This is a distinctive grass of open rocky areas above timberline. Similar-looking plants with longer, looser spikes and longer glumes with several nerves are referred to *E. bakeri*.

Elymus smithii (Rydb.) Gould (for Jared Gage Smith, 1866–1925, prominent USDA botanist) Western wheatgrass. Plants perennial, rhizomatous, usually prominently bluish glaucous. **CULMS** 30–80 cm tall, in clumps scattered along the rhizome. **LIGULES** about 0.5 mm long. **BLADES** flat, 2–5 mm wide, firm, prominently ridged above, auricles well developed, to 2 mm long. **SPIKES** erect, stiff, 5–18 cm long. **SPIKELETS** mostly 1 per node, overlapping, sometimes 2 per node and crowded, 4- to 8-flowered, erect to curving outward; disarticulation above the glumes and between the florets. **GLUMES** linear-lanceolate, rigid, 3- to 5-nerved, asymmetric and tapering to an awn tip, about 1/2 the length of the spikelet, subequal, the first 7–9 mm long, the second slightly longer. **LEMMAS** 5-nerved, 8–12 mm long,

glabrous to hairy, awn-tipped to 4 mm. **ANTHERS** 2–4 mm long. $2n = 56$. [*Agropyron molle* (Scribn. & J. G. Sm.) Rydb.; *A. palmeri* (Scribn. & J. G. Sm.) Rydb.; *A. smithii* Rydb.; *Elytrigia smithii* (Rydb.) Nevski; *Pascopyrum smithii* (Rydb.) Á. Löve]. Plains, swales, grassy hills and slopes, bottomlands. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1550–2800 m (5100–9100′). Flowering: Jun–Sep. Throughout western Canada and United States. Western wheatgrass often forms thick bluish stands along roads and swales.

Elymus spicatus (Pursh) Gould (spiked) Bluebunch wheatgrass. Plants perennial, tufted, rarely with short rhizomes, green to glaucous. **CULMS** erect, slender, 40–75 cm tall. **LIGULES** less than 1 mm long. **BLADES** flat to loosely rolled, 1–2 mm wide; auricles developed. **SPIKES** slender, 6–15 cm long. **SPIKELETS** 1 per node, scattered along the axis, scarcely overlapping, 4- to 6-flowered, awned or sometimes awnless; disarticulation above the glumes and between the florets. **GLUMES** narrowly oblong, blunt to acute, 4- to 5-nerved, 1/2 the length of the spikelet, the first 4–8 mm long, the second 5–9 mm long. **LEMMAS** 5-nerved, 8–10 mm long, usually with divergent awns 10–18 mm long. **ANTHERS** 4–6 mm long. $2n = 14, 28$. [*Agropyron inerme* (Scribn. & J. G. Sm.) Rydb.; *A. spicatum* (Pursh) Scribn. & J. G. Sm.; *Elytrigia spicata* (Pursh) D. R. Dewey; *Pseudoroegneria spicata* (Pursh) Á. Löve]. Dry mountain slopes and foothills, but not common in our area. ARIZ: Nav; COLO: LPl, Mon, SJn; NMEX: McK, SJn. 2100–2500 m (6950–8200′). Flowering: Jun–Aug. Western Canada and the United States.

Elymus trachycaulus (Link) Gould ex Shinners (rough stem) Slender wheatgrass. Plants perennial, mostly glabrous, tufted, rarely with rhizomes. **CULMS** erect, 30–100 cm tall or more. **LIGULES** scarcely 0.5 mm long. **BLADES** flat, green, 2–8 mm wide; auricles absent. **SPIKES** 5–20 cm long, compact. **SPIKELETS** 1 per node, overlapping, 3- to 7-flowered, awned or awnless. **GLUMES** broadly elliptic, 3/4 or more the length of the spikelet, prominently 5- to 7-nerved, the first 7–10 mm long, the second 7–12 mm long. **LEMMAS** 7–12 mm long, mostly 5-nerved, awnless or with an awn to 25 mm long. **ANTHERS** 1–2 mm long. $2n = 28$. [*Agropyron latiglume* (Scribn. & J. G. Sm.) Rydb.; *A. novae-angliae* Scribn.; *A. pauciflorum* (Schwein.) Hitchc.; *A. tenerum* Vasey; *Agropyron trachycaulum* (Link) Malte; *A. violaceum* (Hornem.) Lange; *A. unilaterale* Cassidy; *E. trachycaulus* subsp. *novae-angliae* (Scribn.) Tzvelev; *E. trachycaulus* subsp. *subsecundus* (Link) Á. Löve & D. Löve; *E. trachycaulus* subsp. *violaceus* (Hornem.) Á. Löve & D. Löve]. Moist areas in the foothills to alpine regions. ARIZ: Apa, Nav; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1600–3850 m (5300–12600′). Flowering: Jun–Sep. Nearly throughout North America to northern Mexico, scarce or absent in the southeastern states; Siberia, exotic in Eurasia. This is an extremely variable species, difficult to interpret or circumscribe. My concept includes populations of tufted plants with flat blades and large, prominently nerved glumes. Numerous names have been proposed, and some infraspecific taxa may be warranted. Awned forms have been called subsp. *subsecundus*.

Enneapogon Desv. ex P. Beauv. Pappusgrass

(Greek *ennea*, nine, + *pogon*, beard, referring to the awns of the floret) Plants annual or perennial (ours), short-hairy throughout, with hollow culms and hairy nodes. **LEAVES** with open sheaths, flat to rolled blades, hairy ligules, and lacking auricles. **INFL** a weakly developed panicle, often spikelike; disarticulation above the glumes, the florets falling together. **SPIKELETS** 3- to 6-flowered, only the lowermost fertile and well developed; glumes nearly as long as the entire spikelet, few- to several-nerved; lowermost floret fertile, villous on the lower 1/2, the lemma 9-nerved and 9-awned, the awns plumose and pappuslike; upper florets progressively reduced, sterile; paleas slightly longer than the lemmas, 2-nerved, awnless. **STAMENS** 3. $x = 10$. About 28 species in the warm regions of the world, especially Africa and Australia.

Enneapogon desvauxii P. Beauv. (for Nicaise Auguste Desvaux, 1784–1856, French botanist) Spike pappusgrass. Plants tufted perennials, hairy throughout, with a knotty base. **CULMS** erect, 20–45 cm tall. **LIGULES** about 0.5 mm long. **BLADES** flat, rolling in age, 1–2 mm wide. **PANICLES** spikelike, 2–10 cm long, grayish, the short branches poorly developed and appressed. **SPIKELETS** 3- to 4-flowered, only the lower fertile, the uppermost scarcely developed; awnless cleistogamous spikelets often present in the lower sheaths. **GLUMES** nearly equal, 3–5 mm long, thin. **LEMMAS** 1.5–2 mm long; awns 3–4 mm long. **ANTHERS** 0.3–0.5 mm long. $2n = 20$. [*Pappophorum wrightii* S. Watson]. Desert hills and plains, disturbed ground. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1550–1800 m (5200–5850′). Flowering: Aug–Sep. Southwestern United States and Mexico; Peru, Bolivia, Argentina; Africa and Asia (Chase 1946).

Eragrostis Wolf Lovegrass

(Greek *eros*, God of love, and *agrostis*, a grass; a concoction prepared from *E. cilianensis* was thought to act as a love potion) Plants annual or perennial, mostly tufted, some rhizomatous, with pithy or hollow culms (ours). **LEAVES** with

open sheaths, flat to rolled blades, hairy ligules, and lacking auricles. **INFL** a panicle with usually rebranched branches **SPIKELETS** 3- to many-flowered, awnless; disarticulation above the glumes, the rachilla and palea persistent, the glumes and lemmas falling; glumes shorter than the lowermost floret, mostly 1-nerved, lemmas 3-nerved, paleas 2-nerved. **STAMENS** 2–3. $x = 10$. A large genus of 300 or more species from the tropical, subtropical, and warm regions of the world, some species adapted to cool-temperate areas.

1. Plants perennial, 50–130 cm tall or more; panicles 20–30 cm long ..... ***E. curvula***
1′ Plants annual, mostly much less than 50 cm tall; panicles 5–25 cm long ..... (2)

2. Grains with a prominent groove on the side opposite the embryo ..... ***E. mexicana***
2′ Grains lacking a groove ..... (3)

3. Culms prostrate and rooting at the nodes, forming mats ..... ***E. hypnoides***
3′ Culms erect or only geniculate-based, not forming mats ..... (4)

4. Plants lacking any glandular depressions or rings; panicle branchlets usually appressed along the primary branch ..... ***E. pectinacea***
4′ Plants with glandular depressions or rings below the nodes or on the blade margins, or on the keels of the glumes or lemmas; panicles various, but often the branchlets divergent from the primary branch ..... (5)

5. Keels of glumes and lemmas with small craterlike glands (use a lens); spikelets 2–4 mm wide; anthers yellow ..... ***E. cilianensis***
5′ Keels of glumes and lemmas lacking glands; spikelets 1–2 mm wide; anthers reddish brown or purplish ..... (6)

6. Panicles narrow, 0.5–2 cm wide, the branchlets and spikelets erect-appressed; culms with glandular pits below the nodes, but not a solid band or ring; bases of blades with glandular pits or craterlike glands on the margins ..... ***E. lutescens***
6′ Panicles 2–18 cm wide, open, the branchlets diverging; culms with bands or rings of glandular tissue below the nodes; bases of blades lacking glands ..... ***E. barrelieri***

Eragrostis barrelieri Daveau (for Jacques Barrelier, 1606–1673, French botanist) Mediterranean lovegrass. Plants tufted annuals. **CULMS** 10–40 cm tall, with a band of glandular tissue below the nodes, the band usually shiny and yellowish. **LIGULES** 0.2–0.5 mm long. **BLADES** flat, 1–4 mm wide, mostly glabrous, sometimes with scattered long pilose hairs on the upper surface (also tufts of hair at the collar), lacking craterlike glands on the margins. **PANICLES** 5–15 cm long, 3–8 cm wide, ovate, usually open, with yellowish glandular bands below the nodes; branches and pedicels usually with axillary pulvini. **SPIKELETS** 7- to 12-flowered, 1–2.2 mm wide, the pedicels lacking glandular bands. **GLUMES** ovate, 1-nerved, subequal, 1–1.5 mm long, shorter than the lowermost florets, early-deciduous. **LEMMAS** ovate, 1.4–1.8 mm long. **PALEAS** slightly shorter than the lemmas, hyaline. **ANTHERS** 3, tiny, 0.1–0.2 mm long, reddish brown. $2n = 40$. Roadsides, sandy ground, disturbed sites. ARIZ: Apa, Coc, Nav; NMEX: McK, SIn; UTAH. 1550–1950 m (5100–6350′). Flowering: Jul–Sep. Native to Europe; scattered locales throughout the southwestern United States and northern Mexico. *Eragrostis minor* Host may occur in the region. It can be distinguished from *E. barrelieri* by having spotty glandular areas below the nodes (not rings or bands), two anthers, and blade margins and pedicels often with glands.

Eragrostis cilianensis (All.) Vignolo ex Janch. (from the Ciliani Estate, Italy) Stinkgrass. Plants tufted annuals. **CULMS** erect or decumbent-based, 15–45 cm tall, sometimes with craterlike glands below the nodes. **LIGULES** 0.4–0.8 mm long. **BLADES** flat to rolled in age or upon drying, mostly 2–6 mm wide, sometimes narrower or wider, mostly glabrous or scaberulous, sometime lightly pilose, usually lacking glands. **PANICLES** oblong to ovate, 5–18 cm long, usually open when mature, the pedicels lacking glandular bands. **SPIKELETS** 10- to 40-flowered, 2–4 mm wide, lead-green in color. **GLUMES** ovate to lanceolate, somewhat unequal, the first 1.2–2 mm long and 1-nerved, the second 1.2–2.6 mm long and 3-nerved. **LEMMAS** ovate, 2–2.8 mm long, the keeled midvein with 1–3 craterlike glands. **PALEAS** shorter than the lemmas. **ANTHERS** 3, 0.2–0.5 mm long, yellow (drying whitish). $2n = 20$. [*E. megastachya* (Koeler) Link]. Disturbed and weedy ground, roadsides, fields, pastures. ARIZ: Apa, Nav; COLO: Dol, LPl; NMEX: McK, RAr, San, SIn; UTAH. 1300–2150 m (4300–7000′). Flowering: Jul–Sep. Native to Eurasia; widespread from southern Canada to northern Mexico. When actively growing, the glands give plants a distinctive odor, hence the common name.

Eragrostis curvula (Schrad.) Nees (curved, weeping) Weeping lovegrass. Plants tufted perennials. **CULMS** erect, robust, 50–150 cm tall. **LIGULES** 0.5–1.5 mm long. **BLADES** flat to rolled, 1–3 mm wide, elongate-attenuate to fine

tips. **PANICLES** oblong, lead-greenish, 15–35 cm long, the branches ascending to spreading, pilose in the axils of the primary branches. **SPIKELETS** 4- to 10-flowered, 1–2 mm wide, the rachilla persistent. **GLUMES** lanceolate, 1-nerved, 1.5–3 mm long, the first slightly shorter than the second. **LEMMAS** ovate, 2–3 mm long, the lateral nerves prominent. **PALEAS** about the same size as the lemmas and falling with them. **ANTHERS** 3, 0.6–1.2, reddish brown. $2n = 40, 50$. Foothills and woodlands, roadsides and reseeded ground. NMEX: SJn. 1750–1950 m (5800–6300'). Flowering: Jul–Aug. Native to South Africa, introduced for forage and rangeland restoration throughout much of the southern and southwestern states.

Eragrostis hypnoides (Lam.) Britton, Sterns & Poggenb. (resembling the moss *Hypnum*) Teal lovegrass. Plants annual, stoloniferous, often forming low mats, lacking glands. **CULMS** decumbent, rooting at the nodes, the erect portion 5–15 cm tall. **LIGULES** 0.3–0.6 mm long. **BLADES** flat to rolled, 1–2 mm wide. **PANICLES** both terminal and axillary, ovate, 1–4 cm long and about as wide. **SPIKELETS** 12- to 35-flowered, 1–1.5 mm wide. **GLUMES** lanceolate, hyaline, 1-nerved, the first 0.4–0.7 mm long, the second about twice as long. **LEMMAS** ovate, 1.4–2 mm long, the nerves greenish and prominent. **PALEAS** shorter than the lemmas. **ANTHERS** 2, tiny, 0.2–0.3 mm long, brownish. $2n = 20$. Sandy shores of ponds and lakes, not common in our area. ARIZ: Coc; NMEX: McK. 1800–2000 m (5900–6600'). Flowering: Jul–Aug. Eastern Canada and United States; scattered locales in the West.

Eragrostis lutescens Scribn. (yellowish) Six-weeks lovegrass. Plants tufted annuals. **CULMS** erect, 8–25 cm tall, with yellowish glandular pits below the nodes, but lacking bands of glandular tissue. **LIGULES** 0.2–0.5 mm long. **BLADES** flat to rolled, 1–3 mm wide, the bases with glandular pits. **PANICLES** narrowly elliptic, 4–12 cm long, 1–2 cm wide, the branches erect-appressed, the rachises and branchlets with glandular pits. **SPIKELETS** 6- to 12-flowered, 1–2 mm wide, narrowly ovate. **GLUMES** ovate-lanceolate, 1-nerved, subequal, 1–1.8 mm long. **LEMMAS** ovate, 1.5–2.2 mm long, the nerves prominent. **PALEAS** slightly shorter than the lemmas, persistent. **ANTHERS** 3, 0.2–0.3 mm long, purplish. $2n$ = not known. Moist alkaline flats, sandy shores and banks, not common in our area. ARIZ: Nav. 1525–1650 m (5000–5400'). Flowering: Jul–Sep. Scattered locales in the western United States.

Eragrostis mexicana (Hornem.) Link (from Mexico) Mexican lovegrass. Plants tufted annuals, lacking glands. **CULMS** erect to geniculate-based, 12–80 cm tall or more. **LIGULES** 0.2–0.5 mm long. **BLADES** flat, 2–7 mm wide, glabrous to scaberulous or lightly pilose near the base. **PANICLES** ovate, 10–40 cm long, 4–18 cm wide, the branches usually spreading to divaricate. **SPIKELETS** 5- to 12-flowered, 1–2.4 mm wide, ovate-lanceolate, grayish green to purplish green. **GLUMES** ovate-lanceolate, nearly equal, 0.7–2.2 mm long, 1-nerved. **LEMMAS** ovate, 1.2–2.4 mm long, the nerves prominent. **PALEAS** shorter than the lemmas. **ANTHERS** 3, 0.2–0.5 mm long, purplish. **GRAINS** with a prominent groove on the side opposite the embryo. $2n = 60$. [*Eragrostis neomexicana* Vasey]. Roadsides, moist disturbed sites and fields. ARIZ: Apa, Nav; NMEX: McK, SJn. 1800–2300 m (6000–7500'). Flowering: Jul–Sep. Western United States, south to Argentina. Our material seems to belong to **subsp. *mexicana***, with subsp. *virescens* found in Nevada and California.

Eragrostis pectinacea (Michx.) Nees (comblike) Carolina lovegrass. Plants tufted annuals, lacking glands. **CULMS** erect to geniculate- or decumbent-based, 10–80 cm long. **LIGULES** 0.2–0.5 mm long. **BLADES** flat to rolled, 1–5 mm wide, glabrous to scaberulous. **PANICLES** pyramidal when mature, usually open with spreading branches, 5–25 cm long, 3–12 cm wide, the branchlets and spikelets usually appressed along the primary branches. **SPIKELETS** 6- to 22-flowered, lanceolate, 1–2.5 mm wide. **GLUMES** linear to lanceolate, 1-nerved, shorter than the adjacent lemma, unequal, the first 0.5–1.5 mm long, the second 1–1.7 mm long. **LEMMAS** ovate-lanceolate, 1–2.2 mm long. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 3, 0.2–0.7, purplish. $2n = 60$. [*Eragrostis diffusa* Buckley]. Widespread in moist weedy sites, roadsides, along ditches. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Min, Mon; NMEX: McK, San, SJn; UTAH. 1130–2550 m (3700–8400'). Flowering: Jul–Sep. From southern Canada to Argentina. This is our most common annual lovegrass, easily distinguished from the others by the absence of glands, appressed branchlets, and a nongrooved grain.

Eremopyrum (Ledeb.) Jaub. & Spach Annual Wheatgrass

(Greek *eremos*, desert, + *pyros*, wheat, alluding to the arid environment) Plants tufted annuals, with hollow, geniculate culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and auricles. **INFL** a short spike with 1 spikelet per node; disarticulation in the rachis, but tardily so. **SPIKELETS** very crowded on the rachis, spreading to divaricate, 3- to 6-flowered; glumes linear-lanceolate, awn-tipped or awnless, firm; lemmas lanceolate, awn-tipped; paleas shorter than the lemmas, 2-keeled; anthers 3, yellow. $x = 7$. A genus of five to eight species native to central Asia and the Mediterranean.

Eremopyrum triticeum (Gaertn.) Nevski (resembling the genus *Triticum*) Annual wheatgrass. **CULMS** erect, 5–30 cm tall. **LIGULES** 0.2–1 mm long, lacerate. **BLADES** 1–4 mm wide. **SPIKES** bristly, 1–2 cm long, ovate, the peduncle extending well beyond the sheath. **SPIKELETS** 2- to 4-flowered. **GLUMES** firm, the margins hyaline, inflated at the base, 1-nerved, 5–7 mm long. **LEMMAS** lanceolate, 5–7 mm long, faintly 3- to 5-nerved, acuminate to a 1–2 mm long awn. **PALEAS** shorter than the lemmas, bifid at the apex. **ANTHERS** 0.8–1 mm long. $2n = 14$ [*Agropyron triticeum* Gaertn.]. Disturbed ground in desert areas. ARIZ: Apa, Nav; COLO: Dol, Mon; NMEX: McK, RAr, SJn; UTAH 1450–2100 m (4800–6900'). Flowering: Apr–Jul. Native to central Asia; scattered locales in southern Canada and the western United States. Plants look like miniature clumps of crested wheatgrass.

Erioneuron Nash Tridens

(Greek *erio*, woolly, + *neuron*, nerve, alluding to the hairy nerves) Plants perennial, tufted (ours) or occasionally stoloniferous, with pithy, erect culms. **LEAVES** with open sheaths, hairy ligules, folded and white-margined blades, and lacking auricles. **INFL** a terminal, dense, few-flowered panicle raised above the foliage, often racemose. **SPIKELETS** laterally compressed, with 4–20 florets, the terminal florets staminate or sterile; disarticulation above the glumes and between the florets; glumes thin, acute to acuminate, 1-nerved; lemmas 3-nerved and conspicuously pilose on the nerves at least basally, the apex bifid and awned or mucronate from the midnerve; paleas 2-keeled, shorter than the lemmas. **STAMENS** 1 or 3. $x = 8$. An American genus of only three species, formerly including *Dasyochloa* and included in *Tridens*.

Erioneuron pilosum (Buckley) Nash (hairy, pilose) Hairy tridens. Plants tufted perennials. **CULMS** 4–25 cm tall. **LIGULES** 2–3.5 mm long. **BLADES** 1–2 mm wide, glabrous or sparsely pilose. **PANICLES** 1–5 cm long. **SPIKELETS** 6- to 12-flowered. **GLUMES** shorter than the lowermost lemma, equal, 4–7 mm long. **LEMMAS** lanceolate, 3–6 mm long; awns 0.5–2.5 mm long. **PALEAS** 3–4 mm long. **ANTHERS** usually 3, 0.3–1 mm long. $2n = 16$. [*Tridens pilosus* (Buckley) Hitchc.]. Dry, rocky hills and plains, desert and juniper woodland communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: SJn; UTAH. 1450–1800 m (4800–5800'). Flowering: May–Jun. Southwestern United States, California to Kansas, south to central Mexico.

Festuca L. Fescue

(ancient Latin name for grass or straw, from the Celtic *fest*, pasture or food) Plants perennial, mostly densely tufted but sometimes with short rhizomes within the clump, with hollow culms. **LEAVES** with open or closed sheaths, membranous ligules, flat to involute blades, and with or without auricles. **INFL** a terminal panicle. **SPIKELETS** laterally compressed, 3- to 15-flowered, the upper few florets sometimes staminate or sterile; disarticulation above the glumes and between the florets; glumes lance-linear, unequal, 1- or 3-nerved, acute to short-awned; lemmas lanceolate to ovate, 3- to 7-nerved, tapered to an awn or awnless; paleas 2-keeled, about equal to the lemmas; stamens 3. $x = 7$. About 100 species in temperate and cool-temperate regions of the world. Annual species with a single stamen are treated in *Vulpia* (Aiken and Darbyshire 1990; Allred 2005b; Frederiksen 1982).

1. Blades mostly wider than 3 mm, usually at least somewhat lax and flat when fresh ..... (2)
1' Blades mostly less than 3 mm wide, usually rolled or folded and somewhat stiff ..... (4)

2. Spikelets 2- to 4-flowered, 8–11 mm long; auricles absent; panicle branches spreading, at least below ***F. sororia***
2' Spikelets (4) 5- to 9-flowered, 10–17 mm long; small auricles usually developed; panicle branches usually ascending ..... (3)

3. Auricles lacking cilia (use a lens); 2 panicle branches borne at the lowermost node, together rarely bearing more than 6 spikelets; old sheaths brown, decaying to fibers; blades 3–6 (7) mm wide ..... ***F. pratensis***
3' Auricles with minute cilia (use a lens); 2 or 3 panicle branches borne at the lowermost node, together usually bearing 5–15 (30) spikelets; old sheaths pale straw-colored, generally remaining intact; blades 3–12 mm wide ..... ***F. arundinacea***

4. Ligules 2.5–5 (9) mm long; lemma awns 0–0.3 mm long; nodes usually visible and conspicuous; plants generally more than 50 cm tall ..... ***F. thurberi***
4' Ligules less than 2 mm long; lemma awns usually more than 0.5 mm long, occasionally shorter; nodes often not visible or conspicuous; plant height various ..... (5)

5. Anthers 2–4 mm long ..... (6)
5' Anthers 0.4–1.7 mm long, rarely longer ..... (8)

6. Basal sheaths reddish and separating into threadlike fibers (the whitish veins) in age; shoots loosely clustered, usually with short rhizomes that break through the old leaf sheaths; sheath margins fused together to near the summit (most easily seen on young tiller shoots) ..... ***F. rubra***

6′ Basal sheaths usually not reddish or separating into threadlike fibers; shoots densely clustered, lacking rhizomes; sheath margins fused only in the lowermost portion ..... (7)

7. Blades, especially the older ones, strongly laterally compressed, thickened and stiff, 0.5–1 mm wide; awn of lower lemma 0.5–2.5 mm long; ligules 0.1–0.3 mm long ..... ***F. trachyphylla***

7′ Blades, even the older ones, at least somewhat terete, not thickened, but threadlike, 0.4–0.6 mm wide; awn of lower lemma 2–7 mm long; ligules 0.3–0.6 mm long ..... ***F. idahoensis***

8. Plants 3–10 cm tall ..... (9)

8′ Plants over 10 cm tall, usually 15–50 cm tall ..... (10)

9. Lemma body 2–3 mm long, with an awn 0.5–1.5 mm long; spikelets with 2, occasionally 3, florets; panicle branches at lowest node usually 2–3; ovary and grain apex pubescent ..... ***F. minutiflora***

9′ Lemma body 3–5.5 mm long, with an awn 2–3.6 mm long; spikelets with 3–4 florets, occasionally only 2; panicle branches at lowest node 1; ovary and grain apex glabrous ..... ***F. brachyphylla***

10. Basal sheaths reddish and splitting into threadlike fibers (the whitish veins) in age; ovary and grain apex pubescent ..... ***F. earlei***

10′ Basal sheaths mostly straw-colored to brownish, not splitting into threadlike fibers in age (occasionally so in *F. brachyphylla*); ovary and grain apex glabrous ..... (11)

11. Blades soft, striate from the veins showing, somewhat wrinkled in drying, with little or no sclerenchyma tissue; spikelets and foliage greenish; culms usually less than twice the height of the leaves; anthers 0.5–1.3 mm long; rachilla internodes of middle florets 0.6–0.8 mm long ..... ***F. brachyphylla***

11′ Blades stiff, terete or sulcate, not striate or wrinkled, the veins generally not visible because of a buildup of sclerenchyma tissue; spikelets and foliage often glaucous; culms usually twice the height of the leaves or more; anthers 1–1.7 mm long (rarely longer); rachilla internodes of middle florets 0.9–1.1 mm long ..... ***F. saximontana***

Festuca arizonica Vasey (from Arizona) Arizona fescue. **CULMS** erect, densely clustered, 35–100 cm tall or more, the bases not purplish. **LIGULES** 0.5–0.2 mm long. **BLADES** yellowish green, 15–40 cm long, 0.3–0.5 mm wide. **PANICLES** 4–20 cm long, the peduncle markedly scabrous, the primary branches usually spreading but sometimes erect. **SPIKELETS** 4- to 8-flowered. **GLUMES** subequal, the first 3–5 mm long and 1-nerved, the second 4.5–7 mm long and 3-nerved. **LEMMAS** 5.5–9 mm long (lowermost lemma); awn of lower lemma 0.4–2.7 mm long. **ANTHERS** 3–3.8 mm long. **GRAINS** 3–3.5 mm long, the apex pubescent. $2n = 42$. |*F. ovina* L. var. *arizonica* (Vasey) Hack. ex Beall. Pine forests to subalpine slopes and meadows in the mountains, often in open parklands with ponderosa pine. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon; NMEX: McK, SJn. 2350–3450 m (7700–11400′). Flowering: Jul–Aug. Mountains of the southwestern United States.

Festuca arundinacea Schreb. (reedlike) Tall fescue. **CULMS** 30–15 cm tall, the bases not or only slightly purplish. **LIGULES** 0.4–1.2 mm long. **BLADES** flat or folded, 4–12 mm wide; auricles present, with tiny cilia. **PANICLES** 10–35 cm long, with 2–3 panicle branches at the lowermost node, these together bearing 5–15 (30) spikelets. **SPIKELETS** 4- to 8-flowered. **GLUMES** subequal, the first 3–6 mm long, the second 4–7 mm long. **LEMMAS** 6–10 mm long (lowermost lemma); awn 0–2 (4) mm long. **ANTHERS** 2.7–4 mm long. **GRAINS** 2–3 mm long, glabrous at the apex. $2n = 28$, 42, 56, 63, 70. |*Festuca elatior* L.; *Lolium arundinaceum* (Schreb.) Darbyshire; *Schedonorus phoenix* (Scop.) Holub|. Widely planted for improved pasture, erosion control, turf, and habitat restoration and found in a variety of habitats. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Mon, SMg; NMEX: McK, SJn; UTAH. 1550–2600 m (5200–8550′). Flowering: May–Aug. Native to Europe, now widespread throughout much of North America. Potentially toxic to grazing animals, sometimes causing summer fescue toxicosis and fescue foot. This and *F. pratensis* are closely related to *Lolium perenne* L., being interfertile, and they are sometimes merged with that genus or placed in the genus *Schedonorus*.

Festuca brachyphylla Schult. & Schult. f. (short-leaved) Shortleaf fescue. **CULMS** densely tufted, 3–12 cm tall, the bases purplish or not. **LIGULES** shorter than 0.5 mm long. **BLADES** 2–6 cm long, 0.3–1 mm wide, soft and somewhat wrinkled upon drying, striate because of the veins showing. **PANICLES** 1–6 cm long. **SPIKELETS** 2- to 4-flowered. **GLUMES** unequal, the first 1.8–3 mm long and 1-nerved, the second 2.3–4.3 mm long and 3-nerved. **LEMMAS** 3.3–4.5 mm long (lowermost lemma); awn 0.7–3.6 mm long. **ANTHERS** 0.4–1.4 mm long. **GRAINS** 1.8–2.5 mm long,

the apex glabrous. $2n = 28$. [*Festuca ovina* L. var. *brachyphylla* of NM reports; *Festuca ovina* L. var. *brevifolia* of NM reports]. Subalpine to alpine slopes, ledges, grassy screes, and cliffs in the mountains. ARIZ: Apa, COLO: Arc, Con, Hin, LPl, Min, Mon, SJn; UTAH. 3050–3850 m (10000–12600'). Flowering: Jun–Aug. Western mountains of the United States, California to New Mexico and Colorado. *Festuca brachyphylla* subsp. *coloradensis* can be confused with *F. saximontana*, but the latter is usually at least somewhat glaucous rather than green, with comparatively stiffer blades and longer anthers, and may grow at lower elevations. Shortleaf fescue also grows with *F. minutiflora*, which is distinguished by having fewer florets, shorter spikelets, shorter awns, and a pubescent rather than glabrous ovary/grain apex. Our material belongs to **subsp. *coloradensis*** Fred. (of Colorado).

Festuca earlei Rydb. (for Franklin Sumner Earle, 1856–1929, USDA agrostologist) Earle's fescue. **CULMS** 15–45 cm tall, densely tufted, the bases usually purplish in age as the sheaths split into threadlike segments. **LIGULES** 0.1–1 mm long. **BLADES** usually rolled or folded, 6–12 cm long, 0.5–1 mm wide (1–3 mm wide when flat). **PANICLES** 3–8 cm long, narrow, the branches ascending-erect. **SPIKELETS** 2- to 4-flowered. **GLUMES** slightly unequal, the first 2.2–3 mm long and with 1–3 nerves, the second 2.7–3.7 mm long and 3-nerved. **LEMMAS** 3.2–4.5 mm long (lowermost lemma); awn 0.4–1.6 mm long. **ANTHERS** 0.6–1.4 mm long. **GRAINS** 2.5–3 mm long, the apex pubescent. $2n$ = unknown. Subalpine to alpine outcrops and rocky slopes, talus, and grasslands in spruce forests. 3400–3800 m (11100–12500'). COLO: Con, Hin. Flowering: Jul–Aug. Southwestern mountains. Like *F. rubra*, its sheaths split into threadlike segments, but that species produces rhizomes and has longer anthers and a glabrous ovary apex.

Festuca idahoensis Elmer (from Idaho) Idaho fescue. **CULMS** 30–70 cm tall, densely tufted, the bases usually not very purplish. **LIGULES** 0.3–0.6 mm long. **BLADES** flat or folded, to 35 cm long, 0.4–0.6 mm wide. **PANICLES** 5–20 cm long, the peduncle glabrous or nearly so, not densely scaberulous. **SPIKELETS** 3- to 9-flowered. **GLUMES** unequal, the first 3.5–4.5 mm long and 1–3-nerved, the second 5–8 mm long and 3-nerved. **LEMMAS** 4.5–5.5 mm long (lowermost lemma); awn 2–7 mm long. **ANTHERS** 2.5–4.5 mm long. **GRAINS** 4–5 mm long, the apex glabrous. $2n = 28$ [*Festuca ovina* L. var. *ingrata* Hack. ex Beal]. Open subalpine grasslands in the mountains, not a common species. COLO: Hin, Min, RGr; NMEX: McK. 2700–3350 m (8850–11000'). Flowering: Jun–Aug. Throughout much of mountainous North America.

Festuca minutiflora Rydb. (tiny-flowered) Small-flowered fescue. **CULMS** 3–10 cm tall, densely tufted, the bases generally not purplish. **LIGULES** 0.1–0.3 mm long. **BLADES** 1–5 cm long, 0.3–0.4 mm wide. **PANICLES** 1–4 cm long, less than 1 cm wide. **SPIKELETS** 2 (3)-flowered. **GLUMES** subequal, 1.5–3.4 mm long. **LEMMAS** 2.3–3 mm long (lowermost lemma); awn 0.5–1.5 mm long. **ANTHERS** 0.8–1.1 mm long. **GRAINS** 2–2.5 mm long, the apex pubescent with a few hairs. $2n = 28$. Alpine ledges, outcrops, grassy slopes, often on mountain peaks. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr. 3450–3650 m (11400–12000'). Flowering: Jun–Aug. Alpine areas of much of western North America. This species is always very short, with short panicles, few spikelets, and few florets. It can be confused only with *F. brachyphylla*, but that species has larger spikelet parts and a glabrous apex on the ovary and grain.

Festuca pratensis Huds. (of meadows) Meadow fescue. **CULMS** 30–125 cm tall, tufted but not densely so, the bases purplish or not, the sheaths decaying into fibers. **LIGULES** 0.2–0.5 mm long. **BLADES** flat or folded, 10–20 cm long, 3–6 (7) mm wide; auricles present, clawlike, glabrous. **PANICLES** 8–22 cm long, with 1–2 branches at the lowermost node, together rarely bearing more than 6 spikelets. **SPIKELETS** 4- to 8-flowered. **GLUMES** subequal, 2.5–5 mm long. **LEMMAS** 5–8 mm long (lowermost lemma); awn 0–2 mm long. **ANTHERS** 2.5–4 mm long. **GRAINS** 2–3 mm long, the apex glabrous. $2n = 28, 42, 56, 63, 70$. [*Lolium pratense* (Huds.) Darbysh.; *Schedonorus pratensis* (Huds.) P. Beauv.]. Occasionally planted for improved pasture, erosion control, turf, and habitat restoration and found in a variety of habitats; not common in our region. COLO: LPl, Mon; NMEX: SJn. 1550–2600 m (5200–8550'). Flowering: Jun–Jul. Native to Europe; throughout most of cool-temperate North America. This and *F. arundinacea* are closely related to *Lolium perenne* and form fertile hybrids. The hybrid of *F. pratensis* × *Lolium perenne* has been named × *Festulolium loliaceum* (Huds.) P. Fourn.—it produces a panicle with the upper spikelets sessile and arranged in a spike and the lower spikelets stalked and on branches.

Festuca rubra L. (red) Red fescue. **CULMS** 20–80 cm tall, curved at the base, loosely clustered from short rhizomes, which break through the basal sheaths. **SHEATHS** closed to near the summit, splitting between the veins into threadlike segments in age. **LIGULES** 0.2–0.5 mm long. **BLADES** mostly folded, 1–4 mm wide; auricles absent or poorly developed. **PANICLES** 5–20 cm long, with 1–4 branches at the lowermost node. **SPIKELETS** 4- to 9-flowered. **GLUMES** unequal, the first 1.5–4 mm long, the second 3–5 mm long. **LEMMAS** 5–8 mm long (lowermost lemma); awn 1–4.5 mm long. **ANTHERS** 2.3–4.2 mm long. **GRAINS** 2.3–4.5 mm long, the apex glabrous. $2n = 14, 21, 28, 42, 49$.

53, 56, 64, 70. Mountain meadows, high-elevation slopes, and outcrops. COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn. 2300–3500 m (7600–11500'). Flowering: Jul–Aug. Widespread in North America, also Eurasia. Young tillers of *F. rubra* have reddish sheaths fused to near the top. The old sheaths of red fescue split between the veins into threadlike segments, a feature also found in *F. earlei* (nearly always), and *F. pratensis* (indistinctly).

Festuca saximontana Rydb. (of rocky mountains) Mountain fescue. **CULMS** 20–50 cm tall (sometimes shorter), often glaucous but sometimes green, densely tufted, the basal sheaths persistent and decaying to fibers. **LIGULES** 0.2–0.5 mm long. **BLADES** 0.3–1 mm wide; auricles poorly developed. **PANICLES** 3–15 cm long. **SPIKELETS** 3- to 5-flowered. **GLUMES** unequal, the first 1.5–3.5 mm long, the second 2.5–4.5 mm long. **LEMMAS** 3–5.5 mm long (lowermost lemma); awn 0.5–2.5 mm long. **ANTHERS** 1–1.7 mm long. **GRAINS** 2.2–2.8 mm long, the apex glabrous. $2n = 42$. [*Festuca ovina* L. var. *rydbergii* St.-Yves; *Festuca ovina* L. subsp. *saximontana* (Rydb.) St.-Yves]. Mountain grasslands and forest clearings. ARIZ: Apa; COLO: Arc, Con, Hin, LPl, Min, Mon, SJn; NMEX: RAr, San; UTAH. 2650–3800 m (8700–12500'). Flowering: Jul–Aug. Widespread in the foothills and mountains of central and western North America.

Festuca sororia Piper (a sister, referring to a related species) Ravine fescue. **CULMS** 40–120 cm long, weak and loosely clustered, the foliage deep green; basal sheaths open, weakly splitting between the veins into threadlike segments. **LIGULES** 0.5–1.5 mm long. **BLADES** flat, 3–8 mm wide; auricles absent. **PANICLES** 15–30 cm long, the branches weak and widely spreading. **SPIKELETS** 2- to 4-flowered. **GLUMES** unequal, the first 3–4 mm long, 1-nerved and narrow, the second 5–6 mm long, 3-nerved and broader. **LEMMAS** 5.5–8.5 mm long (lowermost lemma); awn 0.2–2 mm long. **ANTHERS** 1.8–2.2 mm long. **GRAINS** 4–6 mm long, the apex hairy. $2n = 28$. Damp, shaded ravines and creek bottoms in the mountains. COLO: Arc, Min; NMEX: SJn; UTAH. 2600–3200 m (8500–10500'). Flowering: Jul–Aug. Mountains of the southwestern United States.

Festuca thurberi Vasey (for George Thurber, 1821–1890, botanist with the United States-Mexico boundary survey in the mid-1800s) Thurber's fescue. **CULMS** 45–150 cm tall, in thick dense clumps, the foliage green; basal sheaths not splitting between the veins. **LIGULES** 2.5–8 mm long. **BLADES** flat or more commonly folded, 25–45 cm long, 0.6–1.2 mm wide; auricles absent. **PANICLES** 8–17 cm long, the branches ascending-spreading. **SPIKELETS** 3- to 5-flowered. **GLUMES** unequal, the first 4–5 mm long and 1-nerved, the second 4.5–7 mm long and 1- or 3-nerved. **LEMMAS** 6.5–10 mm long (lowermost lemma); awn 0–0.3 mm long. **ANTHERS** 3–4.5 mm long. **GRAINS** 4–4.5 mm long, the apex hairy. $2n = 28, 42$. Grasslands, meadows, grassy slopes, and openings in coniferous forests in the mountains, to subalpine areas. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr; UTAH. 2550–3700 m (8400–12200'). Flowering: Jul–Aug. Mountains of the western states. *Festuca thurberi* commonly grows with *F. arizonica*, sometimes completely intermingled within a community, but plants of the latter are easily recognized by their rolled glaucous leaves, short ligules, and short-awned (but the awns evident) florets.

Festuca trachyphylla (Hack.) Krajina (rough-leaved) Hard fescue. **CULMS** 25–65 cm tall, the foliage yellowish green, gray-green, or glaucous, the bases somewhat purplish, the basal sheaths persistent and not splitting between the veins. **LIGULES** 0.1–0.3 mm long. **BLADES** folded, stiff when mature, 0.5–1.2 mm wide; auricles scarcely developed. **PANICLES** 3–12 cm long, with a single branch at the lowermost node, narrow, the branches erect-ascending. **SPIKELETS** 3- to 5-flowered. **GLUMES** unequal, the first 2–4 mm long, the second 3–5.5 mm long. **LEMMAS** 4–5.5 mm long (lowermost lemma); awn 0.5–2.5 mm long. **ANTHERS** 2–3.4 mm long. **GRAIN** 2.5–3.5 mm long, the apex glabrous. $2n = 42$. Introduced for range restoration, erosion control, and mine reclamation in scattered locales. COLO: Arc, Con, SJn; NMEX: RAr, SJn. 1700–2100 m (5500–7000'). Flowering: Jun–Aug. Native to Eurasia, widespread throughout much of cool-temperate North America. When mature, the wide, stiff, folded blades are quite distinctive, but other diagnostic features include long anthers, short awns, and glabrous ovary apices. Old sheaths remain at the base of the tuft in a characteristic grayish clump.

Glyceria R. Br. Mannagrass

(Greek *glykys*, sweet, referring to the seed of some species) Plants marsh or aquatic perennials, usually rhizomatous, with hollow culms. **LEAVES** with closed sheaths, membranous ligules, and lacking auricles. **INFL** a panicle, the branches often weak and drooping. **SPIKELETS** several-flowered, linear to ovate, awnless; disarticulating above the glumes and between the florets; glumes unequal, shorter than the lowermost floret, 1-nerved; lemmas prominently 7- to 9-nerved, the nerves parallel and not converging toward the apex, the apex often erose; palea sometimes exceeding the lemma, 2-nerved; stamens 2 or 3. $x = 10$. About 30 species in the Northern Hemisphere.

1. Spikelets linear, nearly round in cross section, 9–15 (18) mm long, 8- to 12-flowered; lemmas 3.3–4 mm long ..... ***G. borealis***
1' Spikelets ovate or oblong, somewhat compressed, 2.5–7 mm long, 3- to 6 (7)-flowered; lemmas 1.5–3 mm long ..... (2)

2. Blades narrow, 2–5 mm wide; first glume less than 1 mm long; plants usually much less than 1 m tall ..... ***G. striata***
2' Blades broad, 5–15 mm wide; first glume more than 1 mm long; plants often 1 m or more tall ..... (3)

3. First glume 1.5 mm or more long; spikelets 4–8 mm long; lower valleys ..... ***G. grandis***
3' First glume 0.8–1.2 mm long; spikelets 2.5–5 mm long; subalpine ..... ***G. elata***

Glyceria borealis (Nash) Batch. (northern) Northern mannagrass. **CULMS** 75–150 cm tall, erect or decumbent-based, loosely clumped together along the rhizome. **LIGULES** 4–12 mm long. **BLADES** flat or folded, 2–5 (7) mm wide. **PANICLES** 16–40 cm long, the branches mostly ascending to appressed, the base enclosed in the sheath. **SPIKELETS** linear, nearly round in cross section, 9–18 mm long, 8- to 12-flowered. **GLUMES** unequal, the first 1.2–2.2 mm long, nerveless, the second 2.2–3.5 mm long, 1-nerved. **LEMMAS** prominently (5) 7- to 9-nerved, erose at the apex. **PALEAS** nearly as long as the lemmas. **ANTHERS** 3, 0.5–0.8 mm long. $2n = 20$. Shallow water at the borders of lakes and ponds and wetlands, midelevations to subalpine. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, SJn, NMEX: McK, SJn. 2400–2800 m (8000–9200'). Flowering: Jul–Aug. Canada south across the northern United States and in the southwestern states.

Glyceria elata (Nash) M. E. Jones (elevated) Tall mannagrass. **CULMS** erect or decumbent-based, 75–150 cm tall. **LIGULES** truncate, erose, 2–6 mm long. **BLADES** flat, 5–12 mm wide. **PANICLES** open, lax, 15–25 cm long, the branches spreading. **SPIKELETS** 4- to 6-flowered. **GLUMES** 1–1.5 mm long, the first slightly shorter than the second. **LEMMAS** ovate, 1.7–2.2 mm long, prominently (5) 7-nerved. **PALEAS** equal to or slightly longer than the lemmas. **ANTHERS** usually 2, 0.5–0.8 mm long. $2n = 20, 28$. In water of ponds and wet meadows at high elevations, not common. COLO: Arc, Hin. 2850–3500 m (9500–11500'). Flowering: Jul–Aug. Western North America.

Glyceria grandis S. Watson (large) American mannagrass. **CULMS** erect to decumbent-based, 75–150 cm tall or more. **LIGULES** truncate to slightly obtuse, 4–6 mm long. **BLADES** flat or folded, 5–15 mm wide. **PANICLES** open, lax, 15–35 cm long, the branches spreading. **SPIKELETS** 4- to 6-flowered. **GLUMES** 1.5–2.5 mm long, the first slightly shorter than the second. **LEMMAS** ovate, 2–3 mm long, prominently (5) 7-nerved. **PALEAS** equal to or slightly longer than the lemmas. **ANTHERS** (2) 3, 0.5–0.9 mm long. $2n = 20$. Stream, pond, and ditch banks in valleys at lower elevations. COLO: Hin, LPl, Min, Mon; NMEX: SJn. 1650–1900 m (5400–6200'). Flowering: Jun–Aug. Canada and the northern United States.

Glyceria striata (Lam.) Hitchc. (furrowed, striped) Fowl mannagrass. **CULMS** erect to decumbent-based, 30–100 cm tall. **LIGULES** truncate, 1–3 mm long. **BLADES** flat or folded, relatively narrow, 2–5 mm wide. **PANICLES** open, lax, 6–20 cm long. **SPIKELETS** 3- to 6-flowered. **GLUMES** subequal, 0.5–1 mm long. **LEMMAS** ovate, 1.5–2 mm long, prominently 5- to 7-nerved. **PALEAS** equal to the lemmas. **ANTHERS** 2, 0.3–0.6 mm long. $2n = 20, 28$. Marshes and springs in the mountains, middle to high elevations. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn, NMEX: McK, SJn; UTAH. 1650–3050 m (5500–10000'). Flowering: Jul–Aug. Throughout much of temperate North America. This is the most common of our mannagrasses.

Helictotrichon Besser Alpine Oat

(Greek *helicos*, twisted, and *trichos*, hair, referring to the awns) Tufted perennials, with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat to rolled blades, and lacking auricles. **INFL** a narrow, spikelike panicle. **SPIKELETS** 3- to 7-flowered; disarticulation above the glumes and between the florets; glumes large, thick, equal, the first 1-nerved, the second 3-nerved, exceeding the lowermost floret; lemmas 3- to several-nerved, firm below and membranous above, often toothed; awn from the midnerve, diverging at about midlength, stout, twisted, palea shorter than the lemma, 2-keeled. **STAMENS** 3, the anthers large. $x = 7$. A genus of 30 or so species, mostly Eurasian and African, with two species native to North America; sometimes split into two genera (*Avenula* and *Helictotrichon*).

Helictotrichon mortonianum (Scribn.) Henrard (for J. Sterling Morton, 1832–1903, Secretary of Agriculture in late 1880s) Alpine oat. **CULMS** 5–20 tall. **LIGULES** 0.5–1 mm long. **BLADES** filiform, rolled, 1–2 mm wide. **PANICLES** 2–8 cm long, few-flowered. **SPIKELETS** pale or purplish, mostly 2-flowered, the rachilla densely villous and extending beyond the upper floret. **GLUMES** hyaline, at least on the margins, acuminate, 8–11 mm long, the first 1-nerved, the second 3-nerved. **LEMMAS** firm, 3-nerved, 7–10 mm long, cleft into 4 bristlelike teeth at the apex; awn 10–16 mm

long, twisted and geniculate, dark brown. **PALEAS** shorter than the lemmas. **ANTHERS** 1.5–2 mm long. $2n = 14, 28$. Alpine and subalpine meadows. COLO: Arc. 3100–3800 m (10200–12500'). Flowering: Jul–Aug. Rocky Mountains.

Hesperostipa (M. K. Elias) Barkworth Needle-and-thread

(Greek *hesperos*, western, + *Stipa*, alluding to its distribution in western North America) Plants tufted perennials, with hollow culms. **LEAVES** with open sheaths, membranous ligules, usually tightly rolled leaves, and lacking auricles. **INFL** a terminal panicle. **SPIKELETS** with 1 floret, the rachilla not prolonged; disarticulation above the glumes; glumes large, papery or membranous, exceeding the floret; lemmas indurate when mature, fusiform, the margins overlapping, the apex fused into a ciliate crown below the terminal awn; awn twice geniculate, the lower portion twisted; callus sharp, densely hairy; palea equal to the lemma, leathery, pubescent, 2-nerved, the apex indurate and prow-shaped. **STAMENS** 3. x = 11. A North American endemic genus of five species, formerly included in *Stipa*, which is now strictly Eurasian (Barkworth 1993).

1. Terminal segment of awn plumose, with feathery hairs 2–3 mm long ..... ***H. neomexicana***
1' Terminal segment of awn not plumose, any hairs present shorter than 1 mm ..... (2)

2. Lemmas 10–18 mm long above the callus; lower ligules rounded to truncate, thick, not cut or torn; margins of lower sheaths often ciliate ..... ***H. spartea***
2' Lemmas 5–11 mm long above the callus; lower ligules usually acute, thin, often cut or torn; margins of lower sheaths mostly glabrous ..... ***H. comata***

Hesperostipa comata (Trin. & Rupr.) Barkworth (long-haired, referring to the awns) Needle-and-thread. **CULMS** 20–80 cm tall or more. **LIGULES** 2–7 mm long, acute. **BLADES** 0.5–2 mm wide. **PANICLES** 10–28 cm long, often still in the sheath below. **GLUMES** 16–35 mm long, acuminate, 3- to 5-nerved, the second glume slightly shorter than the first. **LEMMAS** 7–13 mm long (including callus); awns 7–22 cm long, the terminal portion straight or curling. **ANTHERS** 5–6 mm long. $2n = 38, 44, 46$. [*Stipa comata* Trin. & Rupr.]. Plains, mesas, foothills, mountain slopes, clearings in coniferous forests. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1525–2500 m (5000–8200'). Flowering: May–Jul. Throughout western North America. We have two subspecies, with overlapping distributions, though subspecies *comata* seems to be more common:

1. Terminal portion of the awns 4–12 cm long, sinuous to curled at maturity; lower cauline nodes often concealed by the sheaths; panicles often partially enclosed in the uppermost sheath at maturity ..... **subsp. *comata***
1' Terminal portion of the awns 3–8 cm long, straight; lower cauline nodes usually exposed; panicles usually completely exserted at maturity ..... **subsp. *intermedia*** (Scribn. & Tweedy) Barkworth

Hesperostipa neomexicana (Thurb.) Barkworth (of New Mexico) New Mexico feathergrass. **CULMS** 40–100 cm tall. **LIGULES** ciliolate, 1–3 mm long, those of the lower leaves shorter than the upper. **BLADES** 0.5–1 mm wide. **PANICLES** 10–30 cm long, narrow, the lower portion included in the sheath. **GLUMES** 30–60 mm long, acuminate and awn-tipped, 4- to 7-nerved. **LEMMAS** 15–18 mm long (including callus); callus 4–5 mm long; awns 12–22 cm long, pilose, the terminal portion with hairs 1–3 mm long. **ANTHERS** 6–7 mm long. $2n = 44$. Plains, grassy slopes, mesas, canyon slopes, often on limestone and in well-drained soils, middle elevations. ARIZ: Apa; COLO: LPl, Mon; NMEX: McK, SJn; UTAH. 1750–1950 m (5800–6400'). Flowering: May–Jun. Southwestern United States and northern Mexico.

Hesperostipa spartea (Trin.) Barkworth (a rope or cord, the grass being a source of fiber) Porcupinegrass. **CULMS** 15–45 cm tall, the lower nodes usually crossed by lines of pubescence. **LIGULES** 1–7 mm long, those of the lower blades about 1/2 as long as those of the upper. **BLADES** 1.5–4 mm wide. **PANICLES** 10–25 cm long. **GLUMES** 22–45 mm long, acuminate and awn-tipped. **LEMMAS** 15–25 mm long; callus 3–6 mm long; awn 9–19 cm long, the terminal portion straight. **ANTHERS** 3–4 mm long. $2n = 44, 46$. Grassy plains and clearings in ponderosa pine forests, not common. NMEX: McK, SJn. 1800–2100 m (5900–6800'). Flowering: Aug. Plains and grasslands of North America.

Hierochloë R. Br. Holygrass, Sweetgrass

(Greek *hieros*, sacred, + *chloë*, grass, alluding to its use in religious festivals) Rhizomatous perennials with hollow culms and fragrant herbage. **LEAVES** with open sheaths, membranous ligules, flat to rolled blades, and lacking auricles. **INFL** an open or narrow panicle. **SPIKELETS** with 3 florets, the lower 2 staminate but large, the upper (middle) floret perfect; disarticulation above the glumes, all florets falling together; glumes equal, about as long as the florets, broad and thin, shiny, 1- to 3-nerved, awnless; lemmas all about equal size, entire to bifid, 3- to 5-nerved, awned or awnless; paleas 2-nerved (staminate florets) or 1- or 3-nerved (perfect floret). **STAMENS** 3 (staminate florets) or 2 (perfect

floret). $x = 7$. A small genus of 15 or so species in the cool-temperate regions of the world, recently merged into the genus *Anthoxanthum* by some authors (Weimarck 1971).

Hierochloë odorata (L.) P. Beauv. (fragrant) Northern sweetgrass. **CULMS** erect, 15–60 cm tall. **LIGULES** 2–4 mm long, acute, lacerate. **BLADES** flat, 3–6 mm wide. **PANICLES** pyramidal, 4–10 cm long, about 2/3 as wide. **SPIKELETS** awnless. **GLUMES** ovate, membranous and shiny, 3–6 mm long. **STAMINATE LEMMAS** subequal, 3–5 mm long, ovate, appressed-pubescent, 5- to 7-nerved. **PERFECT LEMMA** 2–4 mm long, lanceolate, pubescent above and glabrous below. **PALEAS** about as long as the lemmas. **ANTHERS** 1.5–2.5 mm long. $2n = 28, 42, 56$. [*Anthoxanthum nitens* (Weber) Y. Schouten & Veldkamp; *Hierochloë hirta* (Schrank) Borbás subsp. *arctica* (I. Presl) G. Weim.] Wet meadows and stream banks, mostly at high elevations. ARIZ: Apa, Nav; COLO: Arc, LPl, SJn; NMEX: SJn. 2300–2900 m (7600–9600'). Flowering: Jun–Aug. Western United States, circumboreal, Eurasia.

Hordeum L. Barley, Foxtail

(the classical Latin name for barley) Tufted annuals and perennials lacking rhizomes, with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and with or without auricles. **INFL** a dense spike or spicate raceme, with both pedicelled and sessile spikelets borne on the main axis. **SPIKELETS** 1-flowered, borne in threes: the central spikelet sessile and perfect, and 2 lateral spikelets usually pedicelled and staminate or sterile (fertile in *H. vulgare*); disarticulation in the rachis and all 3 spikelets falling together; glumes usually subulate, awnlike; lemmas faintly 5-nerved, tapering to a long awn; palea shorter than the lemma. **STAMENS** 3. $x = 7$. About 35 species of Eurasia and the New World (Baum and Bailey 1990; von Bothmer et al. 1995).

1. Rachis persistent, not breaking apart when mature; plants annual ..... ***H. vulgare***
1' Rachis breaking apart when mature; plants annual or perennial ..... (2)

2. Glumes of the central spikelet with conspicuous ciliate margins; auricles usually well developed, mostly longer than 1 mm ..... ***H. murinum***
2' Glumes of the central spikelet without ciliate margins, at most scabrous; auricles usually lacking or weakly developed and less than 1 mm long ..... (3)

3. Glumes of the central spikelet flattened at the base; plants annual or biennial, sometimes short-lived perennial under very favorable circumstances ..... ***H. pusillum***
3' Glumes of the central spikelet setaceous, not flattened; plants perennial ..... (4)

4. Glumes 7–20 mm long; awns of the lemmas 5–10 (20) mm long ..... ***H. brachyantherum***
4' Glumes 20–150 mm long; awns of the lemmas 10–70 mm long ..... ***H. jubatum***

Hordeum brachyantherum Nevski (short-spiked) Meadow barley. Plants perennial. **CULMS** erect or sometimes ascending-spreading, 30–65 cm tall. **LIGULES** truncate, ciliolate, less than 1 mm long. **BLADES** flat, 2–7 mm wide, auricles lacking. **SPIKES** 2–8 cm long, erect, the rachis disarticulating. **CENTRAL SPIKELETS** sessile; glumes 7–18 mm long, setaceous; lemma awns 5–10 (20) mm long; anthers 0.8–2.5 mm long, yellow to violet. **LATERAL SPIKELETS** pedicelled, rudimentary or staminate; lemma awns to 2–6 mm long. $2n = 28$. [*Critesion brachyantherum* (Nevski) Barkworth & D. R. Dewey]. Moist, grassy slopes and meadows, middle to high elevations. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, RGr, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1850–3250 m (6100–10600'). Flowering: Jun–Aug. Western North America north of Mexico. Meadow barley hybridizes with *H. jubatum*, producing stabilized hybrid plants referred to *H. jubatum* subsp. *intermedium*; see below.

Hordeum jubatum L. (having a mane) Foxtail barley. Plants perennial, but sometimes flowering the first year, glabrous to velvety pubescent. **CULMS** erect to geniculate-based, (20) 30–60 cm tall. **LIGULES** truncate, 0.5–1 mm long. **BLADES** flat to rolled, 1–4 mm wide, auricles usually lacking or very weakly developed. **SPIKES** 4–10 cm long, nodding, the rachis disarticulating. **CENTRAL SPIKELETS** sessile; glumes 20–80 (150) mm long or more, setaceous, spreading when mature; lemma awns 10–70 mm long; anthers 0.6–1 mm long, yellow. **LATERAL SPIKELETS** pedicelled, staminate or sterile; lemma awns 2–7 mm long. $2n = 14, 28, 42$. [*Critesion jubatum* (L.) Nevski]. Moist meadows, roadsides, weedy ground, low to high elevations. 1520–2700 (5000–9000'). Flowering: Jun–Aug. Across cool-temperate North America. Stabilized hybrids with *H. brachyantherum* are referred to subsp. *intermedium*, distinguished as follows:

1. Glumes of the central spikelets (including awns) 20–30 mm long; lemma of central spikelet (including awn) 20–40 mm long ..... **subsp. *intermedium***
1' Glumes of the central spikelets (including awns) 30 mm or more long; lemma of central spikelet (including awn) 30 mm or more long ..... **subsp. *jubatum***

subsp. ***intermedium*** Bowden **CP** (intermediate) [*Hordeum caespitosum* Scribn.]. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, RGr, SMg; NMEX: McK, RAr, San, SJn; UTAH.

subsp. ***jubatum*** ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH.

Hordeum murinum L. (mouselike) Mouse barley, wall barley. Plants annual. **CULMS** erect to widely spreading and sometimes prostrate, 10–40 cm tall. **LIGULES** truncate, less than 1 mm long. **BLADES** flat to folded, 2–5 mm wide; auricles well developed, 1–4 mm long. **SPIKES** 3–8 cm long, erect, somewhat flattened, the rachis disarticulating. **CENTRAL SPIKELETS** sessile; glumes compressed, ciliate; lemma awns 2–4 cm long; anthers 0.2–2.8 mm long. **LATERAL SPIKELETS** well developed, pedicelled, staminate; glumes flattened, ciliate; lemma awns 2–5 cm long; anthers 0.4–3.2 mm long. $2n = 14, 28, 42$. [*Critesion murinum* (L.) Á. Löve]. Disturbed ground, roadsides, fields. Flowering: Apr–Jul. Native to Europe and the Mediterranean region; scattered across the western states, South America. We have two subspecies, of which subsp. *glaucum* is the more common:

1. Anthers of the central spikelet blackish, 0.2–0.6 mm long, those of the lateral spikelets 1.2–1.8 mm long; prolongation of the rachilla of the lateral spikelets stout, orange-brown when mature ..... **subsp. *glaucum***
1′ Anthers of the central and lateral spikelet yellowish, 0.9–3.2 mm long; prolongation of the rachilla of the lateral spikelets slender, greenish when mature ..... **subsp. *leporinum***

subsp. ***glaucum*** (Steud.) Tzvelev (gray-green appearance) [*Hordeum glaucum* Steud.; *H. stebbinsii* Covas]. ARIZ: Apa, Nav; COLO: Dol, Mon; NMEX: McK, SJn; UTAH.

subsp. ***leporinum*** (Link) Arcang. (hare) Hare barley [*Hordeum leporinum* Link]. UTAH.

Hordeum pusillum Nutt. (little) Little barley. Plants annual or biennial (perennial). **CULMS** erect, 10–40 cm tall, rarely taller, in loose tufts. **LIGULES** truncate, less than 0.6 mm long. **BLADES** flat, 2–4 mm wide, glabrous to hairy, auricles lacking. **SPIKES** 2–7 cm long, erect, somewhat squarish, the rachis disarticulating. **CENTRAL SPIKELETS** sessile; glumes flattened at the base, 9–15 mm long, up to 1 mm wide; lemma awns 5–9 mm long; anthers 0.7–1.5 mm long, yellow. **LATERAL SPIKELETS** pedicelled, usually sterile; glumes different in shape, one setaceous and the other broadly flattened at the base. $2n = 14$. [*Critesion pusillum* (Nutt.) Á. Löve]. Weedy sites, pastures, roadsides, disturbed grasslands. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1550–2700 m (5200–8900′). Flowering: May–Aug. Most of the United States except some western regions, extending into Canada and Mexico in scattered locales.

Hordeum vulgare L. (common) Barley. Plants robust annuals. **CULMS** erect, 60–120 cm tall or more. **LIGULES** 0.5–1.2 mm long. **BLADES** flat, 5–12 mm wide, the auricles well developed and up to 6 mm long. **SPIKES** stout, 6–10 cm long, erect, the rachis persistent and not breaking apart. **CENTRAL** and **LATERAL SPIKELETS** sessile and fertile (lateral spikelets pedicelled and staminate in *distichon* phase); glumes 6–20 mm long, widened below and 3-nerved; lemma awns 6–16 cm long (awnless and 3-lobed at the tip in *trifurcatum* phase); anthers 2–2.5 mm long. $2n = 14, 28$. [*Hordeum distichon* L.; *Hordeum trifurcatum* (Schltdl.) Wender]. Introduced crop also used for erosion control along highways, adventive along fields and roadsides. NMEX: McK, SJn. 1550–2070 m (5200–6800′). Flowering: May–Jun. Native to Eurasia, now cultivated throughout temperate areas of the world.

Imperata Cirillo Satintail

(for Ferrante Imperato, 1550–1625, Italian apothecary) Rhizomatous perennials with pithy culms, sometimes clumped. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a spikelike, plumose panicle with appressed branches. **SPIKELETS** short-pedicelled in groups of 2 or 3, 2-flowered, the lower floret neuter, the upper floret perfect; glumes about equal to the spikelet and upper floret, 3- to 9-nerved, beset with long white hairs; lemmas and paleas hyaline. **STAMENS** 1 or 2. $x = 10$. About nine species in the warm regions of the world.

Imperata brevifolia Vasey (short-leaved) Satintail. Plants with short scaly rhizomes between clumps of flowering shoots. **CULMS** tufted, erect, 50–150 cm tall. **LIGULES** 0.7–3 mm long. **BLADES** flat, 5–18 mm wide, sometimes densely pilose on the upper surface near the ligule, otherwise glabrous or scaberulous. **PANICLES** 10–30 cm long, 2–3 cm wide, silvery white. **SPIKELETS** awnless, obscured by the long hairs. **GLUMES** 2.5–4 mm long. **LEMMAS** 2.5–3.5 mm long. **ANTHERS** 1.3–2.3 mm long, yellow to orange. $2n = 20$. Wet sites along streams in sandstone canyons along the San Juan arm of Lake Powell. UTAH. 1130–1150 m (3700–3770′). Flowering: Aug–Sep. Once known in scattered locales across the Desert Southwest, but now nearly absent from former sites.

Koeleria Pers. Junegrass

(for Georg Ludwig Koeler, 1765–1807, German botanist) Tufted annuals and perennials, some rhizomatous, with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat to rolled blades, and lacking auricles. **INFL** a panicle often spikelike, the rachis and branchlets puberulent. **SPIKELETS** 2- to 4-flowered, laterally compressed, the florets perfect or bearing a terminal vestigial floret; disarticulation above the glumes and between the florets, glumes unequal in shape, the first 1-nerved, the second broader and faintly 3-nerved, nearly reaching to the tip of the lemmas, lemmas 5-nerved, awnless or short-awned from the tip; palea 2-nerved, nearly as long as the lemma, hyaline and colorless, visible. **STAMENS** 3. $x = 7$. About 35 species of temperate and Arctic regions of the Northern Hemisphere. Annual members of the genus are sometimes removed to *Lophochloa* or *Rostraria* (Arnow 1994).

Koeleria macrantha (Ledeb.) Schult. (large-flowered) Junegrass. Tufted perennials with mostly basal foliage. **CULMS** 20–75 cm tall. **LIGULES** 0.5–2 mm long. **BLADES** 0.5–4 mm wide, flat or rolled upon drying, with prow-shaped tips. **PANICLES** 5–25 cm long, normally 1–2 cm wide, but up to 8 cm wide during anthesis (exceptional). **SPIKELETS** 4–5 mm long, mostly 2-flowered. **GLUMES** 3–5 mm long, the second broader toward the tip. **LEMMAS** 3–6 mm long, awn-tipped to an awn 1 mm long. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 1–3 mm long. $2n = 14, 28$. [*Koeleria cristata* of many authors; *Koeleria nitida* Nutt.]. Mountain slopes, foothills, plains, clearings in ponderosa forests, sparingly in subalpine communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SIn, SMg, NMEX: McK, RAr, San, SIn, UTAH. 2150–2850 m (7150–9350′). Flowering: Jun–Aug. Widely distributed throughout central and western North America, Eurasia.

Leptochloa P. Beauv. Sprangletop

(Greek *leptos*, slender, + *chloa*, grass) Tufted annuals and perennials, with hollow culms. **LEAVES** distributed up the culms, with open sheaths, membranous ligules, flat to rolled blades, lacking auricles. **INFL** a panicle of unbranched racemose primary branches. **SPIKELETS** 2- to several-flowered, short-pedicelled in 2 rows; disarticulation above the glumes and between the florets; glumes acute, awnless to mucronate, 1- to 3-nerved; lemmas prominently 3-nerved, usually hairy on the nerves, awnless to awned; paleas slightly shorter than the lemmas. **STAMENS** 1–3. $x = 10$. About 32 species in the tropical and temperate regions of the world (Snow 1998).

Leptochloa fusca (L.) Kunth (dark brown) Bearded sprangletop. Loosely tufted annuals. **CULMS** 10–100 cm tall, prostrate to erect. **LIGULES** 2–8 mm long. **BLADES** 2–7 mm wide, flat or rolled. **PANICLES** 5–45 cm long, the base often included in the sheath, the branches ascending to spreading. **SPIKELETS** 5- to 12-flowered. **GLUMES** 1-nerved, the first 2–4 mm long, the second 3.5–5.5 mm long and awn-tipped. **LEMMAS** 3.5–5 mm long, the nerves appressed-hairy, awned from a bifid apex, the awn to 3.5 mm long. **PALEAS** equal to the lemmas, hairy on the nerves. **ANTHERS** 1–3, 0.2–0.5 mm long. $2n = 20$. [*L. fascicularis* (Lam.) A. Gray]. Wet or drying margins of ponds and lakes, irrigated ground, wet disturbed sites. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1450–1800 m (4800–5800′). Flowering Jul–Sep. Throughout much of the United States, south through Mexico; South America. Our material belongs to **subsp *fascicularis*** (Lam.) N. W. Snow (in a bundle).

Leucopoa Griseb. Spike Fescue

(Greek *leucos*, white, and *poa*, bluegrass) Dioecious, rhizomatous perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a narrow or open panicle. **SPIKELETS** mostly unisexual, with rudiments of either stamens or pistils, 3- to 5-flowered, laterally compressed; disarticulation above the glumes and between the florets; glumes lance-ovate, semitransparent, whitish, shorter than the lowermost lemma, the first 1-nerved, the second 3-nerved; lemmas 5-nerved, acute to short-awned; palea subequal to the lemma, 2-keeled. **STAMENS** 3 in the staminate florets. $x = 7$. A small genus of about 10 species, nearly all of which are Asian, sometimes treated in *Festuca* or *Hesperochloa* (Weber 1966).

Leucopoa kingii (S. Watson) W. A. Weber (for Clarence King, 1842–1901, American geologist and mountaineer) Strongly rhizomatous and coarse perennials, forming large rings to 2 m in diameter. **CULMS** stout, 30–100 cm tall, arising from dense clumps of the old sheaths. **LIGULES** 1–4 mm long, erose-ciliate. **BLADES** firm, flat, 2–5 mm wide, striate. **PANICLES** narrow, congested, 5–20 cm long, the branches spikelet-bearing to the base. **SPIKELETS** with mostly 3–4 florets, sometimes fewer or more. **GLUMES** mostly unequal, the first 3–6 mm long, the second 4–7 mm long. **LEMMAS** 4.5–8 mm long, awnless or mucronate, scabrous or short-hirsute. **PALEAS** about equaling the lemmas. **ANTHERS** 3–6 mm long. $2n = 56$. [*Festuca kingii* (S. Watson) Cassidy; *Hesperochloa kingii* (S. Watson) Rydb.]. Rocky slopes and mesas, infrequent. COLO: LPl; NMEX: SJn. 1900–2150 m (6200–7000′). Flowering: Jun–Aug. Western United States

Leymus Hochst. Wildrye

(anagram of *Elymus*, without meaning) Rhizomatous perennials, with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat to convolute blades, and with or without auricles. **INFL** a spike, with 1–several spikelets per node; disarticulation above the glumes and between the florets. **SPIKELETS** 3- to 7-flowered, laterally compressed to only slightly compressed; glumes mostly subulate and 1- to 3-nerved; lemmas 5- to 7-nerved, awned or awnless; palea nearly equaling the lemma, 2-keeled. **STAMENS** 3. $x = 7$. About 30 species of temperate regions of North and South America and Eurasia (Barkworth and Atkins 1984).

1. Plants in giant clumps to 2 m or more tall, usually much taller than 100 cm; blades flat, 5–15 mm wide; spikelets usually 3–6 per node ..... ***L. cinereus***
1′ Plants mostly shorter than 100 cm (*L. triticoides* to 120 cm tall); blades flat to involute, 2.5–5 mm wide; spikelets 1–2 per node ..... (2)

2. Plants strongly rhizomatous, not bunch-forming ..... ***L. triticoides***
2′ Plants tufted or with short rhizomes but still bunch-forming ..... ***L. salina***

Leymus cinereus (Scribn. & Merr.) Á. Löve (ash-colored) Great Basin wildrye. Robust tussocky perennials, often forming clumps to 1 m across, typically without rhizomes. **CULMS** mostly 1–2 m tall or even more, sometimes as short as 70 cm. **LIGULES** 2–7 mm long. **BLADES** mostly flat, 5–15 mm wide, the auricles strongly developed to nearly absent. **SPIKES** 10–20 cm long, 1–3 cm wide, stiffly erect, with 3–6 spikelets per node. **SPIKELETS** 3- to 5-flowered. **GLUMES** nearly subulate, 7–14 mm long, nearly as long as the spikelet. **LEMMAS** lanceolate, 5- to 7-nerved, 8–10 mm long, awnless or short-awned to 5 mm. **ANTHERS** 4–6 mm long. $2n = 28, 56$. [*Elymus cinereus* Scribn. & Merr.]. Canyon bottoms, open grassy slopes and plains, openings in woodlands, roadsides. ARIZ: Nav; COLO: LPl, Mon, SJn; NMEX: SJn; UTAH. 1650–2050 m (5400–6700′). Flowering: Jun–Jul. Western and central North America.

Leymus salina (M. E. Jones) Á. Löve (from Salina Pass, Utah) Salina wildrye. Densely tufted perennials with short rhizomes. **CULMS** 35–70 cm tall, sometimes taller. **LIGULES** 0.2–0.7 mm long. **BLADES** flat to rolled, 2–4 mm wide, the auricles well developed and clasping the culm. **SPIKES** 5–12 cm long, mostly less than 1 cm wide, erect, slender, with 1–2 spikelets per node. **SPIKELETS** 2- to 4-flowered. **GLUMES** subulate, 4–8 mm long, about 1/2 to nearly as long as the spikelet. **LEMMAS** lanceolate, 5-nerved, 8–10 mm long, awnless or short-awned to 2 mm. **ANTHERS** 4–8 mm long. $2n = 28, 56$. [*Elymus salina* M. E. Jones]. Dry, sandy ground in desert scrub and woodland communities, clay hills. ARIZ: Nav; COLO: Dol, LPl, Mon; NMEX: SJn; UTAH. 1500–2300 m (4900–7600′). Flowering: Jun–Jul. Intermountain regions in the western United States.

Leymus triticoides (Buckley) Pilg. (resembling the genus *Triticum*) Creeping wildrye. Glaucous to green perennials from strongly creeping rhizomes. **CULMS** 30–70 cm tall, rarely up to 1 m or more tall, nearly single or few-clumped. **LIGULES** 0.2–0.7 mm long. **BLADES** flat to rolled, 2–5 mm wide, the auricles well developed and clasping the culm. **SPIKES** 3–8 cm long, 1–2 cm wide, erect, with 1–2 spikelets per node. **SPIKELETS** 3- to 6-flowered. **GLUMES** narrowly lanceolate to subulate, 6–10 mm long, with 1–3 nerves, 1/2 to 3/4 as long as the spikelet. **LEMMAS** lanceolate, 5- to 7-nerved, 6–9 mm long, often shiny and smooth, awnless or short-awned to 6 mm. **ANTHERS** 0.5–2.5 mm long. $2n = 28$. [*Elymus simplex* Scribn. & T. A. Williams; *Elymus triticoides* Buckley]. Benches, clay flats, desert scrub communities. ARIZ: Apa, Nav; COLO: Dol, SMg. 1300–1650 m (4400–5400′). Flowering: May–Aug. Western United States and northern Mexico.

Lolium L. Ryegrass

(the ancient Latin name, referred to by Virgil as a troublesome weed) Annuals or perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat or folded blades, and well-developed auricles. **INFL** a spike, without branches. **SPIKELETS** solitary at the nodes, attached edgewise to the rachis, several-flowered; disarticulation above the glumes and between the florets; glumes solitary, the first glume absent except on the terminal spikelet, present only on the side away from the rachis, equaling or exceeding the lowermost floret, 5- to 9-nerved, awnless; lemmas 5-nerved, awned or awnless; palea as long as the lemma, 2-keeled. **STAMENS** 3. $x = 7$. A small genus of about five species, native to Europe, Asia, and North Africa. Very closely related to the flat-leaved species of *Festuca* (*Schedonorus*), with which they hybridize (Soreng and Terrell 1997).

Lolium perenne L. (perennial) Perennial ryegrass. Plants tufted perennials, sometimes annual, glabrous. **CULMS** erect, 25–80 cm or more tall. **LIGULES** 0.5–1.5 mm long. **BLADES** 2–8 mm wide, the auricles to 2 mm long. **SPIKES** 5–25 cm long, the rachis sometimes flexuous. **SPIKELETS** 4- to 16-flowered. **GLUMES** 4–15 mm long, nearly as long as the lowermost floret. **LEMMAS** 4–9 mm long, awnless or awned to about 12 mm. **ANTHERS** 2–4 mm long. $2n = 14$.

[*Lolium multiflorum* Lam.; *Lolium perenne* L. subsp. *italicum* (A. Braun) Syme]. Moist, disturbed areas, roadsides, flower beds, escaped from lawn and pasture plantings. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon, NMEX: RAr, SIn, UTAH 1350–2750 m (4500–9000'). Flowering: Jun–Aug. Native to Europe, now widely introduced throughout North America. We have two intergrading races: long-awned plants with 8–16 florets and rolled leaves in young shoots may be assigned to var. *aristatum* Willd.; awnless plants with 3–10 florets and folded leaves in young shoots may be assigned to var. *perenne*.

Lycurus Kunth Wolftail

(Greek *lycos*, wolf, and *oura*, tail, referring to the bristly inflorescence) Tufted perennials with puberulent, pithy culms. **LEAVES** with open sheaths, membranous ligules, flat or folded blades, and lacking auricles. **INFL** bristly, spikelike panicles with highly shortened branches. **SPIKELETS** 1-flowered, borne in pairs which fall as a unit, usually 1 of the pair staminate or sterile; glumes subequal, the lower 2-awned, the upper 1-awned; lemmas 3-nerved, hairy on the nerves, tapering to an awn; palea about as long as the lemma, 2-keeled. **STAMENS** 3. $x = 10$. A small genus of three species native to amphitropical North America. Our species can only be distinguished by vegetative means.

1. Upper leaves acute or with a mucro or bristle 1–3 mm long; ligules 1.5–3 mm long, with evident narrow triangular lobes 1.5–3 mm long on the sides; culms erect to ascending, often geniculate ..... ***L. phleoides***
1' Upper leaves terminating in a fragile, awnlike tip 4–12 mm long; ligules 3–12 mm long, elongate, acute or acuminate, sometimes with a small cleft on either side; culms erect ..... ***L. setosus***

Lycurus phleoides Kunth (resembling the genus *Phleum*) Wolftail. **CULMS** 20–50 cm long, often geniculate-based. **LIGULES** 1.5–3 mm, commonly acute to acuminate, with narrow triangular lobes 1.5–3 (4) mm long extending from the sides of the sheaths. **BLADES** 4–8 cm long, 1–1.5 mm wide, acute or mucronate, the apex sometimes extending up to 3 mm as a short bristle. **PANICLES** 4–10 cm long, less than 1 cm wide. **GLUMES** 1–2 mm long, the first 2-nerved, the awns 1–3 mm long. **LEMMAS** 3–4 mm long, the awn 1–3 mm long. **ANTHERS** 1.5–2 mm long, yellow. $2n = 40$. Gravelly or rocky hills and slopes. ARIZ: Apa, Coc, Nav; NMEX: McK. 1650–2250 m (5400–7300'). Flowering: Jun–Aug. Southwestern United States and Mexico, northern South America.

Lycurus setosus (Nutt.) C. Reeder (bristly) Bristly wolftail. **CULMS** 25–50 cm long, erect. **LIGULES** 3–12 mm, hyaline, acuminate, sometimes shortly cleft on the sides. **BLADES** 4–10 cm long, 1–2 mm wide, glabrous, the apex fragile, easily broken, awnlike, 3–12 mm long. **PANICLES** 4–10 cm long, less than 1 cm wide. **GLUMES** 1–2 mm long, the first 2-nerved, the awns 1–3 mm long. **LEMMAS** 3–4 mm long, the awn 1–3 mm long. **ANTHERS** 1.5–2 mm long, yellow. $2n = 40$. [*Lycurus phleoides* Kunth var. *glaucifolius* Beal]. Slickrock community with stunted ponderosa pine. NMEX: McK. 2125–2300 m (7000–7500'). Flowering: Aug–Sep. Southwestern United States and northern Mexico, Bolivia, Argentina. This may be more aptly treated as a variety of *Lycurus phleoides*.

Melica L. Melica

(Greek *meli*, honey) Tufted or rhizomatous perennials, with hollow culms, often from bulbous bases. **LEAVES** with closed sheaths, membranous ligules, flat to rolled blades, and lacking auricles. **INFL** a terminal panicle, sometimes weakly developed and racemose; disarticulation below or above the glumes. **SPIKELETS** with 1–6 fertile florets, terminated by 1–4 sterile florets clustered together (the rudiment); glumes papery, 1- to 7-nerved; lemmas membranous, 7- to 15-nerved, awnless or 1-awned; palea 1/2 to as long as the lemma, 2-keeled. **STAMENS** 3. $x = 9$. About 80 species in the temperate regions of the world (except Australia).

Melica porteri Scribn. (for Thomas Conrad Porter, 1822–1901, American botanist, poet, and classicist) Porter's melica. Plants with short rhizomes, sometimes loosely tufted. **CULMS** 50–85 cm tall (sometimes taller), lacking corms. **BLADES** flat, lax, 2–5 mm wide. **PANICLES** 12–25 cm long, the branches basally. **LIGULES** 1–7 mm long, lacerate. **SPIKELETS** on erect and with 1–2 spikelets; disarticulation below the glumes, sometimes the florets falling out also. **GLUMES** unequal, the first 3–6 mm long, the second 5–8 mm long. **LEMMAS** 6–10 mm long, glabrous, 5- to 11-nerved, awnless. **PALEAS** about 2/3 the length of the lemmas, sharply reflexed pedicels, 2- to 5-flowered, 8–16 mm long. **ANTHERS** 1–2.5 mm long. **TERMINAL RUDIMENT** 2–5 mm long. $2n = 18$. Moist, rocky slopes and talus. COLO: Arc, Hin, LPl, Min, Mon, SJn. 2300–2900 m (7500–9500'). Flowering: Aug–Sep. Southwestern United States and northern Mexico.

Muhlenbergia Schreb. Muhly

(for Gotthilf Heinrich Ernst Muhlenberg, 1753–1815, Lutheran pastor and pioneering botanist of Pennsylvania) Delicate annuals to robust perennials, rhizomatous or tufted, with hollow or pithy culms. **LEAVES** with open sheaths,

membranous ligules, flat to rolled blades, and lacking auricles. **INFL** a terminal and sometimes axillary panicle, diverse; disarticulation mostly above the glumes. **SPIKELETS** 1-flowered (rarely with 2–3 florets); glumes mostly 1- or 2-nerved, much shorter to longer than the floret; lemmas 3-nerved, awnless or awned from the apex; paleas shorter than or equaling the lemma. **STAMENS** 3 (sometimes fewer). $x = 10$. About 155 species, mostly in the New World. (Peterson and Annable 1991.)

1. Plants annual ..... (2)
1′ Plants perennial ..... (8)

2. First glume prominently 2-nerved, usually cleft; panicle branches falling as a unit, bearing 2–3 (4) spikelets ..... (3)
2′ First glume 1-nerved; panicle branches persistent ..... (4)

3. Glumes about 1/2 the length of the floret; spikelets 3.5–6 mm long; lemma awns 10–20 mm long ..... ***M. brevis***
3′ Glumes and floret about equal in length; spikelets 2.5–3.5 mm long; lemma awns 0.5–5 (10) mm long ..... ***M. depauperata***

4. Lemma awns 10–30 mm long ..... ***M. tenuifolia***
4′ Lemma awns 0–5 mm long ..... (5)

5. Panicle narrow, contracted, the branches appressed to the main axis; culms decumbent-based and often rooting at the nodes ..... ***M. filiformis***
5′ Panicle open, the branches spreading; culms erect to somewhat decumbent, rarely rooting ..... (6)

6. Pedicels 0.3–1 mm long, stout, of equal thickness throughout; blades lacking thickened white margins ..... ***M. ramulosa***
6′ Pedicels 2–8 mm long, capillary, narrowed downward; blades with or without thickened white margins ..... (7)

7. Glumes minutely pubescent to long-pubescent, at least at the apex (use a lens); blade margins somewhat white-thickened, but this often obscure ..... ***M. minutissima***
7′ Glumes glabrous; blade margins prominently white-thickened ..... ***M. fragilis***

8. Second glume evidently 3-nerved, often 3-toothed; lower sheaths flattened, ribbonlike ..... (9)
8′ Second glume 1-nerved, entire or fringed; lower sheaths usually not ribbonlike ..... (10)

9. Ligules 2–5 mm long; lemma awns 1–5 mm long; stems and blades very slender and narrow; plants usually 15–30 cm tall ..... ***M. filiculmis***
9′ Ligules 10–20 mm long and the tip often shredded; lemma awns 6–25 mm long; stems and blades more robust; plants 25–80 cm tall ..... ***M. montana***

10. Stems stiff, wiry, much-branched, the plants twiggy ..... ***M. porteri***
10′ Stems not as above, the plants not twiggy ..... (11)

11. Plants with evident, slender, creeping rhizomes ..... (12)
11′ Plants tufted, or sometimes the bases decumbent and spreading, but lacking creeping rhizomes ..... (20)

12. Callus hairs very copious, as long as the body of the lemma ..... ***M. andina***
12′ Callus hairs long-pubescent to glabrous, but the hairs much shorter than the body of the lemma ..... (13)

13. Panicles open, loosely flowered with usually spreading to divergent branches at maturity ..... (14)
13′ Panicles contracted, narrow and usually densely flowered, the branches mostly erect to appressed ..... (15)

14. Awns 1–1.5 (2) mm long; panicle branches attached in clusters; blades markedly stiff and pungent ..... ***M. pungens***
14′ Awns 0–0.3 mm long; panicle branches not clustered; blades lax or somewhat stiff ..... ***M. asperifolia***

15. Blades 3–6 mm wide, flat, dark green ..... ***M. racemosa***
15′ Blades 0.5–2 mm wide, flat to rolled, often grayish ..... (16)

16. Lemmas short-pilose on the lower 1/3 to 3/4, the hairs 0.5–1.5 mm long ..... (17)
16′ Lemmas glabrous or scaberulous only ..... (19)

17. Lemma awns 0–1 mm long; blades narrowed at the base where they join the sheath ..... ***M. thurberi***
17′ Lemma awns 1–20 mm long; blades not narrowed at the base ..... (18)

18. Ligules 1–2 mm long, with lateral lobes about 1 mm or so long; lemma awns 4–20 mm long, blades commonly rolled and mostly ascending ..... ***M. arsenei***
18' Ligules 0.2–0.6 mm long, lacking lateral lobes; lemma awns 1–6 mm long; many blades flat and stiffly diverging at right angles ..... ***M. curtifolia***

19. Inflorescence usually included in the sheath at least below, with 9 nodes or fewer; ligules 0.5–1.5 mm long; lemmas mostly 3–4 mm long ..... ***M. repens***
19' Inflorescence usually well exserted from the sheath, with 11–12 nodes; ligules 1–3 mm long; lemmas 2–2.8 mm long ..... ***M. richardsonis***

20. Sheaths (at least the lower) compressed-keeled; blades flat or folded ..... ***M. wrightii***
20' Sheaths rounded on the back; blades usually becoming rolled ..... (21)

21. Lemma awns 0–4 (5) mm long ..... (22)
21' Lemma awns 6–40 mm long ..... (25)

22. Glumes, excluding the awn, 3/4 or more the length of the floret ..... ***M. rigens***
22' Glumes, excluding the awn, 2/3 or less the length of the floret ..... (23)

23. Mature panicles narrow, densely flowered, 0.5–2 cm wide, the primary branches erect to appressed ***M. wrightii***
23' Mature panicles open, loosely flowered, 4–15 cm wide, at least the primary branches widely spreading (24)

24. Blades strongly arcuate, curving, less than 1 mm wide, 1–3 (4) cm long; leafy portion 1/16 to 1/8 the length of the plant; lateral pedicels commonly longer than the spikelets ..... ***M. torreyi***
24' Blades rather straight, 1–2 mm wide, 3–15 cm long; leafy portion 1/3 to 1/2 the length of the plant; lateral pedicels commonly shorter than the spikelets ..... ***M. arenicola***

25. Awns 7–10 mm long ..... (26)
25' Awns 10–40 mm long ..... (27)

26. Blades mostly 1–4 (5) cm long; glumes acute; lemmas and paleas sparsely but noticeably short-pilose on the lower 1/2; lateral lobes of ligules less than 1.5 mm long ..... ***M. arsenei***
26' Blades mostly 4–14 cm long; glumes acuminate to aristate; lemmas and paleas glabrous or minutely scaberulous; lateral lobes of ligules 1.5–3 mm long ..... ***M. pauciflora***

27. Lemmas essentially glabrous, with only a few closely appressed callus hairs; ligules with lateral lobes 1.5–3 mm long ..... ***M. pauciflora***
27' Lemmas pubescent on the lower 1/2; ligules without lateral lobes ..... ***M. tenuifolia***

Muhlenbergia andina (Nutt.) Hitchc. (of the Andes or other high mountains) Foxtail muhly. Rhizomatous perennials. **CULMS** 25–70 cm tall, erect. **LIGULES** 0.5–1.5 mm long, truncate, lacerate. **BLADES** flat, 2–4 mm wide, pubescent above. **PANICLES** contracted, densely flowered, plumose, 2–15 cm long, less than 3 cm wide. **SPIKELETS** 2–4 mm long. **GLUMES** as long as or longer than the florets, 1-nerved, narrow. **LEMMAS** 2–3.5 mm long, lanceolate, copiously long-hairy, the hairs as long as the floret; awns 1–10 mm long. **PALEAS** equaling the lemmas. **ANTHERS** 0.4–1.5 mm long, yellow. $2n = 20$. Wet meadows, marshes, gravel bars in the mountains. ARIZ: Apa, Nav; COLO. Arc, Hin, LPl, Min, Mon, SJn; NMEX: SJn; UTAH. 1500–2500 m (5000–8000'). Flowering: Jul–Aug. Western United States

Muhlenbergia arenicola Buckley (sand-loving) Sand muhly. Tufted perennials. **CULMS** 20–60 cm tall, slightly decumbent-based, otherwise erect. **LIGULES** 2–9 mm long, lacerate. **BLADES** 1–2 mm wide, not arcuate, flat to rolled or folded, not white-margined. **PANICLES** 12–25 cm long, open, to 18 cm wide, the lateral pedicels commonly shorter than the spikelet. **SPIKELETS** 2.5–4 mm long. **GLUMES** 1.5–2.5 mm long, 1-nerved, acute to acuminate, awn-tipped. **LEMMAS** 2.5–4 mm long, often purplish, appressed-puberulent on the lower 1/2; awn 0.4–4 mm long. **PALEAS** slightly shorter than the lemmas, with 2 tiny awns. **ANTHERS** 1.5–2 mm long, greenish. $2n = 80, 82$. Sandy slopes and mesas in grassland regions. NMEX: San. 2000–2150 m (6800–7100'). Flowering: Jul–Sep. Southwestern United States to central Mexico, Argentina.

Muhlenbergia arsenei Hitchc. (for Brother Gustave Arsène, 1867–1938, French clergyman-botanist who lived in Santa Fe, New Mexico) Arsène's muhly. Rhizomatous perennials, the rhizomes sometimes short and the plants tufted. **CULMS** 15–50 cm tall, decumbent-based. **LIGULES** 1–2 mm long, with lateral lobes, the lobes less than 1.5 mm

longer than the central portion. **BLADES** 1–2 mm wide, flat to rolled. **PANICLES** 4–12 cm long, 1–3 cm wide, narrow. **SPIKELETS** 3.5–5 mm long (excluding awn). **GLUMES** subequal, 2–4 mm long, 1-nerved, acuminate to awn-tipped. **LEMMAS** 3.5–5 mm long, purplish with green nerves, hairy on the lower 1/2 or less, the hairs to 1.5 mm long; awn 4–16 mm long. **PALEAS** equaling the lemmas. **ANTHERS** 1.3–3 mm long, purplish. $2n$ = unknown. Rocky outcrops and washes of limestone and travertine parent material; piñon-juniper woodland and ponderosa pine forest communities. ARIZ: Apa, Nav; NMEX: McK. 1900–2200 m (6300–7300'). Flowering: Aug–Sep. Southwestern United States, northern Mexico.

Muhlenbergia asperifolia (Nees & Meyen ex Trin.) Parodi (rough-leaved) Scratchgrass. Rhizomatous, bushy perennials, sometimes stoloniferous. **CULMS** 20–60 cm long, erect to decumbent-spreading. **LIGULES** 0.2–1 mm long. **BLADES** 1–3 mm wide, flat. **PANICLES** ovoid, 6–20 cm long, 4–15 cm wide. **SPIKELETS** 1–2 mm long. **GLUMES** equal, 0.6–1.7 mm long, 1-nerved, purplish. **LEMMAS** lanceolate, 1.2–2.1 mm long, acute to mucronate, the mucro to 0.3 mm long. **PALEAS** equaling the lemmas. **ANTHERS** 1–1.3 mm long. $2n$ = 20, 22, 28. Wet meadows, around seeps and springs, stream banks. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1600–2400 m (5200–7900'). Flowering: Jul–Aug. Throughout western North America.

Muhlenbergia brevis C.O. Goodd. (short) Short muhly. Tufted annuals. **CULMS** 3–20 cm tall, erect, congested. **LIGULES** 1–3 mm long. **BLADES** 0.8–2 mm wide, the margins whitish-thickened. **PANICLES** 3–10 cm long, narrow, less than 2 cm wide. **SPIKELETS** 3–6 mm long, in pairs; disarticulation below the spikelet pair. **GLUMES** unequal, about 1/2 as long as the lemma, the first 2–3.5 mm long and 2-nerved, bifid with teeth or awns to 2 mm long, the second 2.4–4 mm long, 1-nerved, awned to 2 mm. **LEMMAS** 3.5–6 mm long, appressed-pubescent; awn stiff, 10–20 mm long. **PALEAS** equaling the lemmas. **ANTHERS** 0.5–1 mm long. $2n$ = 20. Rocky outcrops and barrens amid grasslands and woodlands. ARIZ: Apa. 1650–1900 m (5400–6300'). Flowering: Jul–Aug. Southwestern United States to central Mexico.

Muhlenbergia curtifolia Scribn. (short-leaved) Utah muhly. Rhizomatous perennials, the foliage glabrous to hirtellous. **CULMS** 5–45 cm tall. **LIGULES** 0.2–0.6 mm long, lacking lateral lobes. **BLADES** mostly 1–3 cm long, 1–2 mm wide, flat at the base, rolled or folded above, conspicuously diverging at right angles or reflexed. **PANICLES** 2–8 cm long, to 1 cm wide. **SPIKELETS** 3–4 mm long. **GLUMES** equal, 1-nerved, 2.5–4 mm long. **LEMMAS** lanceolate, 2.8–4 mm long, short-pilose on the lower 3/4, the hairs 1–1.5 mm long; awn 1–6 (12) mm long. **PALEAS** equaling and pubescent like the lemmas. **ANTHERS** 1.2–1.6 mm long, yellow-purple. $2n$ = unknown. Along moist vertical wall joints and fractures, and talus slopes among sandstone boulders and cliffs. ARIZ: Apa, Nav; UTAH. 1120–2450 m (3700–8000'). Flowering: Jul–Sep. Southwestern United States. This has been incorrectly merged with the sometimes sympatric *M. thurberi* by some authors, but that species can be distinguished by its ascending, rolled blades and awns less than 1 mm long.

Muhlenbergia depauperata Scribn. (impoverished) Six-weeks muhly. Tufted, short-lived annuals. **CULMS** 3–15 cm tall. **LIGULES** 1.5–2.5 mm long, with lateral lobes. **BLADES** 1–3 cm long, 0.5–1.5 mm wide, flat or rolled, the margins whitish-thickened. **PANICLES** 2–8 cm long, narrow, less than 1 cm wide. **SPIKELETS** 2.5–5 mm long, in pairs; disarticulation below the spikelet pair. **GLUMES** unequal, as long as or longer than the floret, the first 2.3–4 mm long and 2-nerved, bifid with teeth to 1.3 mm long, the second 3–5 mm long and 1-nerved, acuminate. **LEMMAS** 2.5–4.5 mm long, appressed-pubescent; awn stiff, 6–15 mm long. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 0.4–0.8 mm long, purplish to yellowish. $2n$ = 20. Sandy banks, gravelly rock outcrops and flats, usually on calcareous or volcanic soils. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1500–1900 m (5000–6200'). Flowering: Aug–Sep. Southwestern United States to southern Mexico.

Muhlenbergia filiculmis Vasey (threadlike stems) Slimstem muhly. Tufted perennials with erect foliage and flattened sheaths. **CULMS** 5–30 cm tall. **LIGULES** 2–5 mm long. **BLADES** 0.4–1.6 mm wide, tightly rolled, stiff, with pungent tips. **PANICLES** 2–7 cm long, narrow, less than 1 cm wide. **SPIKELETS** 2.2–3.5 mm long. **GLUMES** equal, 1–2.5 mm long, the first 1-nerved and awned to 1.6 mm long, the second 3-nerved and 3-toothed. **LEMMAS** 2.2–3.5 mm long, yellowish and mottled with green, sparsely appressed-pubescent on the lower portion, the hairs less than 0.5 mm long; awn 1–5 mm long. **PALEAS** as long as the lemmas. **ANTHERS** 1.5–2 mm long, purplish. Forest clearings and grasslands in the mountains. NMEX: SJn; UTAH. 2500–3500 m (8200–11500'). Flowering: Aug–Sep. Southern Rocky Mountains.

Muhlenbergia filiformis (Thurb. ex S. Watson) Rydb. (threadlike) Pull-up muhly. Tufted annuals, the bases sometimes clumped and appearing perennial. **CULMS** 5–25 cm long, erect to commonly geniculate-based and rooting at the nodes. **LIGULES** 1–3.5 mm long. **BLADES** flat to rolled, 0.6–1.6 mm wide. **PANICLES** spikelike, 2–6 cm long, less than

1 cm wide, exserted from the sheath. **SPIKELETS** 1.5–3.2 mm long. **GLUMES** 1-nerved, rounded to obtuse, subequal, 0.6–1.7 mm long. **LEMMAS** 1.5–3 mm long, appressed-hairy, the hairs less than 0.3 mm long, awnless to mucronate. **PALEAS** equaling the lemmas. **ANTHERS** 0.5–1.2 mm long, purplish. $2n = 18$. Wet meadows, shores of ponds and springs, in the mountains. ARIZ: Apa; COLO: Min, SJn; NMEX: McK, SIn. 2200–2600 m (7200–8600'). Flowering Jun–Aug. Western United States to northern Mexico.

Muhlenbergia fragilis Swallen (brittle) Delicate muhly. Tufted annuals. **CULMS** 10–30 cm tall, mostly erect. **LIGULES** 1–3 mm long, with lateral pointed lobes. **BLADES** flat, 0.5–2 mm wide, the margins whitish-thickened. **PANICLES** open, diffuse, 10–22 cm long, 4–10 cm wide. **SPIKELETS** about 1 mm long, on delicate straight pedicels. **GLUMES** 0.5–1 mm long, 1-nerved, glabrous or minutely and obscurely puberulent, obtuse. **LEMMAS** 1–1.2 mm long, glabrous to puberulent, awnless. **PALEAS** equaling the lemmas. **ANTHERS** 0.3–0.5 mm long, purplish. $2n = 20$. Moist, sandy ground and rocky clearings, from desert to pine forest communities. ARIZ: Nav; NMEX: McK, UTAH. 1950–2200 m (6400–7200'). Flowering: Jul–Sep. Southwestern United States to southern Mexico.

Muhlenbergia minutissima (Steud.) Swallen (very tiny) Least muhly. Tufted annuals. **CULMS** erect, 5–40 cm tall. **LIGULES** 1–2.5 mm long, with or without lateral lobes. **BLADES** flat to rolled, 1–2 mm wide, the margins not or obscurely whitish-thickened. **PANICLES** 5–18 cm long, 2–6 cm wide, open. **SPIKELETS** 0.8–1.5 mm long, on capillary pedicels. **GLUMES** 1-nerved, sparsely hairy at least near the apex, subequal, 0.5–0.9 mm long, obtuse. **LEMMAS** 0.8–1.5 mm long, glabrous or minutely hairy, awnless. **PALEAS** as long as the lemmas. **ANTHERS** 0.2–0.7 mm long, purplish. $2n = 60, 80$. Moist, sandy or gravelly sites, roadsides, open ground. ARIZ: Apa, Coc, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn. 1900–2700 m (6200–8800'). Flowering: Jul–Sep. Western United States to southern Mexico.

Muhlenbergia montana (Nutt.) Hitchc. (of mountains) Mountain muhly. Tufted perennials. **CULMS** 20–80 cm tall, with curling foliage and flattened sheaths. **LIGULES** (4) 10–20 mm long, acuminate, the tip often shredded. **BLADES** flat to rolled, 1–2.5 mm wide. **PANICLES** 5–22 cm long, narrow but loose, 2–5 cm wide. **SPIKELETS** 3–7 mm long. **GLUMES** 2–4 mm long, subequal, the first 1-nerved and sometimes awn-tipped, the second 3-nerved and 3-toothed to 1.5 mm long. **LEMMAS** 3–5 mm long, loosely short-pilose, the hairs less than 1 mm long; awn 5–25 mm long, flexuous. **PALEAS** as long as the lemmas. **ANTHERS** 1.5–2.3 mm long, purplish. $2n = 20, 40$. Grassy parklands and slopes in the mountains, often in pine forests, to subalpine communities. ARIZ: Apa; COLO: Arc, Hin, Min, Mon, SIn, SMg; NMEX: McK, SJn; UTAH. 2200–2800 m (7350–9100'). Flowering: Jul–Sep. Western United States south to Guatemala.

Muhlenbergia pauciflora Buckley (few-flowered) New Mexico muhly. Tufted perennials, sometimes shortly rhizomatous, the foliage sometimes with brownish necrotic spots. **CULMS** 30–70 cm tall, geniculate-based and sometimes rooting at the lower nodes. **LIGULES** 1–3 mm long, with lateral lobes 1.5–3 mm long. **BLADES** 0.5–1.5 mm wide, flat or rolled. **PANICLES** 4–15 cm long, 1–3 cm wide, narrow but loosely flowered. **SPIKELETS** 3.5–5.5 mm long. **GLUMES** equal, 1.5–3.5 mm long, 1-nerved, acuminate to awn-tipped to 2 mm. **LEMMAS** 3–5.5 mm long, glabrous or with sparse short hairs only at the base; awn 6–25 mm long, flexuous. **PALEAS** as long as the lemmas. **ANTHERS** 1.5–2.1 mm long, yellowish or purplish. $2n$ = unknown. [*M. neomexicana* Vasey]. Rocky slopes and hills, outcrops, and canyons in the forests. ARIZ: Apa; COLO: LPl; NMEX: McK, SJn; UTAH. 1850–2400 m (6000–7800'). Flowering: Aug–Sep. Southwestern United States to central Mexico.

Muhlenbergia porteri Scribn. ex Beal (for Thomas Conrad Porter, 1822–1901, American botanist, poet, and classicist) Loosely tufted perennials from knotty, twiggy bases, not rhizomatous, forming rounded bushy growths. **CULMS** 25–100 cm tall, twiggy, branching at nearly all the nodes, the branches stiff and divergent. **LIGULES** 1–3 mm long, lacerate. **BLADES** 2–8 cm long, 0.5–2 mm wide, flat or folded. **PANICLES** ovoid, purplish, 4–15 cm long and about as wide. **SPIKELETS** 3–4.5 mm long, on pedicels 3–15 mm long. **GLUMES** 2–3 mm long, equal, shorter than the lemma, acute to mucronate. **LEMMAS** 3–4.5 mm long, appressed-pubescent on the lower 1/2 or so, awn 2–12 mm long, straight. **PALEAS** as long as the lemmas. **ANTHERS** 1.5–2.3 mm long, yellowish to purplish. $2n = 20, 23, 24, 40$. Desert plains and mesas, often among shrubs and boulders. ARIZ: Apa, Coc, Nav; NMEX: McK, SIn; UTAH. 1650–1900 m (4800–6200'). Flowering: Jul–Sep. Southwestern United States to northern Mexico. Bush muhly is highly prized by livestock and will disappear from heavily grazed rangelands.

Muhlenbergia pungens Thurb. ex A. Gray (sharp, referring to the blades) Sandhill muhly. Rhizomatous perennials, forming circular clumps. **CULMS** 15–70 cm tall, decumbent-based, hairy below the nodes. **LIGULES** 0.2–1 mm long, densely ciliolate. **BLADES** 2–8 cm long, 1–2 mm wide, flat to tightly rolled, stiff and pungent-tipped. **PANICLES** 8–16

cm long, 4–12 cm wide, open when mature, appearing fascicled when young. **SPIKELETS** 2.5–4.4 mm long. **GLUMES** 1.2–3 mm long, equal, 1-nerved, awn-tipped to 1 mm. **LEMMAS** 2.5–4.5 mm long, purplish, scaberulous only, not noticeably hairy; awn 1–2 mm long, straight. **PALEAS** as long as the lemmas, 2-awned to 2 mm. **ANTHERS** 1.8–2.6 mm long, purplish. $2n = 26, 42, 60$. Sandy soils and dunes in desert to piñon-juniper woodland communities. ARIZ: Apa, Coc, Nav; COLO: LPl; NMEX: McK, RAr, San, SJn; UTAH. 1350–2250 m (4500–7400'). Flowering: Jul–Sep. Central and western United States. Blades are often stiff and sharp enough to puncture the skin as one reaches into a clump.

Muhlenbergia racemosa (Michx.) Britton, Sterns & Poggenb. (racemelike) Green muhly. Rhizomatous perennials. **CULMS** stiffly erect, 30–110 cm tall, branched above the middle, internodes strongly keeled. **LIGULES** 0.6–1.5 mm long, truncate, ciliolate. **BLADES** flat, 3–6 mm wide, some a bit narrower, dark green. **PANICLES** 2–16 cm long, 0.5–2 cm wide, narrow and densely flowered, slightly bristly. **SPIKELETS** 3–8 mm long, nearly sessile. **GLUMES** 1-nerved, equal, 3–8 mm long (including the awn), 1–2 times as long as the lemma, acuminate to an awn to 5 mm long. **LEMMAS** 2.2–3.8 mm long, pilose on the lower 1/2, the hairs to 1 mm long, unawned or awned to 1 mm. **PALEAS** about as long as the lemmas. **ANTHERS** 0.4–0.8 mm long, yellowish. $2n = 40$. Meadows, along ditches and roadsides. ARIZ: Apa; COLO: Arc; NMEX: McK, SJn; UTAH. 1800–2250 m (5900–7300'). Flowering: Jul–Sep. Central Canada and United States, to western states and northern Mexico. The flat, green blades and profuse branching are distinctive.

Muhlenbergia ramulosa (Kunth) Swallen (branched) Red muhly. Tufted annuals. **CULMS** 3–20 cm tall, with erect branches from the base. **LIGULES** 0.2–0.5 mm long. **BLADES** flat to rolled, 0.8–1.2 mm wide, the margins not whitish-thickened. **PANICLES** open, ovoid, 2–9 cm long, 1–3 cm wide. **SPIKELETS** 0.8–1.3 mm long, on stout thick pedicels. **GLUMES** equal, 0.4–0.7 mm long, shorter than the floret, glabrous, awnless. **LEMMAS** 0.8–1.3 mm long, glabrous to sparsely puberulent, awnless. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 0.2–0.3 mm long, purplish. $2n = 20$. [*Muhlenbergia wolfii* (Vasey) Rydb.]. Open, sandy meadows, edges of ponds and lakes, washes, and roadcuts, pine forests. COLO: LPl, Mon, SJn; NMEX: SJn. 2250–2400 m (7400–7900'). Flowering: Aug–Sep. Southwestern United States, Mexico, Guatemala, Costa Rica, Argentina.

Muhlenbergia repens (J. Presl) Hitchc. (creeping) Creeping muhly. Rhizomatous perennials, forming low, nearly turflike, mats. **CULMS** 5–30 cm tall, decumbent-based. **LIGULES** 0.1–1.5 mm long, truncate. **BLADES** 0.5–5 cm long, 0.5–1.5 mm wide, rolled. **PANICLES** few-flowered, narrow, 1–9 cm long, less than 0.6 cm wide, the base often included in the subtending sheath. **SPIKELETS** 2.6–4.2 mm long, occasionally 2-flowered. **GLUMES** subequal, 1–3.5 mm long, 1/2 to as long as the lemma, mostly 1-nerved, acute, unawned. **LEMMAS** (2.8) 3–4 mm long, glabrous to appressed-pubescent with tiny hairs, acuminate to mucronate. **PALEAS** shorter than the lemmas. **ANTHERS** 0.7–1.4 mm long, yellowish to purplish. $2n = 60, 70, 71, 72$. Moist plains, flats, swales, and roadsides. ARIZ: Apa; NMEX: McK, SJn; UTAH. 1750–2500 m (5800–8200'). Flowering: Jul–Sep. Southwestern United States to southern Mexico.

Muhlenbergia richardsonis (Trin.) Rydb. (for Sir John Richardson, 1787–1865, Scottish naturalist) Mat muhly. Rhizomatous perennials, mat-forming. **CULMS** 10–30 cm tall, decumbent-based. **LIGULES** 0.8–3 mm long, erose. **BLADES** 1–6 cm long, 0.5–3 mm wide, flat to rolled. **PANICLES** few-flowered, narrow, 1–15 cm long, less than 2 cm wide, usually exserted from the sheath. **SPIKELETS** 1.7–3.1 mm long, occasionally 2-flowered. **GLUMES**

subequal, 0.6–2 mm long, 1/3 to 1/2 as long as the lemma, mostly 1-nerved, acute to mucronate. **LEMMAS** 1.7–2.8 mm long, glabrous, acuminate to mucronate to 0.5 mm. **PALEAS** about as long as the lemmas. **ANTHERS** 0.9–1.6 mm long, yellowish to purplish. $2n = 40$. Mountain meadows and cienegas, shores of ponds, alkaline flats, foothills to the mountains. ARIZ: Apa; COLO: LPl, Mon, SJn; NMEX: McK, SJn. 2300–2700 m (7600–8800'). Flowering: Jul–Sep. Throughout western Canada and United States.

Muhlenbergia rigens (Benth.) Hitchc. (stiff, rigid) Deergrass. Tufted, tussocky perennials, lacking rhizomes. **CULMS** erect, 40–150 cm tall. **LIGULES** 0.5–3 mm long, truncate. **BLADES** stiff, flat or rolled, 15–50 cm long, 1.5–5 mm wide. **PANICLES** spikelike, 15–50 cm long, 0.5–1 cm wide. **SPIKELETS** 2.5–4 mm long. **GLUMES** 1.8–3.2 mm long, nearly as long as the florets, 1-nerved, acute to mucronate to 0.5 mm. **LEMMAS** 2.4–4 mm long, short-hairy only at the base, awnless. **PALEAS** only slightly shorter than the lemmas. **ANTHERS** 1.3–1.8 mm long, yellowish to purplish. $2n = 40$. [*Muhlenbergia mundula* I. M. Johnst.]. Rocky ravines and washes, along woodland streams. UTAH. 1800–1950 m (5900–6400'). Flowering: Jul–Sep. Southwestern United States to southern Mexico.

Muhlenbergia tenuifolia (Kunth) Trin. (thin-leaved) Mesa muhly. Tufted annuals or short-lived perennials, lacking rhizomes. **CULMS** 20–60 cm tall, erect or decumbent-based. **LIGULES** 1–4 mm long, acute and lacerate. **BLADES** flat or loosely rolled, 1.2–2.5 mm wide. **PANICLES** terminal and axillary, several per shoot, mostly 5–10 cm long, narrow, 0.5–2 cm wide, often nodding. **SPIKELETS** 2–4 mm long. **GLUMES** 1.2–2.8 mm long, shorter than the florets, 1-nerved, awnless to awn-tipped. **LEMMAS** 2–4 mm long, hairy on the lower 1/2; awns 10–30 mm long, sinuous. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 0.9–1.5 mm long, yellowish. $2n = 20, 40$. [*M. monticola* Buckley]. Rocky outcrops and ledges, canyon walls. ARIZ: Apa; COLO: Mon; NMEX: McK, SJn. Flowering: Jul–Sep. Southwestern United States, south through Mexico to northern South America.

Muhlenbergia thurberi (Scribn.) Rydb. (for George Thurber, 1821–1890, botanist with the United States-Mexico boundary survey in the mid-1800s) Thurber's muhly. Green to glaucous perennials, with slender creeping rhizomes. **CULMS** wiry, 10–40 cm tall, clumped together, decumbent-based. **LIGULES** 1–1.2 mm long. **BLADES** tightly involute, 1–4 cm long, 0.2–1 mm wide, the margins not whitish-thickened. **PANICLES** narrow, 1–6 cm long, less than 1 cm wide. **SPIKELETS** 2.6–4 mm long. **GLUMES** subequal, 1.6–3 mm long, awnless. **LEMMAS** 2.6–4 mm long, pubescent on the lower 3/4, awnless or awn-tipped to 1 mm. **PALEAS** as long as the lemmas. **ANTHERS** 2.1–2.3 mm long, yellowish purple. $2n$ = unknown. Seeps and springs, often at the base of cliffs and ledges, juniper to ponderosa pine zones, imperfectly known from the *Flora* region. NMEX: San. 2050–2200 m (6800–7200'). Flowering: Aug–Sep. Southwestern United States. This has been incorrectly expanded by some authors to include the sometimes sympatric *M. curtifolia*, but that species can be distinguished by its widely spreading flat blades and awns 1–12 mm long.

Muhlenbergia torreyi (Kunth) Hitchc. ex Bush (for John Torrey, 1796–1873, American physician-botanist) Ring muhly. Tufted, ring-forming perennials, lacking creeping rhizomes. **CULMS** 10–35 cm tall (occasionally taller), with decumbent bases. **LIGULES** 2–5 mm long, acuminate. **BLADES** 1–4 cm long, less than 1 mm wide, tightly rolled, arcuate, the margins not whitish-thickened. **PANICLES** diffuse, 7–20 cm long, 3–15 cm wide. **SPIKELETS** 2–3.5 mm long. **GLUMES** equal, 1-nerved, 1.3–2.5 mm long, acuminate, awn-tipped to 1 mm. **LEMMAS** 2.3–3.5 mm long, hairy on the lower 1/2–3/4; awn 0.5–4 mm long. **PALEAS** as long as the lemmas. **ANTHERS** 1.2–2.1 mm long, greenish. $2n = 20$. Desert and woodland grasslands, mesas, and plains. ARIZ: Apa; NMEX: McK, San, SJn. 1350–1700 m (4500–5600'). Flowering: Jul–Sep. Southwestern United States, Argentina.

Muhlenbergia wrightii Vasey ex J. M. Coult. (for Charles Wright, 1811–1885, American botanical collector) Spike muhly. Tufted perennials, lacking rhizomes. **CULMS** erect, 15–50 cm tall, compressed, as are the sheaths. **LIGULES** 1–4 mm long, truncate. **BLADES** flat to folded, 1–3 mm wide. **PANICLES** spikelike, interrupted below, 5–15 cm long, 0.3–1.2 cm wide. **SPIKELETS** 2–3 mm long, dark. **GLUMES** equal, 1-nerved, 0.5–1.6 mm long, less than 3/4 the length of the lemma, acuminate and awn-tipped. **LEMMAS** 2–3 mm long, hairy on the lower 1/2–3/4; awn 0.3–1 mm long. **PALEAS** as long as the lemmas. **ANTHERS** 1.3–1.8 mm long, greenish. $2n$ = unknown. Grassy, rocky hills and slopes in woodlands and forests. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon; NMEX: McK, RAr, SJn; UTAH. 2000–2750 m (6600–9000'). Flowering: Aug–Sep. Southwestern United States to northern Mexico.

Munroa Torr. False Buffalograss

(for William Munro, 1818–1880, British botanist and general in the Indian colonial army) Stoloniferous, mat-forming annuals with hollow culms. **LEAVES** clustered at the nodes, with open sheaths, hairy ligules, stiff pungent blades, and lacking auricles. **INFL** a dense cluster of spikelets almost hidden in the fascicle of leaves at the branch tips.

SPIKELETS 3- to 5-flowered, disarticulating above the glumes and between the florets; glumes 1-nerved, narrow, shorter than the lowermost floret; lemmas 3-nerved, lanceolate, mucronate to short-awned, hairy on the nerves; palea shorter than the lemma, 2-keeled. **STAMENS** 3. $x = 7, 8$. A small genus of five species in the New World. The genus name was originally spelled "Monroa," but this is an obvious orthographic error that need not be perpetuated.

Munroa squarrosa (Nutt.) Torr. (curled back) False buffalograss. **CULMS** 3–15 cm long. **LIGULES** 0.5–1 mm long. **BLADES** flat to folded, white-margined, 1–5 cm long, 1–2.5 mm wide. **SPIKELETS** 6–8 mm long, 3- to 5-flowered. **GLUMES** of lower 1–2 spikelets subequal, 2.5–4 mm long, those of upper spikelets unequal, the first reduced or absent. **LEMMAS** 3.5–5 mm long, with a tuft of hairs at the base; awn 0.5–2 mm long. **ANTHERS** 1–1.5 mm long. $2n = 16$. [*Munroa squarrosa* (Nutt.) Torr. var. *floccuosa* Vasey ex Beal]. Sandy plains and flats, disturbed ground, desert plains, and foothills. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1250–2200 m (4200–7200'). Flowering: Jun–Sep. Western Canada and United States, to northern Mexico. Some plants are beset with a white-woolly covering of unsubstantiated origin: leavings of a species of woolly aphid, or water-soluble crystals that mimic hairs.

Nassella É. Desv. Needlegrass

(diminutive of the Latin *nassa*, a wicker basket with a narrow neck, referring to the shape of the lemma) Tufted perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat or folded blades, and lacking auricles. **INFL** a panicle or rebranching branches. **SPIKELETS** 1-flowered, the rachilla not extended; glumes usually longer than the floret, (1) 3- to 5-nerved, acuminate, often purplish-based; lemmas leathery, convolute, the margins overlapping, the apex often solid and necklike; awn twisted or not, persistent to deciduous; palea to 1/3 the length of the lemma, glabrous, without nerves. **STAMENS** 1 or 3, when 3 then of 2 different lengths. $x = 11$. A New World genus of about 70 species, most of which are found in Argentina, Bolivia, and northern Chile; formerly included in the genus *Stipa*, which is now strictly Eurasian (Barkworth 1993).

Nassella viridula (Trin.) Barkworth (somewhat green) Green needlegrass. Tufted perennials with green foliage. **CULMS** 45–100 cm or more tall. **SHEATHS** with a line of hairs on the margins. **LIGULES** 1–3 mm long. **BLADES** flat to rolled, 2–6 mm wide. **PANICLES** narrow, contracted, 10–25 cm long, mostly less than 2 cm wide. **GLUMES** subequal, translucent-membranous, 8–13 mm long, with 3 bright green nerves. **LEMMAS** 5–6.5 mm long, brownish, appressed-pubescent below the neck, with a tuft of hairs at the callus; awn 20–35 mm long, twice-geniculate, twisted. **PALEAS** membranous, rounded at the apex. **ANTHERS** 2–3 mm long or vestigial. $2n = 82, 88$. Roadsides, edges of grassy clearings in woodlands and forests, foothills and mountains. ARIZ: Apa; COLO: Arc, Dol, Min, Mon, SJn. 2000–2250 m (6600–7300'). Flowering: Jul–Sep. Central and Rocky Mountain United States and Canada. Confused with *Achnatherum robustum*, but that species lacks the bright green nerves on the glumes, and the lemma margins are scarcely overlapping if at all.

Oryzopsis Michx. Ricegrass

(Greek *oryza*, rice, and *opsis*, similar to, alluding to a supposed similarity to rice) Following Barkworth (1993), *Oryzopsis* is treated here as a monotypic genus endemic to North America. Species formerly found in *Oryzopsis* are herein treated in *Achnatherum* and *Piptatherum* (Barkworth 1993).

Oryzopsis asperifolia Michx. (rough-leaved) Mountain ricegrass. Tufted, glabrous perennials. **CULMS** hollow, erect to spreading, 25–65 cm tall. **SHEATHS** open. **LIGULES** membranous, 0.2–1 mm long, truncate or rounded. **BASAL BLADES** flat, 25–60 cm long, 3–10 mm wide, the bases twisted so the lower (abaxial) surface is uppermost. **UPPER BLADES** rudimentary. **INFL** a contracted panicle, 4–13 cm long. **SPIKELETS** 1-flowered, disarticulating above the glumes and the floret falling out. **GLUMES** subequal, 6- to 10-nerved, 5–7.5 mm long. **LEMMAS** terete to laterally compressed, 3- to 5-nerved or more, the margins strongly overlapping, leathery or indurate when mature, appressed-pubescent, 5–7 mm long; awn 7–15 mm long, deciduous. **PALEAS** similar to the lemmas, concealed, 2-nerved. **ANTHERS** 3, 2–4 mm long. $x = 11, 12$; $n = 46$. Forests, under aspen and pines. COLO: Arc, Hin, LPl, Min; NMEX: RAr. 1775–2700 m (5800–8800'). Flowering: Jul–Aug. Across Canada and the northern United States.

Panicum L. Panicum, Panic-grass

(Latin *panus*, an ear of millet, or *panis*, bread) Annuals and perennials with hollow or pithy culms. **LEAVES** with open sheaths, membranous and usually ciliate ligules, flat to rolled blades, and lacking auricles; basal leaves not forming a winter rosette. **INFL** terminal and axillary panicles, sterile branchlets and bristles absent, disarticulating mostly below the glumes. **SPIKELETS** 2-flowered, dorsally compressed, awnless, the lower floret reduced, the upper floret perfect;

glumes unequal, the first much smaller than the second to almost obsolete; lower floret staminate or sterile, the lemma membranous and similar in size and texture to the second glume; upper floret perfect, the lemma and palea forming a hard seedcase around the flower and grain. **STAMENS** 3. $x = 9, 10$. A large genus of 300 to 400 species of tropical to warm-temperate regions of the world. Members of subgenus *Dichanthelium* are herein treated as a separate genus.

1. Plants annual ..... (2)
1' Plants perennial ..... (6)

2. Lemma of the upper floret wrinkled; spikelets nearly sessile on simple or nearly simple primary branches ..... see ***Urochloa***
2' Lemma of the upper floret smooth, not wrinkled; spikelets pedicelled in a usually open, freely rebranched panicle (3)

3. First glume about 1/4 as long as the spikelet, obtuse or rounded at the tip; stems as much as 1 m long, coarse and often somewhat trailing ..... ***P. dichotomiflorum***
3' First glume more than 1/4 as long as the spikelet, acute to acuminate at the tip; stems various ..... (4)

4. Spikelets 4.5–5 mm long; panicle nodding at maturity ..... ***P. miliaceum***
4' Spikelets less than 4 mm long; panicle usually not nodding ..... (5)

5. Mature panicles less than 1/2 the length of the entire plant; panicle axils glabrous ..... ***P. hirticaule***
5' Mature panicles more than 1/2 the length of the entire plant; panicle axils pubescent ..... ***P. capillare***

6. First glume about as long as the second; primary panicle branches mostly unbranched, long stolons developed ..... ***P. obtusum***
6' First glume shorter than the second; primary panicle branches often rebranched, stolons not developed ..... (7)

7. Culms with bulbous, cormlike bases; sheaths keeled; fertile florets dull, transversely rugose ..... ***P. bulbosum***
7' Culms lacking bulbous, cormlike bases; sheaths not keeled; fertile florets shiny, not rugose ..... (8)

8. Plants rhizomatous; blades not curling; lower florets staminate ..... ***P. virgatum***
8' Plants tufted, lacking rhizomes; blades usually curling in age; lower florets sterile ..... ***P. hallii***

Panicum bulbosum Kunth (bulbous) Bulb panicum. Tufted perennials with short rhizomes. **CULMS** erect or geniculate-based, 50–100 cm tall or more, with bulbous corms at the base. **LIGULES** 0.5–2 mm long, ciliate. **BLADES** flat, 2–12 mm wide. **PANICLES** open, pyramidal, 10–35 cm long, 2–12 cm wide. **SPIKELETS** 2.8–4.5 mm long. **FIRST GLUME** 3- to 5-nerved, 1/2 to nearly as long as the spikelet. **SECOND GLUME** 5- to 7-nerved, often longer than the fertile floret. **LOWER FLORET** sterile or staminate, glabrous. **UPPER FLORET** 3–4 mm long, dull, finely transversely rugose. $2n = 36, 54, 70, 72$. Moist sites in canyons and rocky hills, often with ponderosa pine. ARIZ: Apa. COLO: LPl. NMEX: McK. 1900–2300 m (6300–7600'). Flowering: Jul–Sep. Southwestern United States to central Mexico.

Panicum capillare L. (hairlike) Common witchgrass. Tufted, stiff-hairy annuals, the hairs bulbous-based. **CULMS** 15–70 cm tall, erect, often much-branched. **LIGULES** 1–2 mm long, ciliate. **BLADES** flat, 3–15 mm wide. **PANICLES** diffuse, oblong, 12–40 cm long, about 1/2 as wide, the base often included in the sheath, breaking at the base of the peduncle and rolling as a tumbleweed. **SPIKELETS** 2–4 mm long. **FIRST GLUME** 1- to 3-nerved, 1/3–1/2 as long as the spikelet. **SECOND GLUME** 7- to 9-nerved, 1.8–3.1 mm long. **LOWER FLORET** sterile, exceeding the fertile floret. **UPPER FLORET** shiny, 1.5–2 mm long. $2n = 18$. Roadsides, moist disturbed ground, deserts and valleys. ARIZ: Apa. **UPPER FLORET** shiny, 1.5–2 mm long. $2n = 18$. Roadsides, moist disturbed ground, deserts and valleys. ARIZ: Apa. Nav; COLO: Arc, Dol, LPl, Min, Mon, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1300–2550 m (4300–8300'). Flowering Jun–Sep. Throughout temperate North America, South America, naturalized in much of Eurasia.

Panicum dichotomiflorum Michx. (flower divided in two) Fall panicum. Tufted, sprawling annual (perennial in tropical regions). **CULMS** 10–100 cm or more tall, erect to decumbent- or geniculate-based, rooting at the lower nodes in wet soil, often zigzag and compressed, branched below. **LIGULES** 0.5–2 mm long. **BLADES** flat, 3–20 mm wide. **PANICLES** terminal and axillary, open, 5–30 cm long or more. **SPIKELETS** 1.8–3.8 mm long, narrowly elliptic. **FIRST GLUME** mostly 3-nerved, 0.6–1.2 mm long, less than 1/3 as long as the spikelet. **SECOND GLUME** 7- to 9-nerved, as long as the spikelet. **LOWER FLORET** sterile, 7- to 9-nerved, with or without a palea. **UPPER FLORET** 1.4–2.5 mm long, narrowly elliptic, smooth and shiny. $2n = 36, 54$. Moist to wet disturbed ground, roadsides, ditches. ARIZ: Apa; NMEX: SJn; UTAH. 1300–1700 m (4400–5500'). Flowering: Aug–Sep. Native to the eastern United States and Canada; introduced westward; Eurasia.

Panicum hallii Vasey (for Elihu Hall, 1822–1882, botanical collector from Illinois) Hall's panicum. Tufted perennials. **CULMS** 12–50 cm tall, erect, scarcely branched. **LIGULES** 0.6–2 mm long. **BLADES** flat, 2–10 mm wide, curling in age (conspicuous in winter), glaucous, with thickened margins. **PANICLES** open, 10–25 cm long, 4–12 cm wide. **SPIKELETS** 2.1–4.2 mm long. **FIRST GLUME** 1/2–3/4 as long as the spikelet. **SECOND GLUME** 7- to 11-nerved, as long as the spikelet. **LOWER FLORET** sterile, similar to the second glume, with a palea. **UPPER FLORET** 1.5–2.4 mm long, smooth, shiny, elliptic. $2n = 18$. Roadsides, grassy hills, deserts, and woodlands. ARIZ: Apa. 1350–1550 m (4400–5100'). Flowering: Aug–Sep. Southwestern United States to Guatemala.

Panicum hirticaule J. Presl (hairy-stemmed) Mexican witchgrass. Tufted annuals, glabrous or hispid with bulbous-based hairs. **CULMS** 6–55 cm tall, mostly erect. **LIGULES** 1.5–3.5 mm long. **BLADES** flat, 3–6 mm wide, with bulbous-based hairs. **PANICLES** open, 8–25 cm long, 4–8 cm wide. **SPIKELETS** 2–4 mm long. **FIRST GLUME** 3- to 5-nerved, 1/2–3/4 as long as the spikelet. **SECOND GLUME** 7- to 11-nerved, 1.8–3.3 mm long. **LOWER FLORET** sterile, the lemma similar to the second glume. **UPPER FLORET** 1.5–2.4 mm long, smooth or papillose, shiny, often with a lunate scar at the base. $2n = 18, 36$. Gravelly washes, roadsides, rocky hills and slopes, commonly in desert regions. ARIZ: Nav; NMEX: SJn. 1550–1700 m (5200–5600'). Flowering: Jul–Sep. Southwestern United States south to Central America, western South America, and Argentina.

Panicum miliaceum L. (milletlike) Broomcorn millet. Tufted annuals with bulbous-based hairs. **CULMS** 20–75 cm tall or more, sometimes branching below. **LIGULES** 1–3 mm long. **BLADES** 5–20 mm wide. **PANICLES** 6–20 cm long, 4–11 cm wide, the base often included in the sheath, often nodding, the spikelets toward the ends of the branches. **SPIKELETS** 4–6 mm long, ovoid, usually glabrous. **FIRST GLUME** 5- to 7-nerved, 1/2–3/4 the length of the spikelet. **SECOND GLUME** 11- to 13-nerved, exceeding the upper floret. **LOWER FLORET** sterile, 9- to 13-nerved, similar to the second glume. **UPPER FLORET** 3–3.8 mm long, smooth or striate, shiny, remaining in the spikelet or falling before the spikelet disarticulates. $2n = 36, 40, 42, 49, 54, 72$. Weedy, disturbed ground at lower elevations. COLO: Arc; NMEX: SJn; UTAH. 1550–1950 m (5200–6400'). Flowering: Jul–Aug. Native to Asia, escaped to scattered locales throughout North America. Widely cultivated throughout the world as a crop; also used in birdseed mixes.

Panicum obtusum Kunth (blunt) Vine mesquite. Stoloniferous perennials, occasionally with short rhizomes. **CULMS** 20–70 cm tall; stolon internodes to 35 cm or more long, the nodes swollen and densely pilose. **LIGULES** 0.2–2 mm long, truncate. **BLADES** flat, 2–7 mm wide, glaucous, stiff and ascending. **PANICLES** narrow, 5–15 cm long, 1–2 cm wide, the branches ascending to appressed, usually simple. **SPIKELETS** 2.8–4.4 mm long, blunt, glabrous, nearly terete. **FIRST GLUME** 5- to 7-nerved, 3/4 to nearly as long as the entire spikelet. **SECOND GLUME** 5- to 9-nerved, as long as the spikelet. **LOWER FLORET** staminate, similar to the second glume. **UPPER FLORET** 2.5–3.2 mm long, broadly elliptic, smooth and shiny. $2n = 20, 36, 40$. Heavy soils of swales, flats, playas, and low spots. NMEX: SJn; UTAH. 1350–1650 m (4500–5400'). Flowering: Aug–Sep. Southwestern United States to central Mexico.

Panicum virgatum L. (broomlike) Switchgrass. Robust, rhizomatous perennials. **CULMS** 40–150 cm tall or more, erect, thick, not much-branched. **LIGULES** 2–6 mm long. **BLADES** flat, 3–15 mm wide. **PANICLES** stiffly open, 10–45 cm long, 5–20 cm wide. **SPIKELETS** 2.5–8 mm long, pointed. **FIRST GLUME** 5- to 9-nerved, 1/2 to nearly as long as the spikelet. **SECOND GLUME** 7- to 11-nerved, exceeding the upper floret. **LOWER FLORET** staminate, with a well-developed palea. **UPPER FLORET** 2.3–3 mm long, narrowly ovoid, smooth and shiny. $2n = 18, 21, 25, 30, 32, 35, 36, 67–72, 74, 77, 90, 108$. Moist sites along roads, drainages, hanging gardens, ditch banks, at lower elevations. COLO: Dol, LPl, Mon; NMEX: San; UTAH. 1125–2100 m (3700–6800'). Flowering: Jun–Sep. Southern Canada throughout much of the United States, especially east of the Rocky Mountains; Mexico and Central America.

Paspalum L. Paspalum

(Greek *paspalos*, a kind of millet) Annuals and perennials, tufted, rhizomatous, or stoloniferous, with pithy culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a panicle of 1 to many unbranched unilateral primary branches. **SPIKELETS** 2-flowered, dorsally compressed, awnless, the lower floret reduced, the upper floret perfect; disarticulation below the glumes; glumes unequal, the first mostly absent; lower floret sterile, the lemma membranous and similar in size and texture to the second glume, the palea absent or rudimentary; upper floret perfect, the lemma and palea forming a hard seedcase around the flower and grain. **STAMENS** 3. $x = 10, 12$. A large genus of 300–400 species throughout the world, most well developed in tropical to warm-temperate regions.

Paspalum distichum L. (two-rowed, referring to the spikelets) Knotgrass. Stoloniferous or rhizomatous perennials, glabrous to densely pilose. **CULMS** 20–100 cm long, erect or decumbent, rooting at the lower nodes in wet soil. **LIGULES** 1–2 mm long. **BLADES** flat or folded, 2–10 mm wide. **PANICLES** terminal, composed of 2 branches paired at the tip of the peduncle, sometimes a third branch present below, the branches 2–7 cm long, winged. **SPIKELETS** 2.4–3.2 mm long, solitary. **FIRST GLUME** absent or rarely to 1 mm long. **SECOND GLUME** 3-nerved, as long as the spikelet, puberulent. **LOWER FLORET** 3-nerved, glabrous. **UPPER FLORET** 2.2–2.8 mm long, ovate, smooth and shiny. $2n$ = 20, 30, 40, 48, 60. [*Paspalum distichum* var. *indutum* Shinners] Along streams, canals, and ditch banks. NMEX: SJn. 1550–1700 m (5100–5600'). Flowering: Aug–Sep. Native to warm regions of the world. Forms with densely pilose sheaths have been referred to var. *indutum* Shinners, but this seems to be an arbitrary expression without taxonomic strength.

Phalaris L. Canarygrass

(Greek *phalaris*, a coot, which has a white spot on the head, referring to a grain enclosed in white scales) Tufted or rhizomatous annuals and perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a contracted panicle, often spikelike. **SPIKELETS** with 1 perfect well-developed floret and (0) 1–2 sterile rudimentary florets below, laterally compressed; disarticulation above the glume, glumes large, exceeding the floret, often keeled on the midnerve, 3- to 7-nerved, awnless; sterile florets much reduced, scalelike or bristlelike; fertile floret hard and shiny, usually hairy, the lemma permanently enclosing the palea and grain, obscurely 5-nerved. **STAMENS** 3. x = 6, 7. About 22 species nearly throughout the temperate regions of the world (Anderson 1961). The common name, canarygrass, originates from the Canary Islands. The islands were named not for the birds but for their aboriginal dogs, the name deriving from the Latin *Insulae Canariae*, dog islands, incorrectly anglicized to Canary Islands.

1. Plants perennial, rhizomatous; panicles 5–40 cm long ..... ***P. arundinacea***
1' Plants annual, tufted; panicles 1–5 cm long ..... ***P. canariensis***

Phalaris arundinacea L. (reedlike) Reed canarygrass. Robust, rhizomatous perennials. **CULMS** erect, 40–200 cm tall or more. **LIGULES** 4–10 mm long. **BLADES** 10–30 cm long, 5–20 mm wide, serrate. **PANICLES** elongate, 5–40 cm long, 1–2 cm wide, dense and contracted, the branches erect-appressed. **SPIKELETS** 4–8 mm long. **GLUMES** as long as the spikelet, the keels scarcely winged. **STERILE FLORETS** 2, subequal, 1.5–2 mm long, less than 1/2 the length of the fertile floret, hairy. **FERTILE FLORET** 2.5–4 mm long, the lemma hairy above and on the margins, shiny pale brown when mature. **ANTHERS** 2.5–3 mm long. $2n$ = 27, 28, 29, 30, 31, 35. [*Phalaroides arundinacea* (L.) Rauschert] Marshy ground, sloughs, wet meadows, forming dense thickets. COLO: Arc, Dol, LPl, Min, Mon, SJn. NMEX: SJn. 1550–2750 m (5150–8950'). Flowering: Jun–Aug. Throughout cool-temperate North America, Mexico, South America.

Phalaris canariensis L. (of the Canary Islands) Common canarygrass. Tufted annuals. **CULMS** erect, 25–100 cm tall. **LIGULES** 3–6 mm long. **BLADES** 3–25 cm long, 2–10 mm wide. **PANICLES** ovoid, 1.5–5 cm long, 1–2 cm wide, dense and contracted. **SPIKELETS** 7–10 mm long. **GLUMES** as long as the spikelet, the keels winged. **STERILE FLORETS** 2, subequal, 2–4.5 mm long, chaffy and sparsely hairy. **FERTILE FLORET** 4.5–7 mm long, ovate, densely hairy, shiny. **ANTHERS** 2–4 mm long. $2n$ = 12. Moist to wet, weedy ground, often grown for birdseed. COLO: LPl. 1900–2200 m (6250–7200'). Flowering: Jul–Aug. Native to southern Europe, now widespread throughout the world.

Phleum L. Timothy

(Greek *phleos*, the name for some marsh reed; the common name of timothy remembers Timothy Hansen, who promoted its use in Virginia and the Carolinas about 1720) Tufted annuals and perennials with hollow culms, sometimes with short rhizomes. **LEAVES** with open sheaths, membranous ligules, flat blades, and with absent or inconspicuous auricles. **INFL** a dense, spikelike panicle, the branches much reduced and shortened. **SPIKELETS** 1-flowered; disarticulation above (and sometimes below) the glumes; glumes 3-nerved, subequal, strongly laterally compressed, ciliate on the keels, abruptly short-awned from the truncate apex; lemma much shorter than the glumes, 3- to 5-nerved, not keeled, awnless; palea subequal to the lemma, 2-nerved. **STAMENS** 3. x = 7. About 15 species of the temperate regions of the world, most native to Eurasia.

1. Panicles subglobose or broadly cylindrical, only 2 or 3 times longer than wide, 1–5 cm long and 8–12 mm wide; awns of glumes 1.5–2.5 mm long ..... ***P. alpinum***
1' Panicles cylindrical, several times longer than wide, 4–16 cm long and 5–8 mm wide; awns of glumes 1–1.5 mm long ..... ***P. pratense***

Phleum alpinum L. (alpine) Alpine timothy. Tufted perennials, sometimes with short rhizomes. **CULMS** erect to decumbent-based, 15–50 cm tall, the bases not bulbous. **LIGULES** 1–4 mm long, truncate. **SHEATH** of flag leaf inflated. **BLADES** 4–7 mm wide, auricles not developed. **PANICLES** subglobose or broadly cylindrical, 1–5 (6) cm long, (5) 8–12 mm wide. **GLUMES** 2.5–3.5 mm long, the keels ciliate-hispid; awn of the midnerve 1.5–2.5 mm long. **LEMMAS** 1.7–2.5 mm long, puberulent. **PALEAS** about as long as the lemmas. **ANTHERS** 1–2 mm long. $2n = 14, 28$. [*Phleum commutatum* Gaudin]. Mountain meadows, wet slopes, and moist roadsides, subalpine to alpine vegetation. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, SJn. 2750–3950 m (9000–13000'). Flowering: Jun–Aug. Circumboreal in the Northern Hemisphere, South America, Eurasia.

Phleum pratense L. (of meadows) Timothy. Tufted perennials. **CULMS** erect, 30–150 cm tall, the bases often bulbous. **LIGULES** 2–4 mm long. **SHEATH** of flag leaf not inflated. **BLADES** 4–8 mm wide. **PANICLES** cylindrical, 4–16 cm long, 5–8 mm wide. **GLUMES** 3–4 mm long, the keels ciliate-hispid. **LEMMAS** 1.5–2 mm long, usually puberulent. **PALEAS** about as long as the lemmas. **ANTHERS** 1.6–2.3 mm long. $2n = 42$ (21, 35, 36, 49, 56, 63, 70, 84). Meadows, roadsides, pastures, moist fields, from juniper woodlands to subalpine zones. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 2000–3200 m (6500–10500'). Flowering: Jun–Sep. Native to Eurasia, introduced widely in cool-temperate regions of the world.

Phragmites Adans. Reed

(Greek *phragma*, a hedge, referring to its growth habit) Tall perennials with long-reaching rhizomes or stolons, forming dense thickets or hedges, the culms hollow. **LEAVES** mostly glabrous, with open sheaths, membranous-ciliate ligules, flat to folded blades, and lacking auricles. **INFL** terminal, a plumose panicle. **SPIKELETS** 3- to 8-flowered, weakly laterally compressed, the lower 1–2 florets staminate, the terminal 1–2 florets rudimentary, the remaining florets perfect; rachilla internode sericeous; disarticulation above the glumes and between the florets; glumes unequal, shorter than the florets, glabrous, 1- to 3-nerved; lemmas 3-nerved, linear, glabrous, acuminate, awnless; palea shorter than the lemma. **STAMENS** 1–3. $x = 12$. A small genus of one to three species. Recent investigations indicate the presence of at least three races in North America (Saltonstall, Peterson, and Soreng 2004).

Phragmites australis (Cav.) Trin. ex Steud. (southern) Common reed. **CULMS** 1–4 m tall, 0.5–1.5 cm thick. **LIGULES** 0.4–2 mm long. **BLADES** to 40 cm long, 2–4 cm wide. **PANICLES** ovoid to lanceolate, 15–35 cm long, 8–20 cm wide, often purplish when young, straw-colored in age. **SPIKELETS** long-hairy on the rachilla, the hairs 6–10 mm long. **GLUMES** unequal, the first 3–7 mm long, the second 5–10 mm long. **LEMMAS** 8–15 mm long, the margins inrolled. **PALEAS** 3–4 mm long. **ANTHERS** 1.5–2 mm long, purplish. $2n = 36, 42, 44, 46, 48, 49–54, 72, 84, 96$. [*P. communis* Trin.; *P. berlandieri* E. Fourn.; *P. phragmites* H. Karst.]. Along streams, rivers, canals, and ditches, wet ground of springs and seeps. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: RAr, SJn; UTAH. 1200–2300 m (4000–7500'). Flowering: Jul–Sep. Essentially throughout the world. Roots, shoots, and seeds have been used for food throughout the world. Known as *carrizo* in the Southwest. We have both native and exotic races in the Four Corners region, which are told apart with difficulty.

1. Ligules 1–1.7 mm long; lower glumes 3–6.5 mm long; upper glumes 5.5–11 mm long; lemmas 8–13.5 mm long; leaf sheaths deciduous in age, the culms exposed in the winter, smooth and shiny; native ..... **subsp. *americanus*** Saltonstall, P. M. Peterson & Soreng

1' Ligules 0.4–0.9 mm long; lower glumes 2.5–5 mm long; upper glumes 4.5–7.5 mm long; lemmas 7.5–12 mm long; leaf sheaths not deciduous in age, the culms not exposed, smooth and shiny or ridged and not shiny..... (2)

2. Culm internodes smooth and shiny; native ..... **var. *berlandieri*** (E. Fourn.) C. F. Reed

2' Culm internodes ridged and not shiny; exotic ..... **subsp. *australis***

Piptatherum P. Beauv. Ricegrass

(Greek *pipto*, to fall, and *ather*, awn, alluding to deciduous awns) Tufted perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat to involute blades, and lacking auricles. **INFL** terminal, a branching panicle. **SPIKELETS** 1-flowered; glumes subequal, obtuse to acute, with evident nerves; disarticulation above the glumes; floret hardened, fusiform; lemma convolute, but the margins separated at maturity and not overlapping, the awn deciduous; palea similar to the lemma. **STAMENS** 3. $x = 11$. About 30 species in arid, temperate, and subtropical regions of the world. Formerly included in the genus *Oryzopsis* (Barkworth 1993).

Piptatherum micranthum (Trin. & Rupr.) Barkworth (small-flowered) Littleseed ricegrass. **CULMS** densely tufted, 25–70 cm tall. **LIGULES** 0.4–2 mm long, truncate. **BLADES** flat to involute, less than 2 mm wide. **PANICLES** 5–18 cm

long, narrow, the branches ascending to appressed. **GLUMES** 3- to 5-nerved, 2.7–4 mm long, ovate-acute, hyaline above. **LEMMAS** 1.8–2.8 mm long, glabrous, shiny, becoming indurate and brownish in age, awn 2–9 mm long, straight to sinuous, early-deciduous. **PALEAS** similar to the lemmas. **ANTHERS** about 1 mm long. $2n = 22$ [*Oryzopsis micrantha* (Trin. & Rupr.) Thurb.]. Moist, shaded, often rocky ground in the foothills and mountains. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1700–2600 m (5500–8500'). Flowering: Jun–Aug. Western Canada and the United States.

Pleuraphis Torr. Galleta

(Greek *pleuron*, rib, and *raphis*, needle, referring to the short-awned nerve of glumes and lemmas) Strongly rhizomatous perennials forming large clumps, tufts, or bushes, with pithy culms. **LEAVES** with open sheaths, membranous-ciliate ligules, flat to rolled blades, and lacking auricles. **INFL** a spikelike panicle with extremely reduced branches; rachis zigzag or wavy. **SPIKELETS** in clusters of 3, with a tuft of hairs at the base, the central fertile, the lateral staminate. **CENTRAL SPIKELET** subsessile; glumes equal, 3- to 9-nerved, shorter than the florets, ciliate, the tip deeply 2-lobed, awned from the nerves; florets 1–2, the lower perfect, the upper (if present) perfect or staminate, lemma lanceolate, 3-nerved, ciliate, the tip 2-lobed and awned from the sinus. **LATERAL SPIKELETS** sessile, glumes shorter than to equaling the florets, ciliate, usually lobed, the first glume asymmetric and awned from about the middle near the margin; florets 1–4, usually staminate; lemma 3-nerved, ciliate at the tip. A small genus of three species of the western United States. Formerly included in *Hilaria*, which differs (among numerous features) in being stoloniferous and not rhizomatous.

Pleuraphis jamesii Torr. (for Edwin James, 1797–1861, surgeon-naturalist with the 1820 Long Expedition) Galleta. **CULMS** 15–50 cm tall, forming large clumps from the thick rhizomes, appearing tufted. **SHEATHS** glabrous to scaberulous, often with a few long hairs at the summit. **LIGULES** 1–3 mm long, with lateral erect lobes. **BLADES** 2–3 mm wide, mostly glabrous. **SPIKES** 3–7 cm long. $2n = 36, 38$. [*Hilaria jamesii* (Torr.) Benth.]. Desert flats and gravelly slopes of foothills. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SIn. UTAH. 1550–2200 m (5100–7200'). Flowering: May–Aug. Southwestern United States.

Poa L. Bluegrass

(ancient Greek name for grass or fodder) Annuals and perennials, tufted, rhizomatous, or stoloniferous, with hollow culms. **LEAVES** with open to closed sheaths, membranous ligules, flat to folded (sometimes rolled) blades, and lacking ligules. **INFL** a terminal panicle, open to contracted, generally elevated well above the leaves. **SPIKELETS** (1) 2- to 8-flowered, relatively small, the florets usually perfect, some species dioecious; disarticulation above the glumes and between the florets; glumes membranous, shorter than the lowermost floret, the first mostly 1-nerved, the second often 3-nerved; lemmas membranous, (3) 5-nerved, glabrous to variously pubescent, some with a conspicuous tuft of cobwebby hairs on the callus; palea slightly shorter than the lemma, 2-keeled. **STAMENS** 3. $x = 7$. A difficult genus of 150–200 species, mostly of temperate to Arctic regions, the identification complicated by hybridization and apomixis. Care should be taken to collect mature, complete specimens, paying particular attention to the presence of rhizomes, basal growth, and mature panicles (Kellogg 1985a; Soreng 1985, 1991).

1. Florets modified and forming small leafy plantlets; stems slightly to strongly bulblike at the base ..... ***P. bulbosa***
1' Florets not modified into small leafy plantlets; stems rarely somewhat bulblike ..... (2)

2. Stems and nodes strongly flattened; plants with creeping rhizomes; lemma short-villous on the nerves toward the base, longer cobwebby hairs absent or scant ..... ***P. compressa***
2' Stems and nodes terete or nearly so; combination of features other than above ..... (3)

3. Panicles closed and contracted at maturity, the branches erect, appressed to ascending ..... (4)
3' Panicles open at maturity, the branches spreading to reflexed ..... (12)

4. Florets with a conspicuous tuft of cobwebby hairs at the base, these short-kinky to long-sinuous and longer than any other hairs on the lemma ..... (5)
4' Florets glabrous or hairy, but not with a conspicuous tuft of cobwebby hairs at the base as above, any hairs present all about the same length ..... (6)

5. Plants tufted, annual or short-lived perennial; anthers less than 1 mm long ..... ***P. bigelovii***
5' Plants with creeping rhizomes, perennial; anthers mostly longer than 1 mm ..... ***P. pratensis***

6. Plants with short-creeping rhizomes; ligules 1.5–3.5 mm long, conspicuous ..... ***P. arida***
6′ Plants tufted, lacking creeping rhizomes; ligules various ..... (7)

7. Spikelets rounded and little compressed; glumes and lemmas not keeled or only obscurely so at the tip ..... ***P. secunda***
7′ Spikelets compressed; glumes and lemmas mostly keeled to the base ..... (8)

8. Lemmas glabrous to minutely scabrous, the hairs scarcely visible with magnification; plants of subalpine to alpine rocky ridges and talus ..... (9)
8′ Lemmas noticeably pubescent or puberulent on the keels, nerves, or body, though the hairs may be short ..... (10)

9. Dwarf plants, 3–10 cm tall; lemmas 2–3 mm long; glumes nearly as long as the spikelet; sheaths open their full length ..... ***P. lettermanii***
9′ Taller plants, 15–45 cm tall; lemmas 4–4.5 mm long; glumes shorter than the spikelet; sheaths open only about 1/2 their length, closed below ..... ***P. cusickii***

10. Plants unisexual, all the spikelets of a plant either male or female; uppermost stem blade very reduced, often absent; lemmas 4–7 mm long ..... ***P. fendleriana***
10′ Plants perfect-flowered, the spikelets with both anthers and pistil in a single floret; uppermost stem blade well developed; lemmas 2–5 mm long ..... (11)

11. Blades stiffly erect, 1–5 cm long; sheaths not elongate or papery; panicle stiff; plants forming tight clumps ..... ***P. glauca***
11′ Blades gracefully curved, 5–10 cm long; sheaths elongate and papery, persistent; panicle soft and lax; plants forming loose spreading clumps ..... ***P. abbreviata***

12. Plants annual, the remains of old shoots not present ..... ***P. annua***
12′ Plants perennial, with some remains of old shoots ..... (13)

13. Florets with a conspicuous tuft of cobwebby hairs at the base, these short-kinky to long-sinuous and longer than other hairs on the lemma ..... (14)
13′ Florets glabrous or hairy, but not with a conspicuous tuft of cobwebby hairs at the base as above, any hairs present all about the same length ..... (24)

14. Plants with creeping rhizomes; panicle branches glabrous to moderately scabrous, round ..... (15)
14′ Plants tufted, lacking rhizomes (in wet habitats occasionally producing decumbent stems that root at the nodes); panicle branches distinctly scabrous, mostly angled ..... (16)

15. Glumes distinctly keeled, scabrous on the nerves, the second glume plainly shorter than the first lemma; panicles often with 4 or more branches at the lowermost node (some occasionally vestigial); ligules mostly 1–2 mm long ..... ***P. pratensis***
15′ Glumes weakly keeled, nearly glabrous, the second glume subequal to or longer than the first lemma; panicles usually with fewer than 4 branches at the lowermost node; ligules 2–4 mm long ..... ***P. arctica***

16. Sheaths densely and conspicuously scabrous with downward-pointing hairs ..... (17)
16′ Sheaths glabrous to sparsely scaberulous ..... (18)

17. Anthers mostly 2–3 mm long; sheaths rarely scabrous ..... ***P. tracyi***
17′ Anthers mostly 0.5–1 mm long; sheaths nearly always scabrous ..... ***P. occidentalis***

18. Anthers mostly less than 1 mm long; blades flat ..... (19)
18′ Anthers mostly longer than 1 mm; blades various, flat to rolled or folded ..... (21)

19. First glume mostly 3-nerved; sheath margins fused together only at the very base ..... ***P. palustris***
19′ First glume mostly 1-nerved; sheath margins fused together 1/4 to 2/3 their length ..... (20)

20. First glume linear-lanceolate, much narrower than the second; paleas glabrous to scabrous on the keels ..... ***P. leptocoma***
20′ First glume about the same shape and width as the second, both broadly lanceolate; paleas short-pubescent on the keels ..... ***P. reflexa***

21. Panicles mostly 10–30 cm long, abundantly rebranched; lowermost panicle branches mostly 3–5 per node (22)
21′ Panicles mostly less than 12 cm long, sparingly rebranched; lowermost panicle branches mostly 1–2 per node (23)

22. Anthers mostly 2–3 mm long; first glume 1-nerved ***P. tracyi***
22′ Anthers less than 1.5 mm long; first glume mostly 3-nerved ***P. palustris***

23. Lemmas glabrous between the nerves, with a copious web on the callus; leaves green ***P. interior***
23′ Lemmas mostly pubescent between the nerves, with a scant web on the callus; leaves glaucous ***P. glauca***

24. Basal blades short and broad, 2–5 mm wide; spikelets rounded or almost cordate at the base; stem bases enclosed in persistent, thick, closely overlapping sheaths ***P. alpina***
24′ Basal blades elongate and narrow, 1–3 mm wide; spikelets not broadly rounded at the base; stem bases not enclosed in persistent sheaths as above (25)

25. Plants with creeping rhizomes (26)
25′ Plants tufted, lacking rhizomes (27)

26. Lower sheaths minutely retrorse-hairy and purplish; lemmas nearly glabrous on the nerves ***P. wheeleri***
26′ Lower sheaths smooth, greenish; lemmas puberulent on the nerves ***P. arctica***

27. Plants annual or short-lived perennial, with lax succulent blades; spikelets strongly compressed, the glumes and lemmas mostly keeled to the base; lemmas prominently short-pilose on the nerves, but not between ***P. annua***
27′ Plants perennial, with relatively stiff, firm blades; spikelets rounded and little compressed, the glumes and lemmas not keeled or only obscurely so at the tip; lemmas not pilose on the nerves, but rather uniformly puberulent across the back and between the nerves ***P. secunda***

Poa abbreviata R. Br. (shortened) Short bluegrass. Densely tufted alpine perennials, with numerous basal leaves and persistent elongate sheaths. **CULMS** 5–30 cm tall. **LIGULES** 1–3 mm long. **BLADES** folded, lax and curving, mostly less than 10 cm long, 1–2 mm wide. **PANICLES** narrow and loosely contracted, 3–9 cm long. **SPIKELETS** 2- to 4-flowered, nearly sessile, strongly compressed. **GLUMES** somewhat unequal, the first 2–4 mm long and 1-nerved, the second 3–5 mm long and 1- to 3-nerved and often equaling the lowermost lemma. **LEMMAS** 2.5–5 mm long, short-pubescent on the keel and lateral nerves, also puberulent between the nerves, usually purplish banded at the tip. **ANTHERS** 0.8–1.8 mm long. $2n = 42$. Subalpine to alpine slopes, ridges, and meadows, mostly near timberline, uncommon. COLO: Hin, LPl. 3400–3800 m (11100–12500′). Flowering: Jul–Aug. Western Rocky Mountains, Canada south to Colorado. Our material belongs to **subsp.** ***pattersonii*** (Vasey) Á. Löve, D. Löve & B. M. Kapoor (for Henry Norton Patterson, 1853–1919, Illinois botanist of the late 19th century). Its most conspicuous feature is the persistent, papery sheaths.

Poa alpina L. (alpine) Alpine bluegrass. Densely tufted perennials with thick mats of basal leaves, the sheaths closely overlapping and persistent. **CULMS** erect, 10–30 cm tall. **LIGULES** 1–4 mm long, truncate to obtuse. **BLADES** usually flat, the basal ones 3–5 cm long and 2–5 mm wide. **PANICLES** 3–5 cm long and wide, broadly pyramidal, the branches spreading to horizontal. **SPIKELETS** mostly 4- to 5-flowered, purplish, the bases rounded or subcordate. **LEMMAS** faintly nerved, 3–4 mm long. **GLUMES** ovate, 3-nerved, the first 2.3–3.2 mm long, the second slightly longer. **ANTHERS** strongly scarious-margined, short-villous on the keel and marginal nerves, lacking a web on the callus. **ANTHERS** 1.2–2 mm long. $2n = 14$, 21–74. Subalpine to alpine meadows and rocky or gravelly slopes. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn; UTAH. 2400–3800 m (8000–12500′). Flowering: Jul–Aug. Circumboreal, south into the Rocky Mountains, Eurasia. This is one of the easier *Poa* species to identify, with its broad, almost rosettelike, basal leaves and cordate-based spikelets, always at high elevations.

Poa annua L. (annual) Annual bluegrass. Tufted, bright green, often winter-annuals or short-lived perennials. **CULMS** erect to prostrate and then sometimes rooting at the nodes and mat-forming, 3–25 cm tall. **LIGULES** 1–3 mm long. **BLADES** lax, folded to flat, 1–3 mm wide. **PANICLES** 2–5 (8) cm long, open. **SPIKELETS** 3- to 6-flowered, the rachilla often visible. **GLUMES** subequal, oblanceolate, broadest above the middle, the first 1-nerved and 1.5–2.2 mm long, the second 1- to 3-nerved and slightly longer. **LEMMAS** 2.5–3.5 mm long, (3) 5-nerved, short-pilose on the nerves, lacking a web on the callus. **ANTHERS** 0.7–1.1 mm long. $2n = 14$, 24–26, 28. Moist, weedy areas, stream banks, ditches, lake margins, gardens, and lawns. ARIZ: Apa, Coc, Nav; COLO: Hin, LPl, Mon, SJn; NMEX: RAr, SIn; UTAH. 1450–2800 m (4800–9100′). Flowering: Apr–Sep. Native to Europe, throughout much of North America.

Poa arctica R. Br. (arctic) Arctic bluegrass. Tufted and rhizomatous perennials. **CULMS** in small tufts and also usually producing short rhizomes, 10–45 cm tall. **LIGULES** 2–4 mm long, acuminate. **BLADES** flat or folded, 1.5–3.5 mm wide. **PANICLES** open, 4–12 cm long, the lower branches spreading. **SPIKELETS** 2- to 5-flowered, often purplish. **GLUMES** subequal, the first 2.5–4.5 mm long, the second slightly longer. **LEMMAS** 3.5–5 mm long, short-pilose on the nerves, usually with a scant web on the callus. **ANTHERS** 1.4–2.5 mm long. $2n = 38–92$. [*Poa aperta* Scribn. & Merr.; *Poa grayana* Vasey]. Upper subalpine and alpine ridges, open slopes, and meadows. COLO: Arc, Con, Hin, LPl, Min, SJn; UTAH. 2700–4000 m (9000–13000′). Flowering: Jul–Sep. Circumboreal, south in the Rocky Mountains to New Mexico.

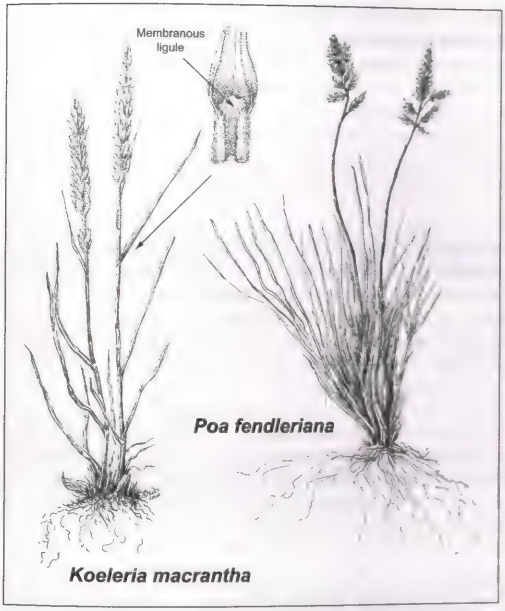
Poa arida Vasey (arid) Plains bluegrass. Tufted and rhizomatous perennials. **CULMS** in small tufts along rhizomes, 12–50 cm tall. **LIGULES** 1.5–3.5 mm long, conspicuous. **BLADES** flat to rolled or folded, 1–3 mm wide. **PANICLES** narrow, contracted, 3–12 cm long, the branches erect. **SPIKELETS** 2- to 6-flowered. **GLUMES** subequal, 1- to 3-nerved, the first 2.5–4.2 mm long, the second 3–5 mm long. **LEMMAS** 3.2–5 mm long, densely short-villous on the nerves, lacking a web on the callus. **ANTHERS** 1.2–2.5 mm long. $2n = 63–103$. [*Poa glaucifolia* Scribn. & T. A. Williams]. Low flats in the valleys, poorly understood in our area. ARIZ: Apa; COLO: Dol, LPl. 1550–1900 m (5100–6200′). Flowering: Jun–Aug. Central plains of southern Canada and the United States, west into the Rocky Mountain region.

Poa bigelovii Vasey & Scribn. (for John Milton Bigelow, 1804–1878, surgeon-botanist on early boundary surveys) Bigelow's bluegrass. Tufted winter annuals. **CULMS** erect, leafy, 10–55 cm tall. **LIGULES** 1–3 mm long. **BLADES** lax, flat, 1–4 mm wide. **PANICLES** elongate, narrow, 4–18 cm long, less than 2 cm wide, the branches erect. **SPIKELETS** 4- to 6-flowered. **GLUMES** acuminate, mostly 3-nerved, subequal, the first 2–3.5 mm long, the second slightly longer. **LEMMAS** 2.7–4 mm long, short-villous on the nerves, with a web on the callus. **ANTHERS** 0.4–0.8 mm long. $2n = 28$, 29. Seasonally moist washes, woodlands, desert plains, and foothills. NMEX: McK, San; UTAH. 1150–2130 m (3800–7000′). Flowering: Feb–May. Southwestern United States from Oklahoma to California.

Poa bulbosa L. (having a bulb) Bulbous bluegrass. Densely tufted perennials. **CULMS** usually bulbous and purplish at the base, 25–50 cm tall. **LIGULES** 1.5–5 mm long, acuminate. **BLADES** flat to folded, 1.5–4 mm wide. **PANICLES** 4–10 cm long, usually narrow and contracted, the branches ascending to erect. **SPIKELETS** 4- to 6-flowered, these nearly always transformed into conspicuous vegetative bulblets. **GLUMES** 2–3.5 mm long. **LEMMAS** 3–6 mm long, normal lemmas rarely present and with a web on the callus. **ANTHERS** 1–2.5 mm long when present. $2n = 14, 21, 28, 39, 40–58$. Moist, weedy ground in the foothills and mountains, pastures, meadows, stream banks. ARIZ: Apa, Nav; COLO: Arc, Dol, Mon, SMg; NMEX: McK, SJn; UTAH. 1500–2950 m (4900–9700′). Flowering: Apr–Aug. Native to Eurasia and North Africa, common in western North America. The viviparous bulblets in the inflorescence are unmistakable, and perhaps confusing at first sight.

Poa compressa L. (flattened) Canada bluegrass. Rhizomatous, bluish green perennials. **CULMS** 20–70 cm tall, nearly always prominently flattened, including the nodes, decumbent- or geniculate-based, remaining green after the sheaths have faded. **LIGULES** 0.5–2 mm long, rounded. **BLADES** flat to folded, 1.5–3.5 mm long. **PANICLES** narrow and contracted to somewhat open, but never diffuse, the branches erect-appressed to spreading. **SPIKELETS** 3- to 7-flowered. **GLUMES** subequal, 1.8–3 mm long, the first 1- to 3-nerved, the second broader and 3-nerved. **LEMMAS** 2–3 mm long, firm and almost leathery, usually bronze-tipped, short-villous on the nerves, without a web on the callus, or the web quite scant. **ANTHERS** 0.9–1.7 mm long. $2n = 14, 35, 39, 42, 45, 49, 50, 56$. Quite common in forest clearings, disturbed meadows, roadsides in the mountains, often with *P. pratensis*. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 2050–2750 m (6700–9000′). Flowering: Jun–Aug. Native to Eurasia, now found nearly throughout cool-temperate regions of the world. The florets of *P. compressa* are distinctive, being tannish purplish with a rough, almost leathery surface and obscure nerves, and quite similar to those of *P. palustris*. The flattened culms and sheaths are diagnostic.

Poa cusickii Vasey (for W. C. Cusick, 1842–1922, Oregon botanist) Skyline bluegrass. Loosely tufted perennials, lacking rhizomes. **CULMS** erect, generally not decumbent- or geniculate-based, 15–45 cm tall. **LIGULES** 2–5 mm long. **BLADES** flat or folded, bright green, 1–3 mm wide. **PANICLES** narrow and contracted, the branches appressed, 3–8 cm long. **SPIKELETS** 2- to 5-flowered, strongly compressed, usually pistillate. **GLUMES** subequal, 1-nerved, 2.4–5 mm long, the second slightly longer and sometimes 3-nerved. **LEMMAS** 4–6 mm long, glabrous to minutely scabrous, 5-nerved, lacking a web on the callus. **ANTHERS** about 2.5 mm long when present. $2n = 56, 84$. [*Poa epilis* Scribn.]. Alpine or upper subalpine rocky ridges and talus, not commonly collected. COLO: Hin, Min, Mon, LPl, SJn; UTAH. 3000–3750 m (9800–12400′). Flowering: Jun–Aug. Western Canada and United States, south to Colorado



and California. Four Corners material belongs to **subsp. *epilis*** (Scribn.) W. A. Weber (hairless). Related to *P. fendleriana*, and merged by some into that species, but our populations are distinguished by the glabrous florets (Soreng 1991).

Poa fendleriana (Steud.) Vasey (for Augustus Fendler, 1813–1883, German-born botanical collector) Muttongrass. Densely tufted perennials, sometimes with short rhizomes, often glaucous. **CULMS** erect, commonly with a curving or geniculate base, 25–65 cm tall. **LIGULES** 1–10 mm long, highly variable. **BLADES** firm, flat to commonly folded or rolled, 1.5–4 mm wide, the uppermost blade often reduced to nothing. **PANICLES** narrow, oblong, 4–15 cm long, 1–2 cm wide. **SPIKELETS** mostly pistillate, 3- to 6-flowered, large and strongly compressed, appearing papery. **GLUMES** subequal, 2.8–5 mm long, the second broader than the first. **LEMMAS** 4–7 mm long, short-pilose on the nerves, lacking a web on the callus. **ANTHERS** usually abortive, less than 1 mm long. $2n = 29, 56$. [*Poa longiligula* Scribn. & T. A. Williams]. Common throughout our region in foothill woodlands to subalpine forests and grassy slopes. ARIZ: Apa, Coc, Nav; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SIn; UTAH: 1370–3700 m (4500–12200'). Flowering: May–Sep. Western half of Canada and the United States, northern Mexico. Plants with long ligules (2–10 mm) have been referred to subspecies *longiligula* (Scribn. & T. A. Williams) Soreng.

Poa glauca Vahl (bluish) Timberline bluegrass. Densely tufted perennials. **CULMS** erect, rigid, 5–25 cm tall. **LIGULES** 0.5–2 mm long, rounded. **BLADES** rolled, short and stiff, 15 cm long, 1–2 mm wide. **PANICLES** narrow, compact, often purplish, 1–7 cm long, the branches appressed. **SPIKELETS** 2- to 4-flowered, strongly compressed. **GLUMES** subequal, 3-nerved, 2–3.5 mm long. **LEMMAS** 2.5–4.5 mm long, short-villous on the nerves and also between the nerves, lacking a web on the callus. **ANTHERS** 1–1.5 mm long. $2n = 44, 56–58, 62, 70–72, 75, 78$. Alpine and subalpine ridges, rocky grassy slopes, and mossy ledges often above timberline. COLO: Con, Hin, LPl, Min, Mon, SIn; 3600–3900 m (11800–12800'). Flowering: Jul–Aug. Western Canada and United States, south to New Mexico and California. Our material is referred to as **subsp. *rupicola*** (Nash) W. A. Weber (growing on rocks). **Subspecies *glauca*** may also be present, which is sparsely webbed on the callus.

Poa interior Rydb. (interior) Inland bluegrass. Tufted perennials. **CULMS** stiffly erect, 20–50 cm tall. **LIGULES** 0.5–2 mm long, truncate. **BLADES** crowded at the base, lax, flat to rolled, 1–2 mm wide. **PANICLES** 4–14 cm long, pyramidal, the branches spreading, the lower branches 2–5 per node. **SPIKELETS** mostly 2- to 3-flowered. **GLUMES** subequal, 1- to 3-nerved, 1.8–3 mm long. **LEMMAS** 2.5–3.5 mm long, strongly keeled, short-villous on the nerves, with a copious web on the callus. **ANTHERS** 1–1.5 mm long. $2n = 28, 42, 43, 56$. [*Poa nemoralis* L. subsp. *interior* (Rydb.) W. A. Weber]. Subalpine to alpine meadows, ledges, and forest clearings in the mountains. COLO: Arc, Dol, LPl, Mon, SJn, SMg; NMEX: SJn. 2900–4000 m (9500–13000'). Flowering: Jun–Aug. Canada, northern and western United States.

Poa leptocoma Trin. (weakly hairy) Bog bluegrass. Loosely tufted perennials, lacking rhizomes. **CULMS** erect to decumbent-based and rooting at the nodes, solitary or a few together, 15–55 cm tall. **LIGULES** 1–4 mm long, truncate. **BLADES** lax, flat, green, 1–4 mm wide. **PANICLES** delicate, lax, the tip often nodding, 4–14 cm long, the branches capillary, spreading to drooping. **SPIKELETS** 2- to 5-flowered, strongly compressed, purplish. **GLUMES** unequal, the first 2–3.5 mm long, mostly 1-nerved and narrower than the second, the second 2.5–4 mm long and 3-nerved. **LEMMAS** 3–5 mm long, short-sericeous on the nerves, with a web on the callus. **ANTHERS** 0.5–1 mm long (rarely longer). $2n = 42$. Subalpine to alpine bogs, springs, and wet meadows. COLO: Arc, Hin, LPl, Min, Mon, SIn; 3000–3900 m (9850–12800'). Flowering: Jul–Aug. Western Canada and United States.

Poa lettermanii Vasey (for George Washington Letterman, 1840–1913, Missouri botanist) Letterman's bluegrass. Small, densely tufted perennials. **CULMS** erect, 3–12 cm tall, the leaves often exceeding the panicle. **LIGULES** 1–2 mm long, truncate. **BLADES** flat to folded, 0.5–2 mm wide. **PANICLES** narrow, few-flowered, 1–2 cm long, to 1 cm wide, the branches erect. **SPIKELETS** (1) 2 (3)-flowered, purplish, compressed. **GLUMES** subequal, nearly as long as the spikelet, 2–3 mm long, 1- to 3-nerved. **LEMMAS** 2–3 mm long, glabrous, lacking a web on the callus. **ANTHERS** about 0.3–0.8 mm long. $2n$ = not known. Rocky ridges and ledges above timberline. COLO: SJn. 3900–4050 m (12700–13200'). Flowering: Jul–Aug. Western Canada and United States, south to California and Colorado. Dwarf and often overlooked, *P. lettermanii* is easily distinguished by its diminutive stature, few glabrous florets, and relatively large glumes.

Poa occidentalis Vasey (western) New Mexico bluegrass. Tufted perennials, lacking rhizomes. **CULMS** erect, 25–75 cm tall or more, terete. **LIGULES** 1–6 mm long, acute. **BLADES** flat, lax, blue-green, 2–5 mm wide. **PANICLES** broadly pyramidal, open, 8–30 cm long or more, nodding, the branches widely spreading. **SPIKELETS** 2- to 7-flowered. **GLUMES** nearly equal, 2–3.5 mm long, the first 1-nerved, the second 3-nerved. **LEMMAS** 2.6–4.2 mm long, strongly keeled, short-villous on the nerves, with a web on the callus. **ANTHERS** 0.4–1 mm long. $2n$ = 14, about 28. Forest clearings and moist woods, montane to subalpine forests. COLO: LPl, Min, Mon. 2300–3000 m (7500–9800'). Flowering: Jul–Aug. Colorado and New Mexico.

Poa palustris L. (of marshes) Fowl bluegrass. Loosely tufted perennials. **CULMS** decumbent-based and often rooting at the lower nodes in wet soil, 25–90 cm tall or more, often purplish based. **LIGULES** 1–5 mm long, acute. **BLADES** lax, flat or folded, 1–3.5 mm wide. **PANICLES** open and loosely flowered, pyramidal, 7–25 dm long, yellowish green or purplish, the lower branches spreading. **SPIKELETS** 2- to 4-flowered, strongly compressed. **GLUMES** subequal, 1.8–3 mm long, 3-nerved. **LEMMAS** 2.5–3.5 mm long, bronze-tipped, obscurely nerved, short-villous on the nerves, with a web on the callus. **ANTHERS** 0.8–1.2 mm long. $2n$ = 28, 42. Moist meadows, marshy ground, sloughs, and ditch banks. COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2250–3500 m (7450–11500'). Flowering: Jun–Sep. Circumboreal throughout much of North America, Europe, and Eurasia, introduced in South America. The spikelets are quite similar to those of *P. compressa*.

Poa pratensis L. (of meadows) Kentucky bluegrass. Densely tufted perennials with creeping rhizomes, often forming a thick sod. **CULMS** erect to geniculate- or decumbent-based, 20–80 cm tall or more, freely branching below. **LIGULES** 0.5–1.7 mm long, truncate. **BLADES** soft or firm, flat to folded or rolled, 1–4 mm wide, mostly glabrous above (in our subspecies). **PANICLES** open, often pyramidal, sometimes contracted and dense, 4–12 cm long, the lower branches in whorls of 4 or 5. **SPIKELETS** 2- to 5-flowered, strongly compressed. **GLUMES** keeled, scabrous on the nerves, unequal, the first 1.8–2.5 mm long and 1-nerved, the second 2.2–3.3 mm long and 3-nerved. **LEMMAS** 3- to 5-nerved, the lateral nerves faint, mostly glabrous on the marginal nerves and short-villous on the midnerve, with a web on the callus. **ANTHERS** 1–2 mm long. $2n$ = 21–147. In a variety of habitats throughout the *Flora* region; roadsides, meadows, grassy slopes, clearings in forests, ditch banks, seeps, cultivated as lawn grass. Expected for all counties in the Four Corners region. 1150–2900 m (3800–9500'). We have two subspecies, one native and the other exotic:

1. Stems erect at the base; basal leaves pale grayish blue-green, 0.8–2 mm broad, folded and somewhat revolute, strongly ribbed on the back with the ribs almost touching, the sheaths remaining intact through several seasons; upper stem blade 1–3 cm long; lowermost panicle branches usually 2–3 at the node (up to 5), ascending; spikelets mostly 2-flowered; upper glume 2–2.7 mm long; lowermost lemma only slightly cobwebby ...**subsp. *agassizensis***
1′ Stems geniculate at the base; basal leaves bright green, 2–3 mm broad, flat or channeled, ribbed on the back with well-separated ridges, the sheaths withering and disintegrating after a season or two; upper stem blade 3–8 cm long; lowermost panicle branches usually 5 at the node, spreading; spikelets mostly 3- to 5-flowered; upper glume 3–3.5 mm long; lowermost lemma very cobwebby at the base .....**subsp. *pratensis***

subsp. *agassizensis* (B. Boivin & D. Löve) Roy L. Taylor & MacBryde (of ancient glacial Lake Agassiz, Manitoba, Canada) [*Poa agassizensis* B. Boivin & D. Löve]. This is the native race, common in drier, upland meadows and grassy understories of open forests. ARIZ: Apa; COLO: Dol, Hin, LPl, Mon, SMg; NMEX: McK, RAr, SJn.

subsp. *pratensis* Introduced from Europe (and called smooth meadow grass there) for improved pastures, meadow reseeding, and lawns, escaping to similar moist sites in natural habitats. ARIZ: Apa, Nav; COLO: Dol, Hin, LPl, Mon, SMg; NMEX: McK, RAr, SJn.

Poa reflexa Vasey & Scribn. (bent back) Nodding bluegrass. Loosely tufted perennials, lacking rhizomes. **CULMS** erect to decumbent-based and rooting at the nodes, in small tufts, 15–50 cm tall. **LIGULES** 1–3 mm long, truncate.

BLADES flat, 1–3 mm wide. **PANICLES** open, 4–14 cm long, the branches capillary and spreading to reflexed. **SPIKELETS** 2- to 4-flowered, strongly compressed. **GLUMES** subequal, 1.8–3 mm long, the first 1-nerved, the second 3-nerved. **LEMMAS** 2.2–3.5 mm long, purplish below a scarious tip, short-villous on the nerves, with a web on the callus. **ANTHERS** 0.5–1 mm long. $2n = 28$. Subalpine to alpine bogs, springs and seeps, rocky ridges and ledges. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3100–3600 m (10200–11800'). Flowering Jul–Aug. Rocky Mountains in southern Canada and the United States, south to New Mexico.

Poa secunda J. Presl (to one side) Sandberg's bluegrass. Tufted perennials, sometimes with short rhizomes but these not well developed, yellowish green to glaucous. **CULMS** erect, 20–100 cm tall or more. **LIGULES** 1–6 mm long, truncate to acute. **BLADES** mostly folded, rolled upon drying, 0.5–3.5 mm wide. **PANICLES** narrow, contracted, only rarely open in infrequent individuals, 3–25 cm long or more, the branches ascending to erect-appressed (rarely spreading). **SPIKELETS** 3- to 6-flowered, rounded on the back and only slightly compressed if at all. **GLUMES** subequal, the first 2–5 mm long, the second slightly longer, shorter to longer than the lowermost floret. **LEMMAS** 3–6 mm long, rounded on the back, often bronze-tipped, densely even-pubescent across the back to glabrous, lacking a web on the callus. **ANTHERS** 1.2–3.5 mm long. $2n = 44, 56, 61–72, 74, 78, 81–106$. Forest clearings, sagebrush plains, dry meadows, disturbed ground. ARIZ: Apa; COLO: Dol, Hin, Mon; NMEX: McK, RAr, SJn; UTAH. 1400–3800 m (4600–12500'). Flowering: Apr–Aug. Most of Canada, south through the western United States, into Mexico, South America (Kellogg 1985a, 1985b). A widely varying and difficult group, with numerous races that have been named as species. One may attempt to recognize two subspecies:

1. Lemmas glabrous to minutely scabrous on the back ..... **subsp. *juncifolia*** (Scribn.) Soreng
[*Poa ampla* Merr.; *P. nevadensis* Vasey].

1' Lemmas prominently crisp-puberulent across the back toward the base ..... **subsp. *secunda***
[*Poa canbyi* (Scribn.) Howell; *P. sandbergii* Vasey; *P. scabrella* (Thurb.) Vasey].

Poa tracyi Vasey (for Samuel Mills Tracy, 1847–1920, USDA agronomist and forage botanist) Tracy's bluegrass. Tufted perennials, sometimes with short rhizomes. **CULMS** erect, 30–100 cm tall or more. **LIGULES** 1–4 mm long, acute. **BLADES** cauline, flat, 1.5–5 mm wide. **PANICLES** open, pyramidal, 8–25 cm long, the branches capillary, spreading to divergent. **SPIKELETS** compressed, 2- to 5-flowered. **GLUMES** unequal, the first 1.6–3.5 mm long and 1-nerved, the second 2.2–5 mm long and 1- to faintly 3-nerved. **LEMMAS** strongly keeled, 3- to faintly 5-nerved, 2.6–5 mm long, short-sericeous on the nerves, with a web on the callus (rarely scant). **ANTHERS** 1–3 mm long. $2n = 28$. Rich humus and moist loam of forests and woodlands in the mountains. COLO: Arc, SJn. Flowering: May–Jul. Colorado, Utah (Grand County), and New Mexico (Soreng and Hatch 1983).

Poa wheeleri Vasey (for George Montague Wheeler, 1842–1905, of the U.S. Army Corps of Engineers, director of the western surveys of 1869–1879, mapping almost 1/3 of the land west of the 100th meridian; namesake of Wheeler Peak, highest point in New Mexico) Wheeler's bluegrass. Shortly rhizomatous to sometimes loosely tufted perennials. **CULMS** erect or with weakly decumbent bases, 35–80 cm tall, terete or weakly compressed. **LIGULES** 0.5–2 mm long, minutely fringed, truncate. **BLADES** flat or folded, lax, 2–3.5 mm wide. **PANICLES** pyramidal to loosely contracted, 5–15 cm long, the branches lax and ascending to spreading. **SPIKELETS** 2- to 7-flowered, compressed. **GLUMES** 1/4–2/3 as long as the adjacent lemmas, subequal, 1- to 3-nerved. **LEMMAS** 3–6 mm long, distinctly keeled, mostly glabrous, sometimes puberulent between the nerves, glabrous on the callus. **ANTHERS** mostly vestigial and 0.1–0.2 mm long, or sometimes large and up to 2 mm long. [*Poa nervosa* (Hook.) Vasey var. *wheeleri* (Vasey) C. L. Hitchc.] Moist, coniferous woods, montane to subalpine habitats. COLO: Hin, LPl. Flowering: May–Aug. Western United States.

Polypogon Desf. Polypogon

(Greek *poly*, many, and *pogon*, beard, alluding to the numerous awns) Tufted to stoloniferous annuals and perennials, often of wet places, with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a terminal, dense panicle; disarticulation below the glumes, the spikelet falling entire and often with a portion of the pedicel. **SPIKELETS** 1-flowered, perfect, the rachilla not prolonged; glumes exceeding the floret, awned or awnless; lemmas 1- to 3-nerved, usually awned, the awn terminal or subterminal, sometimes near midlength; palea much shorter than to equaling the lemma. **STAMENS** 3. $x = 7$. A genus of about 18 species of the tropical and warm-temperate regions of the world (Björkman 1960).

1. Glumes awnless ..... ***P. viridis***

1' Glumes awned ..... (2)

2. Awns 1–3 (5) mm long; perennial ..... ***P. interruptus***
2' Awns 4–12 mm long; annual ..... ***P. monspeliensis***

Polypogon interruptus Kunth (severed, interrupted) Ditch polypogon. Perennials, sometimes flowering the first year. **CULMS** decumbent-based and often rooting at the nodes, 20–80 cm long or more. **LIGULES** 2–6 mm long. **BLADES** 3–6 mm wide. **PANICLES** compact but often lobed or interrupted, 3–15 cm long, 1–3 cm wide, greenish. **GLUMES** 2–3 mm long, scabrous, acute and entire to minutely cleft at the apex; awns 1–3 (5) mm long. **LEMMAS** 0.8–1.5 mm long, smooth and shiny, the awn 1–2 mm long. **PALEAS** about 3/4 the length of the lemmas. **ANTHERS** 0.5–0.7 mm long. $2n = 28, 42$. |×*Agropogon littoralis* (Sm.) C. E. Hubb.; *Polypogon littoralis* Smith|. Wet ground, ditches, seeps, and springs in disturbed sites at lower elevations. ARIZ: Apa, Nav; COLO: Mon; NMEX: SJn; UTAH. 1500–1900 m (4900–6250'). Flowering: May–Aug. Native to South America, exotic in western United States and southward.

Polypogon monspeliensis (L.) Desf. (of Montpellier, France) Rabbitfootgrass. Tufted annuals. **CULMS** erect to ascending, often geniculate-based, 5–70 cm tall or more. **LIGULES** 2.5–16 mm long. **BLADES** 1–7 mm wide. **PANICLES** dense, elliptic, 2–17 cm long. **GLUMES** 1–3 mm long, hispidulous, the apex rounded and minutely lobed; awns 4–12 mm long. **LEMMAS** 0.5–1.5 mm long, smooth and shiny, the awn 0.5–4 mm long. **PALEAS** subequal to the lemmas. **ANTHERS** 0.2–1 mm long. $2n = 14, 28, 35, 42$. Ditch banks, seeps, wet disturbed ground, widespread. ARIZ: Apa, Nav; COLO: Dol, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1550–2250 m (5050–7400'). Flowering: Jun–Sep. Native to Eurasia, widespread in North America, Mexico, South America. The furry-feeling panicles can scarcely be confused with any other species in the *Flora* region.

Polypogon viridis (Gouan) Breistr. (green) Water polypogon, water bentgrass. Tufted perennials. **CULMS** erect to decumbent-based and rooting at the nodes, 10–90 cm long. **LIGULES** 1–5 mm long. **BLADES** 1–6 mm wide. **PANICLES** oblong to narrowly pyramidal, interrupted, 2–10 cm long, 1–3 cm wide, greenish to purplish. **GLUMES** 1.5–2 mm long, scabrous, awnless, the apex obtuse to truncate. **LEMMAS** 0.7–1.3 mm long, erose-tipped, awnless. **PALEAS** subequal to the lemmas. **ANTHERS** 0.3–0.5 mm long. $2n = 28, 42$. |*Agrostis semiverticillata* (Forssk.) C. Chr.; *Polypogon semiverticillatus* (Forssk.) Hyl.|. Wet ground of springs, seeps, ponds, and ditch banks. ARIZ: Apa, Nav; COLO: Mon; NMEX: SJn; UTAH. 1120–1750 m (3700–5800'). Flowering: May–Aug. Native to Eurasia, now found in scattered locales throughout the western United States, Mexico, South America. Because of the absence of awns, this species was formerly classed in *Agrostis*, but its disarticulation below the glumes reveals a relationship to *Polypogon*, where most botanists now treat it.

Psathyrostachys Nevski Wildrye

(Greek *psathyros*, shattering, and *stachys*, spike) Tufted perennials, sometimes rhizomatous or stoloniferous, with hollow culms. **LEAVES** with closed sheaths, membranous ligules, and with or without auricles. **INFL** a spike; disarticulation in the rachis of the spike. **SPIKELETS** 2–3 per node of the rachis, 1- to 3-flowered and often with additional vestigial florets; glumes subulate, ± equal, 1-nerved; lemmas 5- to 7-nerved, narrowly elliptic, awnless to awned; palea equaling to slightly longer than the lemma, 2-keeled. **STAMENS** 3, yellow or violet. $x = 7$. A small genus of eight species native to central Asia (Baden 1991).

Psathyrostachys juncea (Fisch.) Nevski (rushlike) Russian wildrye. Densely tufted perennials. **CULMS** erect to decumbent-based, 30–80 cm tall. **LIGULES** tiny, 0.2–0.3 mm long. **BLADES** flat or rolled, 1–5 mm wide; auricles 0.5–1.5 mm long. **SPIKES** stiffly erect, 5–15 cm long, 5–15 mm wide, the rachis puberulent. **SPIKELETS** strongly overlapping. **GLUMES** 4–10 mm long, scabrous to puberulent-ciliate. **LEMMAS** lanceolate, 5.5–7.5 mm long, glabrous to stiff-puberulent; awn 1–4 mm long. **ANTHERS** 2.5–5 mm long. $2n = 14, 28$. Introduced for range restoration and reseeding, woodlands and ponderosa pine forests. COLO: LPl, Mon; NMEX: SJn. 1850–2150 m (6100–7000'). Flowering: Jun–Jul. Native to central Asia, introduced in scattered locales in western North America.

Puccinellia Parl. Alkaligrass

(for Benedetto Puccinelli, 1808–1850, Italian botanist) Tufted annuals and perennials of wetlands, with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat to rolled blades, and lacking auricles. **INFL** a panicle, the branches usually rebranched. **SPIKELETS** 2- to 9-flowered, disarticulating above the glumes and between the florets; glumes rounded on the back, the first 1-nerved, the second 3- to 5-nerved, shorter than the lowermost lemma, awnless; lemmas rounded on the back or rarely keeled, obscurely (3) 5- to 7-nerved, the nerves parallel or nearly so, the tip erose, awnless; palea nearly as long as the lemma. **STAMENS** 3. $x = 7$. About 30 species. *Puccinellia pauciflora* has been removed to the genus *Torreyochloa* and is distinguished from *Puccinellia* by its conspicuous nerves, creeping rhi-

zomes, very broad flat blades, and freshwater habitats. Plants are often more easily identified in the field than from herbarium specimens. Distinctions among the perennial species are difficult and this treatment must be considered tentative (Church 1949).

1. Plants annual; lemma nerves puberulent on the lower 1/2, glabrous between the nerves ..... ***P. parishii***
1' Plants perennial; lemma nerves glabrous, the body of the lemma may be minutely hairy between the nerves ...(2)

2. Florets coriaceous, firmer than the glumes; panicle branches spikelet-bearing to the base or nearly so; known only from Apache County, Arizona ..... ***P. fasciculata***
2' Florets membranous, similar to the glumes in texture; panicle branches naked below; widespread .....(3)

3. Plants with yellow-green herbage and erect culms; panicles 10–28 cm long, the branches as much as 15 cm long; lemmas 2–3.5 mm long; anthers 0.7–2 mm long ..... ***P. nuttalliana***
3' Plants with blue-green herbage and geniculate-based culms; panicles 5–14 cm long, the branches to about 8 cm long; lemmas 1.5–2.5 mm long; anthers 0.3–1 mm long ..... ***P. distans***

Puccinellia distans (L.) Parl. (separated, apart) Weeping alkaligrass. Weakly tufted perennials with blue-green herbage, the culms sometimes solitary. **CULMS** usually geniculate-based, 10–70 cm tall. **LIGULES** 1–2 mm long. **BLADES** flat to involute, 1–5 mm wide. **PANICLES** open at maturity, 6–20 cm long, the branches divergent to reflexed and loosely spaced, to 8 cm long. **SPIKELETS** 5- to 9-flowered. **GLUMES** ovate-lanceolate, unequal, the first 0.5–1.5 mm long, the second 1–2.5 mm long. **LEMMAS** ovate to oblong, similar to the glumes in texture, 1.5–3 mm long, subtruncate and minutely erose at the apex. **ANTHERS** 0.3–1 mm long. $2n$ = 14, 28, 42. Alkaline and saline lowlands in desert shrub communities. ARIZ: Apa, Nav; COLO: Dol, LPl, Mon; NMEX: RAr, SJn; UTAH. 1350–2250 m (4400–7400'). Flowering: Jun–Aug. Alaska across southern Canada, south through the western United States.

Puccinellia fasciculata (Torr.) E. P. Bicknell (clustered in bundles) Torrey's alkaligrass. Tufted perennials, the herbage usually glaucous. **CULMS** erect to decumbent-based, 6–60 cm tall. **LIGULES** 0.5–2.5 mm long. **BLADES** flat to commonly involute, 1–4 mm wide. **PANICLES** mostly narrow and contracted, the branches spikelet-bearing to near the base, sometimes diverging at maturity, to 7 cm long. **SPIKELETS** 2- to 6-flowered. **GLUMES** ovate, unequal, the first 0.5–1.5 mm long and 1-nerved, the second 1–2 mm long and 3-nerved. **LEMMAS** firmer than the glumes, somewhat coriaceous, ovate to oblong, 1.5–2.5 mm long, faintly nerved, glabrous throughout. **ANTHERS** 0.5–1 mm long. $2n$ = 28. Alkaline and saline lowlands in desert shrub communities. ARIZ: Apa. 1200–1700 m (4200–5600'). Flowering: May–Jul. Intermountain region of the United States.

Puccinellia nuttalliana (Schult.) Hitchc. (for Thomas Nuttall, 1786–1859, early botanist in North America) Nuttall's alkaligrass. Tufted perennials with blue-green herbage, the culms clustered or solitary. **CULMS** strictly erect, 30–100 cm tall. **LIGULES** 1–3.1 mm long. **BLADES** flat to involute, 0.5–4 mm wide. **PANICLES** open when mature, 6–30 cm long, the branches divergent, to 15 cm long. **SPIKELETS** 3- to 7-flowered. **GLUMES** ovate-lanceolate, unequal, the first 0.5–1.8 mm long, the second 1–2.5 mm long. **LEMMAS** ovate to oblong, similar to the glumes in texture, 1.8–3.5 mm long. **ANTHERS** 0.7–2 mm long. $2n$ = 42, 56. Alkaline and saline lowlands in desert shrub communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: RAr, SJn; UTAH. 1200–2050 m (4200–6700'). Flowering: May–Aug. Alaska across southern Canada, south through the western United States.

Puccinellia parishii Hitchc. (for Samuel Bonsall Parish, 1838–1928, southern California botanist) Parish's alkaligrass. Dwarf tufted annuals. **CULMS** erect, solitary or few together, 3–15 cm tall. **LIGULES** 0.5–1 mm long. **BLADES** flat to involute, less than 1 mm wide. **PANICLES** narrow and contracted, the branches erect or sometimes spreading in fruit, 1–8 cm long. **SPIKELETS** 3- to 6-flowered. **GLUMES** unequal, 1–2.3 mm long, the first about 2/3 the length of the second. **LEMMAS** broadly oblong, 1.5–2 mm long, puberulent on the lower 1/2 of the nerves. **ANTHERS** 0.5–0.8 mm long. $2n$ = unknown. Alkaline and saline lowlands in desert shrub communities, frequently with *Distichlis spicata*. ARIZ: Apa, Nav; NMEX: SJn. 1200–1700 m (4200–5600'). Flowering: May–Jun. New Mexico to California, Colorado.

Saccharum L. Sugar Cane

(Latin *saccharum*, sugar) Large, coarse, tufted perennials, sometimes with short rhizomes, with pithy to hollow culms. **LEAVES** cauline, with open sheaths, membranous or hairy ligules, flat blades, and lacking auricles. **INFL** a terminal plumose panicle, often very large. **SPIKELETS** all alike and perfect, in pairs of 1 sessile and 1 pedicelled, with a tuft of long silky hair at the base, 2-flowered, the lower floret sterile, the upper floret perfect; disarticulation below the glumes, the sessile spikelet falling with attached rachis joint and pedicel, the pedicelled spikelet falling separately; glumes large and firm, exceeding the florets, subequal, glabrous or villous; lemmas hyaline. **STAMENS** 2 or 3. $x = 10$. A tropical to subtropical genus of 25–40 species. Awned species have been placed in the genus *Erianthus*, which is herein included in *Saccharum*.

Saccharum ravennae (L.) L. (from the valley of Ravenna, Italy) Ravenna-grass. **CULMS** 2–4 m tall, glabrous. **LIGULES** hairy, 0.3–1.2 mm long. **BLADES** to 1 m long, 5–15 mm wide, strongly scabrous on the margins and usually long-hairy at the base near the ligule. **PANICLES** 30–70 cm long, the branches erect to spreading and 6–20 cm long. **SPIKELETS** 4–7 mm long, straw-colored, the basal hairs to about 7 mm long and obscuring the spikelet. **GLUMES** 4- to 5-nerved (lower) or 3-nerved (upper), acute to acuminate, awn-tipped. **LOWER LEMMA** 3–5 mm long, 1-nerved. **UPPER LEMMA** without nerves, the awn 2–8 mm long, flat. **ANTHERS** about 2 mm long. $2n = 20$. |*Erianthus ravennae* (L.) P. Beauv.|. Grown as an ornamental and escaping and persisting, often becoming noxious in wetlands and along riparian areas. NMEX: SJn. 1600–1800 m (5200–5800'). Flowering: Jul–Aug. Native to southern Europe and western Asia.

Schedonnardus Steud. Tumblegrass

(Greek *schedon*, near, and *Nardus*, a genus of grass that Steudel took to be a close relative) A monotypic genus.

Schedonnardus paniculatus (Nutt.) Branner & Coville (having a panicle) Tumblegrass. Tufted perennials with open sheaths and mostly basal foliage. **CULMS** hollow to pithy, strongly angled, 10–45 cm tall, ascending to geniculate-based. **LIGULES** membranous, 1–3.5 mm long. **BLADES** flat to folded, 1–10 cm long, 1–2 mm wide, white-margined, twisting upon drying; auricles lacking. **PANICLES** with a few unbranched spicate branches spread along the rachis, 10–25 cm long, the branches stiff and widely spreading, 4–10 cm long, often breaking at the base and rolling as a tumbleweed. **SPIKELETS** 1-flowered, disarticulating above the glumes. **GLUMES** acuminate-lanceolate, 1-nerved, stiff, unequal, the first 1.5–3 mm long, the second 2.5–5 mm long and as long as the lemma. **LEMMAS** 3-nerved, awnless or awn-tipped, 3–5 mm long. **PALEAS** similar to the lemmas and about as long. **ANTHERS** 3, 0.5–1.2 mm long. $x = 10$; $2n = 20$, 30. Dry plains and grasslands in the valleys and foothills, often with disturbance. ARIZ: Apa; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn. 1700–2000 m (5500–6500'). Flowering: Jun–Sep. Prairies and plains of Canada, the United States, and northwestern Mexico. The twisted, white-margined blades are unmistakable.

Schismus P. Beauv. Mediterranean Grass

(Greek *schizein*, to split, alluding to the cleft lemma) Tufted annuals or short-lived perennials, with hollow culms. **LEAVES** with open sheaths, membranous or hairy ligules, flat or folded blades, and lacking auricles. **INFL** a terminal dense panicle. **SPIKELETS** 4- to 10-flowered, awnless; glumes subequal, about as long as the spikelet, 3- to 7-nerved; lemmas 7- to 9-nerved, the apex cleft to shallowly notched; palea 2-keeled, shorter than the lemma. **STAMENS** 3. $x = 6$. A small genus of five species native to Africa and Asia (Conert and Turpe 1974).

Schismus arabicus Nees (of Arabia) Arabian Mediterranean grass. Tightly tufted winter-annuals. **CULMS** 2–30 cm tall. **LIGULES** hairy, 0.5–1.5 mm long. **BLADES** 0.5–2 mm wide. **PANICLES** 1–4 cm long, usually less than 2 cm wide, congested. **SPIKELETS** 5–7 mm long. **GLUMES** 4–6.5 mm long. **LEMMAS** 1.8–2.6 mm long, densely short-sericeous between the nerves, the apex narrowly notched, the teeth narrowly triangular and longer than wide. **PALEAS** 1.5–2.2 mm long, reaching at most to the middle of the lemma teeth and usually to only the base of the cleft. **ANTHERS** 0.2–0.5 mm long. **CARYOPSIS** 0.5–0.8 mm long, remarkably glossy-translucent. $2n = 12$. Disturbed sites in desert communities. ARIZ: Coc; NMEX: SJn; UTAH. 1125–1675 m (3700–5500'). Flowering: Feb–May. Native to Eurasia.

Schizachne Hack. False Melic

(Greek *schizein*, to split, and *achne*, chaff, referring to the cleft lemmas) A monotypic genus of North America and eastern Asia.

Schizachne purpurascens (Torr.) Swallen (purplish) Tufted perennials. **CULMS** hollow, erect or slightly geniculate-based, loosely tufted, 35–80 cm tall or more. **LEAVES** with closed sheaths and lacking auricles. **LIGULES** membranous, 0.5–1.5 mm long, sometimes split and appearing as auricles. **BLADES** flat to involute, 2–5 mm wide, largely glabrous.

INFL a few-flowered panicle or raceme, open or closed, 7–15 cm long, the spikelets drooping. **SPIKELETS** 3- to 7-flowered, disarticulating above the glumes and between the florets. **GLUMES** membranous, 2- to 5-nerved, awnless, shorter than the lowermost floret, the first 4–6 mm long, the second 6–9 mm long. **LEMMAS** 7- to 13-nerved with the nerves converging, 8–12 mm long, awned from just below the bifid apex, the awns 8–15 mm long and twisted or geniculate; callus strongly bearded. **PALEAS** much shorter than the lemmas. **STAMENS** 3, the anthers 1.4–2 mm long. $x = 10$; $2n = 20$. Moist woods, pine forests, streamsides, and meadows. COLO: Arc, LPl, SJn. 2350–2600 m (7800–8500'). Flowering: Jun–Aug. Across Canada and the eastern United States and south through the mountainous states.

Schizachyrium Nees Bluestem
